beginning decontamination—often determine how far the incident will spread. When more victims appear than expected, triage becomes a moving target rather than a fixed procedure. After the urgent phase ends, new concerns emerge. Water and food contamination can cause unexpected problems days later, especially when infrastructure is damaged. This paper looks at these recurring challenges and reflects on how teams cope with them in real conditions. The discussion highlights the value of flexible planning, continuous practice, and cooperation across different fields, which together strengthen the overall response to CBRN emergencies

Keywords: CBRN Incidents, Disaster Management, Emergency Response, Decontamination Methods, Triage Practices

GİRİŞ

KBRN olayları çoğu zaman beklenmedik şekilde başlar ve ilk anda tam olarak ne olduğuna dair net bir bilgi olmaz. Çoğu ekip, önce çevredeki anormallikleri fark eder; bu fark ediş bazen ölçüm cihazlarıyla değil, basit sahne gözlemleriyle başlar. Franz ve çalışma arkadaşları (1997), kimyasal olaylarda ilk dakikaların belirsizlikle dolu olduğunu ve kararların çoğu zaman sınırlı bilgiyle verildiğini vurgular. Bilginin bu kadar dağınık olması, olayın daha ilk aşamada kontrol altına alınmasını güçleştirir.

Her tehdit türü farklı hızla yayılır ve farklı klinik belirtiler oluşturur. Kimyasal ajanların çoğu dakikalar içinde etki gösterirken, biyolojik ajanların bazıları günlerce sessiz kalabilir. Holloway ve meslektaşları (1997), biyolojik tehditlerin genellikle geç fark edildiğini ve bu nedenle salgın benzeri sonuçlar doğurabileceğini belirtir. Radyolojik maruziyet ise bazen hiçbir belirti göstermeden ilerleyebilir ve bu durum özellikle olay yerindeki ekipleri zorlar (DiCarlo et al., 2021).

Hazırlık aşaması, KBRN yönetiminde teoriden çok daha pratik sonuçlar doğurur. Pek çok plan kağıt üzerinde mükemmel görünür; ancak olay anında işe yarayan şey genellikle ekiplerin önceden yaptığı tatbikatlardır. Vale ve Crome (1994), kimyasal olaylardaki hataların çoğunun hazırlık eksikliğinden kaynaklandığını belirtir. Bu yüzden eğitimlerin düzenli aralıklarla tekrarlanması, teknik protokollerin güncelliği kadar hayati görülür.

Kurumlar arası iletişim bu alanda sürekli sorun yaratır. Okumura ve çalışma arkadaşları (1998), Tokyo metro saldırısı sırasında iletişim kopukluklarının hasta yönetimini belirgin şekilde zorlaştırdığını göstermiştir. KBRN olaylarında bir kurumun yapacağı küçük bir gecikme, zincirleme olarak tüm müdahale planını etkileyebilir. KBRN olaylarında teknik müdahale kadar, kurumlar arasındaki bilgi akışının düzgün olması da operasyonun başarısını belirleyen bir faktördür.

Son yıllarda gelişen tespit teknolojileri sahadaki belirsizliği azaltmıştır; ancak teknolojinin tek başına yeterli olmadığı açıktır. Ekiplerin bu cihazları nasıl kullanacağını bilmemesi hâlinde teknoloji yalnızca bir araç olarak kalır. Çalışma, literatürde yer alan mevcut uygulamaları değerlendirerek hangi alanlarda iyileştirmeye ihtiyaç duyulduğunu tartışmayı amaçlamaktadır.

KAVRAMSAL ÇERÇEVE

KBRN kavramı çoğu kişi için tek bir tehdit türünü çağrıştırsa da, aslında dört ayrı grubun oldukça farklı özellikleri bulunur. Kimyasal maddeler genelde hızla etki gösterir ve çoğu zaman olay yerinde ilk panik dalgasını bu maddeler yaratır. Salem (2007), kimyasal ajanların ani belirtilerinin ekipleri çoğu zaman hataya zorladığını belirtir. Biyolojik tehditler ise çok daha sessiz ilerler. İlk saatlerde neredeyse hiçbir şey fark edilmez ve bu sessizlik olayın gerçek boyutunu gizler (Fauci, 2005).

Radyolojik ve nükleer tehditlerde durum biraz daha tuhaftır; çünkü görünür bir belirti olmayabilir. İnsanlar yalnızca cihazların verdiği uyarılarla hareket eder ve bu da belirsizliği artırır. Hall (2000), radyasyonun etkilerinin çoğu zaman geç ortaya çıktığını ve bu nedenle erken müdahalenin psikolojik baskı oluşturduğunu vurgulamıştır. Bu farklılıklar nedeniyle KBRN olaylarını tek bir modelle açıklamaya çalışmak genellikle yetersiz kalır.

Kavramsal çerçevede bir diğer önemli unsur, KBRN olaylarının çoğunda “bilgi eksikliği” nin temel sorun olarak ortaya çıkmasıdır. Olay yeri bazen karmaşık bir bulmaca gibidir; ekipler farklı ipuçlarını bir araya getirerek tabloyu anlamaya çalışır. Bostock ve arkadaşları (2016), acil durumlarda bilgi akışının dağınık olmasının karar kalitesini düşürdüğünü göstermiştir. Kavramsal çerçevede yalnızca ajan türlerine değil, belirsizlik yönetimi gibi karar süreçlerini etkileyen unsurlara da yer verilmiştir.

Bu bölümde ele alınan kavramlar, KBRN yönetiminin neden çok disiplinli bir yaklaşım gerektirdiğini de açıklar. Her tehdit türü ayrı uzmanlık ister, fakat olayın genel yönetimi bu uzmanlıkları tek potada birleştirmeyi zorunlu kılar. Tam da bu nedenle KBRN alanı, klasik afet yönetiminden daha dinamik, daha dalgalı ve çoğu zaman daha yorucu bir süreçtir.

3. KBRN OLAYLARININ TANIMI VE SINIFLANDIRILMASI

KBRN kavramı zaman içinde genişleyen bir çerçeveye dönüştü ve artık yalnızca askeri tehditlerle sınırlı görülmüyor. Günümüzde endüstriyel kazalar, laboratuvar hataları ve kasıtlı saldırılar da bu yapının içine giriyor. Chemical, Biological, Radiological ve Nuclear başlıkları ilk bakışta tek bir grup gibi görünse de, her birinin kendine has etkileri, yayılma biçimleri ve müdahale gereksinimleri bulunur. Tucker (2000), KBRN tehditlerinin ortak noktalarının az, ayrımlarının ise oldukça belirgin olduğunu vurgular.

Kimyasal olaylar, çoğu zaman hızlı etki göstermeleri nedeniyle tanımlaması en kolay olan gruptur. Sinir gazları, boğucu ajanlar veya endüstriyel toksinler kısa sürede belirti oluşturur ve bu belirtiler genellikle olay yerindeki ilk gözlemleri yönlendirir. Kimyasal ajanların çoğu uçucu yapıları nedeniyle hızla yayılabilir Salem (2007), Bazı ajanlar, özellikle kontrol edilemediğinde dakikalar içinde olayın daha geniş bir alana yayılmasına yol açabilir.

Biyolojik olaylar ise çok daha farklı bir zorluk yaratır. Belirtiler genellikle saatler ya da günler sonra ortaya çıktığı için olayın kapsamı uzun süre belirsiz kalabilir. Inglesby ve arkadaşları (2000), biyolojik tehditlerin "sessiz ilerlemesinin" müdahaleyi geciktiren en kritik unsur olduğunu belirtir. Bu gecikme, özellikle de salgın potansiyeli taşıyan ajanlarda ciddi sorunlara yol açar.

Radyolojik olaylar, görünmez bir tehlike niteliği taşır. Çevredeki insanlar çoğu zaman olayın yaşandığını bile anlamaz; ancak cihazlar radyasyon seviyelerini ortaya çıkarır. Radyolojik partiküller yüzeylerde uzun süre kalabilir ve temizlenmesi karmaşık bir sürece dönüşebilir (IAEA, 2014). Bu tür durumlarda sahada çalışan tespit ekiplerinin hızlı hareket etmesi, müdahalenin doğru yönlendirilmesi açısından kritik kabul edilir.

Nükleer olaylar, düşük ihtimalle gerçekleşse de etkileri en geniş olan tehdit kategorisidir. Bir nükleer patlama, yalnızca fiziksel yıkım yaratmakla kalmaz; uzun dönemli radyasyon etkileri nedeniyle geniş bölgelerde yaşamı olumsuz etkiler. Moulder (2004), nükleer olayların sonrasında oluşan sağlık sorunlarının büyük kısmının radyasyonun gecikmeli etkilerinden kaynaklandığını belirtir.

Bu dört kategori bir araya geldiğinde, KBRN olaylarının aslında tek bir çatı terimle ifade edilen oldukça farklı senaryolar bütünü olduğu anlaşılır. Ajanların sınıflandırılması yalnızca teorik bir ayrım değildir; sahadaki uygulamaları doğrudan etkilediği için pratik açıdan da belirleyicidir.

4. AFET YÖNETİMİ AŞAMALARI

KBRN olaylarının yönetimi genellikle dört temel aşamada ele alınır; ancak bu aşamalar gerçek bir olay sırasında birbirine karışarak ilerler. Teoride hazırlık, müdahale, iyileştirme ve azaltım ayrıdır, fakat pratikte sınırlar çoğu zaman bulanıklaşır. Perry ve Lindell (2003), afet yönetiminin çizgisel bir süreç gibi görünmesine rağmen gerçekte döngüsel davrandığını belirtir. KBRN olaylarında bu döngüsellik daha da belirginleşir.

Hazırlık aşaması, çoğu planlamacının düşündüğünden daha zorlu bir dönemdir. Ekipler yeni cihazlar dener, senaryoları gözden geçirir ve kimi zaman beklenmedik küçük ayrıntılarla uğraşır. Bu ayrıntılar önemsiz gibi görünse de olay anında belirleyici olabilir. Drabek (2013), hazırlık döneminde ortaya çıkan küçük aksaklıkların gerçek olaylarda büyüyerek geri döndüğünü ifade eder. Hazırlık süreci, teknik planlamaların ötesinde kurumların geçmiş deneyimlerinden ders çıkarmasını da içeren daha geniş bir yapıyı kapsar.

Müdahale aşaması, olayın en yoğun ve en yorucu evresidir. Ekipler ilk dakikalarda sınırlı bilgiyle hızlı kararlar almak zorunda kalır. Kimyasal bir olayda ekiplerin hareket süresi dakikalarla sınırlıyken, biyolojik olaylarda belirsizlik çok daha uzun sürer. Dynes (1994), müdahale döneminin çoğu zaman "kontrollü kaos" ile ilerlediğini ve bu kaosun doğru yönetildiğinde işlevsel olabileceğini vurgulamıştır.

İyileştirme aşaması, genellikle en uzun süren dönemdir. KBRN olaylarında çevresel etkiler, psikolojik stres ve altyapı sorunları bir arada görülebilir. Paton ve Johnston (2006), iyileştirme sürecinin yalnızca fiziksel düzenlemeleri değil, aynı zamanda toplumun güven duygusunu yeniden kazanmasını da içerdiğini belirtir. İyileştirme aşaması, yalnızca fiziksel hasarın giderilmesini değil, toplumun psikolojik olarak toparlanmasını da içeren karmaşık bir dönemdir.

Azaltım aşaması, gelecekteki olaylara karşı dayanıklılığı artırmayı amaçlar. Bu aşamada kurumlar, önceki deneyimlerden öğrenerek düzenlemeler yapar. Mileti (1999), azaltımın afet yönetiminin en ihmal edilen fakat en etkili adımı olduğunu söylemiştir. KBRN olaylarında azaltım, genellikle yeni cihazların geliştirilmesi, protokollerin güncellenmesi ve eğitimlerin yeniden yapılandırılması şeklinde görülür.

Bu dört aşama bir bütün olarak ele alındığında, KBRN yönetiminin yalnızca teknik bir dizi işlemden ibaret olmadığı anlaşılır. Her aşama bir sonrakini etkiler ve küçük bir aksama bile tüm sistemi zorlayabilir. KBRN olaylarında yönetim, çoğu zaman önceden hazırlanmış planlara birebir bağlı kalmaktan ziyade sahadaki koşullara hızla uyum sağlamayı gerektirir.

5. İLK MÜDAHALE VE DEKONTAMİNASYON

KBRN olaylarında ilk müdahale çoğu zaman belirsizlik içinde başlar. Olay yerine ulaşan ekipler, başlangıçta net bir tabloyla karşılaşmaz; yalnızca durumun sıradan bir acil vakadan farklı olduğunu hissederler. Bu ilk dakikalar hem zihinsel açıdan yorucudur hem de alınacak kararları büyük ölçüde belirler. Kimyasal ya da biyolojik bir maruziyet olup olmadığını anlamak, çoğu zaman cihazlardan önce ekiplerin hızlı gözlemlerine dayanır. Razak ve çalışma arkadaşları (2018), sahadaki ilk izlenimlerin müdahale kalitesini doğrudan etkilediğini vurgulamıştır.

Ekiplerin olay yerine yaklaşma biçimi, kullanılan kişisel koruyucu donanımın (KKD) türüne göre değişir. Doğru KKD seçimi, teoride basit görünse de sahada birkaç saniye içinde alınması gereken bir karardır. Yanlış bir seçim hem ekipleri hem de mağdurları riske atabilir. Okumura ve meslektaşları (1998), Tokyo metro saldırısında birçok sağlık çalışanının uygun olmayan KKD nedeniyle ikincil maruziyet yaşadığını belirtmiştir. Olayın başlangıcında yeterli bilgi bulunmadığından, ekipler genellikle en üst düzey koruyucu ekipmanla sahaya çıkmayı tercih eder.

Dekontaminasyon ise ilk müdahalenin en görünür aşamasıdır. Ancak bu süreç çoğu kişinin düşündüğünden daha karmaşık ilerler. Dekontaminasyonun nasıl uygulanacağı, ajanın türüne, çevresel koşullara ve maruz kalan kişilerin durumuna göre değişir. Kimyasal ajanlara maruz kalınan durumlardan bir kısmında su ve sabunla yapılan hızlı dekontaminasyon etkili olabilir; ancak bazı ajanlar için bundan daha kapsamlı uygulamalara ihtiyaç duyulur (IAEA, 2015). Biyolojik ajanlarda ise fazla su kullanımı bazen mikroorganizmaların yayılma riskini artırabilir.

Sahada en zorlayıcı konulardan biri, mağdurların panik hâlidir. İnsanlar kendi üzerlerinde görünür bir belirti olmasa bile kirlenmiş olabileceklerini düşünerek yoğun kaygı yaşar. Cone ve Koenig (2005), dekontaminasyon istasyonlarındaki panik davranışlarının çoğu zaman fiziksel risklerden daha büyük sorun yarattığını göstermiştir. Bu nedenle ekipler yalnızca teknik uygulama yapmaz; aynı zamanda kalabalığı sakinleştirmeye çalışır.

Dekontaminasyonun sonunda temiz ve kirli alanlar net şekilde ayrılır. Ancak bu alanların yönetimi bile zaman zaman karışabilir. Ekipler yorgunlaştıkça sınırlar bulanıklaşabilir ve küçük ihlaller büyük risklere dönüşebilir. KBRN olaylarında ilk müdahale ve dekontaminasyon süreci, yalnızca prosedürlere uymaktan ibaret değildir; aynı zamanda olay yerindeki kaosu kontrol etmeyi, bilgi eksikliğini yönetmeyi ve insanların duygusal tepkilerini dengelemeyi gerektirir.

6. TRİYAJ

KBRN olaylarında triyaj, çoğu kişinin düşündüğünden çok daha zorlayıcı bir süreçtir. Olay yerine ulaşan ekipler, ilk anda hem sınırlı bilgiye sahiptir hem de hızla karar vermek zorunda kalır. Bu koşullarda kimin önce müdahale alacağına karar vermek, yalnızca tıbbi durumla değil, ajanın türüyle de yakından ilişkilidir. Kimyasal bir olayda belirtiler dakikalar içinde değişebilir ve bu hızlı değişim, ekipleri sürekli tetikte tutar. Culley ve arkadaşları (2014), bu tür olaylarda triyaj kararlarının "hareketli bir hedefi takip etmeye" benzediğini ifade eder.

Klasik travma triyaj sistemleri, KBRN olaylarında her zaman işe yaramaz. Çünkü travmada belirgin yaralanmalar ön plandayken, kimyasal veya radyolojik maruziyette görünür bir yaralanma olmayabilir. Bazı hastalar başlangıçta iyi görünür fakat birkaç dakika içinde kritik duruma geçebilir. Ramesh & Kumar (2010), kimyasal maruziyette belirtilerin hızlı dalgalanmasının standart protokolleri yetersiz bıraktığını göstermiştir. Bu nedenle ekipler, her kararın arkasında sürekli bir "ya gözden kaçırdığım bir şey varsa" endişesi taşır.

Biyolojik olaylarda ise durum daha farklıdır. Belirtiler büyük ölçüde belirsizdir ve çoğu zaman hasta yoğunluğu belirli bir noktada birden artar. Bu durum, triyajı bir "ilk iz sürme" faaliyetine dönüştürür. Levi ve arkadaşları (2008), biyolojik tehditlerde ilk vakaların geç fark edildiğini ve triyaj yükünün kısa sürede katlanarak arttığını belirtir. Bu nedenle ekipler, hasta akışını yönetirken hem klinik hem de epidemiyolojik ipuçlarını birlikte değerlendirmek zorunda kalır.

Radyolojik olaylarda triyaj, genellikle dışsal belirtilerin yokluğu nedeniyle daha da karışık bir hâl alır. İnsanlar iyi görünse bile yüksek doz almış olabilir. Bunu belirlemek için saha ölçümleri kritik hâle gelir. Blakely ve ark., (2010), radyasyon doz değerlendirmesinin triyaj sürecini "yavaşlatan ama kaçınılmaz" bir adım olduğunu vurgular. Bu nedenle radyasyon olaylarında triyaj, tıbbi kararlar kadar ölçüm cihazlarının doğruluğuna da bağlıdır.

Tüm bu farklılıklar, KBRN triyajının aslında sabit bir protokolden çok sürekli güncellenen bir süreç olduğunu gösterir. Ekipler yalnızca hastaların durumuna bakmaz; olayın değişen dinamiklerini de izler. Bu nedenle KBRN triyajı, klasik acil tıp bilgisi ile olay yeri sezgisinin birleştiği en kritik aşamalardan biridir.

7. SU TEMİNİ

KBRN olaylarında su temini, çoğu zaman olayın ilk şokundan sonra fark edilen ama etkisi hızla büyüyen bir ihtiyaç hâline gelir. Olay yerindeki ekipler başlangıçta daha acil görünen müdahalelerle uğraşırken, su kaynaklarının durumu bir süre ihmal edilebilir. Fakat kimyasal ya da biyolojik bir kontaminasyon söz konusuysa, en küçük bir ihmal bile geniş kitleleri etkileyebilir. Macler ve Merkle (2000), su güvenliğinin KBRN olaylarında "ikinci dalga risklerin" en önemli kaynağı olduğunu belirtir.

Olay sırasında su kaynaklarının zarar görme biçimi, tehdit türüne göre değişir. Kimyasal bir ajan suya karıştığında çoğu zaman hızlı bir yayılım gösterir ve suyun görsel olarak temiz görünmesi hiçbir anlam taşımaz. Biyolojik ajanlarda ise tehdit genellikle daha sessiz ilerler. İnsanlar suyu kullanmaya devam ederken kontaminasyon fark edilmez ve risk giderek büyür. Craun ve çalışma arkadaşları (2002), biyolojik kirlenmenin çoğu zaman rutin kontrollerle bile kolay fark edilmediğini vurgulamıştır.

Radyolojik olaylarda su güvenliği daha karmaşık bir hâl alır. Radyonüklidlerin suda çözünmesi veya çökelmesi, uzun vadeli bir gözetim ihtiyacı doğurur. IAEA (2011), bazı radyonüklidlerin su kaynaklarında aylarca kalabildiğini ve temizleme çalışmalarının titizlik gerektirdiğini belirtir. Bu durum, su yönetim ekiplerini sabırlı ama sürekli bir izleme sürecine zorlar.

Olay sonrası dönemde en kritik adım, güvenli içme suyu sağlanana kadar geçici çözümler üretebilmektir. Sahra tipi arıtma sistemleri bu noktada büyük önem taşır. Bu sistemler mükemmel değildir; ancak altyapının çöktüğü durumlarda hayat kurtarır. Clasen (2008), taşınabilir arıtma teknolojilerinin kriz anlarında su kaynaklı hastalıkları belirgin şekilde azalttığını göstermiştir.

Su temini yalnızca teknik bir görev değildir; aynı zamanda toplumun güvenini şekillendiren bir süreçtir. İnsanlar suyun temiz olduğuna inanmadıkça, diğer müdahalelerin etkisi de azalır. Bu nedenle KBRN olaylarında su temini, hem mühendislik hem iletişim hem de halk sağlığı açısından kritik bir kavşaktır.

8. BESİN GÜVENLİĞİ

KBRN olaylarında besin güvenliği çoğu zaman gözden kaçan ama etkisi geç fark edildiğinde büyük sorun yaratan bir alandır. İnsanlar ilk anda suya odaklanır; fakat gıda zincirinin bozulması çok daha uzun süreli riskler doğurabilir. Kontaminasyonun nasıl gerçekleştiği her zaman belirgin değildir. Bazen kimyasal bir ajan rüzgârla tarım alanlarına taşınır, bazen de biyolojik bir tehdit soğuk zincirde fark edilmeden ilerler. Hamada & Ogino(2012), gıdaların "sessiz taşıyıcılar" hâline gelmesinin acil durum yönetimini zorlaştırdığını belirtir.

Kimyasal kontaminasyonda görünür bir işaret olmayabilir. Toksik maddeler tat ya da koku bırakmadığından insanlar tehlikeyi geç fark eder. Rather ve ark., (2017), birçok kimyasal bulaşmanın laboratuvar analizleri yapılana kadar fark edilmediğini ve bu gecikmenin sağlık etkilerini artırdığını göstermiştir. Bu nedenle gıda örneklerinin hızlı testlerle değerlendirilmesi kritik bir adımdır.

Biyolojik tehditlerde durum daha karmaşık ilerler. Bazı patojenler düşük dozlarda bile ciddi hastalık oluşturabilir. Özellikle de et, süt ve taze sebze gibi ürünlerde bu risk daha belirgindir. Painter ve çalışma arkadaşları (2013), gıda kaynaklı biyolojik tehditlerin acil durumların ikinci dalgasını oluşturabileceğini vurgulamıştır. Bu yüzden KBRN olaylarında gıda zincirinin en küçük adımı bile göz ardı edilmemelidir.

Radyolojik kontaminasyon ise hem tespit hem temizleme açısından ayrı bir zorluk yaratır. Radyoaktif partiküller toprağa, hayvan yemine ve bitkilere kolayca tutunur. UNSCEAR (2010), radyolojik olaylardan sonra süt ve yapraklı sebzelerde yüksek oranlarda birikme görüldüğünü belirtmiştir. Bu nedenle radyolojik kontaminasyonun değerlendirilmesi uzun soluklu takip gerektirir.

Besin güvenliği yalnızca laboratuvarda yürütülen bir süreç değildir. Halkın paniğini yönetmek de en az teknik analizler kadar önemlidir. İnsanlar bir ürüne güvenmediğinde, temiz olduğu kanıtlansa bile kullanmaktan çekinebilir. Bu nedenle KBRN olaylarında besin güvenliği, hem bilimsel hem toplumsal boyutları olan çok yönlü bir süreçtir.

9. MÜDAHALE KOORDİNASYONU

KBRN olaylarında müdahale koordinasyonu çoğu zaman teknik bilgi kadar iletişim becerisini de gerektirir. Olay yerindeki ekipler genellikle aynı anda birçok sorunla karşılaşır ve bu sorunların hangisinin önce ele alınacağı konusunda hızlı bir uzlaşı sağlanmalıdır. Bu uzlaşı, teoride basit görünse de sahada oldukça kırılgan olabilir. Kapucu (2006), acil durumlarda iletişim zincirindeki küçük kopuklukların bile müdahale hızını belirgin biçimde yavaşlattığını belirtir.

Koordinasyonun temel dayanağı, farklı kurumların birbirinin görev alanını anlamasıdır. Ancak bu her zaman mümkün olmaz. Olay anında kararlar hızla alındığı için kurumlar arasındaki sınırlar kolayca bulanıklaşır. Moynihan (2008), kriz yönetiminde kurumların "tek bir organizma gibi" hareket etmesinin müdahale performansını artırdığını vurgulamıştır. Bu yaklaşım, KBRN olaylarında daha da önem kazanır; çünkü belirsizlik, her kurumun kendi içinde izlediği prosedürü bile zorlaştırabilir.

Bilgi paylaşımı koordinasyonun en hassas noktalarından biridir. Farklı ekiplerin sahadan topladığı verilerin tek kanalda birleşmesi gerekir; aksi hâlde bilgiler birbirini tamamlamak yerine karıştırır. Comfort (2007), bilgi akışının düzenli olmadığı durumlarda karar alma hızının üçte bire kadar düştüğünü göstermiştir. Bu nedenle KBRN olaylarında bilgi yönetimi, teknik müdahalenin doğal bir uzantısı olarak görülmelidir.
Lojistik koordinasyon da göz ardı edilemeyecek bir yük oluşturur. Ekipman, personel ve ulaşım planlaması, olayın büyüklüğüne göre sürekli güncellenmek zorunda kalır. Holguín-Veras ve çalışma arkadaşları (2012), afet lojistiğinin "asla tam olarak planlanamayan" bir alan olduğunu ve en büyük sorunların genellikle malzeme dağıtımında yaşandığını belirtmiştir. KBRN olaylarında bu sorun biraz daha belirgin olur, çünkü özel ekipman gereksinimi lojistik baskıyı artırır.
Koordinasyon yalnızca teknik bir süreç değil, aynı zamanda psikolojik bir denge gerektirir. Ekipler, hem kendi güvenliklerini gözetmek hem de hızlı hareket etmek zorunda olduklarından zaman zaman karar baskısı yaşar. Alexander (2015), bu baskının kontrol edilebilir olduğunu, ancak düzenli tatbikat yapılmadığında ekiplerin müdahale sırasında "karar yorgunluğu" yaşadığını ifade etmiştir. Bu nedenle güçlü bir müdahale koordinasyonu, hem teknik hem insani unsurları birlikte taşır.

10. LİTERATÜR İNCELEMESİ

KBRN olaylarına ilişkin literatür, tek bir alana sıkışmayan oldukça geniş bir yapı sunar. Bu kaynakların bir kısmı askeri geçmişe dayanırken, önemli bir bölümü modern kamu sağlığı ve afet yönetimi çalışmalarından beslenir. Tehdit türleri arasında belirgin ayrımlar olduğundan, literatür çoğu zaman bu ayrımlar üzerinden ilerler. Kimyasal olaylar üzerine yapılan erken araştırmalar, genellikle ani belirtilerin yönetilmesine odaklanmıştır. Sidell (1997), sinir ajanlarının birkaç dakika içinde ölümcül etki gösterebildiğini ve bu nedenle ilk müdahalenin çok kritik olduğunu vurgulamıştır.
Biyolojik tehditlere ilişkin çalışmalar ise daha farklı bir bilgi birikimi sunar. Biyolojik ajanların sessiz ilerlemesi, araştırmacıları erken fark edilme yöntemleri üzerine yoğunlaştırmıştır. Inglesby ve arkadaşları (2000), biyolojik saldırıların geç fark edilmesinin toplum sağlığı açısından en büyük zorluk olduğunu ifade eder. Bu nedenle literatürde sürveyans sistemleri, hızlı test teknolojileri ve epidemiyolojik modellemeler ön plana çıkar.
Radyolojik ve nükleer olaylara ilişkin çalışmalar ise genellikle daha dar ama derin bir çerçeve sunar. Radyasyonun biyolojik etkileri uzun yıllardır araştırılmasına rağmen, acil durum yönetimi bağlamındaki modern çalışmalar daha yenidir. Hall (2000), radyasyonun hücresel düzeyde karmaşık ve gecikmeli hasarlar oluşturduğunu belirtir. Fukushima ve Çernobil sonrası literatür, özellikle uzun dönem izleme çalışmalarının önemini güçlü biçimde göstermiştir. Hasegawa ve çalışma arkadaşları (2015), bu tür olayların yalnızca fiziksel değil, toplumsal etkilerinin de uzun süre devam ettiğini göstermiştir.
Son yıllarda literatürün bir kısmı, kurumlar arası koordinasyon ve teknoloji kullanımının müdahale kapasitesine etkisi üzerinde yoğunlaşmıştır. Boin ve 't Hart (2010), kriz yönetiminde karar süreçlerinin teknik kapasiteden çok iletişim kalitesine bağlı olduğunu savunur. Dijital tespit sistemleri ve simülasyon tabanlı eğitimler üzerine yapılan çalışmalar da giderek artmaktadır. Yates ve Paquette (2011), dijital bilgi akışının olay yönetimini hızlandırdığını ancak doğru kullanım olmadığında bilgi kirliliği yaratabildiğini vurgulamıştır.
Genel olarak literatür, KBRN olaylarının tek bir disiplinden yönetilemeyeceğini ve farklı alanlardan gelen bilgi birikimlerinin birbirini tamamladığını göstermektedir. Bu nedenle literatür, yalnızca teknik bulguları değil; aynı zamanda insan davranışını, kurum işleyişini ve toplumsal etkileri bir arada değerlendiren geniş bir çerçeve sunar.

11. TARTIŞMA VE SONUÇ

KBRN olaylarına ilişkin bulgular bir araya getirildiğinde, bu olayların tek bir disiplinin sınırları içinde yönetilemeyeceği açık biçimde görülüyor. Her olay kendi içinde farklı bir mantıkla ilerliyor ve ekipler çoğu zaman sahada beklenmedik durumlarla karşılaşıyor. Bazen kimyasal bir olayda belirtiler tahmin edildiğinden daha hızlı gelişiyor; bazen de biyolojik bir tehdit günlerce sessiz kalarak tüm değerlendirmeyi zorluyor. Tierney (2014), afetlerde belirsizliğin en büyük baskı unsuru olduğunu ve bu baskının karar doğruluğunu etkilediğini belirtmiştir. Bu çalışma da bu görüşü destekleyen bulgular ortaya koyuyor.
KBRN olaylarında kurumlar arası koordinasyonun önemi özellikle belirgin hâle geliyor. Çünkü tek bir kurumun tüm süreci yönetmesi gerçekçi değil. Ekiplerin farklı uzmanlıklara sahip olması bir avantaj yaratırken aynı zamanda iletişim hatalarına da kapı açabiliyor. Boin ve arkadaşları (2005), kriz yönetiminde küçük iletişim kopukluklarının zincirleme sorunlara neden olduğunu göstermiştir. Bu nedenle güçlü koordinasyon, teknik müdahaleden çok daha geniş bir yapıyı gerektiriyor.
Hazırlık aşamasının tartışılması da önemli sonuçlar ortaya koyuyor. Tatbikatların yalnızca teknik uygulamalar değil, aynı zamanda ekiplerin birbiriyle çalışma uyumunu geliştiren bir süreç olduğu görülüyor. Waugh ve

Streib (2006), tatbikatların kurumlar arası güven duygusunu güçlendirdiğini ve karar hızını artırdığını vurgulamıştır. Bu çalışma, hazırlık aşamasının çoğu zaman hafife alındığını ancak sahada en çok fayda sağlayan adımın yine bu aşama olduğunu gösteriyor.

Olay sonrası dönem de en az akut müdahale kadar önemli. Çünkü su ve besin güvenliği gibi süreçler, olayın görünenden daha uzun süre etkili olmasına neden olabiliyor. Alexander (2013), iyileştirme sürecinin teknik olduğu kadar psikolojik bir süreç olduğunu ve toplumun güven duygusunu yeniden inşa etmenin zaman aldığını ifade eder. KBRN olaylarında bu güven kaybı daha derin yaşanıyor.

Sonuç olarak bu çalışma, KBRN olaylarının yönetiminde tek boyutlu çözümlerin yeterli olmadığını ortaya koyuyor. Etkili bir KBRN yönetimi; esnek planlama, güçlü iletişim, düzenli eğitim, güvenilir tespit mekanizmaları ve kurumlar arası uyum gerektiriyor. Her olayın kendine özgü dinamikleri bulunduğundan, sabit protokollerden çok duruma uyarlanabilir stratejilerin geliştirilmesi gerekiyor. Bu yaklaşım yalnızca müdahale kapasitesini artırmakla kalmaz, aynı zamanda toplumsal dayanıklılığı da belirgin biçimde güçlendirir.

Özet

Nano boyutta geliştirilen ilaç taşıyıcı sistemlerin, ilaç yükleme kapasitesi ve salınım mekanizmaları açısından optimize edilmesi, tedavi etkinliğinin artırılması ve hedefe yönelik ilaç iletimi açısından büyük önem taşımaktadır. Bu çalışmada, yoğun silika nanoparçacıkları (YSN) manganez dioksit (MnO_2) nanoplakaları ile kaplanarak hibrit bir nanotaşıyıcı sistem (YSN-MnO_2) geliştirilmiştir. Anti-kanser ve anti-bakteriyel etkileriyle bilinen, ancak hidrofobik doğası nedeniyle biyolojik uygulamalarda sınırlı çözünebilirlik gösteren usnik asit (UA), bu taşıyıcı sisteme yüklenmiştir. Yaklaşık 150 nm çapında, kolay ve hızlı şekilde sentezlenebilen YSN–MnO_2 formülasyonunun morfolojik ve kimyasal özellikleri karakterize edilmiştir. Takiben, 1.5 mg YSN–MnO_2 nanoparçacıklarına yüklenen UA miktarının 0.3 mg olduğu, UV–Vis spektrofotometre ile belirlenmiştir. Ayrıca, tümör mikro-ortamını simüle etmek amacıyla UA salınımı fizyolojik pH (7.4) ve asidik pH (5.5) koşullarında değerlendirilmiştir. Elde edilen kümülatif salınım verileri kullanılarak farklı kinetik modeller ((sıfırıncı, birinci ve Higuchi) uygulanmış ve UA salınımının birinci derece modele en iyi uyum gösterdiği belirlenmiştir. Bulgular, YSN-MnO_2 sisteminin asidik ortamda UA salınımının hızlandığını ve kontrollü salınım potansiyeline sahip etkili bir nanotaşıyıcı olduğunu göstermektedir. Ek olarak, sistemin hücresel etkilerini değerlendirmek amacıyla prostat kanseri hücre hattı (PC3) üzerinde yürütülen *in vitro* analiz, UA@YSN–MnO_2 nanoparçacıklarının yalnızca 1 saatlik inkübasyon sonrasında hücre morfolojisinde belirgin değişimlere ve hızlı hücre–nanoparçacık etkileşimine neden olduğunu ortaya koymuştur.

Anahtar Kelimeler: Usnik asit; Yoğun silika nanoparçacıkları; Manganez dioksit; Kontrollü ilaç salınımı

Synthesis of secondary metabolite-based drug-loaded nanoparticles and modeling of their release behavior

Abstract

Optimizing drug delivery systems developed at nanoscale in terms of drug loading capacity and release mechanisms is crucial for increasing therapeutic efficacy and targeted drug delivery. In this study, a hybrid nanocarrier system (DSN-MnO_2) was developed by coating dense silica nanoparticles (DSN) with manganese dioxide (MnO_2) nanoplates. Usnic acid (UA), known for its anti-cancer and antibacterial properties but with limited solubility in biological applications due to its hydrophobic nature, was loaded into this carrier system. The morphological and chemical properties of the DSN-MnO_2 formulation, which is easily and rapidly synthesized and has a diameter of approximately 150 nm, were characterized. Subsequently, the amount of UA loaded into 1.5 mg of DSN-MnO_2 nanoparticles was determined to be 0.3 mg using a UV-Vis spectrophotometer. Additionally, UA release was evaluated at physiological pH (7.4) and acidic pH (5.5) to simulate the tumor microenvironment. Different kinetic models (zero-, first-, and Higuchi-order) were applied using the cumulative release data, and it was determined that UA release best fit the first-order model. The findings indicate that the DSN-MnO_2 system accelerates UA release in acidic environments and is an effective nanocarrier with controlled release potential. Additionally, in vitro analysis conducted on a prostate cancer cell line (PC3) to evaluate the cellular effects of the system revealed that UA@DSN–MnO_2 nanoparticles caused significant changes in cell morphology and rapid cell-nanoparticle interactions after only 1 hour of incubation.

Keywords: Usnic acid; Dense silica nanoparticles; Manganese dioxide; Controlled drug release

GİRİŞ

Nanoteknoloji, son yıllarda farmasötik araştırmalarda özellikle hedefe yönelik ilaç taşıyıcı sistemlerinin geliştirilmesinde önemli bir alan haline gelmiştir. Nanoparçacıklar, yüksek yüzey alanı ve modifiye edilebilir yüzey özellikleri sayesinde ilaç yükleme kapasitesini artırmakta ve kontrollü salım potansiyeli sunmaktadır (Aparna ve ark., 2025; Dadwal ve ark., 2018). Bu özellikler, hidrofobik doğaya sahip bileşiklerin biyolojik sistemlerde kullanımını kolaylaştırmakta ve tedavi etkinliğini artırmaktadır. Yoğun silika nanoparçacıkları (YSN), kimyasal kararlılık, biyouyumluluk ve yüzey modifikasyon olanakları ile öne çıkan bir taşıyıcı sistemi sunmaktadır (Macedo ve ark., 2021; Meng ve ark., 2024). YSN nanoparçacıklarının MnO_2(mangan diokits) ile kaplanması, hem taşıyıcıların yapısal bütünlüğünü korumakta hem de tümör mikroçevresine duyarlı ilaç salımını desteklemektedir (Chen ve ark., 2019; Wu ve ark., 2019).

Sekonder metabolitler, başta usnik asit (UA) gibi terpenoidler, antikanser ve antibakteriyel aktiviteleri nedeniyle oldukça ilgi çekmektedir; ancak hidrofobik yapıları nedeniyle biyoyararlanımları sınırlıdır (Kumar ve ark., 2020; Patra ve ark., 2018). Nanoparçacık taşıyıcılar, bu tip moleküllerin çözünürlüğünü artırarak hedefe yönelik salımı mümkün kılmakta ve yan etkilerin azaltılmasına katkıda bulunmaktadır (Bae ve ark., 2024; Chandratre ve Dash, 2015). Salım davranışının kinetik modeller ile incelenmesi, taşıyıcı sistemlerin etkinliğini ve ilaç salım mekanizmasını anlamada kritik öneme sahiptir. Özellikle birinci derece kinetik model, difüzyon ve yüzey etkileşimlerinin salım sürecinde belirleyici olduğunu ortaya koymakta ve hidrofobik ilaçların silika bazlı taşıyıcılarda davranışını başarılı şekilde açıklamaktadır (Kumar ve ark., 2021).

Bu çalışmada, YSN nanoparçacıklarının MnO_2 kaplaması ile hibrit bir sistem oluşturulmuş ve UA yüklemesi gerçekleştirilmiştir. Sistem, morfolojik, kimyasal ve salım özellikleri açısından karakterize edilmiş; farklı pH koşullarında salım kinetiği incelenmiş ve in vitro PC-3 hücre hattı üzerinde terapötik potansiyeli değerlendirilmiştir. Elde edilen bulgular, pH-duyarlı nanotaşıyıcıların kontrollü ilaç salımı ve hedefe yönelik tedavi stratejileri için uygun bir platform oluşturduğunu göstermektedir (Zhou ve ark., 2019; Wang ve ark., 2020; Zhang ve ark., 2020).

MATERYAL VE METOT

Kimyasallar ve Reaktifler

Bu çalışmada kullanılan usnik asit (UA), tetraetil ortosilikat (TEOS), amonyak çözeltisi (NH_4OH), potasyum permanganat ($KMnO_4$), etanol ve fosfat tampon çözeltisi (PBS) analitik saflıkta olup ticari kaynaklardan temin edilmiştir.

Yoğun Silika Nanoparçacıklarının Sentezi

Yoğun silika nanoparçacıkları için etanol, saf su ve amonyak 50°C'de karıştırılmış, ardından TEOS damla damla eklenerek 2 saat 400 RPM'de karıştırılmıştır. Oluşan nanoparçacıklar santrifüj edilip etanol ve su ile iki kez yıkanmış, sonra tüplere alınarak fırında 24 saat kurutulmuş ve SiO_2 nanopartikülleri elde edilmiştir.

MnO_2 Kaplı Silika Nanoparçacıklarının Hazırlanması

YSN-MnO_2 nanoparçacıkları sentezi için NaOH (%1 M) ve MES tamponu (%0,1 M, pH 5.0) hazırlanmış, $KMnO_4$ (%10 mM) çözeltisi karanlıkta çözündürülmüştür. MES tamponu (900 µL), sonike edilmiş 10 mg/mL SiO_2 solüsyonu (150 µL) ve $KMnO_4$ çözeltisi (300 µL) 15 mL tüpe eklenmiş, sonik prob ile %20 güçte 10 dakika işlenerek YSN-MnO_2 nanoparçacıkları elde edilmiştir. Oluşan sarı-kahverengi partiküller 2 mL tüplere alınarak üç kez su ile yıkanmıştır.

Sekonder Metabolit (Usnik Asit) Yükleme İşlemi

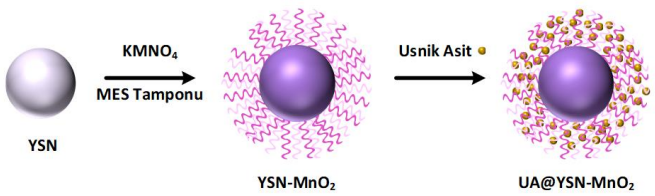
Usnik asit yüklemesi için 5 mg/mL çözeltisi hazırlanmış, ultrasonik banyoda 10 dakika bekletilmiştir. 5 mL beherde 1500 µL MnO_2 süspansiyonu, 300 µL DMSO+usnik asit ve 1200 µL distile su karıştırılmış, manyetik karıştırıcıda 24 saat tutulmuş ve ardından 13.200 rpm'de 10–15 dakika santrifüj edilerek MnO_2 partikülleri ayrılmıştır.

Hücrelere nanoparçacıklarının uygulanması

Prostat kanseri hücreleri 96 kuyucuklu plaklara 15.000 hücre/kuyu olacak şekilde ekilmiş, 24 saat inkübe edildikten sonra kültür ortamı 50 µg/mL UA@YSN-MnO_2 içeren taze ortamla değiştirilmiş ve 24 saat daha inkübasyona bırakılmıştır. İnkübasyon sonunda hücre morfolojisi ters ışık mikroskobu ile incelenmiştir.

Nanoparçacıkların Karakterizasyonu

Nanoparçacıkların boyut dağılımı SEM (Thermo Scientific Quattro S) ile, yüzey kimyasal özellikleri FTIR (Thermo Scientific Nicolet 380) ile, soğurma özellikleri ise UV–Vis (Thermo Scientific Nanodrop 2000c) ile analiz edilmiştir.



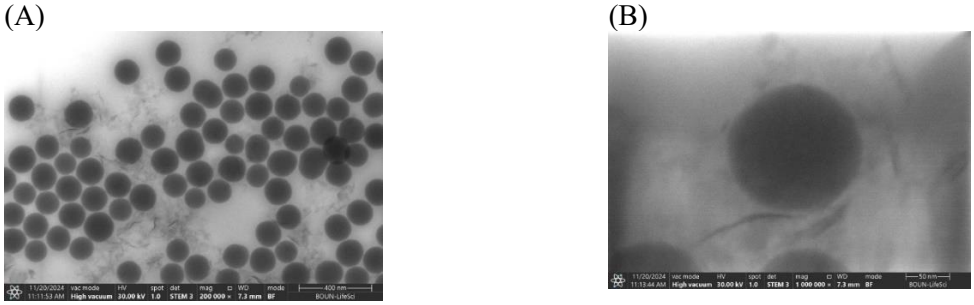
İlaç çıkışı deneyi

İlaç çıkışı deneyi için UA, MnO_2 nanoparçacıklara yüklenmiş ve PBS (pH 7.4) ile asidik ortamda (pH 5.5) santrifüj tüplerinde sürekli karıştırılmıştır. Belirli aralıklarla alınan numunelerde salınan ilaç miktarı UV–Vis ile ölçülmüş, pH değerleri pH metre ile doğrulanmış ve çözeltiler her analiz öncesi taze hazırlanmıştır.

BULGULAR ve TARTIŞMA

Nanoparçacıkların Sentezlenmesi ve Karakterizasyonu

Nanoparçacıklar, MnO_2 kaplı silika üzerinde usnik asit taşımak üzere hazırlanmış ve detaylı karakterizasyonla incelenmiştir. İlaç salımı farklı pH'larda ölçülmüş ve çeşitli kinetik modellerle değerlendirilmiştir.

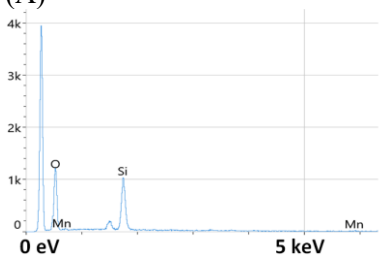


Şekil 1. UA@YSN-MnO_2 nanoparçacıkların sentezlenme aşamalarının şematik gösterimi.

SEM (Taramalı Elektron Mikroskopu) Ölçümü

Nanoparçacıkların yüzey yapısı, Taramalı Elektron Mikroskobu (SEM) ile analiz edilmiştir. Elde edilen görüntüler, MnO_2 kaplı silika nanoparçacıkların büyük ölçüde küresel formda olduğunu, homojen boyut dağılımına sahip olduğunu ve yaklaşık 120–140 nm çapında olduğunu göstermiştir, MnO_2 tabakasının silika yüzeyine etkin bir şekilde bağlandığını ve kaplama sonrası parçacıklarda belirgin şekil bozulması veya düzensizlik gözlenmediğini doğrulamaktadır.

(A) (B)



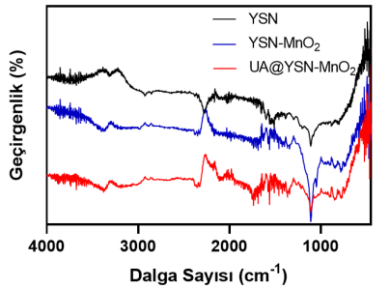
Şekil 2. YSN-MnO_2 nanoparçacığın SEM ile farklı ölçeklerde görüntülenmesi: (A) 400 nm ve (B) 50 nm.

EDS (Enerji Dağılım Spektroskopisi) Ölçümü

Enerji Dağılım Spektroskopisi (EDS), elektron ışını ile açığa çıkan X-ışınları sayesinde numunenin elementel bileşimini belirler (Giardino ve ark., 2024).Hazırlanan YSN-MnO_2 nanoparçacıkları SEM-EDS (EDAX METEK) sistemi ile analiz edilmiştir (Şekil 3). Element haritalama sonuçları, yapıda O, Si ve Mn elementlerinin bulunduğunu göstermiştir. O ve Si sinyalleri SiO_2 yapısını doğrularken, manganın karakteristik pikleri MnO_2 kaplamasının başarıyla gerçekleştirildiğini ortaya koymaktadır.

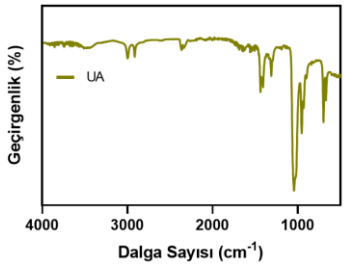
(A)

(B)



Element	Weight %
O	67.9
Si	31.2
Mn	0.9

Şekil 3. YSN-MnO_2 nanoparçacığın EDS analiz verileri.

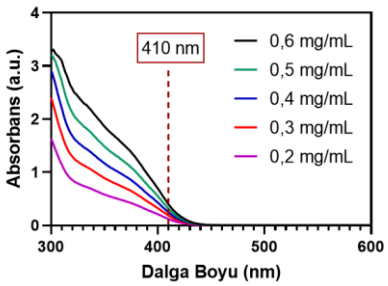


FT-İR (Fourier Dönüşümlü Kızılötesi Spektroskopisi) Ölçümü

FTIR analizi, nanoparçacıkların kimyasal yapısını ve usnik asit yüklemesini doğrulamak için yapılmıştır. YSN ve YSN-MnO_2'de 500–600 cm^{-1} (Mn–O) ve ~1080 cm^{-1} (Si–O–Si) bantları gözlenmiştir. UA@YSN-MnO_2'de ise 3400–3200 cm^{-1} (O–H), 2920–2850 cm^{-1} (C–H), 1720 cm^{-1} (C=O) ve 1600–1500 cm^{-1} (aromatik C=C) bantları belirlenmiş, hafif kaymalar usnik asidin nanoparçacık yüzeyine bağlandığını göstermiştir. Bulgular, usnik asidin başarılı şekilde yüklendiğini ve matrisin korunduğunu doğrulamaktadır.

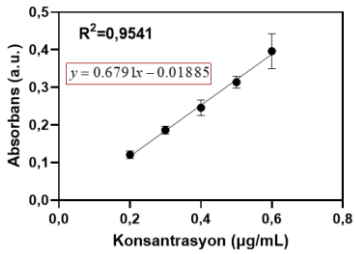
(A)

(B)



Şekil 4. (A) YSN, YSN-MnO_2 ve UA@YSN-MnO2 formülasyonları ve (B) sekonder metabolit UA için FTIR analizi sonuçları

UA'nın Yüklenmesi Sonuçları

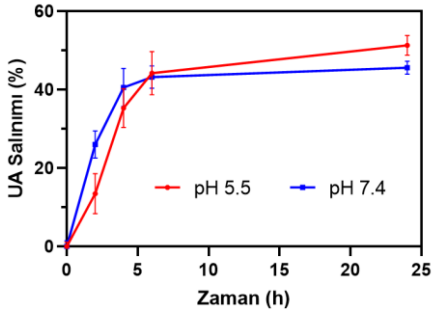


Usnik asit farklı konsantrasyonlarda hazırlanarak 96 kuyucuklu mikroplakalarda UV–Vis spektrofotometresi ile 300–800 nm aralığında analiz edilmiştir. 410 nm'de ölçülen absorbans değerleri kullanılarak oluşturulan lineer denklem (Denklem 1), nanoparçacıklara yüklenen UA miktarının hesaplanmasında kullanılmıştır. Yükleme sonrası UA@YSN-MnO_2 süspansiyonu santrifüjlenmiş, süpernatanttan ölçülen absorbans ile bağlanmamış usnik asit miktarı belirlenmiştir. Üç tekrarlı deneyler sonucunda yüklenen usnik asit miktarı 0,28409 ± 0,10928 mg olarak hesaplanmıştır.

$$y = 0.6791x - 0.01885 \quad (1)$$

(A)

(B)

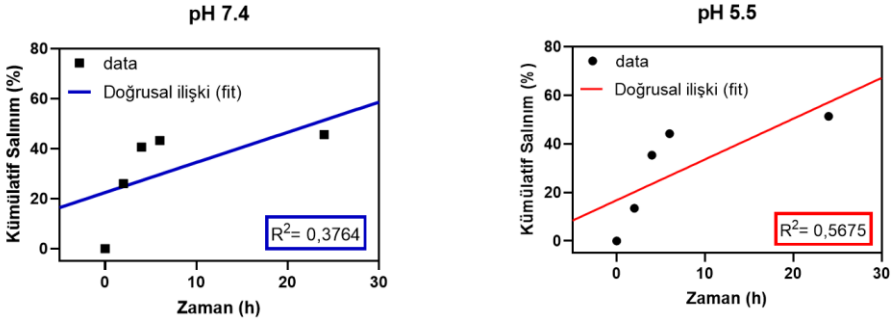


Şekil 5. (A) İlaç yükleme deneyi için usnik asitin farklı konsantrasonlarda alınan absorbans değerlerini ve (B) 410 nm bandına karşılık gelen konsantrasyon-absorbans denkleminin eldesi.

İlaç Salınım Deneyi Sonuçları

Usnik asit yüklü YSN-MnO_2 nanoparçacıklarının ilaç salımı pH 5.5 ve 7.4 ortamlarında farklı zamanlarda incelenmiştir (Şekil 6). 2. saatte pH 7.4'te %26, pH 5.5'te %13,5 salım; 4–6. saatlerde her iki ortamda yaklaşık

%40; 24. saatte ise pH 5.5'te %51,3, pH 7.4'te %45,6 salım gözlenmiştir. Bu sonuçlar, sistemin pH-duyarlı salım sergilediğini göstermektedir.

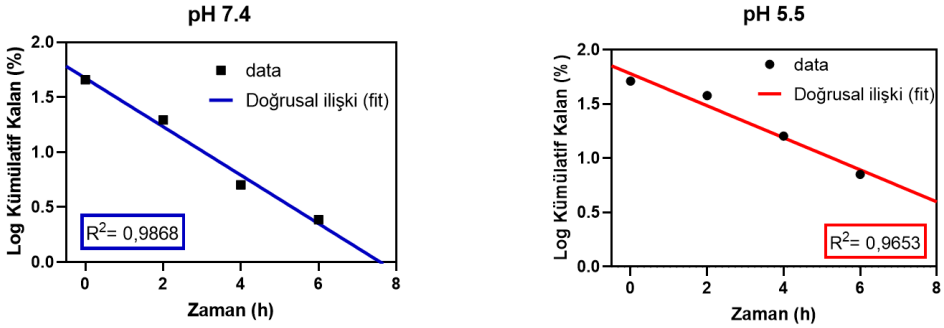


Şekil 6. pH 7.4 ve 5.5 koşullarında YSN-MnO_2'den UA salınımı.

UA Salımın Kinetik Modellemesi

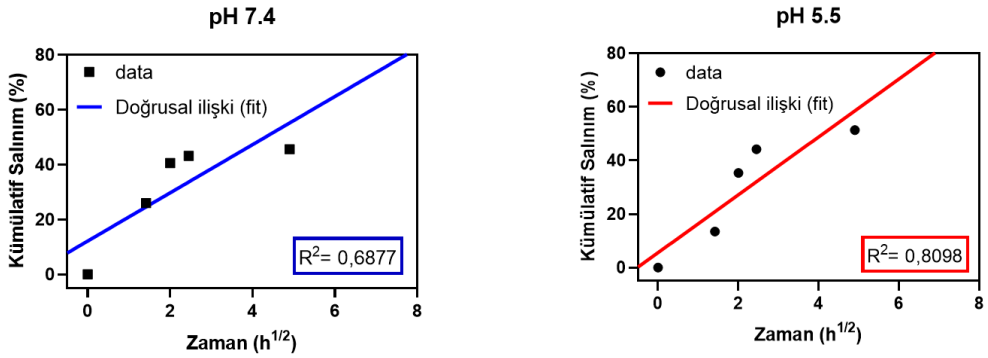
UA'nın salınım mekanizmasını değerlendirmek amacıyla deneysel veriler sıfırıncı derece, birinci derece ve Higuchi kinetik modellerine uygulanmıştır.

Sıfırıncı Dereceden Salım Modeli



Bu kinetik model, UA salınımının hızını zamana bağlı olmayan durumda incelemektedir. Bu modele uygun salınıma sahip nanoparçacık sistemlerinde birim zamanda salınan ilaçların miktarı her zaman aynı olmalıdır. Bu nanoparçacık sisteminde sıfırıncı derece kinetik modeli ile uyumunu ifade eden R^2 verileri ph 7.4 ortamında 0,38 iken pH 5.5 ortamında 0,57 olarak bulunmuştur (Şekil 7). Modelin UA salınımını yeterli doğrulukta açıklamadığı sonucuna ulaşılmıştır

Şekil 7. Sıfırıncı derece salınım modeli ile nanoparçacıkların incelenmesi

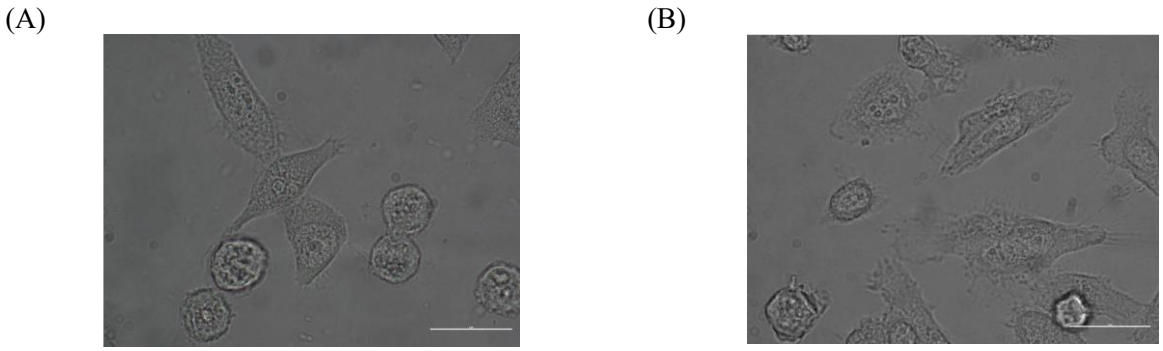


Birinci Dereceden Salım Modeli

Nanoparçacıklarda kalan ilaç miktarına bağlı olduğu varsayımına dayanarak salınımı inceleyen bir modeldir. Zamanla ilaç miktarı azaldığından salınımında doğru orantılı azaldığını ifade eden bir profil gözlenmesi beklenir. UA@YSN-MnO_2 nanoparçacıklarının R^2 değerleri, pH 7.4 ortamında 0,99, pH 5.5 ortamında ise 0,96 olarak bulunmuştur. Her iki ortamda da yüksek korelasyon katsayısı, UA salınımının birinci dereceden kinetiğe güçlü bir şekilde uyduğunu göstermektedir.

Şekil 8. Birinci derece salınım modeli ile nanoparçacıkların incelenmesi

Higuchi Salım Modeli



Şekil 9. Higuchi modeli ile nanoparçacıkların incelenmesi

Higuchi modeli 1961 yılında Takeru Higuchi tarafından geliştirilmiş olup özellikle difüzyona dış ortama geçen ilacı ifade eder. Nanoparçacıklarda yüksek konsantrasyonda bulunan ilaç yoğunluğu az olan bölgeye doğru hareket etmesidir. R^2 değerleri, pH 7.4 ortamında 0,69, pH 5.5 ortamında ise 0,81 olarak bulunmuştur. Bu sonuçlar UA salınımının yalnızca kısmen Higchi kinetiğine uyduğunu göstermektedir.

Hücresel etkinlik

Şekil 10'da kontrol grubu ve UA yüklü YSN–MnO_2 nanoparçacıkları ile muamele edilen hücrelerin mikroskop görüntüleri karşılaştırılmaktadır. Kontrol hücreleri sağlıklı ve düzenli morfoloji sergilerken, UA@YSN–MnO_2 uygulanan hücrelerde 1 saat içinde yuvarlaklaşma, büzülme, hücre bağlantılarının kopması ve hücre yoğunluğunda azalma gözlenmiştir. Bu bulgular, sistemin sitotoksik etkisinin başladığını göstermektedir.

Şekil 10. A) Kontrol grubu ve B) 50 µg/mL UA@YSN–MnO_2 nanoparçacıklarıyla 1 saat inkübe edilen hücrelerin mikroskop görüntüleri.

Geliştirilen YSN-MnO_2 hibrit nanoparçacıklar, ~150 nm boyutunda ve düzgün yüzey morfolojisine sahiptir; SEM görüntüleri kaplamanın başarılı olduğunu ve morfolojik bütünlüğün korunduğunu göstermiştir (Zhang ve ark., 2020). Nanoparçacıklara yaklaşık 0,3 mg usnik asit yüklenmiş, salım çalışmaları sistemin pH-duyarlı olduğunu ortaya koymuştur; 24. saatte asidik ortamda %51,3, fizyolojik pH'da %45,6 salım gözlenmiştir (Patra ve ark., 2018). Kinetik analiz, salımın birinci derece modele uyduğunu göstermiştir (Kumar ve ark., 2021). Hücresel etkinlik deneyleri, UA@YSN–MnO_2'nin hızlı sitotoksik etki oluşturduğunu doğrulamıştır (Wang ve ark., 2020). Bu bulgular, YSN-MnO_2 tabanlı pH-duyarlı nanotaşıyıcıların kontrollü ilaç salımı ve terapötik etki için uygun olduğunu ve tümör mikroçevresinde hedefe yönelik dağılım potansiyelini göstermektedir (Zhou ve ark., 2019).

SONUÇ

Elde edilen bulgular, pH-duyarlı nanotaşıyıcıların kontrollü ilaç salımı ve hedefe yönelik tedavi açısından etkin bir platform oluşturduğunu ortaya koymaktadır. Bu çalışma, MnO_2 kaplı yoğun silika nanoparçacıkları kullanılarak usnik asidin pH-duyarlı ve kontrollü salım davranışının kinetik modelleme ve hücresel analizler ile birlikte değerlendirilmesini sağlamaktadır.

TEŞEKKÜR

Bu çalışma kapsamında sağlanan laboratuvar altyapısı ve teknik destek için Haliç Üniversitesi, Boğaziçi Üniversitesi ve Yeditepe Üniversitesi'ne teşekkür ederiz.

Özet

Bu çalışma, bazı silajlık mısır (*Zea mays* L.) çeşit adaylarının ikinci ürün koşullarında performanslarını değerlendirmek amacıyla Bursa Uludağ Üniversitesi Ziraat Fakültesi Tarımsal Uygulama ve Araştırma Merkezi'nde 2023 yılında yürütülmüştür. Araştırmada 22 adet yeni geliştirilmiş F1 hibridi ve 7 adet ticari yüksek verimli kontrol hibridi bitki materyali olarak kullanılmıştır. Tüm genotipler atdişi tane yapısında olup FAO olum grupları 500–750 arasında değişmektedir. Deneme, tesadüf blokları deneme desenine göre 3 tekerrürlü olarak yürütülmüştür. Çalışmada bitki boyu (cm), ilk koçan yüksekliği (cm), koçan/bitki oranı (%), yaprak/sap oranı (%), sap çapı (mm), yeşil ot verimi (t da^{-1}) ve kuru madde verimi (t da^{-1}) parametreleri incelenmiştir. Araştırma sonuçlarına göre bitki boyu 221.1–283.0 cm, ilk koçan yüksekliği 79.1–125.4 cm, koçan/bitki oranı %39.9–51.7, yaprak/sap oranı %32.3–50.9, sap çapı 17.6–24.3 mm, yeşil ot verimi 3.63–6.36 t da^{-1} ve kuru madde verimi ise 1.11–2.03 t da^{-1} arasında değişmiştir. En yüksek yeşil ot verimi kontrol hibritlerini geride bırakarak PN22 genotipinden, en yüksek kuru madde verimi ise PN13 genotipinden elde edilmiştir.

Anahtar Kelimeler: *Zea mays* L, genotip, yeşil ot verimi.

Performance evaluation of candidate silage maize (*Zea mays* L.) hybrids under second-crop production conditions

Abstract

This study was conducted in 2023 at the Agricultural Practice and Research Center of Bursa Uludag University Faculty of Agriculture to evaluate the performance of some candidate silage maize (*Zea mays* L.) hybrids under second-crop growing conditions. A total of 22 newly developed F1 hybrids and 7 high-yielding commercial control hybrids were used as plant material. All genotypes possessed dent kernel type and belonged to FAO maturity groups ranging from 500 to 750. The experiment was laid out in a randomized complete block design with three replications. In the study, plant height, ear height, ear/plant ratio, leaf/stem ratio, stem diameter, forage yield, and dry matter yield were investigated. According to the research results, plant height ranged from 221.1 to 283.0 cm, ear height from 79.1 to 125.4 cm, ear/plant ratio from 39.9% to 51.7%, leaf/stem ratio from 32.3% to 50.9%, stem diameter from 17.6 to 24.3 mm, forage yield from 3.63–6.36 t da^{-1}, and dry matter yield from 1.11–2.03 t da^{-1}. The highest forage yield was obtained from genotype PN22, surpassing the commercial control hybrids, while the highest dry matter yield was recorded in genotype PN13.

Keywords: *Zea mays* L, genotype, forage yield.

GİRİŞ

Mısır (*Zea mays* L.), yüksek verim potansiyeli, iyi sindirilebilirliği ve lezzetliliğinin yanı sıra yüksek kuru madde ve enerji içeriğine sahip olması nedeniyle hayvan beslenmesinde önemli bir yer tutmaktadır. Ayrıca tarımın tüm aşamalarında mekanizasyona uygun olması, geniş alanlarda düşük maliyetle üretimine olanak sağlamaktadır. Bu özellikleri sayesinde mısır, dünyada ve Türkiye'de silaj üretiminde en yaygın olarak tercih edilen yem bitkilerinden biri hâline gelmiştir (Özata ve ark., 2011).

Son yıllarda hayvancılık sektöründe artan kaba yem ihtiyacı, silajlık mısır çeşitlerine olan ilginin daha da artmasına neden olmuştur. Kaliteli silaj üretimi; süt ve et veriminin yükseltilmesi, yem maliyetlerinin

azaltılması ve sürdürülebilir hayvansal üretimin devamlılığı açısından büyük önem taşımaktadır. Bu doğrultuda, silajlık amaçla geliştirilen yeni hibritlerin yaygınlaşması ile birlikte tanelik mısır çeşitlerinin silajlık olarak da kullanılabileceği görüşü önemini kaybetmiş; seleksiyon kriterleri, kalite ve verim odaklı olarak yeniden şekillenmiştir (Ma ve ark., 2006).

Silajlık mısır yetiştiriciliğinde uygun çeşit seçimi ve doğru agronomik uygulamalar başarıyı doğrudan etkilemektedir (Oliveira ve ark., 2019). Her genotip çevre koşullarına bağlı olarak farklı performans gösterebilmekte; bu nedenle yetiştirilecek bölgeye uyum yeteneği yüksek, verimli ve kaliteli materyallerin belirlenmesi gerekmektedir (Zopollatto ve ark., 2009).

Bu araştırma, Bursa ekolojik koşullarında ikinci ürün olarak yetiştirilen bazı silajlık mısır çeşit adaylarının verim ve verim unsurları bakımından performanslarını değerlendirmek amacıyla yürütülmüştür..

MATERYAL VE METOT

Araştırma Bursa Uludağ Üniversitesi Ziraat Fakültesi Tarımsal Uygulama ve Araştırma Merkezi'nde 2023 yılında yürütülmüştür. Araştırmanın yürütüldüğü Bursa ilinde, Köppen–Geiger iklim sınıflandırmasına göre sıcak yazların görüldüğü ve yazların kurak, kışların ılık ve yağışlı geçtiği Csa tipinde Akdeniz iklimi hakimdir (Yılmaz ve Çiçek, 2018). Çalışmanın yürütüldüğü yıllara ait iklim verileri ve uzun yıllar ortalaması Tablo 1'de sunulmuştur.

Tablo 1. Denemenin yürütüldüğü Bursa İlinde 2023 yıllına ait ortalama sıcaklık (°C), toplam yağış (mm) ve ortalama nem (%) değerleri.

Aylar	Ortalama Sıcaklık (°C)		Toplam Yağış (mm)		Ortalama Nem (%)	
	2023	UYO*	2023	UYO	2023	UYO
Haziran	24.3	22.5	0.0	42.1	63.0	62.7
Temmuz	26.1	25.1	0.0	15.1	57.8	59.4
Ağustos	27.1	25.1	0.0	16.9	60.4	61.3
Eylül	22.6	20.8	0.0	50.3	62.9	67.4
Ekim	18.2	15.9	7.3	84.2	70.5	74.7
Kasım		10.8		69.7		75.4
Toplam			7.3	278.3		
Ortalama	23.66	20.0			62.92	66.82

*: UYO: Uzun yıllar ortalaması (1990-2020)

Deneme alanının farklı yerlerinden 0-20 cm derinlikten alınan toprak örneklerinin fiziksel ve kimyasal analizleri Uludağ Üniversitesi Ziraat Fakültesi, Toprak Bilimi ve Bitki Besleme Bölümü, Toprak Analiz Laboratuvarı'nda yaptırılmış ve sonuçlar Tablo 2'de sunulmuştur. Analiz sonuçlarına göre, deneme alanı toprağı tınlı bünyeye sahip olup hafif alkali özellik göstermektedir (pH 8.48). Fosfor ve potasyum içeriği yüksek, organik madde miktarı orta düzeydedir. Tuzluluk problemi bulunmayıp, azot yönünden fakirdir. Kireç içeriği ise orta kireçli sınıfa yakın değerlere sahiptir.

Tablo 2. Çalışmanın yürütüldüğü Uludağ Üniversitesi Ziraat Fakültesi Tarımsal Uygulama ve Araştırma Merkezi'ndeki deneme alanının toprak analiz sonuçları.

Toplam K mg kg^{-1}	5180

Bu çalışmada 22 adet yeni geliştirilen F1 hibriti (PN2, PN3, PN4, PN5, PN7, PN8, PN9, PN11, PN12, PN13, PN14, PN15, PN16, PN17, PN18, PN21, PN22, PN23, PN24, PN26, PN27, PN28) ve 7 adet ticari yüksek verimli silajlık kontrol hibriti (PN1, PN6, PN10, PN19, PN20, PN25, PN29) kullanılmıştır. Tüm genotipler atdişi tane yapısında olup FAO olum grupları 500-750 arasında değişmektedir

Genotiplerin ekileceği arazi pullukla sürülmüş, ardından rotavatörle işlenerek tohum yatağı hazırlığı tamamlanmıştır. Deneme tesadüf blokları deneme desenine göre 3 tekerrürlü olarak yürütülmüştür. Tüm genotipler; sıra arası 70 cm ve sıra üzeri 20 cm olacak şekilde 5 m uzunluğundaki sıralara 17.07.2023 tarihinde ekilmişlerdir. Ekimlerle birlikte deneme alanına 15-15-15 taban gübre uygulanmıştır. Bitkilerin çimlenmesinden 4-5 yapraklı döneme kadar elle yabancı ot mücadelesi yapılmıştır. Bitkilerin birinci çapası 15-20 cm boylandıkları 4 yapraklı dönemde, ikinci çapa bitki boyları 40-50 cm olduğu 6-8 yapraklı dönemde yapılmıştır. Birinci çapa esnasında her tohum yatağında bir bitki kalacak şekilde tekleme yapılmıştır. Yabancı otlara karşı ayrıca pülverizatörle herbisit uygulanmıştır.

Çalışmada bitki boyu (cm), ilk koçan yüksekliği (cm), koçan/bitki oranı (%), yaprak/sap oranı (%), sap çapı (mm), yeşil ot verimi (t da^{-1}), kuru madde verimi (t da^{-1}) ölçümleri alınmıştır. Hasat işlemi hamur olum döneminde gerçekleştirilmiştir. Genotiplerin bitki boyunun belirlenmesi için hasat parselinden rastgele 5 bitki seçilmiş, mira yardımı ile ölçülmüş ve ortalaması alınmıştır. İlk koçan yüksekliği, rastgele seçilen 5 bitkide toprak yüzeyinden ilk koçanın çıktığı noktaya kadar mesafenin mira yardımı ile ölçülüp ortalamasının alınması ile tespit edilmiştir. Koçan/bitki oranı (%) için her parselden rastgele seçilen 5 bitkinin koçan yapraklarından ayrılmış çıplak koçan ağırlıkları ve bitki ağırlıkları tespit edilip oranlanmıştır. Yaprak/sap oranı (%) 5 bitkinin yaprak ve sap ağırlıkları ölçülüp oranlanması ile bulunmuştur. Sap çapı, rastgele seçilen 5 bitkinin toprak yüzeyine en yakın kısmından kumpas yardımı ile ölçülüp ortalaması alınarak belirlenmiştir. Yeşil ot verimi orta 2 sıradan hasat edilen bitkilerin tartılması ile belirlenmiştir. 1 kg bitki örneği 105 °C'de 48 saat kurutulup tartıldıktan sonra kuru madde oranları belirlenmiştir. Kuru madde oranları yeşil ot verim değerleri ile çarpılarak kuru madde verimi değerleri hesaplanmıştır (TTSM, 2018).

Çalışmada veriler tesadüf blokları deneme desenine göre JMP® Pro 17.0.0 programından yararlanılarak hesaplanmıştır. Önemlilik testlerinde 0.01 ve 0.05 farklı gurupların belirlenmesinde ise 0.05 olasılık düzeyi kullanılmıştır. Ortalamalar arası farklılık asgari önemli fark (Least Significant Difference - LSD) testi ile 0.05 düzeyinde belirlenmiştir.

BULGULAR ve TARTIŞMA

İncelenen parametreler üzerinde yapılan varyans analizi sonuçlarına göre yaprak/sap oranı hariç diğer tüm özelliklerde istatistiksel olarak önemli bulunmuştur (Tablo 3).

Tablo 3. Genotiplerin varyans analiz sonuçları

**:0,01 olasılık düzeyinde istatistiki olarak önemlidir.

Araştırmada incelenen genotiplerin bitki boyları 221.1–283.0 cm, ilk koçan yükseklikleri ise 79.1–125.4 cm arasında değişmiştir. En yüksek bitki boyu ve koçan yüksekliği PN15 genotipinden elde edilirken, PN3 genotipi her iki özellik bakımından en düşük değerlere sahip olmuştur (Tablo 4). Güneş ve Acar (2006) Karaman koşullarında ortalama bitki boyunu 286 cm olarak belirtmiş, Sade ve ark. (2002) ise Konya koşullarında 235–

284 cm arasında değişen bitki boyu değerleri tespit etmişlerdir. Bu bulgular, çalışmamızda elde edilen değerler ile benzerlik göstermektedir (Tablo 4). İlk koçan yüksekliği bakımından literatürde farklı sonuçlar bildirilmiştir. Han (2016) ile Akman (2019) çalışmalarında sırasıyla 110–153 cm ve 100–156 cm aralıklarında değerler rapor etmiş olup, bu sonuçlar araştırmamızda elde edilen değerlerden daha yüksektir. Buna karşılık, Okursoy (2009) ile İdikut ve ark. (2005) tarafından bildirilen 67.42–84.32 cm ve 22.7–35.0 cm değerleri çalışmamızdan daha düşük bulunmuştur. Olgun ve ark. (2012) ilk koçan yüksekliğini 72.78–133.61 cm arasında bildirmiş olup, bu sonuçlar da çalışmamız ile uyumludur. Çalışmamızla diğer araştırmacılar arasındaki bu farklılıkların; kullanılan genetik materyalin farklılığı, sulama olanakları ve ekolojik koşulların farklı olmasından kaynaklandığı söylenebilir.

Koçan/bitki oranı %39.9–51.7, yaprak/sap oranı ise %32.3–50.9 arasında değişiklik göstermiştir. PN23 genotipi en düşük koçan/bitki oranına sahip olurken; PN3, PN4 ve PN14 genotipleri en yüksek değerlere ulaşmıştır. Yaprak/sap oranında ise PN3 öne çıkmış, kontrol hibritlerinden PN19 en düşük değeri vermiştir (Tablo 4). Atakul ve ark. (2016) Diyarbakır'da yürüttükleri çalışmada yaprak/sap oranını %41.1–49.7 aralığında rapor etmiş olup, sonuçlarımız bu bulgularla genel olarak uyum sağlamaktadır. Bu durum, bazı genotiplerin sindirilebilirliği olumlu yönde etkileyebilecek daha yüksek yaprak oranına sahip olduğunu göstermektedir.

Genotiplerin sap çapları 18.3–24.3 mm arasında değişmiş; PN8 en yüksek, PN2 ise en düşük sap çapına sahip olmuştur (Tablo 4). Bayram ve ark. (2017) benzer koşullarda yaptıkları çalışma sonucunda sap çaplarını 18.9–24.1 mm aralığında bildirmiş olup, verilerimizi destekler niteliktedir.

Çalışmada yeşil ot verimi 3.63–6.36 t da^{-1} arasında değişmiş olup, en yüksek değer PN22, en düşük değer ise PN7 genotipinden elde edilmiştir (Tablo 4). Aşar (2014) ikinci ürün koşullarında 5.80–6.40 t da^{-1}

değerleri rapor etmiş olup, bu bulgular çalışmamızda elde edilen üst sınırla uyumludur. Faklı araştırmacılar tarafından bildirilen; Seydoşoğlu ve Saruhan (2017) 6.00-10.37 t da^{-1}, Çaçan ve İşikten (2019) 7.11-9.98 ton/da, Kuşvuran ve ark. (2015) 9.80-13.10 t da^{-1}, Ergül (2008) 6.70-10.30 t da^{-1} değerleri ise çalışmamızın üst sınırından bir miktar daha yüksektir. Buna karşın, Küçük (2011)'ün bildirdiği 4.00-6.50 t da^{-1} değerleri çalışmamızla benzerlik göstermektedir. Genel olarak, çalışmamızda elde edilen yeşil ot verimi değerleri literatürde bildirilen geniş varyasyon aralığı içinde yer almaktadır.

Araştırmada kuru madde verimi 1.1–2.0 t da^{-1} arasında bulunmuştur. En yüksek yeşil ot verimi PN22 genotipinden elde edilirken, PN7 en düşük değeri göstermiştir. Kuru madde veriminde ise PN13 öne çıkmış, PN7 yine en düşük değeri vermiştir (Tablo 4). Ergül (2008) 1.9-3.02 t da^{-1}, Kuşvuran ve ark. (2015) 2.8-4.1 ton/da, Aşar (2014) 1.6-1.8 t da^{-1}, Küçük (2011) 1.3-2.1 t da^{-1}, Seydoşoğlu ve Saruhan (2017) 1.6-2.5 t da^{-1} sonuçlarını bildirmişlerdir. Bu bulgular, çalışmamızda elde edilen kuru madde verimlerinin literatürde bildirilen sonuçlarla genel olarak uyumlu olduğunu ortaya koymaktadır.

Tablo 4. Mısır genotiplerinin bitki boyu (cm), ilk koçan yüksekliği (cm), koçan/bitki oranı (%), yaprak/sap oranı (%), sap çapı (mm), yeşil ot verimi (kg/da) ve kuru madde verimi (kg/da) ortalama değerleri.

SONUÇ

22 adet yeni geliştirilen F1 hibridi ve 7 adet ticari yüksek verimli kontrol çeşidi ile yapılan bu araştırmada ikinci ürün koşullarında verim performansları değerlendirilmiştir. Çalışmada, incelenen parametreler bakımından genotipler arasında belirgin farklılıklar ortaya çıkmıştır. Yeşil ot veriminde PN22 istatistiksel olarak tek başına en yüksek grupta yer almış ve ticari kontrol çeşitlerini geride bırakmıştır. Kuru madde veriminde ise PN13, önemli bir üstünlük göstermiştir. Bununla birlikte, PN28 ve PN26 genotipleri her iki verim unsuru açısından da üst istatistiksel gruplarda yer almışlardır. Araştırmada PN22, PN13, PN26 ve PN28 genotipleri ümitvar bulunmuş olup ilerleyen ıslah çalışmalarında silajlık mısır çeşit adayı olarak değerlendirilmek üzere önerilebilir.

Abstract

Stem cells and extracellular vesicles (EVs) are increasingly used in the treatment of reproductive system disorders. Human umbilical cord mesenchymal stem cells (hUC-MSCs) and their derived EVs offer promising therapeutic potential due to their low immunogenicity, paracrine effects, and ease of collection. This review summarizes the current research on hUC-MSCs and EVs in ovarian and endometrial injury models. hUC-MSCs have been shown to improve ovarian function in premature ovarian failure (POF) and polycystic ovary syndrome (PCOS) models through immune modulation, anti-apoptotic effects, inhibition of ferroptosis, and restoration of hormone levels. Additionally, hUC-MSC-derived EVs enhance ovarian recovery by regulating pathways such as PI3K/AKT, Nrf2/GPX4, and IGF-1/HO-1 to mitigate oxidative stress and autophagy. In endometrial injury, hUC-MSCs and their EVs modulate inflammatory responses, inhibit fibrosis, promote angiogenesis, and remodel the extracellular matrix through miRNA-mediated paracrine mechanisms. Collectively, these studies indicate that hUC-MSCs and EVs are promising candidates for regenerative therapy in female reproductive disorders, with ongoing clinical trials investigating their safety and efficacy.

Keywords: Stem cells, extracellular vesicles, hUC-MSCs, ovarian injury, endometrial injury

INTRODUCTION

Stem cells and extracellular vesicles (EVs) are currently utilized in various areas of disease treatment. For instance, stem cells can address acute myocardial infarction by releasing biological factors, whereas mesenchymal stem cell (MSCs)-derived EVs can significantly inhibit tumor cell growth (Farahzadi et al., 2024; Fathi et al., 2020; Yan et al., 2024). Enhancing the effectiveness of stem cells in disease treatment has become an important area of interest. Hematopoietic stem cells that express tumor-associated antigen-specific T-cell receptors or chimeric antigen receptors are explored for acute myeloid leukemia treatment (Fathi et al., 2020). Stem cells are defined by self-renewal and multilineage differentiation potential. They include embryonic stem cells, adult stem cells, and induced pluripotent stem cells, with ethical and efficiency limitations in some types (Tan et al., 2024; Tian et al., 2023; Gopalarethinam et al., 2023).

Mesoderm-derived MSCs are widely used due to strong proliferation, pluripotency, genomic stability, and lack of ethical issues (Elhaieg et al., 2025). hUC-MSCs were isolated from human umbilical cords in 2006 and show higher proliferative capacity than BM-MSCs, with similar cytokine profiles. As umbilical cords are medical waste, hUC-MSCs bypass ethical constraints.

MATERIALS AND METHODS

Human umbilical cord-derived mesenchymal stem cells (hUC-MSCs) possess distinct characteristics compared to other MSC sources. They express markers such as CD10, CD29, CD44, CD73, CD90, and CD105, and secrete bioactive molecules like HGF, FGF-2, and NGF that promote proliferation, angiogenesis, and tissue repair (Mebarki et al., 2021; Ganguly et al., 2023; Petrenko et al., 2020). hUC-MSCs exhibit rapid proliferation and low immunogenicity, making them suitable for clinical applications (Xie et al., 2020; Lee & Kwok, 2023). EVs, including exosomes and microvesicles, act as paracrine mediators, transferring proteins, lipids, and nucleic acids to target cells. Isolation and characterization involve ultracentrifugation, size-exclusion chromatography, microscopy, light scattering, and flow cytometry to determine size, concentration, and protein markers (Carberry et al., 2022; Welsh et al., 2024; Huang et al., 2025).

RESULTS and DISCUSSION

hUC-MSCs have demonstrated significant therapeutic potential in models of ovarian injury, including premature ovarian failure (POF) and polycystic ovary syndrome (PCOS). Studies indicate that hUC-MSC transplantation reduces inflammation, apoptosis, oxidative stress, and ferroptosis in ovarian tissue, leading to improved follicular development and hormone homeostasis (Xie et al., 2019; Deng et al., 2021). In DHEA-induced PCOS models, hUC-MSCs modulate macrophage polarization, enhance regulatory T cell populations, and restore normal estrous cycles. In addition to cellular therapy, hUC-MSC-derived extracellular vesicles (EVs) have been shown to mediate ovarian recovery through paracrine signaling. EVs regulate critical pathways such as PI3K/AKT, Nrf2/GPX4, IGF-1/HO-1, and METTL3/PINK1, mitigating oxidative stress, autophagy dysregulation, and apoptosis in granulosa cells (He et al., 2024; Zhou et al., 2024). These findings suggest that both hUC-MSCs and their EVs can synergistically restore ovarian structure and function.

Endometrial injury, often leading to fibrosis and intrauterine adhesions, poses a major cause of female infertility. hUC-MSC transplantation promotes regeneration of damaged endometrium by modulating inflammatory responses, inhibiting fibrotic signaling, stimulating angiogenesis, and remodeling the extracellular matrix. These effects are mediated through paracrine factors, including growth factors and miRNAs, which regulate apoptosis and extracellular matrix composition (Tan et al., 2024; Huang et al., 2025). hUC-MSC-derived EVs contribute to endometrial repair by transferring functional miRNAs that influence key signaling pathways such as TGF-β/Smad and PTEN/AKT, ultimately enhancing epithelial recovery, reducing fibrosis, and improving vascularization. Collectively, preclinical evidence demonstrates that EV-based therapy can mimic the beneficial effects of whole-cell transplantation while minimizing risks associated with cell engraftment.

The regenerative potential of hUC-MSCs and EVs in reproductive tissues appears largely mediated by paracrine signaling. Anti-inflammatory cytokines and growth factors secreted by MSCs reduce local immune activation, while EVs transfer proteins, lipids, and nucleic acids to recipient cells, modulating apoptosis, autophagy, and oxidative stress. Key signaling pathways such as PI3K/AKT, Nrf2/GPX4, IGF-1/HO-1, and METTL3/PINK1 have been repeatedly implicated in ovarian recovery, whereas TGF-β/Smad and PTEN/AKT pathways play central roles in endometrial regeneration. These mechanisms collectively improve tissue architecture, restore hormonal balance, and support reproductive function.

While most evidence stems from preclinical models, early clinical trials have shown the safety and potential efficacy of hUC-MSCs and EVs in reproductive system disorders. Standardization of EV isolation, dosing, and delivery methods remains a critical challenge. Future research should focus on optimizing therapeutic regimens, understanding long-term outcomes, and developing standardized protocols to facilitate the translation of preclinical findings into clinical practice. Overall, hUC-MSCs and their EVs represent a promising regenerative strategy for female reproductive health.

CONCLUSION

hUC-MSCs and their EVs are promising therapeutic agents for ovarian and endometrial injuries due to their low immunogenicity, paracrine effects, and ease of collection. Mechanisms include immune modulation, anti-apoptotic effects, antioxidant protection, and autophagy regulation. Preclinical studies demonstrate their ability to restore tissue structure, function, and hormonal balance. Early clinical data support safety and potential efficacy, with ongoing trials and standardized protocols guiding their future application in regenerative medicine.

Özet

Bu çalışmada, hidrojen depolama uygulamaları açısından potansiyellerini değerlendirmek amacıyla altıgen (hekzagonal) bor nitrür ($B_{19}N_{18}$) nano levhaların alüminyum katkılı yapıları (Al-hBN); alkali (Li^+, Na^+, K^+), toprak alkali (Mg^{2+}, Ca^{2+}) ve dördüncü periyot geçiş metali (Sc^{3+}, Ti^{4+}, V^{3+}, Cr^{2+}, Mn^{7+}, Fe^{3+}, Co^{3+}, Ni^{2+}, Cu^+, Cu^{2+}, Zn^{2+}) katyonları ile tek atom dekorasyonu yoluyla modifiye edilmiştir. Yapısal kararlılık, adsorpsiyon enerjileri ve elektronik özellikleri incelemek için yoğunluk fonksiyoneli teorisi (DFT) hesaplamaları, Perdew–Burke–Ernzerhof (PBE) değiş-korelasyon fonksiyoneli ve def2-SVP baz seti kullanılarak gerçekleştirilmiştir. Termodinamik kararlılık analizleri, tüm dekorasyonlu sistemlerin negatif toplam elektronik ve termal entalpi değerleri sergileyerek termodinamik olarak kararlı yapıların oluştuğunu göstermektedir. Hidrojen adsorpsiyon özellikleri; adsorpsiyon enerjileri, bağ uzunlukları ve sınır moleküler orbital (FMO) analizi ile incelenen moleküler orbital özellikleri dikkate alınarak değerlendirilmiştir. Sc^{3+}, Fe^{3+} ve Co^{3+} dekorasyonlu Al-hBN yüzeylerinde elde edilen adsorpsiyon enerjileri sırasıyla 0,42, 0,56 ve 0,58 eV/H_2 olup, bu değerler hidrojenin oda sıcaklığında tersinir olarak adsorplanabilmesi için önerilen optimum aralık (~0,2 ila 0,6 eV/H_2) içerisindedir. Buna karşın, Li^+, Na^+, K^+, Ca^{2+} ve Zn^{2+} dekorasyonlu sistemlerde pozitif Gibbs adsorpsiyon serbest enerji değerleri, kısa adsorpsiyon mesafeleri ve geniş bant aralığı nedeniyle hidrojen adsorpsiyonunun zayıf veya termodinamik olarak elverişsiz olduğu belirlenmiştir. Bu bulgular, uygun metal dekorasyonu ile birleştirilen Al-hBN nano levhalarının, verimli, hafif ve geri dönüştürülebilir hidrojen depolama malzemeleri için umut verici adaylar olduğunu göstermektedir.

Anahtar Kelimeler: altıgen bor nitrür nano levhalar, alüminyum katkılı dekorasyon, hidrojen depolama, DFT

Computational investigation of hydrogen storage properties of several metal decorated aluminum-doped hexagonal boron nitride nanosheets

Abstract

In this study, aluminum-doped structures (Al-hBN) of hexagonal boron nitride ($B_{19}N_{18}$) nanosheets were modified via single-atom decoration with alkali (Li^+, Na^+, K^+), alkaline earth (Mg^{2+}, Ca^{2+}), and fourth-period transition metal cations (Sc^{3+}, Ti^{4+}, V^{3+}, Cr^{2+}, Mn^{7+}, Fe^{3+}, Co^{3+}, Ni^{2+}, Cu^+, Cu^{2+}, Zn^{2+}) in order to evaluate their potential for hydrogen storage applications. Density functional theory (DFT) calculations using the Perdew–Burke–Ernzerhof (PBE) exchange-correlation functional and def2-SVP basis set were performed to investigate structural stability, adsorption energies, and electronic properties. Thermodynamic stability analyses revealed that all decorated systems exhibit negative total electronic and thermal enthalpy values, confirming their thermodynamic feasibility. Hydrogen adsorption features were assessed considering adsorption energies, bond lengths, and molecular orbital properties examined via frontier molecular orbital (FMO) analysis. Adsorption energies obtained for Sc^{3+}, Fe^{3+}, and Co^{3+} decorated Al-hBN surfaces are 0,42, 0,56, and 0,58 eV/H_2, respectively, which fall within the suggested optimal range (~0,2 to 0,6 eV/H_2) for reversible hydrogen adsorption at room temperature. In contrast, Li^+, Na^+, K^+, Ca^{2+} and Zn^{2+} decorated systems show weak or thermodynamically unfavorable hydrogen adsorption due to positive Gibbs adsorption free energy values, short adsorption distances, and wide energy gaps. Overall, this study suggests that Al-hBN nanosheets, when combined with appropriate transition metal decoration, can serve as promising candidates for lightweight, stable, and recyclable hydrogen storage materials.

Keywords: hexagonal boron nitride nanosheets, aluminum-doped decoration, hydrogen storage, DFT

GİRİŞ

Sanayileşmenin erken dönemlerinden bu yana enerji sistemleri, çevresel etkilerine rağmen büyük ölçüde fosil yakıtlara dayanmıştır. Küresel emisyonlar tarihsel olarak yüksek seviyelerde seyretmeye devam etmektedir: enerji kaynaklı CO_2 emisyonları 2024 yılında yaklaşık 37,8 milyar ton (Gt) (IEA, 2025), fosil kaynaklı CO_2 emisyonları ise yaklaşık 37,4 milyar ton (Gt) (Friedlingstein ve ark., 2025) olarak gerçekleşmiştir. Bu değerlendirmeler, emisyonların 2025'in başlarına kadar yüksek seviyelerde kaldığını ve düşük karbonlu enerji taşıyıcıları ile depolama teknolojilerinin ölçeklenebilir biçimde geliştirilmesi gerekliliğini vurgulamaktadır.

Moleküler hidrojen (H_2), yalnızca su üretmesi ve yüksek özgül enerji değerine sahip olması nedeniyle cazip bir ikincil enerji taşıyıcısıdır — yaklaşık 120 MJ kg^{-1} (alt ısıl değeri, LHV) veya 142 MJ kg^{-1} (üst ısıl değeri, HHV). Kütle bazında, bu değer benzininkinin (~44-46 MJ kg^{-1}, LHV) yaklaşık üç katıdır. Ancak, hidrojenin düşük hacimsel enerji yoğunluğu, pratik sistemler için temel malzeme depolama sorununu ortaya çıkarmaktadır (Møller ve ark., 2017; U.S. Department of Energy, 2025a; U.S. Department of Energy, 2025b).

Aday malzemeler arasında, iki boyutlu (2B) yapılar yüksek yüzey/kütle oranları, kusur veya katkılama yoluyla ayarlanabilir adsorpsiyon bölgeleri ve iki yüzeyli fonksiyonelleştirme olasılıkları sayesinde hidrojen depolama açısından dikkat çekicidir. Bu sınıfta, hekzagonal bor nitrür nano levhalar termal ve kimyasal kararlılıkları, mekanik dayanıklılıkları ve grafen benzeri örgü yapıları sayesinde gaz adsorpsiyonu ve hidrojen depolama için yoğun biçimde araştırılmıştır (Zhang ve ark., 2017; Kovalskii ve ark., 2024).

Bor nitrür (BN) nanoyapılar, hidrojen depolama amacıyla incelenen ilk karbon dışı nanomalzemeler arasındadır. BN nanotüplerinin (BNNT) kararlılığı 1994 yılında öngörülmüş, sentezleri ise 1995'te karbon içermeyen ark deşarjı yöntemiyle gerçekleştirilmiştir (Rubio ve ark., 1994; Chopra ve ark., 1995). Sonraki çalışmalar, yüksek basınç altında hidrojen tutulumu ve heteroatom katkılı (örneğin oksijen) BN nano yapılarla adsorpsiyonun iyileştirilmesi üzerine yoğunlaşmıştır (Ma ve ark., 2002; Lei ve ark., 2014). Bu araştırmalar, saf BN'nin H_2'yi zayıf biçimde (fiziksel adsorpsiyon) bağladığını ve tersinir, ortam koşullarına yakın performansın genellikle eğrilik, kusur, katkı veya metal dekorasyonu gibi stratejiler gerektirdiğini göstermektedir. Yoğun Al katkılı BNNT için yapılan teorik çalışmalar da moleküler adsorpsiyon rejiminin korunurken yüksek gravimetrik hidrojen depolama kapasitesi elde edilebileceğini göstermektedir. Özellikle, Al katkılı zigzag (5,0) ve sandalye (3,3) BNNT yapılarına ilişkin hesaplamalar, sırasıyla %8,6 ve %9,4 gravimetrik hidrojen depolama kapasitesine ulaşılabileceğini öngörmektedir; bu değerler, ABD Enerji Bakanlığı'nın ağırlıkça %6,5 hedefinin üzerinde olup, Al katkısının hidrojen depolama kapasitesini artırmada etkili olduğunu göstermektedir (Noura ve ark., 2020). Ayrıca, geçiş metali (örneğin Ni veya Rh) ile dekore edilmiş hekzagonal BN yüzeylerinde daha güçlü kimisorpsiyon gözlenmekte; özellikle Rh için ilk H_2 molekülünün ayrıştığı ve molekül başına 0,7-1,6 eV arasında enerji değerleri bildirilmektedir (Venkataramanan ve ark., 2009).

H_2 adsorpsiyon enerjilerinin, oda sıcaklığında tersinir adsorpsiyonun sağlanabilmesi için, molekül başına ~0,2-0,6 eV aralığında olması gerektiği çeşitli çalışmalarda rapor edilmiştir. (Kim ve ark., 2006; Meng ve ark., 2007; Gao ve ark., 2014). Bu karşılaştırmalar, BN-tabanlı malzemelerin bağlanma enerjisi, tersinirlik, aktif bölge yoğunluğu ve kararlılık arasında dikkatli bir denge kurulması gerektiğini açıkça ortaya koymaktadır.

Bu çalışmada, Al katkılı hekzagonal bor nitrür nano levhalar üzerine alkali (Li^+, Na^+, K^+), toprak alkali (Mg^{2+}, Ca^{2+}) ve 3d geçiş metal katyonlarının (Sc^{3+}–Zn^{2+}) tek atom dekorasyonlarının etkileri, yoğunluk fonksiyonel teorisi (DFT) hesaplamaları ile incelenmiştir. Amaç; Al katkısının yapısal ve elektronik özellikler üzerindeki etkilerini nicel olarak belirlemek, H_2 adsorpsiyon termodinamiği ve tercih edilen adsorpsiyon motiflerini ortaya koymak, farklı metal modifikasyonlarını sistematik olarak karşılaştırarak H_2 etkileşimini artırmaya yönelik tasarım ilkeleri elde etmektir. Elde edilen bulgular, hafif, kararlı ve geri dönüştürülebilir 2B hekzagonal BN tabanlı adsorbanların hidrojen depolama uygulamaları için rasyonel tasarımına rehberlik etmeyi amaçlamaktadır.

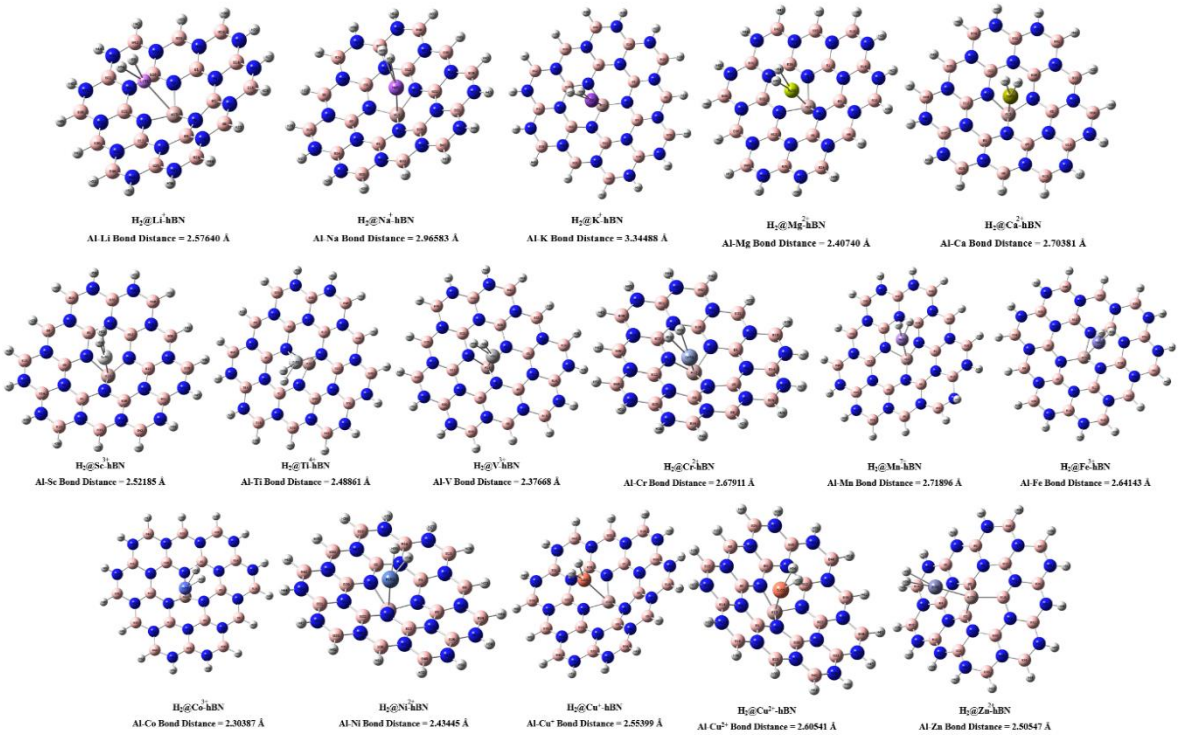
MATERYAL VE METOT

Hesapsal Detaylar

Bu çalışmadaki tüm hesaplamalar, Gaussian 09 yazılım paketinde (Frisch ve ark., 2013) uygulandığı gibi yoğunluk fonksiyonel teorisi (DFT) kullanılarak gerçekleştirilmiştir. Moleküler sistemlerin görselleştirilmesi ve yapısal modellemesinde GaussView 6.0 kullanılmıştır. Geometri optimizasyonları ve elektronik yapı hesaplamaları, Perdew-Burke-Ernzerhof (PBE) fonksiyoneline sahip genelleştirilmiş gradyan yaklaşımı (GGA) (Perdew ve ark., 1996) ve def2-SVP baz kümesi (Weigend ve Ahlrichs, 2005), metallerle dekore edilmiş Al-

hBN nano levha hesaplamalarında kullanılmıştır. Yapısal kararlılığı ve elektronik özellikleri değerlendirmek için; önce Al-hBN ($Al\text{-}B_{18}H_{15}N_{18}$) nano levhalar, ardından hidrojenli yapıları ve hidrojen adsorpsiyonu üzerindeki etkiyi değerlendirmek için çeşitli metal katyonlarıyla dekore edilmiş bileşikleri incelenmiştir. Her dekore edilmiş sistem için geometri optimizasyonları yapılarak, ardından adsorpsiyon enerjilerini ve HOMO-LUMO enerji boşluğu gibi elektronik özellikleri belirlemek için enerji hesaplamaları yapılmıştır.

H_2 moleküllerinin tüm incelenen yüzeylerdeki adsorpsiyon davranışı analiz edilerek değerlendirilmiş; metallerle dekore edilmiş Al-hBN nano levhaların adsorpsiyon enerjisi ise Denklem (1) kullanılarak nicel olarak belirlenmiştir (Weigend ve Ahlrichs, 2005).



$$E_{ads} = E_{H2+yüzey} - (E_{H2} + E_{yüzey}) \quad (1)$$

Bu denklemde, $E_{H2+yüzey}$, H_2 adsorpsiyonundan sonra sistemin toplam enerjisidir, E_{H2}, izole edilmiş H_2 molekülünün enerjisi ve $E_{yüzey}$, H_2 adsorpsiyonundan önce Al-hBN nano levhaların toplam enerjisidir.

BULGULAR ve TARTIŞMA

Yapısal ve Enerjetik Analiz

Çeşitli metal katyonları ile dekore edilmiş Al-hBN nano levhaların üzerinde H_2 molekülü adsorpsiyonunun geometrik optimizasyonları, def2-SVP düzeyinde gerçekleştirilmiştir (Şekil 1).

Şekil 1. Metal dekorasyonlu Al-hBN nano levhaların hidrojen molekülü adsorpsiyonunun optimize edilmiş geometrileri

H_2 molekülünün adsorpsiyonundan sonra, tüm metallerle dekore edilmiş Al-hBN kompleksleri yapısal bütünlüklerini korumakta ve bu da termodinamik kararlılığa işaret etmektedir. Bununla birlikte, ΔG_{ads} değerleri, adsorpsiyon süreçlerinin yalnızca belirli metal katkılı sistemler için termodinamik olarak uygun olduğunu göstermektedir. Özellikle, Mg^{2+}, Sc^{3+}, Ti^{4+}, V^{3+}, Cr^{2+}, Mn^{7+}, Fe^{3+}, Co^{3+}, Ni^{2+}, Cu^{+}, Cu^{2+} katkılı bileşiklerde negatif; Li^{+}, Na^{+}, K^{+}, Ca^{2+} ve Zn^{2+} katkılı bileşiklerde ise pozitif değerler gözlenmiştir ve bu da daha az kendiliğinden adsorpsiyonu göstermektedir. (Tablo 1)

Tablo 1. 298 K sıcaklık ve 1 atm basınçta PBE/def2-SVP düzeyinde hesaplanan elektronik ve termal entalpilerin ve serbest enerjilerin toplamı, mutlak adsorpsiyon enerjisi($|\Delta H_{ads}|$), adsorpsiyon serbest enerjisi (ΔG_{ads}), HOMO-LUMO enerjileri (E_{HOMO}, E_{LUMO}) ve enerji boşluğu (E_{gap}) değerleri.

Bileşikler	Elektronik ve termal entalpilerin toplamı*(au)*	Elektronik ve termal serbest enerjilerin toplamı*(au)*	$\lvert\Delta H_{ads}\rvert$ *(eV)*	ΔG_{ads} *(eV)*	E_{HOMO} (eV)	E_{LUMO} (eV)	E_{gap} (eV)

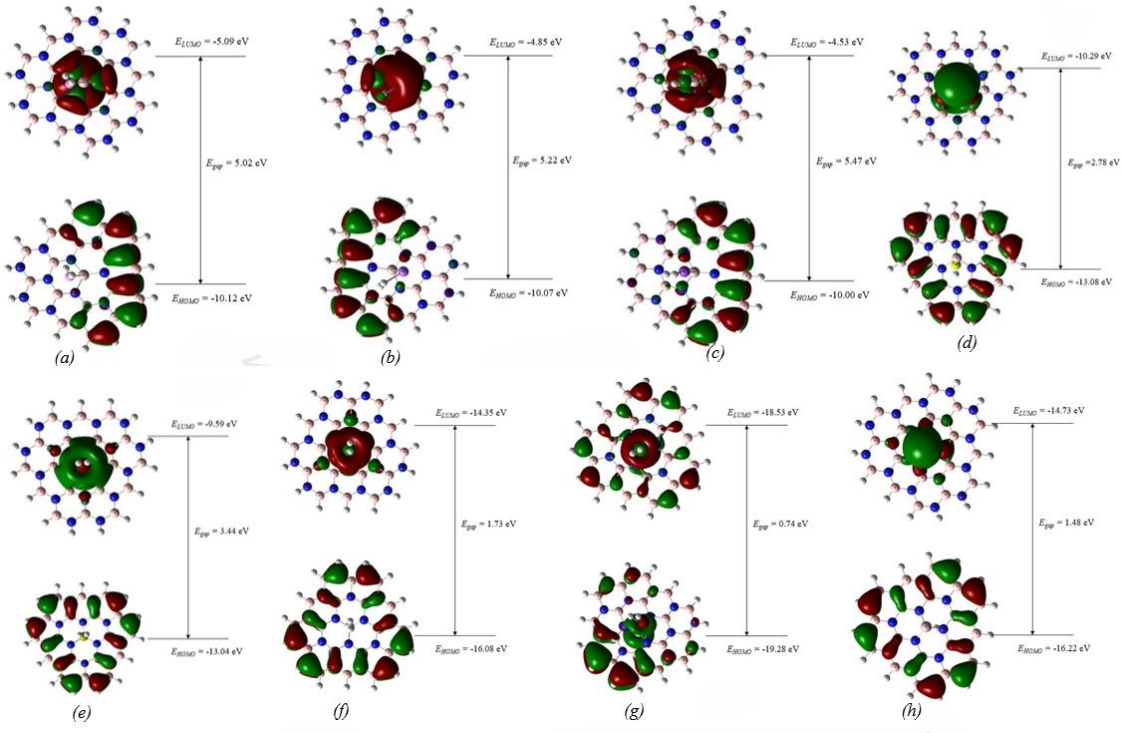
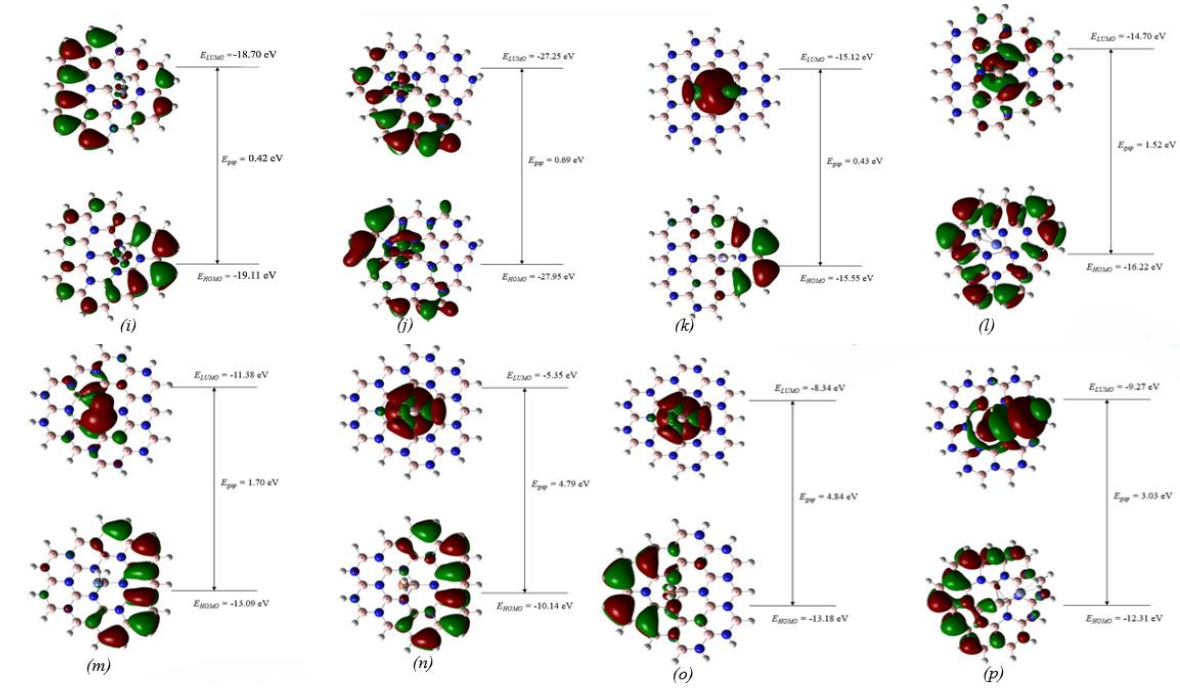
V^{3+}, Mn^{7+} ve Ni^{2+} katyonları ile dekore edilmiş Al-hBN yapıları en yüksek adsorpsiyon enerjilerini (sırasıyla 1,25, 0,99 ve 0,74 eV/H_2) göstermiştir. Buradaki güçlü etkileşimler, H_2 molekülünün yüzeye sıkı bir şekilde bağlandığını ve bu adsorpsiyonun tersinirliğinin düşük olabileceğini düşündürmektedir. Buna karşın, Mg^{2+}, Sc^{3+}, Fe^{3+} ve Co^{3+} dekorasyonlu yüzeylerde elde edilen adsorpsiyon enerjileri sırasıyla 0,46, 0,42, 0,56 ve 0,58 eV/H_2 olup, bu değerler önerilen optimum aralık (~0,2-0,6 eV/H_2) içerisindedir. Li^+, Na^+, K^+, Ca^{2+}, Zn^{2+} ile dekorasyonlarında ise adsorpsiyon enerjileri oldukça düşük bulunmuştur ($|\Delta H_{ads}|$<0,25 eV). Bu da fiziksel adsorpsiyon potansiyelini ve oda sıcaklığında hidrojenin zayıf şekilde tutulduğunu göstermektedir. Ayrıca, bu bileşikler için pozitif ΔG_{ads} değerleri de bu yorumu desteklemektedir.

Şekil 1'de gösterildiği gibi, en kısa adsorpsiyon mesafeleri Cu^+, Cu^{2+}, Ni^{2+} ve Co^{3+} ile dekore edilmiş bileşiklerde gözlemlenmiştir (~1,67–1,83 Å). K^+(~3,02 Å) ve Na^+(~2,53 Å) katyonları ile dekore edilmiş bileşiklerde daha uzun mesafeler gözlenmekte ve bu da daha zayıf van der Waals etkileşimleri sonucunu desteklemektedir. Bu bulgular, enerji adsorpsiyon eğilimleriyle tutarlıdır.



Sınır Moleküler Orbital Analizi (FMO)

En yüksek dolu moleküler orbital (HOMO) ve en düşük boş moleküler orbital (LUMO), sınır moleküler orbitalinin iki ana parametresidir (Li ve ark., 2021; Liu ve ark., 2022). FMO analizi, sistemlerin veya kimyasal reaksiyonların elektronik özelliklerini göstermek ve tasvir etmek için yaygın olarak kullanılır (Huang ve ark., 2019). H_2 adsorpsiyonu üzerine metallerle dekore edilmiş Al-hBN nano levhaların elektronik özelliklerini, kararlılığını ve reaktivitesini daha iyi anlamak için kapsamlı bir FMO analizi yürütülmüştür. Tüm incelenen yapılar için HOMO ve LUMO enerjileri hesaplanmıştır (Tablo 1). HOMO ve LUMO enerjileri arasındaki fark ya da değişim, HOMO–LUMO boşluğu (E_{gap}) olarak adlandırılır ve bir malzemenin elektronik iletkenliğini ve kimyasal reaktivitesini belirlemede önemli bir kuantum tanımlayıcıdır (Louis ve ark., 2022). Geniş bir enerji boşluğu, düşük elektriksel iletkenlik ve kimyasal eylemsizlik anlamına gelir; bu da yüzeyin H_2 molekülü ile etkileşimini zorlaştırır. Buna karşılık, daha dar bir boşluk, daha iyi elektronik iletkenlik ve daha yüksek yüzey reaktivitesi gösterir, bu da H_2 adsorpsiyonunu kolaylaştırır (Mohammadi ve ark., 2022). Enerji boşluğu matematiksel olarak şu şekilde tanımlanabilir:



$$E_{gap} = E_{LUMO} - E_{HOMO} \quad (2)$$

Denklem 2'de, E_{gap}, enerji boşluğu, E_{HOMO}, HOMO enerjisi ve E_{LUMO}, LUMO enerjisini ifade etmektedir.

Şekil 2'de gösterildiği gibi, çalışılan alkali ve toprak alkali metal dekorasyonlu bileşikler; Li^+ (5,02 eV), Na^+ (5,22 eV), K^+ (5,47 eV) karşılaştırmalı olarak geniş HOMO–LUMO boşlukları sergilemektedir. Bu geniş enerji boşlukları, düşük kimyasal reaktiviteyi ve sınırlı elektriksel iletkenliği göstermekte, dolayısıyla bu malzemelerin etkili H_2 adsorpsiyonu için uygunluğunu azaltmaktadır. Buna karşılık, çalışılan geçiş metalleriyle (Sc^{3+}–Zn^{2+}) dekore edilmiş yapılar belirgin şekilde daha dar enerji boşlukları sergilemektedir; örneğin Cr^{2+} (0,42 eV), Fe^{3+} (0,43 eV), Mn^{7+} (0,69 eV) vb. (Şekil 3).

Şekil 2. Al-hBN nano levhaların Li^+(a), Na^+(b), K^+(c), Mg^{2+}(d), Ca^{2+}(e) Sc^{3+}(f), Ti^{4+}(g) ve V^{3+}(h) dekorasyonlu optimize edilmiş HOMO ve LUMO izoyüzey grafikleri

Şekil 3. Al-hBN nano levhaların Cr^{2+}(i), Mn^{7+}(j), Fe^{3+}(k), Co^{3+}(l), Ni^{2+}(m), Cu^{+}(n), Cu^{2+}(o) ve Zn^{2+}(p) dekorasyonlu optimize edilmiş HOMO ve LUMO izoyüzey grafikleri

SONUÇ

Bu çalışma, incelenen tüm metal dekorasyonlu Al-hBN bileşiklerinin, toplam negatif elektronik ve termal entalpi değerleri ile termodinamik olarak kararlı olduğunu ortaya koymaktadır. Ancak, H_2 adsorpsiyon verimliliğinin, kullanılan metal türüne bağlı olarak önemli ölçüde değiştiği gözlenmektedir. Çalışmada incelenen geçiş metallerinden Sc^{3+}, Fe^{3+} ve Co^{3+} ile toprak alkali metallerinden Mg^{2+} ile dekore edilmiş yapılar, ideal aralıktaki adsorpsiyon enerjileri ve kısa metal-hidrojen bağ uzaklıklarıyla uyumlu şekilde güçlü fiziksel adsorpsiyon sergilemektedir. Ayrıca, bu bileşikler oda sıcaklığında adsorpsiyon sürecinin kendiliğinden gerçekleştiğini destekleyen uygun toplam elektronik ve termal serbest enerji değerleri göstermektedir. Bununla birlikte, bu bileşikler dar HOMO-LUMO enerji boşluklarına sahiptir ve bu durum elektriksel iletkenliklerinin arttığını, kimyasal olarak daha reaktif hale geldiklerini göstermektedir—her iki özellik de verimli hidrojen adsorpsiyonu için istenen niteliklerdir. Mg^{2+} ile dekore edilmiş yapıda göreceli olarak (diğer geçiş metallerine kıyasla) daha geniş enerji boşluğu gözlenmektedir.

Buna karşılık, çalışılan diğer metal dekorasyonlu bileşikler, çok düşük adsorpsiyon enerji değerleri, pozitif Gibbs serbest enerji değerleri, geniş enerji boşlukları, yüksek metal-hidrojen uzaklıkları nedeniyle, hidrojenle nispeten daha zayıf etkileşimler göstermektedir yorumu yapılabilir. Bu durumda, adsorpsiyonun termodinamik olarak elverişsiz olduğu, dolayısıyla bu bileşiklerde sınırlı adsorpsiyon potansiyeli olduğu anlaşılmaktadır.

Özetle, yapılan tüm kapsamlı analizlerden elde edilen sonuçlara göre, Sc^{3+}, Fe^{3+} ve Co^{3+} ile dekore edilmiş Al-hBN nano yapıları; ideal adsorpsiyon enerjileri, uygun termodinamik kararlılıkları ve yüksek elektronik reaktiviteleri sayesinde gelecekteki H_2 depolama uygulamaları için umut verici adaylardır. Öte yandan, Li^{+}, Na^{+}, K^{+}, Ca^{2+} ve Zn^{2+} metallerinin yer aldığı yapılarda H_2 adsorpsiyonunun olası olmadığı sonucuna varılmıştır. Bu bulgular, temiz enerji teknolojileri için metal fonksiyonelleştirilmiş nanoyapılı malzemelere ilişkin önemli bilgiler sağlamaktadır.

TEŞEKKÜR

Bu araştırmada yer alan tüm nümerik hesaplamalar TÜBİTAK ULAKBİM, Yüksek Başarım ve Grid Hesaplama Merkezi'nde (TRUBA kaynaklarında) gerçekleştirilmiştir.

Özet

Bitki ekstraktları kullanılarak nanopartikül sentezlenmesi, yüksek biyouyumluluk ve düşük toksisite sağlaması nedeniyle nanoteknoloji alanında dikkat çeken yöntemlerden biridir. Bu çalışmada, ***Chenopodium quinoa*** bitkisinin metanol ekstraktı ile kitosan matrisi bir araya getirilerek **yeşil sentez yaklaşımı** ile kitosan nanopartikülleri (Cs-NP) üretilmiş ve çeşitli karakterizasyon analizleri gerçekleştirilmiştir. SEM sonuçları, sentezlenen nanopartiküllerin küçük boyutlu ve yoğun yapılı olduğunu, bazı bölgelerde agregasyon eğilimli bir morfoloji sergilediğini göstermiştir. EDX spektrumu, nanopartiküllerin baskın olarak **C ve O elementlerini** içerdiğini, ekstrakttan kaynaklanan iz elementlerin ise yüzeyde düşük seviyelerde bulunduğunu ortaya koymuştur. Zeta potansiyeli ölçümü **+74.2 mV** olarak belirlenmiş olup, Cs-NP'lerin yüksek kolloidal stabiliteye sahip olduğunu doğrulamaktadır. XRD analizi, nanopartiküllerin **yarı kristalin** bir yapıya sahip olduğunu göstermiştir. FT-IR bulguları ise hem kitosan yapısına ait fonksiyonel grupların hem de metanol ekstraktında bulunan biyolojik bileşiklerin nanopartikül yapısı içerisinde korunduğunu ortaya koymuştur. Elde edilen veriler birlikte değerlendirildiğinde, metanol ekstraktının kitosan nanopartiküllerinin biyosentezinde etkili bir doğal ajan olarak kullanılabileceği anlaşılmaktadır.

Anahtar Kelimeler: *Chenopodium quinoa*, Kitosan nanopartikülleri, Nanoteknoloji, Yeşil sentez

Biosynthesis and characterization of chitosan nanoparticles using *Chenopodium quinoa* extracts

Abstract

The synthesis of nanoparticles using plant extracts is one of the noteworthy methods in the field of nanotechnology due to providing high biocompatibility and low toxicity. In this study, chitosan nanoparticles (Cs-NP) were produced through a green synthesis approach by combining the methanol extract of the Chenopodium quinoa plant with a chitosan matrix, and various characterization analyses were performed. SEM results showed that the synthesized nanoparticles exhibited a small-sized, dense structure with a morphology that tended to aggregate in some areas. The EDX spectrum revealed that the nanoparticles predominantly contained C and O elements, while trace elements originating from the extract were present on the surface at low levels. The zeta potential measurement was at the level of +74.2 mV, confirming that the Cs-NPs possess high colloidal stability. XRD analysis indicated that the nanoparticles had a semi-crystalline structure, whereas FT-IR findings demonstrated that the functional groups belonging to both the chitosan structure and the biological compounds present in the methanol extract were preserved within the nanoparticle structure. When the obtained data are evaluated, it is understood that methanol extract can serve as an effective natural agent in the biosynthesis of chitosan nanoparticles.

GİRİŞ

Biyopolimer temelli nanopartiküllerin biyolojik kaynaklardan, özellikle bitkisel ekstraktlardan üretilmesi, son yıllarda sürdürülebilirlik, biyouyumluluk ve düşük toksisite avantajları nedeniyle nanoteknoloji alanında önemli bir araştırma konusuna dönüşmüştür. Bitki ekstraktlarının indirgeme ve stabilizasyon yeteneği, toksik kimyasal ajanlara duyulan ihtiyacı azaltarak üretim sürecinin daha çevreci ve güvenli şekilde yürütülmesini

sağlamaktadır (El-Naggar ve ark., 2022). Yeşil sentez ile elde edilen kitosan nanopartiküllerinin biyobozunur yapıya sahip olması, antimikrobiyal ve antifungal aktivite gösterebilmesi, onları biyomedikal uygulamalarda potansiyel olarak değerli hale getirmektedir (Ibrahim ve ark., 2024; Polat, 2023).

Bitkisel ekstraktlarla gerçekleştirilen nanopartikül sentezi üzerine yapılan çalışmalar, morfolojik bütünlüğün korunabildiğini, pozitif yüzey yükünün kolloidal stabiliteyi artırdığını ve elde edilen nanopartiküllerin biyolojik sistemlerle uyumlu olduğunu göstermektedir (Erdoğan ve ark., 2019). Ayrıca kitosanın polikationik yapısı, özellikle yüksek zeta potansiyeli değerleriyle birlikte düşünüldüğünde, nanopartiküllerin hem stabilizasyonunu hem de biyolojik etkileşim potansiyelini güçlendirmektedir (El-Naggar ve ark., 2022). Bu bağlamda bitkisel bileşiklerle üretilen kitosan nanopartikülleri; ilaç taşıma, doku mühendisliği ve antimikrobiyal uygulamalar gibi pek çok alanda dikkat çekmektedir.

Bu çalışmanın amacı, *Chenopodium quinoa* bitkisinin metanol ekstraktını doğal bir indirgeme ve stabilizasyon ajanı olarak kullanarak kitosan nanopartiküllerinin yeşil sentezini gerçekleştirmek ve elde edilen yapıların SEM, EDX, XRD, FT-IR ve zeta potansiyeli gibi çok yönlü karakterizasyon analizleri aracılığıyla değerlendirilmesidir.

MATERYAL VE METOT

Bitki Örneklerinin Toplanması ve Hazırlanması

Bu çalışmada ülkemizde yayın olarak yetiştirilen *Chenopodium quinoa* bitkisinin tohumlarıyla çalışılmıştır. Laboratuvara getirilen örnekler oda sıcaklığında havan yardımıyla öğütülerek ince toz haline getirilmiştir. İnce toz halindeki kinoa materyali, ekstraksiyon işlemlerinde kullanılmak üzere kapalı kaplarda muhafaza edilmiştir.

Metanol Ekstraktının Hazırlanması

Ekstraksiyon için 10 g kinoa reaksiyon balonuna alınmış ve üzerine 100 mL metanol eklenmiştir. Örnek, oda sıcaklığında maserasyon yöntemiyle 2–4 kez ekstrakte edilmiştir. Maserasyon süresince balon ara ara elle çalkalanmış, ardından pilili süzgeç kâğıdı ile süzülmüştür. Elde edilen süzüntü 42 °C'de düşük basınç altında rotavapor kullanılarak yoğunlaştırılmıştır. Literatürde bildirildiği şekilde işlem tamamlandıktan sonra metanol ekstraktı koyu renkli cam kaplarda buzdolabında saklanmıştır (Zhang ve ark., 2018).

Metanol Ekstraktı ile Kitosan Nanopartiküllerinin (Cs-NP) Sentezi

Kitosan (≥%90 saflık, Sigma-Aldrich; CAS No: 9012-76-4), %1 (a/h) konsantrasyonda %1'lik asetik asitte çözülmüş ve homojenizasyon için 24 saat manyetik karıştırıcıda tutulmuştur. Çözeltinin pH'ı NaOH ile 5'e ayarlanmış ve sterilizasyon amacıyla 0.22 µm filtreden geçirilmiştir.

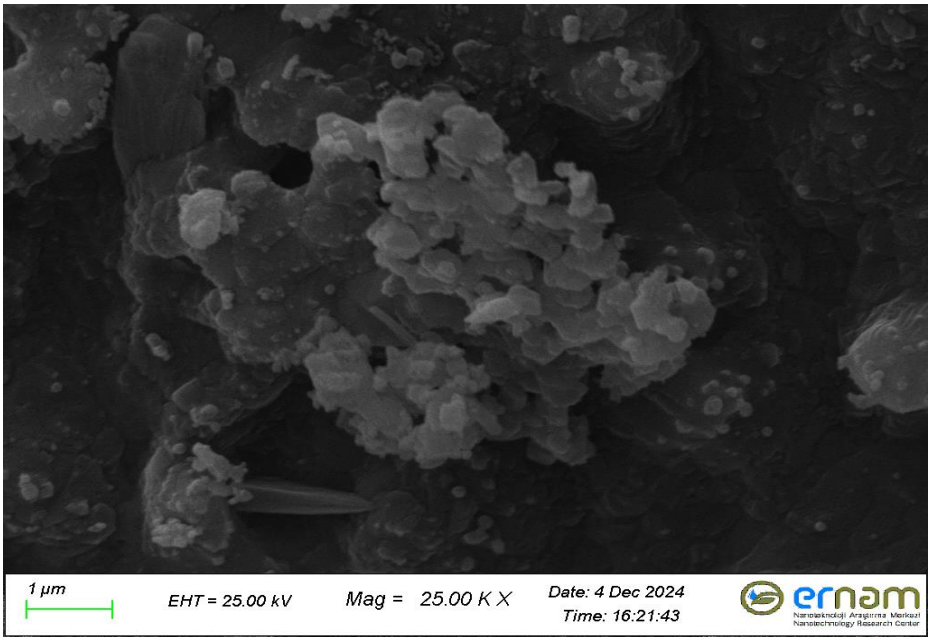
Hazırlanan kitosan çözeltisi, metanol ekstraktı ile 1:1 oranında karıştırılmış ve oda sıcaklığında inkübasyona bırakılmıştır. Sentez sonrası karışım 10.000 × g'de 10 dakika santrifüj edilmiş ve elde edilen çökelti 80 °C'de etüvde bir gece kurutularak karakterizasyon için hazırlanmıştır (El-Naggar ve ark., 2023).

Nanopartiküllerin Karakterizasyonu

Dinamik Işık Saçılması (DLS): Metanol ekstraktı ile sentezlenen Cs-NP'lerin parçacık boyutu ve dağılımı, sonikasyon işleminden geçirilip deiyonize su ile seyreltilen numuneler üzerinde analiz edilmiştir.

Zeta Potansiyeli: Nanopartiküllere ait yüzey yükü değerleri zeta potansiyel cihazı ile ölçülmüştür. Analiz öncesinde numuneler deiyonize suyla yıkanmış ve ölçümde kullanılan tek kullanımlık zeta hücreleri etanol ile temizlenmiştir.

X-Işını Toz Difraksiyonu (XRD): Cs-NP'lerin kristal yapısı XRD cihazı ile incelenmiştir.

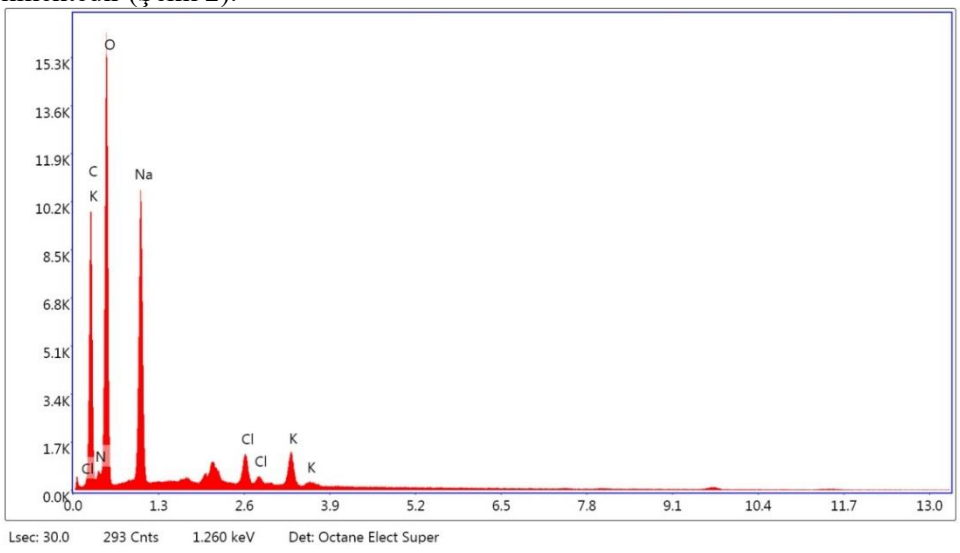


FT-IR Spektroskopisi: Nanopartiküllerin yapısında bulunan fonksiyonel gruplar FT-IR cihazı ile 400–4000 cm^{-1} aralığında analiz edilmiştir.

SEM ve SEM-EDX Analizi: Nanopartiküllerin morfolojisi ve elementel içeriği Erciyes Üniversitesi Nanoteknoloji Araştırma Merkezi'nde (ERNAM) SEM ve SEM-EDX cihazları kullanılarak belirlenmiştir.

BULGULAR

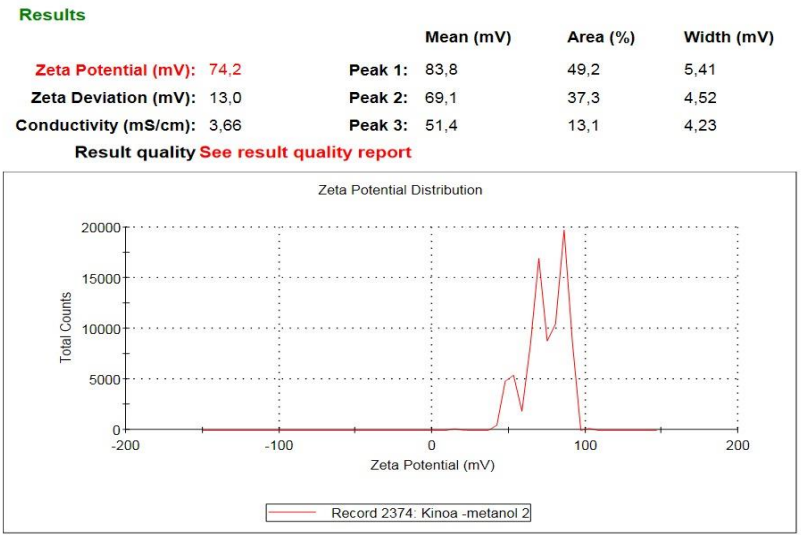
SEM Analizi



Görüntüde metanol ekstraktı ile sentezlenen Cs-NP'lerin yüzey boyunca **düzensiz dağılan, küçük parçacıklardan oluşan ve belirli bölgelerde birikme eğilimi gösteren** bir yapı oluşturduğu görülmektedir (Şekil 1). Partiküllerin tam anlamıyla küresel bir formdan uzak, **amorf ve heterojen bir morfoloji** sergilemesi, kitosan bazlı nanopartiküllerin doğal birleşme ve yüzeyde tutunma eğilimlerini yansıtmaktadır.

Şekil 1. *Chenopodium quinoa* ekstraktları kullanılarak metanol ortamında biyosentezlenen Cs-NP'nin SEM görüntüsü

SEM-EDX Analizi



Cs-NP'lere ait EDX spektrumu, yapının temel elementlerinin **karbon (C)** ve **oksijen (O)** olduğunu göstermektedir. Ayrıca spektrumda görülen **Na, Cl** ve **K** iz elementleri, metanol ekstraktından veya sentez ortamındaki iyonik bileşenlerden nanopartikül yüzeyine taşınan küçük miktarlardaki mineral içeriklerle ilişkilendirilmektedir (Şekil 2).

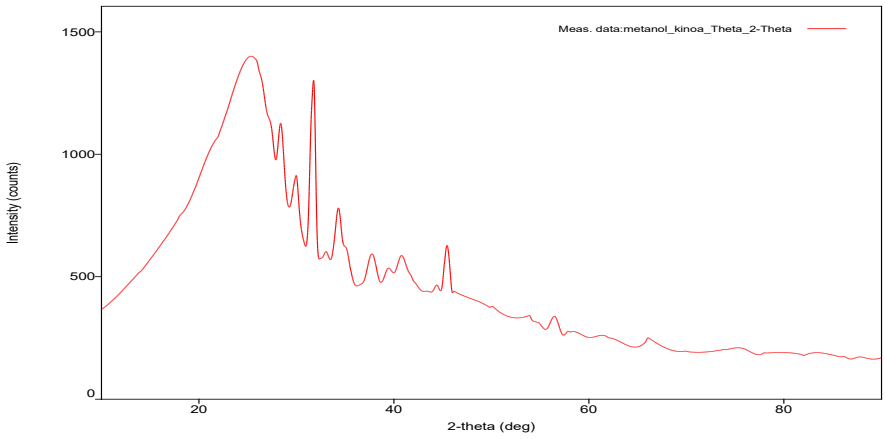
Şekil 2. *Chenopodium quinoa* ekstraktları kullanılarak Metanol ekstraktı ile sentezlenen Cs-NP'lere ait SEM-EDX spektrumu

Zeta Potansiyel Analizi

Sentezlenen Cs-NP'lerin Zeta potansiyeli **+74,2 mV** olarak belirlenmiş olup, bu yüksek pozitif yüzey yükü nanopartiküllerin kolloidal ortamda **güçlü elektrostatik stabilite** gösterdiğini ifade etmektedir (Şekil 3). Dağılımda yer alan üç pozitif pik, partiküllerin **yük dağılımında kısmi heterojenlik** bulunduğunu göstermesine rağmen, tüm piklerin yüksek pozitif bölgede yer alması Cs-NP süspansiyonunun genel olarak **stabil ve elektrostatik açıdan kararlı** bir yapıya sahip olduğunu desteklemektedir.

Şekil 3. *Chenopodium quinoa* ekstraktları kullanılarak metanol ortamında biyosentezlenen Cs-NP'nin zeta potansiyel dağılımı

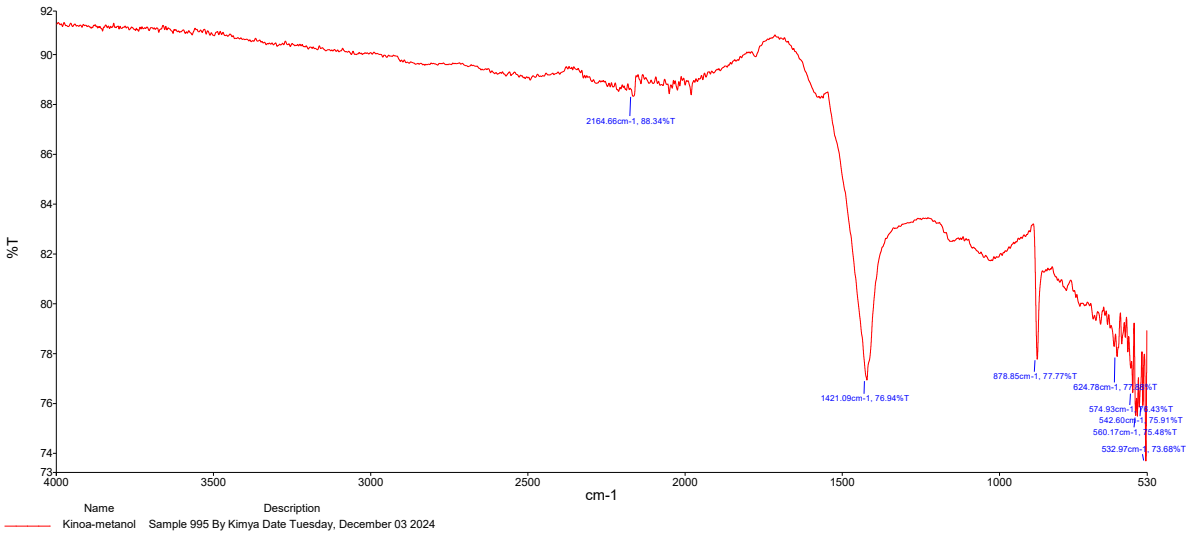
DLS Analizi



DLS analizi, metanol ekstraktı ile sentezlenen Cs-NP süspansiyonunda **Z-ortalama hidrodinamik çapın 579,5 nm** olduğunu ve **PDI değerinin 1,000** çıkması nedeniyle sistemin son derece **polidispers** bir yapıya sahip olduğunu göstermektedir (Şekil 4). Yaklaşık **2463 nm** civarında tek ve yoğun bir pik gözlenmesi, nanopartiküllerin önemli ölçüde **agregasyon/aglomerasyon** eğilimi gösterdiğini ve süspansiyonun homojen nanometrik partiküller yerine daha çok **mikrometre ölçeğinde büyük kümeler** içerdiğini düşündürmektedir.

Şekil 4. *Chenopodium quinoa* ekstraktları kullanılarak metanol ortamında biyosentezlenen Cs-NP'nin DLS analizi

XRD Analizi



Cs-NP'lere ait XRD deseninde 10–40° aralığında geniş bir taban yükselmesi ile birlikte 20–30° civarında çok sayıda belirgin pik görülmektedir (Şekil 5). Bu durum, tamamen amorf bir yapıdan ziyade, amorf kitosan matrisi içerisinde kristalin bölgelerin de bulunduğunu göstermektedir.

Şekil 5. *Chenopodium quinoa* ekstraktları kullanılarak metanol ortamında biyosentezlenen Cs-NP'nin XRD analizi

FT-IR Analizi

FT-IR spektrumunda 3300 cm^{-1} civarındaki geniş bant O–H/N–H gerilmelerine, 2920 cm^{-1} piki alifatik C–H titreşimlerine karşılık gelmektedir. 1410 cm^{-1} bölgesindeki kuvvetli bant, kitosanın karakteristik $–NH_3^+$ ve CH_2 bükülme titreşimlerini doğrulamaktadır. Ayrıca 1220–1020 cm^{-1} aralığındaki C–O–C ve C–O gerilmeleri kitosan yapısının korunduğunu göstermektedir. 879 ve 773 cm^{-1}'deki ek bantlar ise *Chenopodium quinoa* ekstraktındaki fitokimyasalların nanopartikül yüzeyine entegre olduğunu işaret etmektedir (Şekil 6).

Şekil 6. *Chenopodium quinoa* ekstraktları kullanılarak metanol ortamında biyosentezlenen Cs-NP'nin FT-IR analizi

TARTIŞMA

Metanol ekstraktı kullanılarak sentezlenen Cs-NP'lere ait karakterizasyon bulguları, bitki ekstraktı aracılı yeşil sentez yaklaşımının başarıyla işlediğini göstermektedir. SEM analizinde gözlenen yoğun küresel morfoloji ve belirgin agregasyon eğilimi, bitkisel ekstraktlarla sentezlenen Cs-NP'lerde literatürde rapor edilen tipik davranışlarla uyumludur. EDX sonuçları, nanopartikül yüzeyinin kinoa kaynaklı fitokimyasallarla kaplandığını doğrularken, +74.2 mV'luk çok yüksek zeta potansiyeli, güçlü kolloidal stabiliteyi açıkça ortaya koymaktadır. DLS analizindeki yüksek hidrodinamik çap ve XRD'deki yarı kristalin yapı, kitosan özelliklerinin korunduğunu gösterirken; FT-IR bantları hem polimer omurgasının hem de ekstrakt kaynaklı bileşiklerin varlığını desteklemiştir.

SONUÇ

Chenopodium quinoa tohumlarının metanol ekstraktı kullanılarak sentezlenen kitosan nanopartiküllerine (Cs-NP) ait karakterizasyon bulguları, biyosentetik sürecin etkinliğini ve kitosan temelli nanopartiküllerin başarıyla oluşturulduğunu açıkça ortaya koymuştur.

SEM analizi, nanopartiküllerin yoğun, küresel ve belirgin agregasyon eğilimli bir morfoloji sergilediğini göstermiş; yaklaşık **52 nm boyutunda birincil partikül yapısına** rağmen partiküller arasında güçlü bir kümelenme davranışı gözlenmiştir. Bu durum, bitkisel ekstraktlarla gerçekleştirilen biyosentez çalışmalarında yaygın olarak rapor edilen nano-agregasyon eğilimleri ile paralellik göstermektedir (Khanmohammadi ve ark., 2023). EDX analizinde nanopartikül yapısının temel olarak C ve O'dan oluştuğu; ayrıca bitki ekstraktının doğal mineral profilini yansıtan Na ve K gibi elementlerin matrikste yer aldığı tespit edilmiştir. Bu bulgular, nanopartikül yüzeyinin kinoa kaynaklı fitokimyasallarla kaplandığını ve sürecin biyosentetik niteliğini doğrulamaktadır.

Zeta potansiyeli ölçümleri, Cs-NP'lerin **+74.2 mV** gibi son derece yüksek bir pozitif yüzey yüküne sahip olduğunu ortaya koymuştur. Literatürde ±30 mV ve üzeri zeta potansiyeli değerleri, kolloidal sistemler için yüksek stabilite kriteri olarak kabul edilmektedir (Honary ve Zahir, 2013). Bu çerçevede +74.2 mV'luk değer, mevcut kriterin **iki katından daha fazla** olup sentezlenen nanopartiküllerin agregasyona karşı **son derece dirençli ve olağanüstü düzeyde stabil** olduğunu göstermektedir. El-Naggar ve ark. (2022) biyolojik yöntemle sentezledikleri Cs-NP'lerde +31.1 mV'luk bir zeta potansiyeli rapor etmiş olup çalışmamızda elde edilen +74.2 mV'luk değerin literatürdeki bu stabilite referanslarının oldukça üzerinde bulunması, kinoa metanol ekstraktının güçlü bir stabilize edici ajan olarak işlev gördüğünü güçlü şekilde desteklemektedir.

DLS analizleri, Cs-NP'lerin geniş bir hidrodinamik boyut dağılımına sahip olduğunu ve yaklaşık **1912 nm** civarında tek modlu bir pik sergilediğini göstermiştir. Bu yüksek hidrodinamik çap değeri, partiküller arası agregasyonun yoğun olduğunu ortaya koymakta olup SEM sonuçlarıyla uyum içindedir. Singh ve ark. (2021) tarafından yapılan bir çalışmada da, bitkisel ekstraktlarla sentezlenen Cs-NP'lerde gözlenen yoğun agregasyonun DLS ile ölçülen hidrodinamik çapı anlamlı derecede artırdığı bildirilmiştir.

XRD analizinde 20–30° (2θ) aralığında geniş ve yayvan yarı kristalin patern gözlenmiş; bu patern kitosanın karakteristik yarı kristalin yapısının korunduğunu göstermektedir. Bulgular metanol temelli yeşil sentez çalışmalarında rapor edilen desenlerle uyumludur. Duraisamy ve ark. (2022), *Martynia annua* yaprak ekstraktı

ile sentezledikleri Cs-NP'lerde benzer şekilde düşük kristallilik gösteren geniş XRD pikleri rapor etmiş ve bunun kitosanın karakteristik yapısını doğruladığını belirtmiştir. Bu paralellik, kinoa ekstraktı ile yürütülen biyosentetik süreçte de kitosan polimer yapısının bozulmadan korunduğunu teyit etmektedir.

FT-IR analizinde 3300–3350 cm^{-1} aralığındaki geniş bant O–H ve N–H gerilme titreşimlerine; 2920 cm^{-1} civarındaki bantlar alifatik C–H titreşimlerine karşılık gelmiştir. 1410 cm^{-1} bölgesinde gözlenen belirgin bant, kitosanın **protonlanmış amin gruplarına (–NH_3^+)** ait karakteristik bükülme titreşimlerini doğrulamaktadır. Ayrıca 1220–1020 cm^{-1} aralığına karşılık gelen C–O–C ve C–O gerilmeleri, kitosanın polisakkarit omurgasının nanopartikül yapısında korunduğunu göstermektedir. 879 ve 773 cm^{-1}'de kaydedilen ek bantlar, kinoa ekstraktındaki fenolik ve saponin türevi bileşiklerin nanopartikül yüzeyine bağlandığını ve sistemde **doğal stabilizatör** görevi üstlendiğini işaret etmektedir. Ganesan ve ark. (2024) tarafından yapılan benzer bir çalışmada *Cassia fistula* yaprak ekstraktı ile sentezlenen Cs-NP'lerde gözlenen glikozidik ve C–O–C bantlarının bitkisel bileşiklerin nanopartikül yüzeyine bağlanmasıyla ilişkili olduğu bildirilmiş; bu durum çalışmamızdaki FT-IR sonuçlarıyla güçlü bir paralellik göstermektedir.

Genel olarak, elde edilen tüm veriler *Chenopodium quinoa* metanol ekstraktının Cs-NP sentezinde hem indirgeyici hem de stabilize edici bir ajan olarak son derece etkili olduğunu göstermektedir. Bu çalışma, kinoa gibi biyolojik açıdan güvenli ve gıda kaynaklı bir bitkinin nanoteknolojik uygulamalarda sürdürülebilir bir sentez aracı olarak kullanılabileceğini ortaya koyarak literatüre önemli bir katkı sağlamaktadır.

TEŞEKKÜR

Lisans ve yüksek lisans eğitimim süresince bilgi, birikim ve tecrübeleriyle akademik gelişimime önemli katkılar sağlayan; yönlendirmeleri, desteği ve bilimsel rehberliği ile çalışmamın her aşamasında yanımda olan değerli danışmanım Prof. Dr. Zeliha Leblebici'ye saygı ve teşekkürlerimi sunarım.

Özet

Güncel biyomedikal uygulamalarda nanopartiküller, çevre dostu üretim yöntemlerine uyumlulukları ve fonksiyonel özellikleri nedeniyle önemli bir araştırma alanı oluşturmaktadır. Bu çalışmada, *Glycyrrhiza glabra* kökleri metanol ekstraktı kullanılarak, kitosan nanopartikülleri (Cs-NP) sentezlenmiş ve temel karakterizasyon analizleri gerçekleştirilmiştir. SEM görüntüleri parçacıklı ve agregasyon eğilimi gösteren bir morfoloji ortaya koymuştur. EDX analizinde nanopartiküllerin başlıca elementlerinin C ve O olduğu, ayrıca Na, Cl ve K gibi elementlerin yüzeyde bulunduğu belirlenmiştir. Zeta potansiyeli +58,8 mV olarak ölçülmüş ve Cs-NP'lerin kolloidal ortamda yüksek stabiliteye sahip olduğu görülmüştür. XRD analizleri yarı kristalin bir yapıyı işaret etmiş, FT-IR spektrumu ise kitosan ve bitkisel bileşiklere ait karakteristik fonksiyonel grupların korunduğunu göstermiştir. Bulgular, metanol ekstraktının Cs-NP biyosentezi için etkili bir doğal ajan olduğunu ortaya koymaktadır.

Anahtar Kelimeler: *Glycyrrhiza glabra*, Kitosan nanopartikülleri, Nanoteknoloji, Yeşil sentez

Biosynthesis and characterization of chitosan nanoparticles using *Glycyrrhiza glabra* extracts

Abstract

Nanoparticles have gained increasing importance in recent biomedical applications due to their compatibility with eco-friendly synthesis approaches and their versatile functional properties. In the present study, chitosan nanoparticles (Cs-NPs) were synthesized using the methanol extract of *Glycyrrhiza glabra* and their characterization was performed using multiple analytical techniques. SEM imaging revealed an aggregated and irregular particulate morphology. EDX results showed that the nanoparticles were primarily composed of carbon and oxygen, accompanied by trace elements such as Na, Cl, and K. The zeta potential value of +58.8 mV indicated high colloidal stability in suspension. XRD analysis demonstrated a semicrystalline structure, and FT-IR spectra verified the presence of characteristic functional groups belonging to both chitosan and plant-derived compounds. Overall, the findings highlight the effectiveness of *Glycyrrhiza glabra* methanol extract as a natural reducing and stabilizing agent in the biosynthesis of chitosan nanoparticles.

Keywords: Chitosan nanoparticles, *Glycyrrhiza glabra*, Green synthesis, Nanotechnology

GİRİŞ

Bitkiler, tarih boyunca hem gıda hem de tedavi amaçlı kullanılmış ve içeriklerindeki biyolojik olarak aktif bileşikler sayesinde geleneksel tıbbın önemli bir parçası olmuştur. Bu bitkiler arasında yer alan *Glycyrrhiza glabra* (meyan kökü), zengin triterpen, saponin ve flavonoid içeriği ile dikkat çeken değerli bir tıbbi bitkidir. Meyan kökünün başlıca bileşenlerinden biri olan glisirizin; antioksidan, antiinflamatuar ve çeşitli biyolojik etkiler göstermesi nedeniyle pek çok çalışmada ön plana çıkmaktadır (Batiha ve ark., 2020; Celano ve ark., 2021; Esmaeili ve ark., 2024; Pastorino ve ark., 2018). Son yıllarda nanoteknoloji alanındaki gelişmeler, bitkisel kaynaklı biyoaktif bileşiklerin nanopartikül sentezinde kullanılmasına yönelik ilgiyi artırmıştır. Nanopartiküller, yüksek yüzey alanı, özgün fizikokimyasal özellikleri ve fonksiyonel yüzey modifikasyonlarına uygunlukları sayesinde tıp, çevre ve malzeme biliminde geniş bir uygulama alanına sahiptir (Singh ve ark., 2015; Wang ve ark., 2016; Hazarika ve ark., 2022). Bu kapsamda özellikle bitkisel özütlerin

kullanıldığı yeşil sentez yöntemleri; çevre dostu olmaları, toksik kimyasal içermemeleri ve ekonomik olmaları nedeniyle geleneksel fiziksel ve kimyasal yöntemlere güçlü bir alternatif oluşturmaktadır (Ajitha ve ark., 2014; Mittal ve ark., 2014).

Doğal bir polisakkarit olan kitosan; biyouyumlu, biyobozunur ve antimikrobiyal özellikleri nedeniyle biyoteknoloji ve malzeme biliminde yaygın olarak kullanılmaktadır. Ayrıca kitosanın bitkisel bileşiklerle etkileşime girerek nanopartikül oluşturma kapasitesi, yeşil sentez çalışmalarında önemli bir avantaj sunmaktadır (Garavand ve ark., 2022; Hidangmayum ve ark., 2019).

Bu çalışmada, *Glycyrrhiza glabra* köklerinden elde edilen metanol ekstraktı kullanılarak kitosan nanopartiküllerinin yeşil sentez yöntemiyle üretimi amaçlanmıştır. Elde edilen nanopartiküller, SEM, EDX, FT-IR, XRD, DLS ve zeta potansiyel analizleriyle karakterize edilerek metanol ekstraktının kitosan nanopartiküllerinin biyosentezindeki etkinliği değerlendirilmiştir.

MATERYAL VE METOT

Bitki Örneklerinin Toplanması ve Hazırlanması

Bu çalışmada kullanılan *Glycyrrhiza glabra* kökleri, Gaziantep'te bulunan Ra-Ma Bayrakdar firmasından temin edilmiştir. Laboratuvara getirilen örnekler oda sıcaklığında kurutulmuş ve öğütücü (Spice Herb & Grinder IC-04A) kullanılarak ince toz hâline getirilmiştir. Öğütülen kök materyali, ekstraksiyon işlemlerinde kullanılmak üzere kapalı kaplarda muhafaza edilmiştir.

Metanol Ekstraktının Hazırlanması

Ekstraksiyon için 10 g meyan kökü tozu reaksiyon balonuna alınmış ve üzerine 100 mL metanol eklenmiştir. Örnek, oda sıcaklığında maserasyon yöntemiyle 2–4 kez ekstrakte edilmiştir. Maserasyon süresince balon ara ara elle çalkalanmış, ardından pilili süzgeç kâğıdı ile süzülmüştür. Elde edilen süzüntü 42 °C'de düşük basınç altında rotavapor kullanılarak yoğunlaştırılmıştır. Literatürde bildirildiği şekilde işlem tamamlandıktan sonra metanol ekstraktı koyu renkli cam kaplarda buzdolabında saklanmıştır (Zhang ve ark., 2018).

Metanol Ekstraktı ile Kitosan Nanopartiküllerinin (Cs-NP) Sentezi

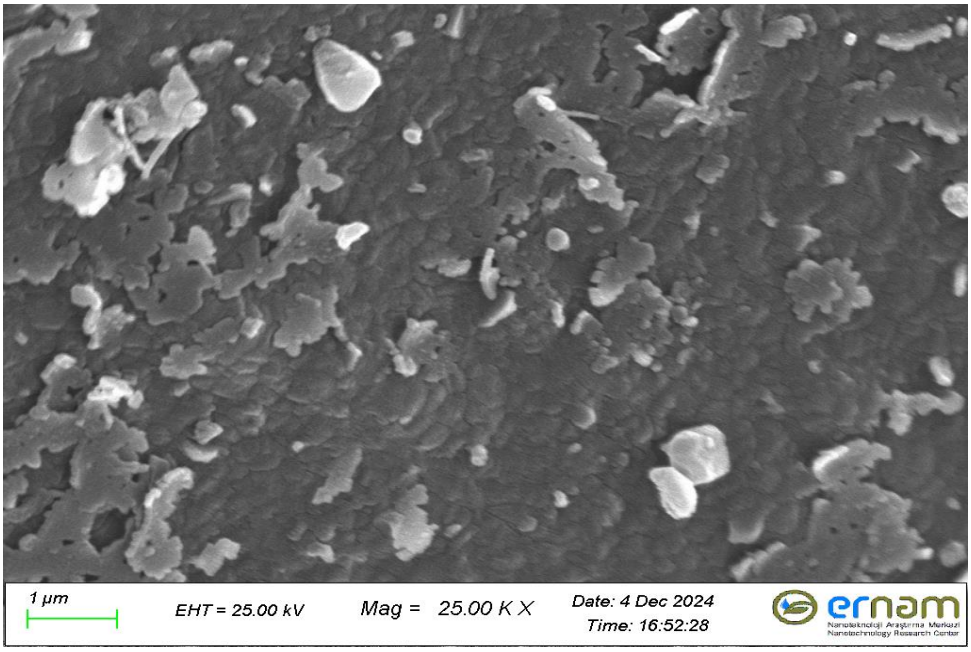
Kitosan (≥%90 saflık, Sigma-Aldrich; CAS No: 9012-76-4), %1 (a/h) konsantrasyonda %1'lik asetik asitte çözülmüş ve homojenizasyon için 24 saat manyetik karıştırıcıda tutulmuştur. Çözeltinin pH'ı NaOH ile 5'e ayarlanmış ve sterilizasyon amacıyla 0.22 µm filtreden geçirilmiştir. Hazırlanan kitosan çözeltisi, metanol ekstraktı ile 1:1 oranında karıştırılmış ve oda sıcaklığında inkübasyona bırakılmıştır. Sentez sonrası karışım 10.000 × g'de 10 dakika santrifüj edilmiş ve elde edilen çökelti 80 °C'de etüvde bir gece kurutularak karakterizasyon için hazırlanmıştır (El-Naggar ve ark., 2023).

Nanopartiküllerin Karakterizasyonu

Dinamik Işık Saçılması (DLS): Metanol ekstraktı ile sentezlenen Cs-NP'lerin parçacık boyutu ve dağılımı, sonikasyon sonrası deiyonize su ile seyreltilmiş numuneler kullanılarak analiz edilmiştir.

Zeta Potansiyeli: Nanopartiküllerin yüzey yükü zeta potansiyel cihazı ile ölçülmüştür. Numuneler ölçüm öncesi deiyonize su ile yıkanmış, tek kullanımlık zeta hücreleri etanol ile durulanmıştır.

X-Işını Toz Difraksiyonu (XRD): Cs-NP'lerin kristal yapısı XRD cihazı ile incelenmiştir.

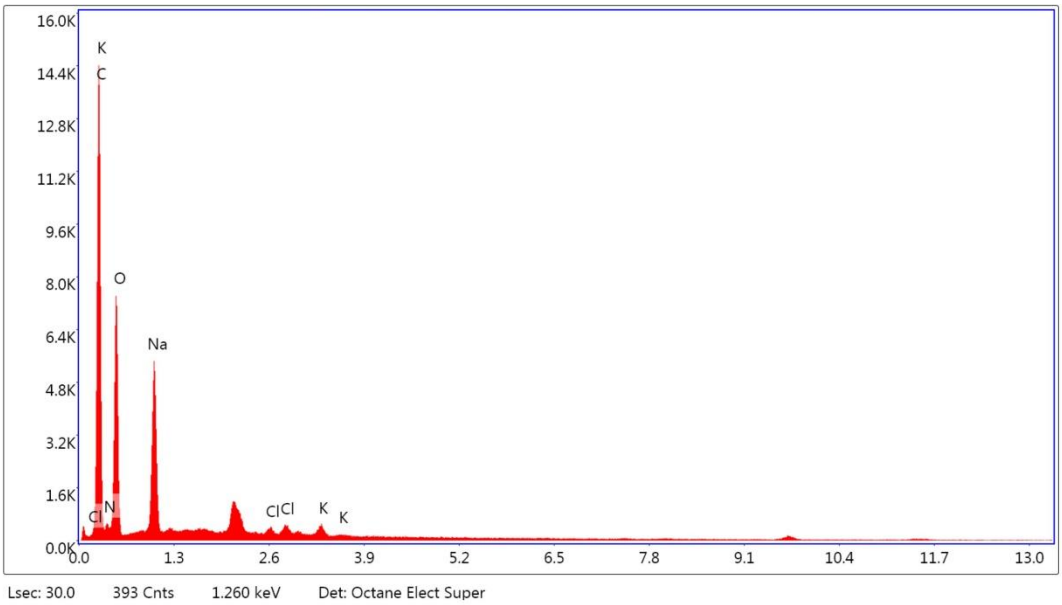


FT-IR Spektroskopisi: Nanopartiküllerin yapısında bulunan fonksiyonel gruplar FT-IR cihazı ile 400–4000 cm^{-1} aralığında analiz edilmiştir.

SEM ve SEM-EDX Analizi: Nanopartiküllerin morfolojisi ve elementel içeriği Erciyes Üniversitesi Nanoteknoloji Araştırma Merkezi'nde (ERNAM) SEM ve SEM-EDX cihazları kullanılarak belirlenmiştir.

BULGULAR

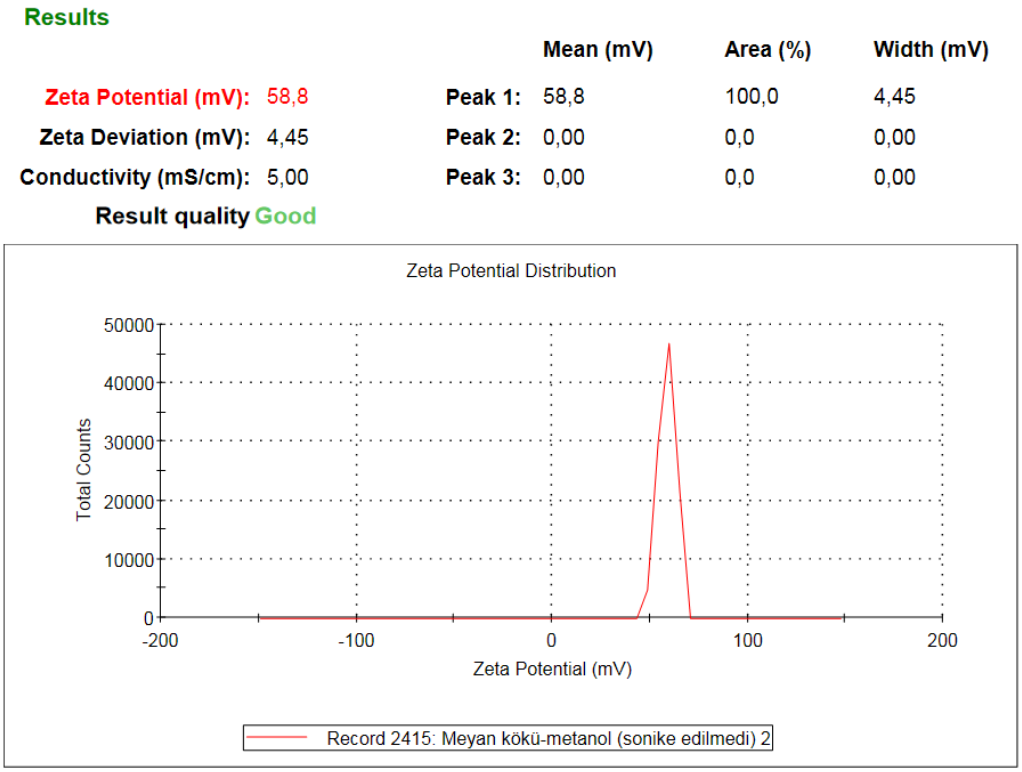
SEM Analizi



SEM görüntülerinde sentezlenen Cs-NP'lerin düzensiz, parçacıklı ve agregasyon eğilimi yüksek bir morfoloji sergilediği görülmüştür (Şekil 1). Bu yapı, kitosan temelli biyosentezlenmiş nanopartiküllerin doğal birleşme davranışının bir sonucu olarak değerlendirilmektedir.

Şekil 1. *Glycyrrhiza glabra* ekstraktları kullanılarak metanol ortamında biyosentezlenen Cs-NP'nin SEM görüntüsü

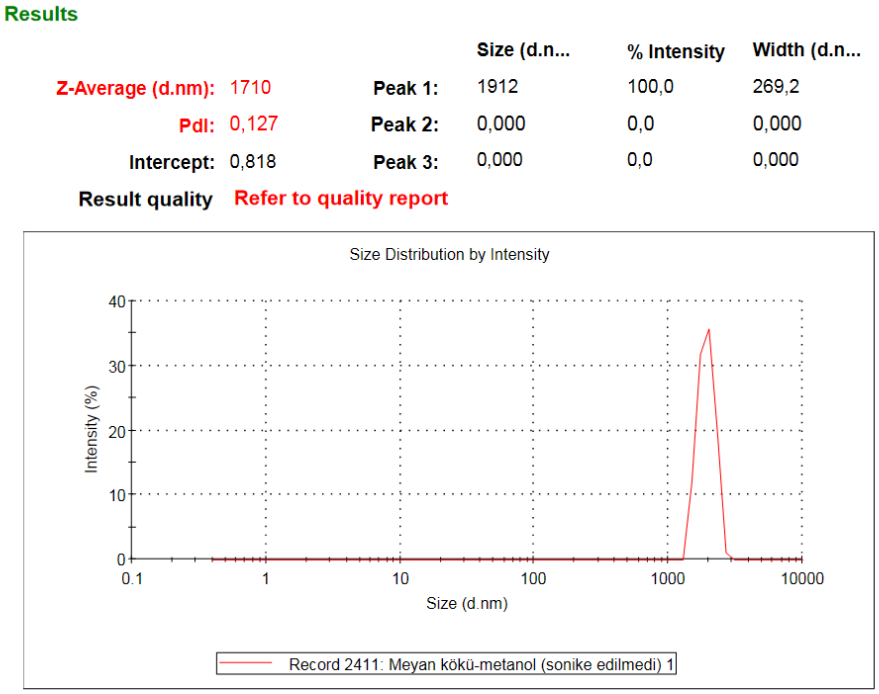
SEM-EDX Analizi



Cs-NP'lere ait EDX spektrumu, yapının temel elementlerinin karbon (C) ve oksijen (O) olduğunu ortaya koymuştur. Ayrıca yüzeyde Na, Cl ve K gibi elementlerin bulunması, bitkisel ekstrakt bileşenlerinin veya sentez ortamındaki iyonların nanopartikül yüzeyine tutulduğunu göstermektedir (Şekil 2).

Şekil 2. *Glycyrrhiza glabra* ekstraktları kullanılarak metanol ortamında biyosentezlenen Cs-NP'nin SEM-EDX analizi

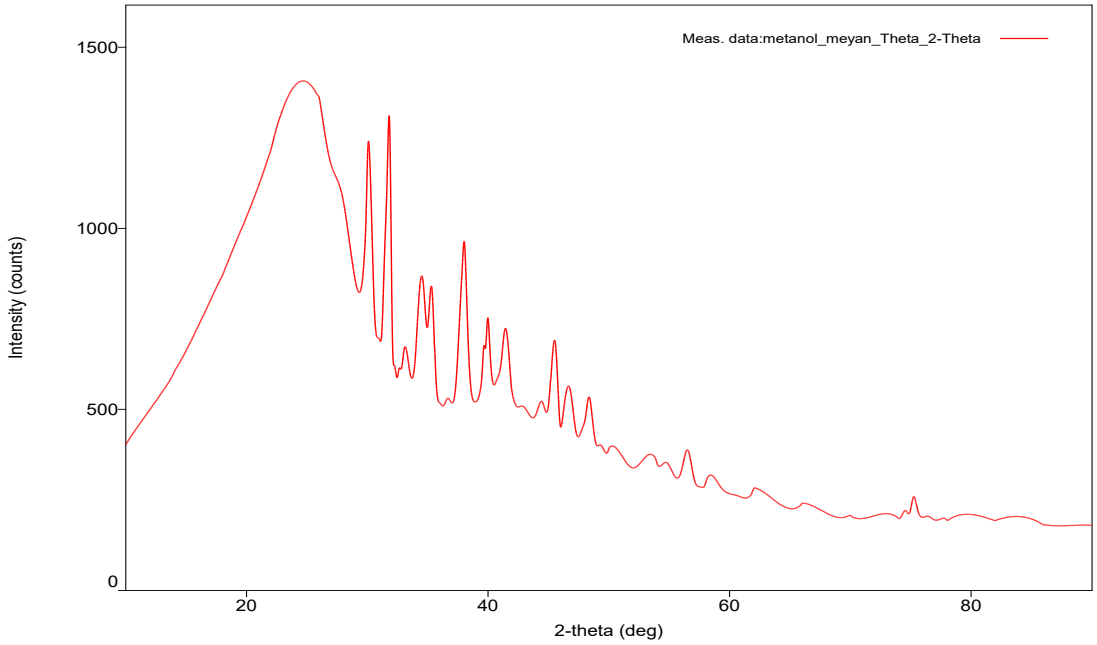
Zeta Potansiyel Analizi



Sentezlenen Cs-NP'lerin zeta potansiyeli +58,8 mV olarak belirlenmiş olup, bu yüksek pozitif yüzey yükü Cs-NP'lerin kolloidal ortamda güçlü elektrostatik stabiliteye sahip olduğunu göstermektedir (Şekil 3). Tek pikli dar dağılım, Cs-NP süspansiyonunun homojen elektrostatik özellik taşıdığını desteklemektedir.

Şekil 3. *Glycyrrhiza glabra* ekstraktları kullanılarak metanol ortamında biyosentezlenen Cs-NP'nin zeta potansiyel dağılımı

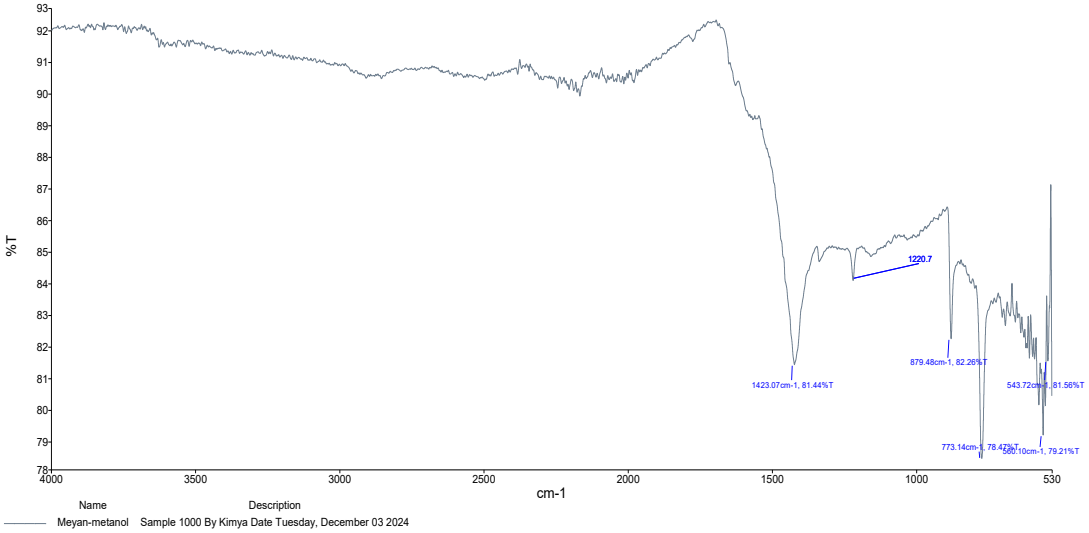
DLS Analizi



DLS ölçümünde Cs-NP'lerin Z-average değerinin 1710 nm olduğu ve dağılımın tek bir pikten oluştuğu görülmüştür (Şekil 4). PDI değerinin 0,127 olması, agregasyona rağmen dağılımın kabul edilebilir düzeyde homojen olduğunu göstermektedir. Ölçülen yüksek boyut değeri, Cs-NP'lerin biyosentez sonrası birleşme eğilimini yansıtmaktadır.

Şekil 4. *Glycyrrhiza glabra* ekstraktları kullanılarak metanol ortamında biyosentezlenen Cs-NP'nin DLS analizi

XRD Analizi



Cs-NP'lere ait XRD deseninde geniş taban hattı ve belirgin olmayan pikler gözlenmiştir (Şekil 5). Bu yapı, biyosentezlenen kitosan nanopartiküllerinin kristalin değil, ağırlıklı olarak amorf veya yarı kristalin yapıda olduğunu göstermektedir. Bu durum kitosan bazlı nanopartiküller için beklenen bir özellik olarak değerlendirilmektedir.

Şekil 5. *Glycyrrhiza glabra* ekstraktları kullanılarak metanol ortamında biyosentezlenen Cs-NP'nin XRD analizi

FT-IR Analizi

FT-IR spektrumunda 1423, 1220, 879 ve 773 cm^{-1} bölgelerinde görülen karakteristik bantlar, kitosanın fonksiyonel gruplarının nanopartikül yapısında korunduğunu doğrulamaktadır. Aynı zamanda bitkisel bileşenlere ait sinyallerin varlığı, *Glycyrrhiza glabra* ekstraktının doğal stabilizatör olarak Cs-NP matriksine başarıyla entegre olduğunu göstermektedir (Şekil 6).

Şekil 6. *Glycyrrhiza glabra* ekstraktları kullanılarak metanol ortamında biyosentezlenen Cs-NP'nin FT-IR analizi

TARTIŞMA

Bu çalışmada elde edilen sonuçlar, *Glycyrrhiza glabra* metanol ekstraktının kitosan nanopartiküllerinin biyosentezinde etkili bir indirgeme ve stabilize edici ajan olarak kullanılabileceğini göstermektedir. Yüksek zeta potansiyeli değerinin (+58,8 mV) ortaya koyduğu güçlü kolloidal stabilite, bitkisel bileşenlerin nanopartikül yüzeyine bağlanarak elektrostatik kararlılık sağladığını desteklemektedir. SEM ve DLS analizlerinde gözlenen agregasyon eğilimi, bitki ekstraktı ile sentezlenen Cs-NP'lerde literatürde de rapor edilen tipik bir davranıştır. XRD'deki yarı kristalin yapı ve FT-IR'deki karakteristik bantlar ise kitosanın yapısal özelliklerinin korunduğunu doğrulamaktadır. Genel olarak bulgular, bitki ekstraktı aracılı yeşil sentez yönteminin kitosan nanopartiküllerinin üretimi için uygun ve uygulanabilir bir yaklaşım olduğunu göstermektedir.

SONUÇ

Glycyrrhiza glabra köklerinin metanol ekstraktı kullanılarak sentezlenen kitosan nanopartiküllerinin (Cs-NP) karakterizasyon verileri, biyosentetik sürecin başarılı bir şekilde gerçekleştiğini ve kitosan temelli nanopartiküllerin oluştuğunu göstermektedir.

SEM analizinde düzensiz, agregasyon eğilimli bir yüzey morfolojisi gözlenmiştir. EDX bulguları nanopartiküllerin temel bileşenlerinin C ve O olduğunu, ayrıca Na, K ve Cl gibi elementlerin matrikste yer aldığını ortaya koymuştur. +58,8 mV olarak belirlenen zeta potansiyel değeri, Cs-NP'lerin yüksek pozitif yüzey yükü nedeniyle güçlü kolloidal stabilite sergilediğini doğrulamaktadır. El-Naggar ve ark. (2022) tarafından yapılan bir çalışmada biyosentezlenen Cs-NP'nin zeta potansiyelinin +31,1 mV olduğu ve bu değerin nanopartiküllerin elektrostatik itme yoluyla yüksek kolloidal stabilite gösterdiği bildirilmiştir. Bu bulgu, bir süspansiyonun kararlı kabul edilebilmesi için en az ±30 mV zeta potansiyeline ihtiyaç duyulduğunu belirten literatür ile uyumludur (Sathiyabama ve ark., 2024). DLS analizi, Cs-NP'lerin Z-average değerinin 1710 nm olduğunu ve yoğunluk dağılımında yaklaşık 1912 nm civarında tek modlu bir pik gösterdiğini ortaya koymuştur. Bu yüksek hidrodinamik boyut, nanopartiküllerin agregasyon eğiliminde olduğunu göstermektedir. XRD difraktogramında 20–30° (2θ) aralığında gözlenen geniş yarı kristalin patern, kitosan nanopartikülleri için tipik bir yapı olup güncel çalışmalarda rapor edilen desenlerle uyumludur. Benzer şekilde, Duraisamy ve ark. (2022) de *Martynia annua* yaprak ekstraktı ile sentezledikleri kitosan nanopartiküllerinde 2θ yaklaşık 20–30°

aralığında geniş yarı kristalin bir XRD piki rapor etmiş ve bunun kitosanın karakteristik yarı kristalin yapısını doğruladığını belirtmiştir.

FT-IR spektrumunda 1423, 1220, 879 ve 773 cm^{-1} bölgelerinde kaydedilen karakteristik bantlar ise kitosan yapısına özgü fonksiyonel grupların korunduğunu ve metanol ekstraktındaki fenolik bileşiklerin nanopartikül yüzeyine bağlanarak stabilize edici rol üstlendiğini desteklemektedir; benzer bulgular bitki ekstraktlarıyla yapılan yeşil sentez çalışmalarında da rapor edilmiştir. Yapılan benzer bir çalışmada, Ganesan ve ark. (2024), *Cassia fistula* yaprak ekstraktı ile sentezledikleri kitosan nanopartiküllerinde FT-IR analizinde 3421 cm^{-1} (O–H/N–H), 1635 cm^{-1} (C=O), 1384 cm^{-1} (C–N), 1078 cm^{-1} (C–O–C) ve 897 cm^{-1} (β-glycosidic) bantlarını rapor etmiş; bu bulgular bitkisel fenolik bileşiklerin nanopartikül yüzeyine bağlanarak stabilizasyon sağladığını göstermiştir.

Bu sonuçlar, *Glycyrrhiza glabra* metanol ekstraktının Cs-NP sentezinde etkili bir indirgeme ve stabilize edici ajan olarak kullanılabileceğini göstermektedir. Gelecek araştırmalarda partikül boyutunun azaltılmasına yönelik parametre optimizasyonlarının yapılması ve biyomedikal uygulamalara yönelik in vitro bulguların in vivo modellerde doğrulanması önerilmektedir.

TEŞEKKÜR

Lisans ve yüksek lisans eğitimim süresince bilgi, birikim ve tecrübeleriyle akademik gelişimime önemli katkılar sağlayan; yönlendirmeleri, desteği ve bilimsel rehberliği ile çalışmamın her aşamasında yanımda olan değerli danışmanım Prof. Dr. Zeliha Leblebici'ye saygı ve teşekkürlerimi sunarım.

Bu tez çalışması, TÜBİTAK Bilim İnsanı Destek Programları Başkanlığı (BİDEB) 2210 – Yurt İçi Lisansüstü Burs Programı ile Nevşehir Hacı Bektaş Veli Üniversitesi Bilimsel Araştırma Projeleri Koordinasyon Birimi (Proje No: TEZ24F05) tarafından sağlanan destekler kapsamında yürütülmüştür. Söz konusu kurumlardan sağlanan maddi destekler için teşekkür ederim.

Abstract

Advances in computational prediction and protein structure modeling have significantly contributed to understanding protein architecture in various biological contexts. These innovations have revolutionized biological research by providing powerful insights and streamlining the design of experimental studies. Mycobacterial pathogens are emerging as a major global challenge in disease management due to their inherent resistance to many antibiotics. The increasing prevalence of drug-resistant *Mycobacterium tuberculosis* strains has heightened the need for new and effective treatment strategies. Schiff bases exhibit broad biological activity, including antimicrobial, anticancer, and anti-inflammatory properties, due to the imine group present in their structures. This study aims to explore the antimycobacterial inhibitory potential of Schiff base based isoniaside (PISH) for InhA protein. In silico analyses, including molecular docking and ADME (Absorption, Distribution, Metabolism, and Excretion) property evaluation, were performed to predict the interaction patterns and binding energies of candidate molecules with InhA and to assess their potential bioavailability and drug potential. PISH exhibited an overall favorable safety profile, low genotoxic risk, and minimal predicted environmental impact. The Pfizer Rule demonstrated that PISH exhibited certain drug-like properties, and its compliance with the SureChEMBL rule further supported its favorable chemical characteristics, although it violated Lipinski's rule. Additionally, its moderate log P (2.92) reflected a balanced level of lipophilicity. However, the compound also had important limitations, including poor oral bioavailability, some drug-drug interaction, and limited water solubility. According to the molecular docking results, the ligand exhibited a strong binding affinity for the target protein, with a binding energy of −11.02 kcal/mol. Hydrogen bonds formed with Gly40, Lys165, and Gly14 contributed significantly to the stable binding of the PISH molecule at the protein's active site.

Keywords: Isoniazid-Based Schiff Base, Molecular docking, ADME, *Mycobacterium tuberculosis*

INTRODUCTION

Tuberculosis (TB) is a life-threatening disease caused by mycobacteria belonging to the *Mycobacterium tuberculosis* complex, primarily *Mycobacterium tuberculosis*, as well as *Mycobacterium bovis* and *Mycobacterium africanum* (Joshi et al., 2015; Zumla et al., 2013). In 2023, TB caused an estimated 1.25 million deaths globally (including 150 000 people with HIV) (WHO, 2023). The situation is further complicated by the global rise of multidrug-resistant *M. tuberculosis* (MDR-TB), extensively drug-resistant TB, and even totally drug-resistant strains. In addition, the high prevalence of HIV infection—which progresses to acquired immune deficiency syndrome (AIDS) has greatly increased the burden of TB.

Advanced computational techniques facilitate the drug discovery process with a flexible and innovative approach. In silico methods offer highly efficient alternatives in terms of time and cost. Using these techniques, it is possible to predict molecular interactions with biological targets, as well as virtually examine the behavior of molecules in the human body and evaluate their pharmacokinetic properties and bioavailability (Dogan et al., 2025; McPhillie et al., 2015; Mounadi et al., 2025; Sahin Dogan et al., 2025).
Schiff bases form when a primary amine combines with an aldehyde or ketone under the right reaction conditions. Schiff bases represent an important class of organic compounds, serving roles as dyes and pigments, catalysts, synthetic intermediates, and polymer stabilizers (da Silva et al., 2011). Furthermore, Schiff bases

have broad biological activity, including antimicrobial, anticancer, and anti-inflammatory properties, due to the imine group present in their structures (Ceramella et al., 2022; Iacopetta et al., 2025; Zúñiga-Miranda et al., 2025).

In present study, the antimycobacterial inhibitory potential of N',N'''-((1E,1'E)-((3-oxo-1,3-dihydroisobenzofuran-1,1-diyl)bis(6-hydroxy3,1phenylene))bis(methaneylylidene))di(isonicotinohydraz-ide) (PISH) for InhA protein were investigated. In computational techniques, including molecular docking and ADME (Absorption, Distribution, Metabolism, and Excretion) property evaluation, were performed to predict the interaction patterns and binding energies of PISH with enoyl–acyl carrier protein reductase (InhA) and to assess their potential bioavailability and drug potential.

MATERIAL AND METHODS

SwissADME and ADMET tools were used to evaluate the drug potential of isoniazid-based Schiff base (N′,N‴-((1E,1′E)-((3-oxo-1,3-dihydroisobenzofuran-1,1-diyl)bis(6-hydroxy-3,1-phenylene))bis (methanylylidene))di(isonicotinohydrazide)) (Aydin & Alici, 2021) as well as its bioactivity and ADME (absorption, distribution, metabolism, and excretion) properties using its Smiles format. The molecule was minimized using the PyRX program and converted to PDB format. The protein receptor downloaded from the PDB database was saved in PDB format after water molecules and ligands were removed. AutoDock tools 1.5.7 were used to perform the docking simulation, resulting in an estimated binding position. By analyzing the docking log files (dlg), the docking conformations with the lowest binding free energy for the ligand were determined. These conformations were used to generate docking images using AutoDock tools 1.5.7 and Discovery Studio (Biovia, 2024; Morris et al., 2009). For validation, the co-crystallized NAD molecule with InhA protein was re-docked with PISH molecule–protein complex.

RESULTS AND DISCUSSION

ADMET predictions indicated that the PISH had a generally acceptable safety profile, characterized by low cardiotoxicity, low genotoxicity, and limited environmental toxicity. However, the violation of Lipinski's rules and the lack of biodegradability should be considered points of concern, particularly in terms of oral bioavailability and environmental persistence (Table 1). When PISH examining for the Lipinski Rule, although it appeared to be outside this rule with a molecular weight greater than 500 g/mol, its moderate log P value of 2.92 provided the advantage of potentially interacting well with hydrophobic targets (Table 2). It was consisted with some Lipinski's rules (HBA ≤10, HBD ≤5), thus it can increase binding affinity. Furthermore, it accepted by the Pfizer Rule, indicating some drug-like properties as well as consistence with the SureChEMBL Rule, representing favorable chemical properties (Table 1). However, a low GI absorption/HIA value indicated that the compound could be poorly absorbed from the gastrointestinal tract and could have low oral bioavailability. Due to its limited water solubility (LogS –4.807), the compound may exhibit reduced bioavailability, needing advanced formulation methods essential to enhance its solubility and membrane permeability. The fact that the compound cannot cross the blood-brain barrier (BBB permeant: No) indicates a low potential risk of neurotoxicity (Table 3). Moreover, it had moderate clearance (2.381) and a rapid half-life of 0.953 h might require frequent dosing (Table 3).

The Protein Data Bank (PDB) structure 1ENY corresponded to InhA from *Mycobacterium tuberculosis*, a key enzyme in the biosynthetic pathway of the mycobacterial cell wall (Dessen et al., 1995). This structure was selected as the target protein for the study to explore the potential of PISH as a novel antitubercular agent. According to the molecular docking results, the ligand exhibited a strong binding affinity for the target protein, with a binding energy of −11.02 kcal/mol. Hydrogen bonds formed with Gly40, Lys165, and Gly14 contributed significantly to the stable binding of the PISH molecule at the protein's active site. Additionally, hydrophobic interactions between Ala191, Ile19, Met194, and Ile21 and PISH were observed, further stabilizing the protein–ligand complex (Figure 1). The high binding affinity and interactions obtained as a result of docking indicated that PISH effectively interacted with the active site of the InhA protein and had the potential to inhibit its function, drawing attention as a new antituberculosis agent. Moreover, the ligand's alignment near the NAD binding site suggested to possible competitive inhibition, supporting its promise as a potential enzyme inhibitor (Figure 2). These findings might provide an important basis for further experimental research and optimization of PISH molecule as an antitubercular candidate.

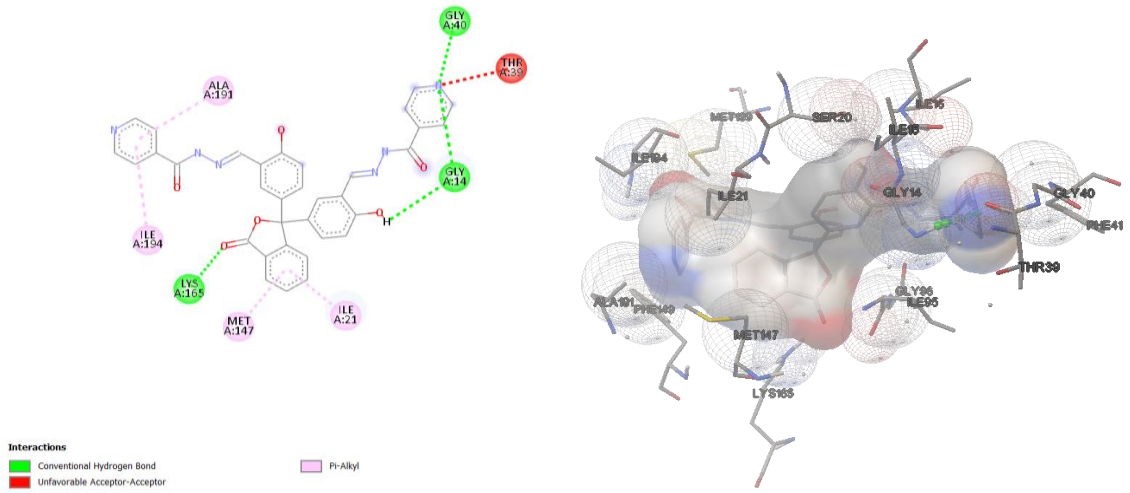

Figure 1. Optimal docking pose of PISH-InhA interactions.

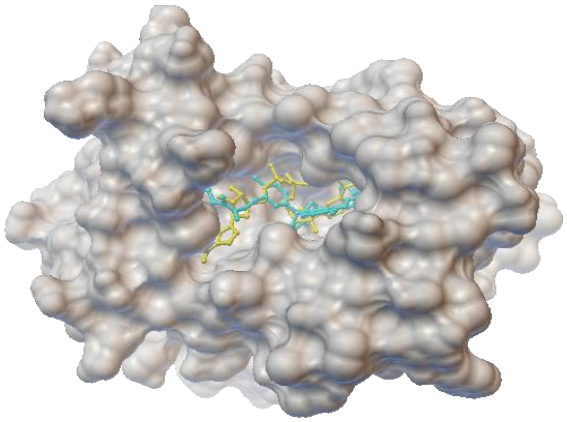

Figure 2. Active site of the 1ENY exhibiting reference molecule in yellow and the docked PISH in turquoise.

CONCLUSION

In conclusion, the isoniazid-based Schiff base represented a potential therapeutic agent. It demonstrated a generally acceptable safety profile, low genotoxicity, and minimal environmental toxicity. Its moderate log P indicates balanced lipophilicity, and its strong binding affinity toward biological targets further supports its potential. However, it also presents notable challenges, including low oral bioavailability, limited water solubility, and possible drug–drug interactions. Future studies may explore structural optimizations to improve solubility and bioavailability. Additionally, in vitro, and in vivo evaluations are recommended to validate computational findings.

Özet

Yeşil çayın özel bir formu olan matcha çayı, içerdiği biyoaktif bileşenler ve potansiyel sağlık etkileri nedeniyle giderek artan bir popülariteye sahiptir. Matcha çayının son yıllarda artan popülaritesi, piyasada satılan ürünlerin fenolik bileşik içerikleri ve antioksidan aktiviteleri arasındaki farklılıkların daha yakından incelenmesini gerekli kılmıştır. Ayrıca yüksek düzeyde fenolik bileşik alabilmek için ekonomik açıdan yüksek maliyetli bu ürünlerin tüketiminin gerekliliğinin ve alternatiflerinin yakından incelenmesi önemli bir diğer hususdur. Bu çalışma, Türkiye'de satışta bulunan farklı matcha çayı türlerinin ve çeşitli yeşil çay formlarının toplam fenolik bileşik konsantrasyonu, antioksidan kapasitesi, toplam flavonoid içeriği ve birim fiyat gibi temel parametreler açısından karşılaştırılmasını amaçlamaktadır. Çalışmaya online olarak satılan farklı matcha çayı türleri (16 adet mutfak sınıfı, 3 adet seremoni sınıfı) ve yeşil çay türleri (2 poşet, 4 dökme yaprak ve bunların toz formları) dahil edilmiştir. Tüm örnekler geleneksel matcha hazırlama seremonisine benzetilerek laboratuvar koşullarında standart bir şekilde (2 g örnek/100 mL, demleme sıcaklığı: 85°C, 3 dk sonikasyon ile karıştırma) hazırlanmıştır. Hazırlanan örneklerin CUPRAC antioksidan kapasitesi, toplam fenolik bileşik (TPC) ve toplam flavonoid içeriği analiz edilmiş ve birim fiyat verileri kaydedilmiştir. Yapılan analizler sonucunda çay türleri arasında TPC, flavonoid içeriği ve birim fiyat açısından istatistiksel olarak anlamlı farklılıklar tespit edilmiştir ($p<0,05$). Bulgulara göre en yüksek TPC (1314,00±294,65 mg GAE/L) ve flavonoid (364,30±56,398 mg CE/L) değerleri dökme yeşil çay tozu örneklerinde ölçülmüştür ($p<0,05$). Buna karşılık, piyasadaki en yüksek birim fiyata sahip olan seremoni sınıfı matcha grubu, incelenen tüm gruplar arasında istatistiksel olarak anlamlı şekilde en düşük TPC (550,58±136,48 mg GAE/L) ve flavonoid (191,20±73,181 mg CE/L) değerlerini göstermiştir ($p<0,05$). Mutfak sınıfı matcha çayları, seremoni sınıfına göre daha yüksek biyoaktif bileşik içeriğine sahip olsa da bu gruptaki ürünlerin bileşiminin markalara göre yüksek düzeyde değişkenlik gösterdiği gözlemlenmiştir. Sonuç olarak bu çalışma, Türkiye piyasasında satılan seremoni sınıfı matchaların, yüksek fiyatlarına rağmen antioksidan kapasite, flavonoid ve fenolik bileşik içeriği açısından beklenen üstünlüğü göstermediğini ortaya koymuştur. Ekonomik bir seçenek olan dökme yeşil çayların ise matchaya benzer şekilde toz haline getirilerek seremoni yöntemiyle hazırlandığında, birçok pahalı matcha ürünüyle yarışan veya daha yüksek biyoaktif bileşen düzeyleri sunduğu belirlenmiştir.

Anahtar Kelimeler: Yeşil çay, kateşin, flavonoidler, sağlıklı beslenme

Comparison of phenolic compound levels and antioxidant capacity in commercially available matcha tea and green tea varieties

Abstact

Matcha tea, a specialized form of green tea, has gained increasing popularity due to its rich bioactive compounds and potential health benefits. This growing interest has made it necessary to examine more closely the differences in phenolic compound content and antioxidant activity among commercially available matcha products. Moreover, considering the high cost of matcha, it is important to evaluate whether the consumption of these products is truly necessary to achieve high phenolic intake and to identify more economical alternatives. This study aims to compare various matcha teas sold in Türkiye with different forms of green tea in terms of total phenolic content, antioxidant capacity, total flavonoid levels, and unit price. The study included

online-purchased matcha products (16 culinary grade, 3 ceremonial grade) and green tea samples (2 bagged, 4 loose-leaf, and their powdered forms). All samples were prepared under standardized laboratory conditions modeled after traditional matcha preparation (2 g sample/100 mL, 85°C brewing temperature, 3 minutes of sonication). CUPRAC antioxidant capacity, total phenolic content (TPC), total flavonoid content, and unit price data were determined for each sample. The analyses revealed statistically significant differences among tea types in terms of TPC, flavonoid levels, and unit price ($p<0.05$). Loose-leaf green tea powders exhibited the highest TPC (1314±294.65 mg GAE/L) and flavonoid content (364.30±56.398 mg CE/L) ($p<0.05$). In contrast, ceremonial grade matcha—the most expensive product group—showed the lowest TPC (550.58±136.48 mg GAE/L) and flavonoid levels (191.20±73.181 mg CE/L) among all tea types ($p<0.05$). Although culinary grade matcha contained higher bioactive compound levels than ceremonial grade, substantial variability was observed among brands. Overall, this study demonstrates that ceremonial grade matcha products sold in Türkiye do not exhibit the expected superiority in antioxidant capacity, flavonoid content, or phenolic composition despite their high cost. Economical loose-leaf green teas, when powdered and prepared similarly to matcha, were found to provide equal or even higher levels of bioactive compounds compared with many expensive matcha products.

Keywords: Green tea, catechins, flavonoids, healthy nutrition

1. GİRİŞ

Dünya genelinde en fazla tüketilen çaylardan birisi olan yeşil çay özellikle antioksidan, anikarsinojenik, antimutajenik ve antipertansif sağlık etkileri ile dikkat çekmektedir (Jakubczyk et al., 2020). Yeşil çayın bu sağlık etkileri ise bileşiminde bulunan fenolik bileşiklerle, özellikler de kateşinlerle (epikateşin (EC), epigallokateşin (EGC), epigallokateşin gallat (EGCG), epikateşin gallat (ECG)) ilişkilendirilmektedir. Japon yeşil çayının toz haline getirilmiş özel bir formu olan matcha çayı da bu potansiyel sağlık etkileri sebebiyle son yıllarda özellikle popülerlik kazanmıştır. Geleneksel çay seremonilerinde kullanılan matcha çayı, diğer yeşil çay türlerinden farklı yetiştirme koşullarına, hazırlama yöntemlerine ve kimyasal bileşime sahiptir (Sokary et al., 2023). Direkt güneş ışınları alacak şekilde yetiştirilen diğer yeşil çaylardan farklı olarak, gölge ortamda yetiştirilen ve bitkinin yalnızca en genç yapraklarının seramik değirmenlerde öğütülmesiyle üretilen matcha çayının theanin, klorofil, kafein gibi biyoaktif bileşik içeriğinin diğer yeşil çaylardan daha yüksek; kateşin içeriklerinin daha düşük olduğu belirtilmektedir (Jakubczyk et al., 2020; Meyer et al., 2023). Ancak matcha çayının hazırlama yönteminden kaynaklanan farklılıklar sebebiyle bileşiminde bulunan fenolik bileşiklerin kullanılabilirliğinin diğer yeşil çaylardan daha yüksek olduğu belirtilmektedir (Sokary et al., 2023). İnce toz formunda olan matcha çayı su içerisinde iyice karıştırılarak tüketilirken, diğer yeşil çaylar su içerisine atılan çay yapraklarının belirli sürelerde demlenmesiyle hazırlanmakta ve sonrasında yaprak içermeyen çay infüzyonları tüketilmektedir. Yapılan bir çalışmada yaprak çay kullanılarak hazırlanan çaylardan 34,7–120,1 mg EGCG ve 46,7–146,4 mg kafein alımı söz konusuyken toz formundaki yeşil çay kullanıldığında bu miktarların sırasıyla 126,1–369,1 mg ve 72,9–187,1 mg düzeylerine çıktığı tespit edilmiştir. Bu bulgular, öğütme işleminin EGCG ve kafein ekstraksiyonunu artırdığını göstermektedir (Fujioka et al., 2016).

Matcha çayları kalitelerine göre seremoni sınıfı ve mutfak sınıfı olmak üzere ikiye ayrılmaktadır. Seremoni sınıfı, matcha çayı içeceklerinin hazırlanmasında kullanılan en yüksek kalite ve en pahalı olan çay türüdür; mutfak sınıfı matcha ise daha ekonomiktir ve içeceklerde ya da atıştırmalık ve tatlılarda bir bileşen olarak kullanılabilmektedir. Seremoni sınıfı matcha; genellikle en genç yapraklardan hazırlanmaktadır. Mutfak sınıfı matcha ise daha ekonomiktir ve genellikle daha geç hasat edilen yapraklardan üretilmektedir (Meyer et al., 2023). Matcha türleri arasındaki bu kalite ve hasat zamanından kaynaklanan farklılıklar da çayların biyoaktif bileşik içeriğini (kateşinler, kafein, theanin, klorofil vb.) etkilemektedir (Meyer et al., 2023). Matcha çayının giderek artan popülaritesi beraberinde ürün çeşitliliğinin ve kalite farklılıklarının da belirginleşmesine neden olmuştur. Türkiye pazarında matcha adıyla satılan ürünlerin hammaddesi, üretim yöntemi, hasat zamanı, yaprak kalitesi ve öğütme tekniği açısından büyük değişkenlik gösterdiği tahmin edilmektedir. Bu durum, "seremoni sınıfı" ve "mutfak sınıfı" gibi kalite tanımlarının çoğu zaman yalnızca pazarlama stratejisi olarak kullanılmasına, ürün içeriklerinin ise yeterince şeffaf olmamasına yol açmaktadır. Nitekim literatürde matcha çaylarının fenolik bileşik ve antioksidan özelliklerinin, üretici firmaya, coğrafi bölgeye, hasat dönemine ve işleme yöntemlerine bağlı olarak oldukça geniş bir aralıkta değiştiği belirtilmektedir (Meyer et al., 2023; White et al., 2025). Buna rağmen ülkemizde piyasada satılan matcha çaylarının fenolik bileşik içeriği, antioksidan kapasitesi ve yeşil çayın diğer formlarıyla karşılaştırılması konusunda yapılmış bilimsel çalışma sayısı bildiğimiz kadarıyla bulunmamaktadır. Öte yandan tüketiciler arasında matchanın, özellikle de seremoni

sınıfının, "daha yüksek antioksidan kapasiteye sahip olduğu" yönünde yaygın bir kanı bulunmaktadır. Ancak bu iddiaların yerel ürünler üzerinden test edilmesi, ürünlerin kalite standartlarının belirlenmesi ve tüketici bilincinin artırılması açısından önem taşımaktadır. Matcha ile benzer kullanım alanlarına sahip olan poşet yeşil çayların, dökme yeşil çayların yaprak ve toz formlarının fenolik bileşik içeriği ile antioksidan kapasitesinin doğrudan karşılaştırılması ise literatürde eksik kalan bir başka husustur.
Bu nedenle bu çalışma, Türkiye'de satışta bulunan farklı matcha çayı türlerinin ve çeşitli yeşil çay formlarının toplam fenolik bileşik konsantrasyonu, antioksidan kapasitesi (CUPRAC), toplam flavonoid içeriği ve birim fiyat gibi temel parametreler açısından karşılaştırılmasını amaçlamaktadır. Böylece piyasadaki ürünlerin içerik farklılıklarının ortaya konulması ve tüketiciye sunulan matcha kategorilerinin kimyasal bileşimlerinin karşılaştırılması hedeflenmiştir. Çalışmadan elde edilecek sonuçlar özellikle tüketici tercihlerine rehberlik etmesi açısından büyük öneme sahiptir.

2. YÖNTEM

2. 1. Örneklerin temini ve hazırlanması

Piyasada satılan farklı markalara ait 19 adet matcha çayı (16 adet mutfak sınıfı matcha tozu, 3 adet seremoni sınıfı matcha tozu), 2 farklı markaya ait bardak poşet yeşil çay, 4 farklı markaya ait dökme yeşil çay ve bu dökme çayların blenderize edilmiş toz formları araştırmaya dahil edilmiştir. Örneklerin temini Mayıs 2025-Eylül 2025 tarihleri arasında online alışveriş sitelerinden sağlanmıştır. Örnek kodlarına göre çay türlerinin sınıflandırılması Tablo 1'de verilmiştir.

Tablo 1. Örnek kodlarına göre çay türleri

Örnek kodları	Çay türü
1-16	Mutfak sınıfı matcha tozu
17-19	Seremoni sınıfı matcha tozu
20-21	Poşet Yeşilçay
22-25	Dökme Yeşilçay (Yaprak)
26-29	Dökme Yeşilçay (Toz)

Bütün çaylar matcha çayı hazırlama seremonisinde önerilen şekilde; 2 gram çay örneği alınarak 100 mL ultra saf su (85°C) ile karıştırılarak hazırlanmıştır. Seremoniye uygun şekilde matcha hazırlanırken ayrıca 3 dakika boyunca bambu fırça (whisk) ile çırpma işlemi uygulanmaktadır. Bu işlemi laboratuvar koşullarında tüm örneklerde standart bir şekilde uygulayabilmek için ultrasonik su banyosunda 3 dakika sonikasyon yapılmıştır. Sonikasyon sonrasında örnekler 3000 rpm'de 5 dakika santrifüj edilmiştir. Santrifüj işlemi sonrasında örnekler hemen süzülerek bekletilmeden analiz edilmiştir (Sielicka-Różyńska et al., 2020; White et al., 2025).

2. 2. Toplam Fenolik Bileşik (TPC) Analizi

Çay örneklerinin toplam fenolik bileşik içeriği, Folin–Ciocalteu yöntemi kullanılarak belirlenmiştir (Singleton & Rossi, 1965). Sielicka-Różyńska et al. tarafından çay infüzyonlarında kullanılan yöntem uygulanmıştır (Sielicka-Różyńska et al., 2020). Çalışmada, 10 µL seyreltilmiş (1:1, v/v) çay infüzyonu; 50 µL Folin–Ciocalteu reaktifi ve 290 µL saf su ile karıştırılarak 3 dakika bekletildi. Ardından, 150 µL %20'lik Na_2CO_3 çözeltisi ve 500 µL su eklenip tekrar karıştırıldı. Reaksiyon karışımları ışık almayan koşullarda, 20°C'de 2 saat inkübe edildi. İnkübasyon süresinin sonunda absorbans değerleri 725 nm dalga boyunda UV-Vis spektrofotometre kullanılarak ölçüldü. TPC hesaplamasında, farklı derişimlerde hazırlanan galik asit standart eğrisi kullanıldı ve sonuçlar mg GAE/L olarak ifade edildi. Tüm ölçümler dublike şekilde gerçekleştirildi, dublike ölçümlerde tutarsızlık olması durumunda bu örnekler tekrar hazırlanarak analiz edildi.

2. 3. Toplam Antioksidan Aktivite (CUPRAC) Analizi

Örneklerin antioksidan kapasite analizinde Apak ve ark. Tarafından geliştirilen ve yeşil çay kateşinlerine yüksek duyarlılık gösterdiği belirtilen CUPRAC (antioksidanların Cu^{2+} (bakır(II)) iyonlarını indirgeme kapasitesi) yöntemi kullanılmıştır (Apak et al., 2004) . Bakır(II) klorür çözeltisi, 0.4262 g $CuCl_2 \cdot 2H_2O$ tartılarak su içinde çözülmüş ve hacim saf su ile 250 mL'ye tamamlanmıştır. pH 7.0 değerinde amonyum asetat (NH_4Ac)

tamponu, 19.27 g NH_4Ac'in suda çözülmesi ve hacmin 250 mL'ye tamamlanması ile hazırlanmıştır. 7.5×10^{-3} M derişimindeki neokuproin (Nc) çözeltisi ise 0.156 g Nc'in %96 EtOH içinde çözülmesi ve etanol ile 100 mL'ye tamamlanmasıyla hazırlanmıştır. Bir deney tüpüne sırasıyla 1 mL Cu (II), 1 mL Nc ve 1 mL NH_4Ac tampon çözeltisi eklenmiştir. Ardından her bir örnek çözeltisinden 0,1 mL ve karışıma son hacmi 4.1 mL olacak şekilde (1 mL) ultra saf su ilave edilmiştir. Tüpler kapatılarak oda koşullarında karanlık bir ortamda 30 dakika bekletildikten sonra 450 nm'de (A_{450}) absorbans değerleri reaktif körüne karşı uv- vis spektrofotometre ile ölçülmüştür. Antioksidan kapasite hesaplamalarında, altı farklı derişimde hazırlanan Trolox standart eğrisi kullanıldı ve sonuçlar mM TEAC (Trolox Equivalent Antioxidant Capacity) olarak ifade edildi.

2.4. Toplam Flavonoid Analizi

Örneklerin flavonoid içeriklerini belirlemek için Zhishen vd. (1999) ve Dewanto vd. (2002) yönteminin biraz değiştirilmiş bir versiyonu kullanıldı. 10 ml'lik bir hacimsel şişeye 1 ml ekstrakt konuldu ve 5 ml damıtılmış su ve 0,3 ml %5'lik NaNO2 eklendi ve karıştırıldı.
5 dakika sonra 0,6 ml %10'luk AlCl3.6H2O eklendi. 5 dakika sonra 2 ml 1 mol l-1NaOH eklendi ve ardından hacim damıtılmış su ile 10 ml'ye tamamlandı. Çözelti iyice karıştırıldı ve absorbans hemen 510 nm'de ölçüldü. Flavonoid içerikleri, (+) kateşinden hazırlanan standart bir kalibrasyon eğrisi kullanılarak hesaplandı.

2. 5. İstatistiksel Analizler

Araştırmadan elde edilen tüm veriler IBM SPSS Statistics paket programı kullanılarak analiz edilmiştir. Çalışmaya dahil edilen beş farklı çay türünün (mutfak sınıfı matcha, seremoni sınıfı matcha, poşet yeşil çay, dökme yeşil çay–yaprak, dökme yeşil çay–toz) CUPRAC antioksidan kapasitesi, TPC, toplam flavonoid ve birim fiyat (TL/kg) değerlerinin grup bazında karşılaştırılmasında tek yönlü varyans analizi (One-Way ANOVA) uygulanmıştır. Analizler öncesinde dağılımın normalliği Shapiro–Wilk testi ve histogram/grafik incelemeleri ile, varyans homojenliği ise Levene testi ile değerlendirilmiştir. Tüm değişkenlerde varyans homojenliği sağlandığı için parametrik testler tercih edilmiştir. Anlamlı farklılık saptanan değişkenlerde gruplar arası farklılığın kaynağını belirlemek amacıyla Bonferroni çoklu karşılaştırma testi uygulanmıştır. ANOVA analizlerinde ayrıca etki büyüklüğünü belirlemek için eta-squared (η^2) değerleri hesaplanmıştır. İstatistiksel anlamlılık düzeyi $p<0,05$ olarak kabul edilmiştir.

3. BULGULAR VE TARTIŞMA

Bu çalışmada piyasada satılan farklı matcha (seremoni ve mutfak sınıfı) ve yeşil çay türlerinin (poşet, dökme yaprak, dökme toz) toplam fenolik madde (TPC), toplam antioksidan kapasite, toplam flavonoid içeriği ve birim fiyat değerleri karşılaştırılmıştır. Elde edilen bulgular Tablo 2 ve Tablo 3'te sunulmuştur.
Çalışma kapsamında incelenen çay türlerinin toplam fenolik bileşik (TPC) düzeyleri istatistiksel olarak anlamlı şekilde farklılık göstermiştir ($p=0,022$; $F=3,121$; $\eta^2=0,191$). TPC bakımından en yüksek ortalamaya sahip olan grup dökme yeşil çay tozu örnekleri (1314±294,65 mg GAE/L) olarak bulunurken; bunu poşet yeşil çay (984,53±360,52 mg GAE/L), dökme yeşil çay-yaprak (972,09±253,14 mg GAE/L) ve mutfak sınıfı matcha (951,63±475,30 mg GAE/L) grupları takip etmiştir ($p>0,05$). Seremoni sınıfı matcha örneklerinin ise diğer gruplardan istatistiksel olarak anlamlı şekilde daha düşük TPC değerlerine (550,58±136,48 mg GAE/L) sahip olduğu tespit edilmiştir ($p<0,05$). Yeşil çay ile matcha çayının TPC içeriklerinin karşılaştırıldığı başka bir araştırmada da benzer şekilde yeşil çayın TPC değeri (1770 mg GAE/L), matcha çayından (1030 mg GAE/L) istatistiksel olarak anlamlı şekilde daha yüksek bulunmuştur (Meremäe et al., 2025). Yapılan başka bir araştırmada da poşet ve yaprak yeşil çayların TPC değerleri (178,40 GAE mg/g), hem mutfak sınıfı (142,49 GAE mg/g) hem de seremoni sınıfı (125,7 GAE mg/g) matchadan daha yüksek bulunmuştur (Meyer et al., 2023). Meyer ve ark. ayrıca çay formunun da önemli bir faktör olduğunu ve en yüksek TPC içeren çay türünün yaprak formundaki yeşil çay örneğine ait olduğunu ifade etmiştir (Meyer et al., 2023). Ancak çalışma kapsamında yalnızca 1 adet yaprak yeşil çay incelenmiştir. Bu çalışmada ise 4 farklı dökme yeşil çay hem yaprak hem de toz haline getirilerek analiz edilmiştir. En yüksek TPC değeri de toz haline getirilen örneklerde gözlemlenmiştir. Bu sonucun, çay yapraklarının yüzey alanının artmasına bağlı olarak suya geçen fenolik bileşik miktarının artmasından kaynaklanmış olabileceği düşünülmüştür. Bu çalışma sonuçları ayrıca, literatürde mutfak sınıfı matchaların seremoni sınıfı matchalardan daha yüksek fenolik içeriğe sahip olduğunu gösteren çalışmalarla tamamen örtüşmektedir. Meyer ve ark. (2023), aynı markaya ait mutfak sınıfı ve seremoni sınıfı matchaları karşılaştırmış, mutfak sınıfı matchaların (149.5 GAE mg/g), seremoni sınıfındakilerden (111.6 GAE mg/g) anlamlı şekilde daha yüksek TPC içerdiğini göstermiştir (Meyer et al., 2023). Benzer şekilde White

ve ark. (2025) de mutfak sınıfı matchaların ortalama TPC değerlerinin seremoni sınıfı matchalara göre anlamlı şekilde yüksek olduğunu belirtmiştir (81.21 mg/g vs. 62.95 mg/g GAE)(White et al., 2025). Pek çok fenolik bileşik çayda acı ve buruk tatla ilişkilendirilmektedir. Bu nedenle daha yumuşak tadıyla öne çıkan seremoni sınıfı matchaların TPC içeriğinin tutarlı şekilde mutfak sınıfı matchaya kıyasla daha düşük bulunması şaşırtıcı bir sonuç değildir (Meyer vd., 2023, p. 664). Seremoni sınıfı çaylarının, yeşil çayın aksine gölge bir ortamda yetişmesi, daha erken hasat edilmesinden kaynaklı farklılıklar da fenolik bileşik düzeylerini etkilemiş olabilir. Örnek sonuçları bireysel olarak incelendiğinde en yüksek TPC değerine sahip örnek mutfak sınıfı kategorisindeki 13 numaralı örnek (1913,15 mg GAE/L); en düşük değere sahip örneğin de yine aynı gruptan 3 numaralı örnek (100,85 mg GAE/L) olduğu görülmüştür (Tablo 2). Aynı gruptan örnekler arasındaki bu tutarsız sonuçların matcha çayı üretiminde kullanılan çayların kalitesi, matcha tozlarının öğütme düzeyleri ve yöntemleri arasındaki farklılıklardan kaynaklanmış olabileceği düşünülmüştür.

Çalışma kapsamında incelenen çay örneklerinin CUPRAC antioksidan kapasitelerinin 1,20 ile 9,37 mM TE arasında oldukça geniş bir değer aralığında değiştiği görülmüştür. En düşük CUPRAC değeri mutfak sınıfı matcha kategorisindeki 3 numaralı örnekte, en yüksek değer ise yine aynı kategorideki 8 numaralı örnekte ölçülmüştür. Bununla birlikte CUPRAC değerleri çay türleri arasında istatistiksel olarak anlamlı bir farklılık göstermemiştir ($p=0,723$; $F=0,518$; $\eta^2=0,038$). Bu konuda yapılan diğer araştırma sonuçları TPC sonuçlarına benzer şekilde yeşil çayların antioksidan kapasitelerinin (185,75 ± 10,26 TEAC mmol/100 g), mutfak sınıfı matchalardan (144,11 ± 3,20; $p<0,001$) ve seremoni sınıfı matchalardan (130,27±4,84; $p<0,001$) istatistiksel olarak anlamlı şekilde yüksek olduğunu göstermiştir (Meyer et al., 2023). White ve arkadaşlarının çalışmasında mutfak sınıfı matchaların seremoni sınıfı matchalardan daha yüksek CUPRAC kapasitesi gösterdiği belirlenmiştir (94.01 ± 2.14 vs. 75.67 ± 1.80 mmol TE /100 g, $p<0.001$) (White et al., 2025). Yapılan başka bir araştırmada ise yeşil çayın DPPH yöntemiyle analiz edilen antioksidan kapasitesi değeri 55,14 mM TE bulunurken matcha çayının 35,51 mM TE olarak bulunmuştur (Meremäe et al., 2025). White ve ark. çalışmasında matcha ürünlerinin genel olarak fenolik bileşikler, flavonoidler, kateşinler ve klorofiller açısından zengin olduğunu ancak matcha kalitesinin bu bileşenlerin seviyelerini belirgin şekilde etkilediğini vurgulamıştır (White et al., 2025). Bu çalışmada da Tablo 2'de de görüldüğü gibi aynı çay grubundan örneklerin bile (örnek 3 ile 14) antioksidan kapasite, TPC, flavonoid değerleri arasında oldukça değişken sonuçlar bulunmaktadır. Bu durumun da matcha tozu olarak satılan ürünlerin kaliteleri ve içerikleri arasındaki farklılıklardan kaynaklandığı düşünülmüştür. CUPRAC antioksidan kapasite sonuçlarının çay türlerine göre anlamlı farklılık göstermemesi de hem çay kaliteleri arasındaki farklılıklardan kaynaklanan tutarsız sonuçlardan hem de çay türlerine ait örnek sayılarının dengeli dağılım göstermemesinden kaynaklanmış olabilir. Ülkemiz piyasasında satılan matcha çaylarının çoğu mutfak sınıfı kategorisinde olduğu ve seremoni sınıfı çayların sayısı daha kısıtlı olduğu için çay türleri arasında böyle bir dağılım oluşmuştur. Seremoni sınıfı çay seçeneklerinin artması durumunda bu karşılaştırmaların tekrar yapılması daha ve güvenilir sonuçlar elde edilmesine imkân sağlayabilir.

Tablo 2. Çay örneklerinin CUPRAC, TPC, flavonoid ve birim fiyat değerlerinin karşılaştırılması

Örnek	CUPRAC (mM TE)	TPC (mg GAE/L)	Flavonoid (mg CE/L)	Birim Fiyat TL/Kg

* Renklerin açıktan koyuya geçişi konsantrasyondaki artışı göstermektedir.

Bu çalışma kapsamında incelenen çay türlerinin toplam flavonoid içerikleri istatistiksel olarak anlamlı şekilde farklılık göstermiştir ($p=0,013$; $F=3,490$; $\eta^2=0,208$). Flavonoid düzeyleri açısından en yüksek ortalama dökme yeşil çay tozu örneklerinde (364,30±56,398 mg CE/L) bulunurken, bunu poşet yeşil çaylar (321,98±39,009 mg CE/L), mutfak sınıfı matcha (292,29±104,605 mg CE/L) ve dökme yeşil çay yaprak (291,84±38,552 mg CE/L) takip etmiştir. En düşük flavonoid içeriği seremoni sınıfı matcha grubunda (191,20±73,181 mg CE/L) ölçülmüştür. Bu sonuçlar, öğütülmüş yeşil çay tozlarının flavonoid düzeyinin yüksek olduğunu göstermektedir. Seremoni sınıfı ve mutfak sınıfı matchaların flavonoid içeriklerinin karşılaştırıldığı bir çalışmada; mutfak sınıfı matchaların belirgin biçimde daha yüksek flavonoid içerdiği rapor edilmiştir. Seremoni sınıfı matchalar ortalama 6,43±0,49 mg/g CE flavonoid içerirken, mutfak sınıfı matchalarda bu değer 12,39 ± 1,42 mg/g CE'ye ulaşmaktadır (White et al., 2025). Yeşil çayın en öne çıkan flavonoidlerinden olan EGCG düzeylerinin de matcha örnekleri arasında geniş bir aralık göstererek 4,36 mg/g ile 41,97 mg/g arasında değişmiştir (White et al., 2025). Matcha çaylarının gölgede yetişme gereksinimlerinin flavonoid sentezinde azalmaya neden olabileceği belirtilmektedir. Ayrıca seremoni sınıfı matchaların, mutfak sınıfı matchalara kıyasla daha erken hasat edilmesi flavonoid ve fenolik bileşik içeriklerinin daha düşük olmasıyla ilişkilendirilmiştir

Çalışmadaki dikkat çekici bulgulardan birisi de fiyat–içerik ilişkisidir. Birim fiyatlar açısından gruplar arasında belirgin ve istatistiksel olarak anlamlı bir farklılık gözlenmiştir ($p<0,001$; $F=8,894$; $\eta^2=0,402$). Seremoni sınıfı matcha örneklerinin birim fiyatının (25.208±16.621,49 TL/kg) diğer çay gruplarından istatistiksel olarak anlamlı şekilde daha yüksek olduğu tespit edilmiştir. İlginç bir şekilde bu grubun TPC ve flavonoid değerleri diğer gruplardan istatistiksel olarak anlamlı şekilde düşüktür ($p<0,001$). Bireysel olarak fiyatlar incelendiğinde de en yüksek fiyatlı iki çay örneğinin (birisi seremoni sınıfı, birisi mutfak sınıfı) de en düşük TPC ve flavonoid değerlerine sahip örnekler arasında yer aldığı göze çarpmaktadır. Yaprak formundaki ve toz formundaki dökme yeşil çay örnekleri birim fiyatlar açısından en ekonomik grubu oluşturmuştur (1.345±570,04 TL/kg). Özellikle dökme yeşil çay tozu örnekleri, yüksek TPC ve flavonoid içeriğine kıyasla düşük fiyatlarıyla öne çıkmıştır. Yapılan bir çalışmada mutfak sınıfı matchanın seremoni sınıfı matchaya kıyasla hem daha yüksek TPC ve flavonoid seviyelerine sahip olabildiği, hem de fiyatının anlamlı şekilde daha düşük olduğu rapor edilmiştir (0.31 USD/g vs. 0.88 USD/g) (White et al., 2025). Başka bir çalışmada da yaprak formundaki dökme yeşil çayın en düşük maliyetli ürünlerden (0,04 USD/g) birisi olmasına rağmen, en yüksek toplam fenolik içeriğe, CUPRAC antioksidan kapasitesine, EGCG düzeylerine ve E-CG konsantrasyonlarına sahip olduğu tespit edilmiştir. Yüksek maliyetli (ortalama 0,68 USD/g) matcha çayları (seremoni ve mutfak sınıfı) ise düşük toplam fenolik içerik ve CUPRAC antioksidan kapasiteleri ile karakterize edilmiştir (Meyer et al., 2023).

4. SONUÇ VE ÖNERİLER

Bu çalışmanın sonuçları toplam fenolik bileşik, flavonoid içeriği ve birim fiyat bakımından çay türleri arasında belirgin farklılıklar olduğunu göstermektedir. Özellikle dökme yeşil çay tozlarının fenolik bileşik ve flavonoid düzeylerinin birçok matcha örneğiyle aynı düzeyde veya daha yüksek olduğu görülmüştür. Buna karşılık ülkemiz piyasasında satılan seremoni sınıfı matchaların antioksidan kapasite, fenolik bileşik ve flavonoid içeriği açısından beklenen üstünlüğü göstermediği dikkat çekmiştir. Dahası seremoni sınıfı matchalara göre ekonomik açıdan daha uygun seçenekler olan mutfak sınıfı matcha ve dökme yeşil çay tozu örneklerinin birçok parametrede daha yüksek değerlere sahip olduğu ortaya koyulmuştur. Tüketicilerin, yüksek antioksidan içerikli ürün arayışında "seremoni sınıfı matcha"lara mucizevi bir ürün olarak yaklaşmaması, çalışmanın bulgularına göre daha doğru bir yaklaşım olacaktır. Matcha türleri arasında da "mutfak sınıfı" ürünler ise fiyat-fayda dengesi açısından daha avantajlı olarak değerlendirilebilir. Ancak bu ürünlerin bileşimlerinin ve kalitelerinin oldukça değişken olduğu ve belli bir standardın olmadığı görülmektedir. Düşük maliyetli dökme yeşil çaylar, özellikle de toz formları, birçok analiz parametresinde matcha çaylarıyla yarışan değerler sunmuştur.

Ancak matcha çayının biyoaktif bileşen profili yalnızca fenolik bileşikler ve flavonoidlerle sınırlı değildir. Theanin, kafein ve klorofil gibi bu çalışma kapsamında kantitatif olarak değerlendirilmemiş diğer önemli bileşiklerin matchanın bilişsel fonksiyonlar, stres yanıtı ve metabolik süreçler üzerindeki etkilerinde belirleyici rol oynadığı bilinmektedir. Bu nedenle elde edilen bulgular, yalnızca incelenen bileşik gruplarıyla sınırlı olup, çayların genel sağlık etkilerine yönelik kapsamlı ve kesin bir öneri niteliği taşımamaktadır. Çayların tüm biyoaktif bileşenlerini kapsayan daha geniş ölçekli, standardize edilmiş ve kantitatif analizlerin yapılacağı ileri çalışmalara ihtiyaç duyulmaktadır.

Abstract

The growing search for alternatives to antibiotic growth promoters has led to increased use of phytobiotics during the embryonic period. This study investigated the effects of in ovo application of varying levels of mistletoe (*Viscum album*) extract (ME) on chick weight, Tona score, relative asymmetry, and chick length. A total of 300 fertile eggs were divided into five different treatment groups with six replicates of 10 eggs each. On day 18 of incubation, the negative control group (NC) received no injection. In contrast, the positive control (PC) group received 0.5 ml of physiological saline, and the ME100, ME200, and ME300 groups received 100 ppm, 200 ppm, and 300 ppm of ME, respectively, in 0.5 ml of physiological saline. The findings indicated that in ovo ME feeding had no significant effect on chick quality ($p > 0.05$). In conclusion, it was determined that in ovo ME feeding at doses up to 300 ppm during the embryonic period did not adversely affect chick quality. This finding provides a basis for the safe in ovo use of ME and necessitates future long-term studies on growth performance, organ development, and immune parameters.

Keywords: mistletoe, in ovo feeding, phytobiotics

INTRODUCTION

The limitations of using antibiotic growth promoters in poultry farming have accelerated research into alternative, safe additives and bioactive compounds of natural origin (Zaikina et al., 2022). Plant extracts, containing numerous bioactive compounds such as phenolic compounds, flavonoids, essential oils, and alkaloids, are attracting increasing attention for their antioxidant, antimicrobial, immunomodulatory, and intestinal development-supporting effects (Alghirani et al., 2021; Zaikina et al., 2022). In this context, phytobiotics have moved beyond dietary use and are now being investigated for hatchery applications (Ergün et al., 2023; Kop-Bozbay and Göneci, 2023).

In ovo feeding, also known as the embryonic nutrition approach, is a modern feeding strategy that aims to prepare the embryo for future environmental and metabolic stresses, accelerate the maturation of the intestinal and immune systems, and reduce variation in post-hatch growth performance (Akosile et al., 2023). In this method, the embryo gains a programmed advantage during critical stages of physiological development by directly supplementing it with targeted compounds at a specific developmental stage (Roto et al., 2016). The success of in ovo applications is evaluated on two basic criteria. These are being safe and tolerable during embryonic development and the potential to improve chick quality and performance indicators after hatching (Sözcü and İpek, 2013; Akosile et al., 2023). Therefore, chick quality is considered one of the most critical indicators of early physiological response in in ovo studies (Sözcü and İpek, 2013). Parameters such as Tona score, chick weight, chick length and leg asymmetry. It directly reflects the embryo's developmental level, yolk sac utilization efficiency, musculoskeletal system development, and post-hatch survival (Sözcü and İpek, 2013; Roto et al., 2016). Positive changes in these parameters indicate successful use of the additive by the embryo negative changes indicate the possibility of stress, toxicity, or metabolic disruption. Therefore, chick quality is considered the primary determinant of the safety and efficacy of in ovo applications (Roto et al., 2016; Akosile et al., 2023; Kop-Bozbay and Göneci, 2023).

Mistletoe (*Viscum album*) is a phytobiotic source with high antioxidant and immunomodulatory potential due to its bioactive components such as lectins, flavonoids, viscotoxins, polyphenols, and triterpenes (Ergun and Deliorman,

1995; Karasu and Öztürk, 2014). While there are limited studies on the dietary use of mistletoe in poultry (Ologhobo et al., 2017), data regarding its application during the embryonic period are very limited, and the dose-tolerance relationship is unclear. The potential effects, whether positive or negative, of in ovo administration of ME on embryonic growth and chick quality have not been scientifically elucidated. This lack of information creates a significant research need for both the development of phytobiotic strategies and the safety assessment of in ovo technologies (Roto et al., 2016; El-Kholy et al., 2021). Therefore, the present study aimed to evaluate the effects of ME administered at different levels in ovo on chick quality (chick weight, Tona score, chick length, and leg asymmetry).

MATERIALS AND METHODS

This study was conducted in a poultry house at the Poultry Unit of the Education, Research, and Application Farm of Eskişehir Osmangazi University's Faculty of Agriculture. 300 fertile Ross 308 broiler eggs purchased from a commercial enterprise (C.P.) were used in the study. The ME used for in ovo injection was purchased in liquid form from a commercial company (Çoruh Vital).

All eggs were individually weighed and recorded using a scale with a precision of 0.01 g. The average egg weight was 58.97 grams. The eggs were distributed into hatching trays according to a randomized plot design, with 10 eggs in 5 treatment groups with 6 replicates, and their average weights were similar (58.67-59.27). They were numbered.

The injection sites of the eggs, which were checked for fertility and ready for in ovo injection, were cleaned with ethyl alcohol. For each treatment group, three doses of mistletoe extract (100 ppm, 200 ppm, and 300 ppm) were prepared in advance, and 0.5 ml of physiological saline (0.9% saline) was prepared for the positive control group. The needle puncture sites of the eggs were cleaned with ethyl alcohol and sealed with liquid paraffin. Eggs that completed the in ovo injection process were placed individually on hatching trays that were numbered in the same way as their respective eggs. Negative control treatment groups were placed separately on hatching trays. They were kept in the in ovo environment throughout the in ovo period, and the time required for transportation from the setter to the hatcher was adjusted for each group.

As soon as hatching was complete, the chicks were individually weighed using a 0.01 g scale (Shimadzu ATX-224). The body length of each chick, from beak to toe, was measured using a digital caliper (Dasqua 2110-8105, 150 mm IP54). The chick quality score recommended by Tona et al. (2003) was used to determine chick quality. Leg relative asymmetry values were calculated as described by Yalçin et al. (2005).

Data obtained from analyses conducted within the scope of the study were analyzed using SPSS (version 21.0; Chicago, IL, USA). Data from the study were subjected to One-Way Analysis of Variance, and the Duncan test was used for multiple comparisons.

RESULTS and DISCUSSION

Chick weight is a composite parameter that reflects the overall outcome of embryonic growth at hatch. It is an indicator of numerous physiological processes, such as protein and energy metabolism and muscle tissue growth. In this study, chick weight did not differ between treatment groups (Figure 1, $p<0.05$), suggesting that the dose ranges applied during in ovo ME feeding did not elicit a physiological response sufficient to support or suppress growth metabolism.

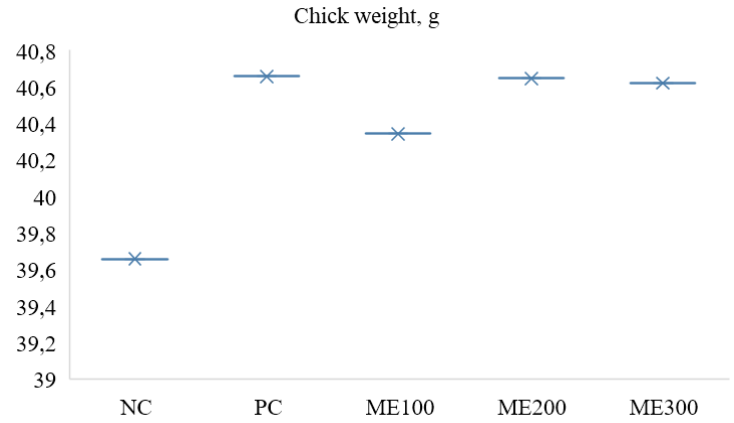

Figure 1. The influence of in ovo injection of mistletoe extract (ME) on chick weights

The fact that chick length did not change (Figure 2, $p<0.05$) supports a similar physiological perspective. The length parameter is highly sensitive, particularly because it reflects skeletal muscle, bone development, and cartilage mineralization. Therefore, the absence of a difference in length indicates that the supplement did not have an adverse or supportive effect on skeletal development and that embryonic growth maintained its naturalness. In conclusion, it is shown that in ovo phytobiotics may provide early physiological stability and metabolic/antioxidant support, but more targeted morphometric and long-term studies are required to prove their direct accelerating or suppressing effects on embryonic skeletal growth (Roto et al., 2016; Madkour et al., 2024).

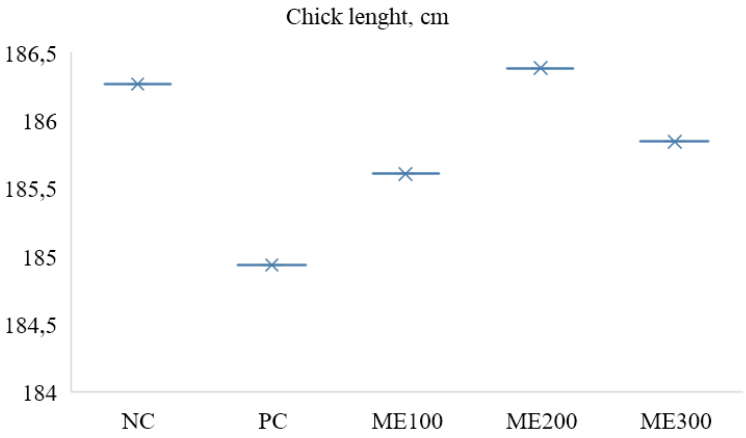

Figure 2. The influence of in ovo injection of mistletoe extract (ME) on chick lengths

The Tona score, one of the most comprehensive indicators used to assess chick quality, simultaneously reflects multiple physiological parameters, including behavioral reflexes, activity level, umbilical closure, yolk sac absorption, body condition, and general appearance (Tona et al., 2003; İpek and Sözcü, 2013). The lack of statistically significant differences in Tona scores across treatment groups (Figure 3, $p>0.05$) indicates that the in ovo applied extract did not negatively affect overall viability, metabolic stability, or post-hatch physiological integrity of the chicks during the embryonic period (Narinç, 2022). Given that even minimal stressors can be reflected in the Tona score, the lack of significant differences between groups indicates that the embryo safely tolerated the administered doses.

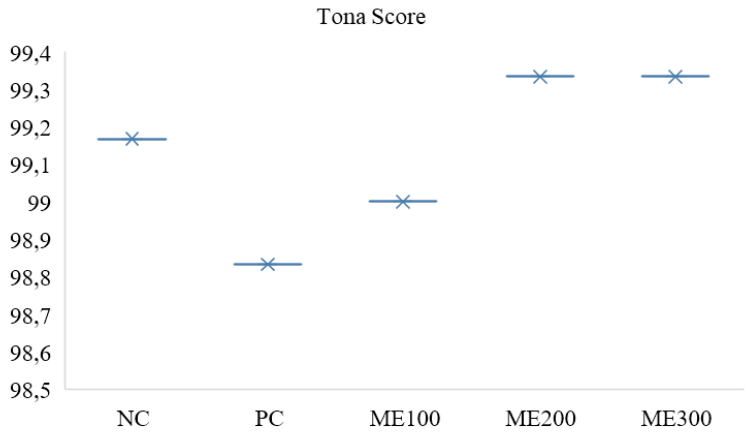

Figure 3. The influence of in ovo injection of mistletoe extract (ME) on Tona score

Leg asymmetry (relative asymmetry) was also found to be statistically insignificant between the groups in this study (Figure 4, $p>0.05$). Leg symmetry reflects multiple physiological processes, such as embryonic bone mineralization, cartilage development, embryo position, and mechanical stresses during hatching. Potential stress or toxicity during in ovo applications often manifests as limb imbalance (Ding et al., 2020). This study supports the finding that the applied extract did not have adverse effects on embryonic musculoskeletal development. Similarly, the literature reports that leg asymmetry was not altered by in ovo application of phytobiotics or natural extracts. Some studies have reported limb differences due to excessive dosage or the use of inappropriate solvents (Uni and Ferket, 2004; Madkour et al., 2024). Therefore, the dose, timing, and biological content of the supplement applied to the embryo are critical factors determining the results obtained.

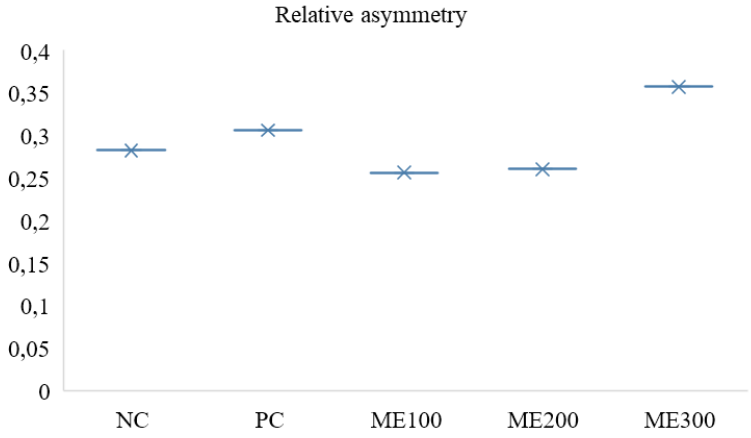

Figure 4. The influence of in ovo injection of mistletoe extract (ME) on relative asymmetry

CONCLUSION

In the current study, no statistically significant differences were observed between groups for chick weight, Tona score, relative asymmetry, or chick length, indicating that ME administration during the embryonic period did not adversely affect chick viability, physiological stability, or skeletal development. In conclusion, in ovo application of mistletoe (*Viscum album*) extract at doses up to 300 ppm during the embryonic period did not adversely affect chick quality, indicating that this extract has potential for safe embryonic applications in poultry.

ACKNOWLEDGEMENTS

This study, a part of M.Sc. thesis of the first author, was approved by the local Ethical Committee of Eskişehir Osmangazi University for Experimental Animals (Case no: 2025/1063). The authors are grateful for the support of the staff and facilities of Animal Science Department, Faculty of Agriculture, Eskişehir Osmangazi University.

Abstract

This study demonstrates the enhanced photocatalytic performance of novel quantum dots (QDs), specifically CdSeTe and Zn-doped CdSeTe, for the degradation of Malachite Green (MG) under visible light irradiation. The incorporation of Zn-doping was aimed at enhancing charge separation and overall photocatalytic efficiency. The CdSeTe and Zn-doped CdSeTe QDs were synthesized via an in-water synthesis method. The photocatalytic degradation process was systematically modeled and optimized using Response Surface Methodology (RSM) based on a Box-Behnken Design (BBD). Key operational parameters, including catalyst dosage, initial dye concentration, and pH, were investigated as independent variables to maximize MG removal efficiency. The results indicated that the Zn-doped CdSeTe QDs exhibited superior photocatalytic activity compared to the undoped CdSeTe QDs. The RSM model was found to be statistically significant and effectively predicted the optimal conditions for MG degradation. Under the optimized conditions (catalyst dosage = 2.97 mg/L, initial dye concentration = 20 mg/L, and pH = 7.8), a maximum MG removal efficiency of 99.99% was achieved. The study demonstrates the potential of Zn-doped CdSeTe QDs as a promising photocatalyst for the treatment of dye-contaminated wastewater.

Keywords: Quantum dots, Zn-doping, Malachite Green, Photocatalysis, Response Surface Methodology, Box-Behnken Design

INTRODUCTION

Water pollution, primarily driven by industrial effluents containing persistent organic pollutants, poses a significant threat to global ecosystems and human health. Among these pollutants, synthetic organic dyes, extensively used in industries such as textile, paper, plastic, and cosmetics, are particularly concerning due to their high visibility, toxicity, carcinogenicity, and resistance to conventional wastewater treatment methods (Chandrika et al., 2022; Thirugnanam et al., 2017). Malachite green (MG), a triphenylmethane dye, is a prominent example. It is widely employed as a colorant and antifungal agent but is known for its genotoxic and carcinogenic properties, necessitating efficient degradation strategies before discharge into aquatic environments (Molaei et al., 2022; Zahedi et al., 2025).

In response to these environmental challenges, advanced oxidation processes (AOPs), particularly photocatalysis, have emerged as highly promising and environmentally friendly technologies for the degradation of organic pollutants. Photocatalysis utilizes semiconductor materials as catalysts to generate reactive oxygen species (ROS) under light irradiation, which then mineralize organic contaminants into innocuous substances like carbon dioxide and water (Ahmed et al., 2022; Alasri et al., 2023). Traditional semiconductor photocatalysts, such as TiO2 and ZnO, have been widely studied; however, their large bandgaps often limit their efficiency to ultraviolet (UV) light absorption, which constitutes only a small fraction of the solar spectrum. This limitation drives the search for novel photocatalytic materials capable of harnessing visible light more effectively (Hemmateenejad et al., 2015).

Quantum dots (QDs), semiconductor nanocrystals exhibiting quantum confinement effects, have garnered considerable attention in photocatalysis due to their unique optical and electronic properties. These properties include size-dependent tunable bandgaps, high surface area-to-volume ratios, excellent light absorption capabilities across the visible spectrum, and efficient charge separation, all of which contribute to enhanced photocatalytic

activity (Wei et al., 2021; Xiang et al., 2022). Among various QDs, cadmium chalcogenide-based quantum dots, such as CdSe and CdTe, have shown significant potential. Ternary alloy quantum dots like CdSeTe offer further advantages by allowing precise tuning of their bandgap and electronic structure through compositional control, thereby optimizing their light absorption and charge carrier dynamics for specific photocatalytic applications (Jacob et al., 2019; Rajabi et al., 2018).

The photocatalytic efficiency of QDs can be further improved through doping with suitable metal ions. Doping introduces defects or alters the electronic band structure, which can enhance light absorption, promote charge separation, and increase the generation of reactive species. Zinc (Zn) doping in cadmium-based quantum dots has been explored to modify their optical and electronic properties, potentially leading to superior photocatalytic performance (Rajabi et al., 2013; Sharma et al., 2017). The incorporation of Zn into CdSeTe QDs is expected to create a more efficient photocatalyst for the degradation of malachite green by optimizing the electron-hole separation and reducing recombination rates, thus improving the overall quantum efficiency under visible light irradiation.

While several studies have reported Cd-based QDs for photocatalysis, the systematic optimization of Zn-doped CdSeTe QDs for MG degradation using RSM remains unexplored. Specifically, the synergistic effects of Zn-doping on charge separation efficiency in ternary QD systems have not been quantitatively investigated through statistical design approaches.

To systematically investigate and optimize the complex interplay of various experimental parameters affecting photocatalytic degradation, statistical experimental design methodologies are indispensable. Response Surface Methodology (RSM), particularly the Box-Behnken Design (BBD), is a powerful tool for this purpose. BBD is a three-level incomplete factorial design that allows for the evaluation of multiple factors and their interactions with a reduced number of experimental runs compared to full factorial designs, thereby saving time and resources (Amigun et al., 2022; Mbuyazi & Ajibade, 2025). This approach enables the identification of optimal operating conditions and provides a comprehensive understanding of the effects of independent variables, such as pH, catalyst dosage, and initial dye concentration, on the degradation efficiency of malachite green. Previous studies have successfully employed BBD to optimize the photocatalytic degradation of various dyes, demonstrating its effectiveness in achieving high degradation rates and understanding process mechanisms (Bendebane et al., 2024; Tolia et al., 2012)

This study focuses on the statistical optimization of malachite green photodegradation using CdSeTe and Zn-doped CdSeTe quantum dots through Response Surface Methodology. The research employs a Box-Behnken Design to: (1) systematically evaluate the individual and interactive effects of pH, catalyst dosage, and initial dye concentration on degradation efficiency; (2) quantitatively compare the photocatalytic performance of undoped and Zn-doped QDs under identical conditions; (3) establish statistically validated optimal parameters for maximum MG removal; and (4) demonstrate the enhancement achieved through Zn-doping in ternary quantum dot systems. The findings provide optimized operational conditions and fundamental insights into parameter interactions for efficient dye degradation applications.

MATERIALS AND METHODS

Preparation of Quantum Dots

The CdSeTe and Zn-doped CdSeTe quantum dots were prepared following previously optimized synthesis protocols. The as-synthesized catalysts were directly used without further modification for all photocatalytic experiments.

The synthesis of CdSeTe quantum dots (QDs) was performed following a modified literature procedure (Xiang et al., 2022). The process commenced with the preparation of precursor solutions.

First, the cadmium precursor was prepared by dissolving 0.4 mmol of cadmium chloride ($CdCl_2$) and 7.0 mmol of thioglycolic acid (TGA) as a stabilizer in 400 mL of ultrapure water. The pH of this solution was subsequently adjusted to 9 using a 1 M sodium hydroxide (NaOH) solution. For the selenium precursor, sodium hydroselenide (NaHSe) was freshly synthesized by reacting 0.4 mmol of selenium powder with 1.0 mmol of sodium borohydride ($NaBH_4$) in 20 mL of ultrapure water under stirring at 80°C for 20 minutes. The tellurium precursor, sodium

hydrotelluride (NaHTe), was prepared analogously using 0.4 mmol of tellurium powder and 1.0 mmol of $NaBH_4$ in 20 mL of ultrapure water, with stirring at 80°C for 30 minutes.

The core CdSeTe QDs were synthesized by initially adding 3.75 mL of the freshly prepared NaHSe solution to the cadmium precursor under vigorous stirring. This mixture was allowed to react at 10°C for 20 minutes. Subsequently, 1.25 mL of the NaHTe precursor was introduced. The reaction temperature was then raised to 100°C, and the solution was stirred for 9 hours to facilitate the growth and alloying of the nanocrystals.

For the deposition of a ZnS shell, a separate precursor solution containing 5.0 mmol of zinc chloride ($ZnCl_2$) and 5.0 mmol of sodium sulfide nonahydrate ($Na_2S{\cdot}9H_2O$) was prepared. Once the core QD reaction mixture reached a temperature of 90°C, the ZnS precursor solution was added dropwise. Following the complete addition, the temperature was maintained at 100°C for 40 minutes under continuous stirring to allow for shell growth.

Finally, the synthesized CdSeTe and CdSeTe/ZnS core–shell QDs were purified. The colloidal solutions were first concentrated using a rotary evaporator. The QDs were then precipitated by adding acetone at a volume ratio of 1:3 (QD solution:acetone). The precipitate was isolated via centrifugation, washed, and subsequently dried at 70°C to obtain the final product.

Photocatalytic Degradation Experiments

The photocatalytic performance of the synthesized CdSeTe and CdSeTe/ZnS quantum dots (QDs) was evaluated through the degradation of MGO under visible light irradiation. All batch experiments were conducted at ambient temperature (25 ± 2 °C) in 15-mL cylindrical glass reactors.

For a typical experiment, a specified mass (3–7 mg) of the QD photocatalyst was dispersed in 15 mL of an aqueous MGO solution. To investigate the effect of pollutant concentration, solutions with three different initial MGO concentrations—5, 12.5, and 20 ppm—were tested. Prior to irradiation, the suspension was stirred in complete darkness for 30 minutes to establish adsorption-desorption equilibrium between the dye molecules and the catalyst surface.

Following the dark adsorption period, the reaction mixture was exposed to visible light from a 60 W daylight LED lamp array. The irradiation was carried out under continuous shaking for a duration of 120 minutes. Aliquots were withdrawn at predetermined time intervals for subsequent analysis to monitor the degradation progress. Control experiments in the absence of either light or catalyst were performed in parallel to ascertain the photocatalytic nature of the degradation process.

Analytical Methods

Samples collected at the end of the photocatalysis experiments were first centrifuged at 10,000 rpm for 3 minutes to separate the catalyst. The absorbance of MGO was measured using a UV–Vis spectrophotometer (λmax = 617 nm). Peak areas were determined from the absorbance spectra. The percentage removal efficiency was calculated using the following formula:

$$Removal\ Efficiency\ (\%) = [(C_0 - Ce)/C_0] \times 100 \quad (1)$$

Where, C_0 and C_e are the initial and final concentrations of MG dye in the aqueous phase (Suganya Josephine et al., 2015).

Experimental Design and Statistical Analysis

The optimization of Malachite Green photodegradation was performed using Response Surface Methodology (RSM) with a Box-Behnken Design (BBD). This design was selected due to its efficiency in evaluating quadratic response surfaces with a reduced number of experimental runs compared to full factorial designs (Bendebane et al., 2024; Rajesh et al., 2023). Three independent variables were investigated at three levels, pH (5, 7, 9), catalyst dosage (3, 5, 7 mg) and initial MG concentration (5, 12.5, 20 ppm).

The experimental design comprised 30 randomized runs conducted with two replicates to enhance statistical reliability and estimate pure error. The design included 12 factorial points (each replicated once) and 6 center point replicates (at pH 7, catalyst 5 mg, concentration 12.5 ppm). The complete randomization of run order minimized the effects of extraneous variables and systematic errors.

A second-order polynomial model was fitted to the experimental data:

$$Y = \beta_0 + \sum_{i=1}^{3} \beta_i X_i + \sum_{i=1}^{3} \beta_i X_i^2 + \sum_{i<j} \beta_{ij} X_i X_j + \epsilon$$

(2)

where Y is predicted response, β_0 is constant, β_i are linear coefficients, β_{ii} are quadratic coefficients, β_{ij} are interaction coefficients, and ϵ is random error.

RESULTS and DISCUSSION

The photocatalytic degradation of Malachite Green (MG) was systematically investigated and optimized using Response Surface Methodology (RSM) based on a Box-Behnken Design (BBD). The experimental design, which included three independent variables—pH (A), catalyst dosage (B), and initial dye concentration (C)—was employed to model the removal efficiency of MG using both undoped CdSeTe and Zn-doped CdSeTe quantum dots (QDs) (Table 1). The statistical significance of the quadratic models for both catalysts was evaluated through the Analysis of Variance (ANOVA), as presented in Table 2 and Table 3.

Table 1. The RSM Box-Behnken Design Matrix

Variables	Symbol	Unit	Range and levels		
			− 1	**0**	**+ 1**
pH	A	-	5	7	9
Catalyst dosage	B	mg	3	5	7
Initial dye conc	C	mg/L	5	12.5	20

For the undoped CdSeTe QDs (Table 2), the model was highly significant ($p < 0.0001$), indicating that the chosen variables and their interactions effectively explain the variation in the MG removal efficiency. The high coefficient of determination ($R^2 = 95.94\%$) and the adjusted R^2 (93.91%) confirm the model's excellent fit to the experimental data and its strong predictive capability. The linear terms for pH (A), catalyst dosage (B), and initial dye concentration (C) were all highly significant ($p<0.0001$), demonstrating their critical individual influence on the degradation process. Furthermore, the two-way interaction terms AB, AC, and B*C were also statistically significant, highlighting the complex, synergistic effects between the operational parameters. The significant quadratic term for pH (A^2) suggests a non-linear relationship between pH and removal efficiency, which is a common observation in photocatalytic systems where surface charge and dye speciation are pH-dependent (Ma et al., 2018).

Table 2. ANOVA for Removal efficiency from RSM Box–Behnken Method for CdSeTe

Source	DF	Sum of squares	Mean square	F-Value	P-Value	
Model	**9**	4056.32	450.70	47.22	0.000	**Significant**
Linear	**3**	3105.83	1035.28	108.47	0.000	
A: pH	1	1788.13	1788.13	187.35	0.000	
B: Catalyst dosage	1	934.11	934.11	97.87	0.000	
C: Initial dye conc.	1	1060.22	1060.22	111.09	0.000	
Square	**3**	412.59	137.53	14.41	0.000	
A^2	1	400.31	400.31	41.94	0.000	
B^2	1	0.26	0.26	0.03	0.870	
C^2	1	9.20	9.20	0.96	0.339	
2-Way Interaction	**3**	452.48	150.83	15.80	0.000	
A*B	1	288.22	288.22	30.20	0.000	
A*C	1	91.54	91.54	9.59	0.006	
B*C	1	72.72	72.72	7.62	0.013	
$R^2 = 95.94\%$	Adjusted $R^2 = 93.91\%$		Predicted $R^2 = 89.45\%$			

Similarly, the ANOVA for the Zn-doped CdSeTe QDs (Table 3) also yielded a highly significant model ($p < 0.0001$), albeit with a slightly lower R^2 value (90.72%). The significance of the linear terms (A, B, C) and the interaction terms (AB, AC) again confirm the strong influence of the chosen variables. The statistical validation of both models provides a robust foundation for identifying the optimal operating conditions and for understanding the underlying mechanisms of the photocatalytic process (Rajesh et al., 2023)

The successful application of the BBD model in this study is consistent with its proven efficacy in optimizing complex advanced oxidation processes (AOPs). For instance, a similar BBD-RSM approach was successfully employed to optimize the photocatalytic oxidation of Reactive Red 195 (RR195) dye, where the model effectively predicted the optimal conditions with high accuracy (Mollaie et al., 2025). This comparative success underscores the reliability of BBD for efficiently evaluating multiple factors and their interactions in dye degradation systems, thereby reducing the number of experimental runs required for optimization (Rajesh et al., 2023).

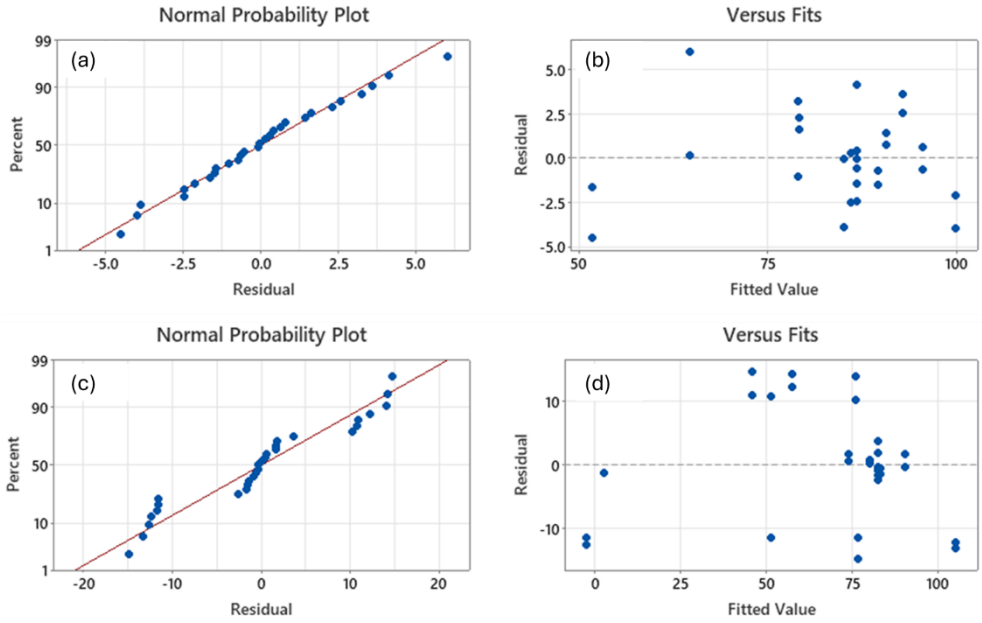

Figure 1. Residual plots for (a, c) CdSeTe and (b, d) Zn-doped CdSeTe

The analysis of the individual and interactive effects of the variables is crucial for process optimization. The contour plots (Figure 1 and Figure 2) visually represent the response surface, illustrating the combined effect of two variables while the third is held constant at its center point. The strong significance of the pH term in both models ($p< 0.0001$) underscores its role as a primary factor, a finding that is frequently reported across various photocatalytic systems (Ma et al., 2018). In photocatalysis, pH dictates the surface charge of the catalyst and the ionic state of the dye molecule. Since MG is a cationic dye, an increase in pH (moving towards the alkaline range) is expected to increase the negative charge on the QD surface, enhancing the electrostatic attraction between the catalyst and the dye, thereby promoting adsorption and subsequent degradation (Montazer et al., 2023). The optimization results (Table 4) confirm this, with the optimal pH for the Zn-doped CdSeTe system being 7.80, which is slightly higher than the optimal pH of 6.89 for the undoped system. This slight shift suggests that the Zn-doping may subtly alter the point of zero charge pH_{pzc} of the QD surface, favoring a slightly more alkaline environment for maximum electrostatic attraction with the cationic MG dye.

Catalyst dosage was also a highly significant factor. An increase in catalyst concentration provides more active sites for the reaction, leading to a higher degradation rate (Hasanpour et al., 2021). However, the quadratic term for catalyst dosage (B^2) was not significant in either model, suggesting that within the studied range (3 to 7 mg), the relationship is predominantly linear. The optimization found a low optimal dosage for both systems (3.00 mg for CdSeTe and 2.97 mg for Zn-doped CdSeTe), demonstrating the high efficiency of these QDs even at minimal concentrations.

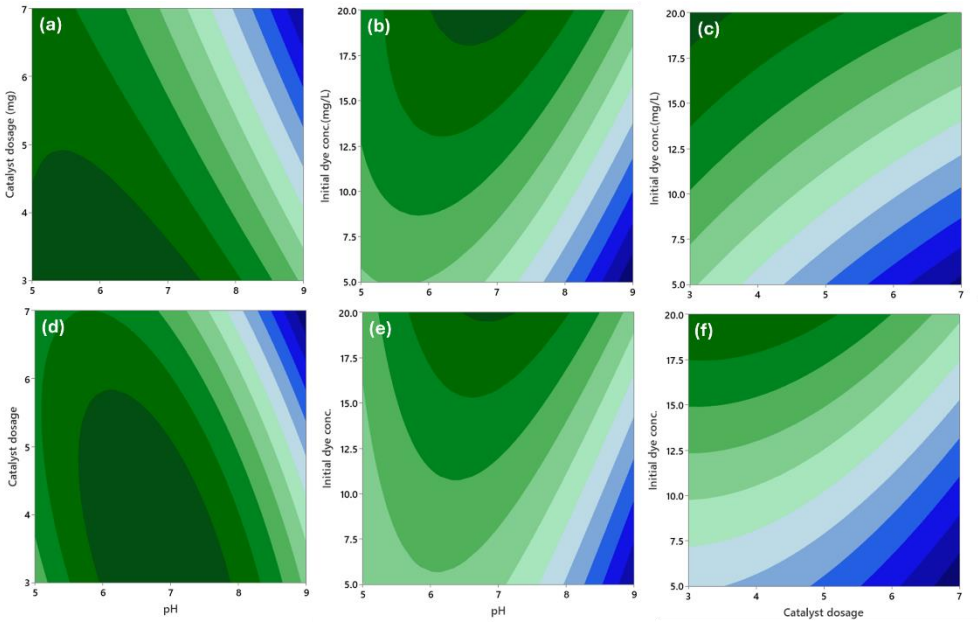

Figure 2. Contour Plots of Removal Efficiency (%) for CdSeTe (a, b, c) and Zn-doped CdSeTe (d, e, f)

The initial dye concentration was inversely related to the removal efficiency, as indicated by the negative coefficient (not explicitly shown but inferred from the significance and general photocatalytic principles). At higher concentrations, the dye molecules can act as an inner filter, reducing the light penetration to the catalyst surface, and also saturate the active sites, leading to a decrease in the overall degradation rate (Ma et al., 2018). Despite this, the optimized condition for both systems was the highest tested concentration (20 mg/L), which, combined with the near-perfect removal efficiency, highlights the exceptional performance of the QDs.

Table 4. Optimized conditions for maximum removal efficiency

Parameter	CdSeTe	Zn-doped CdSeTe
pH	6.89	7.80
Catalyst Dosage (mg)	3.00	2.97
Initial Concentration (mg/L)	20	20
Predicted Removal Efficiency (%)	99.97	99.99
Composite Desirability	1.0	1.0

The most significant finding of this study is the superior photocatalytic performance of the Zn-doped CdSeTe QDs compared to the undoped CdSeTe QDs. The optimization results (Table 4) show that both systems achieved a near-perfect predicted removal efficiency (99.97% for undoped and 99.99% for Zn-doped), but the underlying mechanism for this enhancement is critical.

The incorporation of Zn^{2+} ions into the CdSeTe lattice is a strategy for band-structure engineering and charge carrier dynamics modification (Han et al., 2020). Zinc doping is known to introduce defects or alter the electronic structure, which can serve two primary functions. First one is enhanced charge separation that occur when the presence of Zn^{2+} can create a localized electric field or form a type-II heterojunction-like structure within the QD, which effectively promotes the separation of photogenerated electron-hole pairs and suppresses their recombination (Montazer et al., 2023). This is a key bottleneck in the efficiency of many semiconductor photocatalysts.

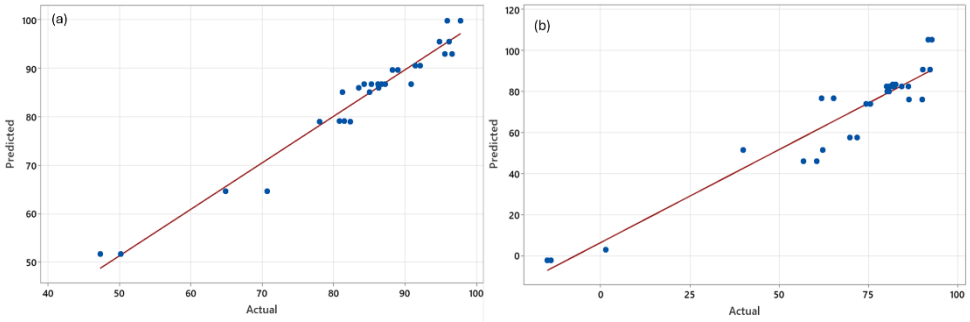

Figure 3. Contour Plots of Removal Efficiency (%) for CdSeTe (a) and Zn-doped CdSeTe (b)

Second is increased active Sites, doping can modify the surface chemistry, potentially create more surface-active sites or altering the adsorption properties, which is supported by the slight shift in optimal pH for the Zn-doped system.

The superior performance of the Zn-doped QDs, even under the statistically optimized conditions, aligns with recent literature demonstrating the effectiveness of metal-ion doping in enhancing the photocatalytic activity of quantum dots (Han et al., 2020). For instance, studies on Zn-doped CdSSe and InP QDs have confirmed that Zn doping reduces interface charge recombination and prolongs the lifetime of charge carriers, leading to a more efficient generation of reactive oxygen species (ROS) responsible for dye degradation (Amigun et al., 2022). The successful optimization via RSM, achieving a near-unity composite desirability, validates the potential of Zn-doped CdSeTe QDs as a highly efficient and promising photocatalyst for the treatment of dye-contaminated wastewater.

The high efficiency achieved under visible light irradiation is particularly noteworthy. While the comparative study on RR195 used a PCO system that included H_2O_2 as an oxidant and UV-A light [14], the current work demonstrates a near-complete degradation of MG using only the visible light-activated QDs. This highlights the intrinsic capability of the Zn-doped CdSeTe QDs to effectively utilize the visible spectrum for charge generation, making them a more sustainable and energy-efficient alternative compared to UV-dependent or H_2O_2-assisted AOPs. The remarkable 99.99% removal efficiency at the optimized conditions confirms the potential of these novel QDs for practical, real-world application in environmental remediation.

CONCLUSION

This study successfully demonstrated the enhanced photocatalytic degradation of Malachite Green (MG) using novel Zn-doped CdSeTe quantum dots (QDs) under visible light irradiation. The Response Surface Methodology (RSM) based on a Box-Behnken Design (BBD) proved to be a robust and effective statistical tool for modeling and optimizing the complex interplay of operational parameters, including pH, catalyst dosage, and initial dye concentration. The statistical models for both undoped and Zn-doped QDs were highly significant, confirming their strong predictive capability for the degradation process.

The key finding is the superior photocatalytic performance of the Zn-doped CdSeTe QDs, which achieved a remarkable maximum MG removal efficiency of 99.99% under the optimized conditions (catalyst dosage = 2.97 mg/L, initial dye concentration = 20 mg/L, and pH = 7.8). This enhancement is mechanistically attributed to the Zn-doping strategy, which acts to engineer the band structure and significantly suppress the recombination of photogenerated electron-hole pairs, thereby promoting the generation of reactive oxygen species.

In conclusion, the Zn-doped CdSeTe QDs represent a highly efficient, visible light-activated, and sustainable photocatalyst. Successful optimization via RSM validates the potential of this material for practical, low-cost, and energy-efficient treatment of dye-contaminated industrial wastewater, offering a promising alternative to UV-dependent or H_2O_2-assisted advanced oxidation processes. Further research should focus on the reusability and scale-up potential of these QDs for industrial application.

Abstract

Deficiencies or excesses of trace elements within these structures in biological systems can lead to numerous pathological disorders. The utility of metal-based compounds as pharmaceutical agents is based on their oxidation-reduction properties and their ability to form coordination complexes that play a critical role in various biochemical reactions. All heavy metals are inevitably toxic. In recent years, people have become aware of the widespread accumulation of heavy metals in the soil, air, and water of ecosystems. Heavy metals migrate from these environments to plants, and from plants to humans, creating significant problems in the human body. Numerous studies have been conducted on biological fluids to understand the toxic effects of trace elements such as copper, zinc, and selenium on the human body. This study highlights studies that illuminate the importance of copper, zinc, and selenium in biological systems for both therapeutic and diagnostic purposes.
Keywords: Copper, Zinc, Selenium, Biological Systems, Life.

INTRODUCTION

The human body is a complex biological system requiring numerous elements with diverse chemical properties to sustain biomolecular processes. These elements are classified as macro, micro, and ultra-trace elements based on their abundance and function, and they play a variety of vital roles, ranging from metabolic regulation and enzymatic catalysis to signal transduction and the formation of building blocks. While essential elements such as carbon, hydrogen, oxygen, and nitrogen ensure the structural integrity of the organism, metallic elements such as calcium, magnesium, iron, zinc, selenium, and copper are critical for maintaining cellular function and biological balance. Adequate levels of these elements are essential for maintaining homeostasis, and any deficiency or excess can lead to various pathophysiological disorders. The chemical properties of biological elements and their effects on metabolism and health constitute a fundamental area of research in biochemistry and medicine. (Amhare et al., 2025)

Minerals, similar to vitamins, are inorganic compounds that make up approximately 5% of the human body and are essential for life. These elements are found in the body mostly as salts, complex compounds, or ionic forms, and they play a role in many critical physiological processes, including regulating enzyme function, maintaining electrolyte balance, nerve conduction, muscle contraction, and maintaining skeletal structure. (Allaniyazova, and Tilewova, 2025). Minerals with a daily requirement above 100 mg are defined as macro minerals, while those with a requirement below this value are classified as micro minerals or trace elements. (Davison, 2017). Major micro minerals include iron, zinc, iodine, selenium, copper, manganese, fluorine, chromium and molybdenum; these elements play important roles in cellular metabolism, control of oxidative stress and hormone synthesis. (Zoroddu et al., 2019).

Trace element deficiencies most often occur in clinical situations such as malnutrition, increased metabolic demands, or long-term parenteral nutrition. The most common deficiencies are iron, iodine, and fluoride deficiencies, which can lead to iron deficiency anemia, thyroid dysfunction, and dental health problems. (Chapple et al., 2017) Deficiencies of other trace elements, particularly zinc, are of clinical importance in premature infants, individuals with protein-energy malnutrition, and patients with limited enteral intake. Therefore, understanding the physiological roles of minerals, their requirements, and the consequences of their deficiencies are of great importance for both clinical nutrition and public health. (Golden et al., 1978).

In recent years, heavy metals have begun to accumulate widely in ecosystems such as soil, water, and air, becoming an increasingly significant environmental problem for almost every organism, from plants to humans, requiring urgent action. Heavy metals accumulate in environmental media such as water, soil, and air, can have toxic effects, and can reach humans and other living organisms through the food chain. Therefore, numerous studies have been conducted on metal removal using natural products and nanotechnology-based methods. Nanomaterials, particularly graphene and its derivatives, magnetic and metal oxide nanoparticles, and carbon nanotubes, offer significant advantages in the effective analysis and removal of heavy metals from complex matrices. (Mitra et al., 2022)

Although heavy metals are trace elements that play a critical role in regulating certain biological processes, they exhibit serious toxic effects when consumed in excessive amounts. These metals lead to increased oxidative stress, particularly by increasing free radical production and suppressing endogenous antioxidant defense systems. Increased oxidative stress contributes to the deterioration of cellular functions and metabolic imbalances by causing structural damage to DNA, RNA, and proteins. Furthermore, heavy metals can disrupt biological functions by disrupting the proper folding of proteins and the normal structure of DNA (Chen et al., 2012; Sadiq, 2023). Chelation therapy is widely used in the treatment of heavy metal toxicity. Chelation is a chemical bonding process between metal ions and one or more ligands, forming complex ring-like structures. Recent studies have shown that the application of potent antioxidants in conjunction with chelation therapy significantly increases the effectiveness of the treatment in reducing cellular oxidative stress and preserving organ function. This approach is considered a promising strategy for improving therapeutic outcomes, especially in cases of toxicity due to chronic metal exposure. (Kim et al.,2019; Jomova et al., 2025)

The aim of this study is to evaluate the physiological roles of copper, zinc, and selenium, essential trace elements in biological systems, the pathophysiological consequences of deficiency or excess, and the oxidative stress mechanisms associated with heavy metal exposure, using a holistic perspective based on Web of Science and Scopus. Overall, the findings demonstrate that trace elements such as copper, zinc, and selenium are indispensable for cellular metabolism, antioxidant defense mechanisms, and the maintenance of enzymatic processes. Furthermore, the increasing accumulation of heavy metals in the environment triggers oxidative stress in ecosystems, leading to serious toxic effects in both plant and animal organisms. Therefore, maintaining trace element balance and preventing heavy metal toxicity are critical for both public health and environmental sustainability. Nanotechnology-based treatment methods and chelation-antioxidant combinations are anticipated to offer more effective and targeted detoxification strategies in the future. The results of this study serve as an important reference for future research in biochemistry and toxicology, as well as for environmental risk management.

MATERIALS AND METHODS

In this review, a study that can contribute to the literature consisting of data from recent years has been prepared by scanning the studies on "Trace Elements Necessary for Life in Biological Systems: Copper, Zinc and Selenium" from databases such as web of science and scopus.

Copper And Biological Systems

Copper is an element found in trace amounts in the body but is critical for biological functions, and its biological role has been recognized since the 19th century. The adult human body contains 70–80 mg of copper. Cu is a trace mineral essential for many important enzymes and proteins in living organisms. Cu homeostasis is generally well maintained by effective regulatory mechanisms, and Cu toxicity resulting from impaired homeostasis contributes significantly to a wide range of symptoms and disease states. Copper participates in the structure of many important enzymes and plays a role in the formation of blood, blood vessels, cartilage, and bone (Charkiewicz, 2024). Inadequate copper intake can lead to muscle weakness, fragility of blood vessels and bones, and impaired impulse transmission in the nervous system. Copper is also essential for hemoglobin synthesis. Excessive copper accumulation can have toxic effects (Maung et al., 2021). Copper is found in almost all foods and drinking water; its absorption and excretion are ensured by regular mechanisms. Daily copper intake is achieved by enterocytes by binding to either amino acids or metallothionein. Copper bound to amino acids is directly transferred to the circulation, while the remainder is bound to albumin and transported to the liver. Approximately 10% of copper is

excreted in the liver via bile, while the remainder is bound to ceruloplasmin synthesized in microsomes and hepatic metallothionein. Copper elimination occurs largely via bile and feces, as well as through mucosal shedding. These regular absorption and excretion mechanisms ensure that copper levels are maintained adequately and prevent potential toxicity (Brake, 2023).
Copper (Cu) is a trace element that plays a critical role in many cellular processes, such as energy metabolism, antioxidant defense, neurotransmitter production, and collagen synthesis. Copper-dependent enzymes such as cytochrome c oxidase (COX), NADH dehydrogenase-2 (ND2), and Cu/Zn-superoxide dismutase (SOD1) have been identified in prokaryotes, and their functions cannot be substituted by any other metal. Copper homeostasis in the human body is regulated by complex mechanisms, and its deficiency can lead to clinical symptoms such as anemia, leukopenia, neutropenia, and pancytopenia. On the other hand, high concentrations of copper can cause toxic effects; acute copper toxicity is characterized by nausea, vomiting, hemolytic anemia, and organ failure due to short-term high exposure, while chronic toxicity can lead to conditions such as Wilson's disease due to long-term low-dose exposure (Delik et al., 2024).

Zinc And Biological Systems

Zinc is one of the most abundant elements on Earth and, thanks to its chemical properties, has important and beneficial effects in biological systems (Brown et al., 2001). The importance of zinc, a trace element, in the growth of living organisms was reported in 1869. The human body contains between 1.4 and 2.3 g of zinc. While it is widespread in all cells, it is most abundant in the prostate, muscle, liver, kidneys, and bones. Zinc deficiency occurs more easily during pregnancy, breastfeeding, and growth. Growth failure, night blindness, and impaired sense of taste and smell are among the symptoms (Muhamed and Vadstrup, 2014).
Zinc deficiency is particularly prevalent in cirrhosis, pustular dermatitis, alopecia, weight loss, sickle cell disease, intestinal disease, hypogonadism, problems in ulcer healingand kidney failure. Zinc deficiency leads to decreased insulin production and storage, resulting in a diabetes-like condition (Gür et al. 1998; Muhamed and Vadstrup, 2014).
Because zinc is a component of many enzymes, it accelerates wound healing. It has been shown to be beneficial in decubitus ulcers and leg ulcers. It is used to reduce copper absorption in Wilson's disease (Di Dato and Hedera 2024). The normal daily zinc requirement for adults is 15 mg, and hazelnuts and walnuts, eggs, beef, and liver are rich sources of zinc. Zinc absorption occurs in the small intestine, but small amounts also occur in the stomach and colon. After absorption, it binds to a plasma protein and is transported to the liver. The primary route of excretion is via the stool, with some of this unabsorbed zinc and some excreted through the small intestinal mucosa (Hawrysz and Woźniacka 2023).

Selenium And Biological Systems

Selenium (Se) is a vital element that strengthens the immune system, provides resistance to disease, protects and supports cells by fighting free radicals, ensures the regular functioning of thyroid hormones, and has powerful antioxidant properties. Because it cannot be synthesized in the body, it must be obtained from foods. It supports cardiovascular health, reduces inflammation, and slows the aging process. Foods such as fish, eggs, walnuts, and whole grains are natural sources of selenium. Adequate intake through a balanced diet is crucial for overall health. Because inadequate Se intake can lead to various metabolic and physiological disorders, nutritional and agricultural strategies to increase Se intake are particularly important in regions with Se-poor soils. While the recommended daily Se intake for adults is generally between 40–70 µg, it is generally accepted that the total daily limit of 400 µg should not be exceeded to avoid the risk of potential toxicity (Ellis and Salt, 2003). The concentration of selenium in the blood is 60-100µg/L. It is found in all human tissues, especially the liver and kidneys (Hadrup and Ravn-Haren, 2020).

Selenium, an essential nutrient in trace amounts, is incorporated into the structure of the enzyme glutathione peroxidase, which protects the body against cancer by preventing the accumulation of hydrogen peroxide and organic peroxides in cells. High cobalt concentrations can increase the toxic effects of selenium and cause enlargement of the heart and liver. Many other human diseases are associated with selenium. These include arthritis, cataracts, cystic fibrosis, muscular dystrophy, phenylketonuria, Down syndrome, bronchopulmonary dysplasia, hemolytic anemia, multiple sclerosis, night blindness, defective immune response, malaria, kwashiorkor, and

sudden death syndrome in children (Manary et al., 1998). Selenium also prevents liver necrosis observed in vitamin E deficiency in rats. Selenium is an essential element required for growth in humans and animals at low concentrations, but it is toxic at high concentrations (Alahmadi et al., 2020). The most toxic compound of selenium is hydrogen selenide. Respiratory system irritation, a metallic taste in the mouth, pulmonary edema, garlic breath, and sweating are the primary signs of intoxication (Banerjee et al., 2022). Selenium is found in the structure of the antioxidant enzyme glutathione peroxidase (GSH-Px), which plays a role in the prevention of some metabolic diseases and cancer. Selenium's biological importance stems from its role as a cofactor in this enzyme. By interacting with vitamin E, selenium protects cell membranes from oxidative damage caused by peroxides formed during lipid metabolism (Memişoğulları et al., 2006; Erdoğan et al., 2025).

RESULTS and DISCUSSION

Studies with Copper in Biological Systems

Copper is a trace element that plays a critical role in redox balance and antioxidant defense systems and is transported in the blood primarily via the ferroxidase ceruloplasmin. Serum copper levels in SARS-CoV-2 infection are associated with immune and antioxidant system function, independent of a simple acute-phase response, and it has been suggested that adequate copper status may positively impact survival and health responses. However, there is no definitive evidence regarding the direct impact of copper status on the severity of COVID-19 or the need for treatment. Consequently, it is important to monitor reference values for trace elements such as copper and selenium, which are critical for both the immune and antioxidant systems in human health, and to supplement them if deficient; excessive levels may pose a risk of toxicity (Keskin et al., 2024).

This study aimed to evaluate the effects of serum copper, zinc, and the copper/zinc ratio on tumor staging in newly diagnosed head and neck (H&N) cancer patients and to compare them with healthy individuals. Serum copper and zinc levels were measured, and copper/zinc ratios were calculated. Findings showed that copper levels and the copper/zinc ratio were elevated in patients with H&N cancer, and these changes increased with tumor stage. Analyses revealed that zinc and copper are critical for cancer progression due to their roles in free radical formation and control. Furthermore, copper has been determined to support tumor nutrition and growth by promoting angiogenesis. The results indicate that high copper levels increase the risk of mortality, while adequate zinc levels are associated with better clinical outcomes (Kudva et al., 2022).

Copper is an element absorbed in the stomach and small intestine, and its deficiency can occur in cases of gastrointestinal anatomical changes and malabsorption. Copper deficiency can be associated with hematological and neurological disorders such as macrocytic anemia, neutropenia, and myelopathy. In one case of short bowel syndrome, progressive neurological symptoms due to severe hypocupria were partially resolved with intravenous copper replacement, highlighting the importance of timely diagnosis. Similar risks have been reported in other malabsorptive conditions such as celiac disease, chronic diarrhea, and inflammatory bowel disease. Furthermore, because copper is an acute-phase reactant, serum levels can be falsely elevated in the presence of inflammation. Therefore, routine copper assessment and, if necessary, early replacement therapy in patients with a history of gastrointestinal malabsorption or anatomical changes are clinically important to prevent potentially permanent neurological sequelae. (Moon et al., 2021).

A 68-year-old patient complained of unsteady gait for a year, prompting suspicion of Romberg's sign and mild hematological abnormalities. Tests revealed low serum copper and ceruloplasmin levels. Given the unavailability of copper-containing pharmaceutical products, the patient was advised to consume two to three cups of pure cocoa daily, which provides 0.4–0.6 mg of copper. Two months after treatment, serum copper levels returned to normal, and hematological parameters improved significantly. Neurological findings only partially resolved, but the subjective complaint of unsteadiness persisted. This case demonstrates that copper deficiency can be easily overlooked by physicians, that neurological symptoms can be irreversible if diagnosed late, and that oral cocoa consumption represents an option for copper replacement therapy (Fujikawa and Haruta, 2023).

Studies with Zinc in Biological Systems

To understand the toxic effects of zinc, many studies have examined zinc levels in biological fluids. The relationship between trace elements and oxidative damage was examined in beta-thalassemia minor patient groups. They found significantly lower Zn levels in patients compared to the control group. Their study concluded that trace element-

based antioxidative processes could increase scavenging enzyme activity and improve clinical symptoms (Kızıler et al., 2009). There is strong evidence that zinc deficiency delays wound healing after neurosurgery, highlighting the importance of preserving quality of life after surgery and assessing zinc levels before surgery. The literature demonstrates that zinc plays a critical role in wound healing through fundamental biological processes such as cell proliferation, immune function, membrane repair, and metalloenzyme activity. Because wound healing is a complex and coordinated process involving coagulation, inflammation, angiogenesis, and tissue remodeling, zinc's regulatory role in these stages is clinically relevant. Based on the current findings, neurosurgeons are encouraged to consider topical zinc applications more widely in appropriate patients to promote healing (Adjepong et al., 2020).

Genital warts are a common sexually transmitted disease, and there is no treatment that completely prevents them. Recent studies have shown promising results in the treatment of warts due to their immunomodulatory effects. In this case-control study, serum zinc levels were measured in patients and healthy volunteers and correlated with the clinical severity of the disease. Overall, the mean zinc level in the genital wart group was found to be lower than in the control group. Serum zinc levels were significantly lower in patients with multiple lesions and in patients with slightly more lesions. The findings suggest that severe genital warts may be associated with low serum zinc levels (Luong et al., 2022).

Febrile seizures are a significant complication in children with high fever, and this study compared serum selenium, zinc, vitamin D, vitamin B12, homocysteine, and magnesium levels in children aged 1-5 years who had and did not have febrile seizures. Selenium, zinc, vitamin D, and B12 levels were significantly lower in the study group compared to the control group, while no differences were observed in homocysteine and magnesium levels. No significant differences were found in these parameters between children with simple and complex febrile seizures. The findings suggest that high serum selenium, zinc, vitamin D, and B12 levels may help prevent febrile seizures and reduce the risk of seizures in children aged 1-5 years (Çığrı and İnan, 2023). This study examined the effects of zinc deficiency on angiogenesis and ischemia-induced revascularization in animal models and in patients with chronic limb-threatening ischemia (CLTI). Low serum zinc levels were independently associated with skin perfusion pressure and post-bypass wound healing in CLTI patients, and zinc supplementation in patients with low zinc levels may promote wound healing and reduce major limb adverse events (MALE). These findings suggest that monitoring zinc levels and, if necessary, supplementing may be an important clinical strategy in the management of ischemia-induced vascular diseases (Kodama et al., 2022).

This study evaluated the nutritional status, growth, and anthropometric and biochemical parameters (B12, folic acid, iron, ferritin, calcium, 25(OH)D3, zinc, plasma phenylalanine, and tyrosine levels) of children and adolescents with PKU aged 4 to 18 years in Tehran, Iran. The prevalence of overweight and obesity was high in PKU patients, and the use of specialized medical foods was recommended to address energy and nutrient deficiencies. Zinc levels were found to be subnormal in 37.5% of participants, and this was explained by dietary protein restriction, a vegetarian diet, and low bioavailability from phytates and fiber. Significant zinc deficiency was observed in 10% of patients, and it was emphasized that other micronutrient deficiencies (iron, vitamin D, B12, and folic acid) may increase the risk of neurological problems. In conclusion, balanced macro and micronutrient intake and the use of special medical foods are important to regulate phenylalanine levels of PKU patients and prevent possible neurological complications (Ahmadzadeh et al., 2022).

Studies with Selenium in Biological Systems

Selenium, previously known for its toxic and carcinogenic properties, has been evaluated as an important and beneficial element for biological systems through recent studies. Following the discovery in 1957 that selenium is an essential trace element for animals, it was determined that administering Se to experimentally induced liver tumors reduced cell death (Schrauzer, 2009). Furthermore, studies have linked the effects of metals such as Se and As on the human body to cancers in the liver, lung, kidney, prostate, and urinary tract (Genchi et al., 2023).

Another factor to consider is the decreased antioxidant activity of GPx and Tnx reductase that occurs with selenium deficiency. Selenium deficiency can therefore lead to ischemia-reperfusion injury, which can subsequently lead to acute myocardial infarction, coronary bypass surgery, heart transplantation, and coronary angioplasty. Similarly, selenium supplementation has been shown to be cardioprotective against ischemia-reperfusion injury. A small study of 46 patients demonstrated that selenium supplementation (400 µg/day for 7 days) reduced the need for cardiac surgery. Interestingly, this study also reported increased glutathione peroxidase mRNA expression in selenium-

supplemented patients (Tanguy et al., 2004). In addition to the pathologies observed in animals, a condition called Keshan disease, which develops due to selenium deficiency, has been encountered in humans. This juvenile cardiomyopathy, commonly seen in China, caused the death of many children and was completely treated with the administration of 0.5–1 mg of Se per week (Shi et al., 2021).

Selenium (Se) is an essential micronutrient for thyroid hormone synthesis and thyroid tissue maintenance. Antioxidant enzymes such as Se-dependent GPx and TRx protect thyroid cells from oxidative damage by detoxifying the high levels of hydrogen peroxide produced during hormone synthesis. In this study of patients with mildly to moderately active UC, Se supplementation (200 µg/day, 10 weeks) resulted in a significant reduction in serum Se levels, a higher rate of clinical improvement, and a higher rate of clinical remission compared to placebo. Data from thyroid disease indicate that even small increases in serum Se levels are associated with a greater normalization of TSH, T3, and T4 levels in individuals living in Se-deficient areas. The thyroid gland is a highly concentrated Se accumulator, which explains why Se elevations are so sensitive to thyroid function. The findings suggest that improving Se status in areas where Se deficiency is common may promote clinical improvement in both inflammatory bowel disease and thyroid dysfunction. (Duntas, 2006; Khazdouz et al., 2023).

CONCLUSION

Cu, Zn, and Se homeostasis is maintained in delicate balance in humans from infancy to old age; disruption of this balance can lead to a wide spectrum of clinical problems affecting all organs in the body, including neurodegenerative diseases, lung, liver, kidney, and systemic toxicity, thyroid, cardiovascular diseases, and cancer. Therefore, it appears that a balanced diet can always lead to a healthy life.

Abstract

Biomass-based Co catalysts were prepared using an impregnation–chemical reduction method and used to catalyze the methanolysis of sodium borohydride ($NaBH_4$) for hydrogen generation. The synthesized catalyst and pre-treated coffee samples were characterized by Fourier transform infrared (FTIR) spectroscopy and scanning electron microscopy (SEM) to determine the morphological and surface properties of the samples. At a solution temperature of 25 °C, the methanolysis reaction is effectively accelerated by the Co/HTCC catalyst, providing a desirable hydrogen generation rate, making it suitable for applications at low environmental temperatures. The catalytic activity of Co/HTCC toward NaBH4 methanolysis can be further improved by optimizing the solution conditions. The catalytic performance was rigorously evaluated for hydrogen generation via the methanolysis of sodium borohydride ($NaBH_4$). The Co/HTCC catalyst showed remarkable activity at an ambient temperature of 25 °C, with 10 mg of catalyst achieving the hydrogen generation rate as 8,882 mL $gcat^{-1}$ min^{-1}.

Keywords: Hydrothermal carbonization, catalyst synthesis, methanolysis, spent coffee grounds.

INTRODUCTION

The increasing global energy demand and the environmental issues caused by dependence on fossil fuels have highlighted the importance of scientific research on sustainable energy sources. Hydrogen is considered an energy carrier expected to play a significant role in the energy sector in the coming century because it produces no harmful emissions during combustion, has a high calorific value, is easily transportable, is simple to produce, and its cost is decreasing due to technological advancements [Hosgun S. (2018)]. Although hydrogen is abundant in nature, it does not exist as H_2 gas that can be directly used as a fuel [Akbar et al. (2024)].

The continuous rise in global energy demand drives the need for sustainable energy carriers that can serve as alternatives to conventional fossil fuels. In this context, hydrogen production from renewable resources is critically important for an environmentally friendly, low-carbon energy system. Given the high carbon emissions associated with conventional hydrogen production methods, environmentally compatible technologies such as biohydrogen are gaining increasing prominence [Jolly et al. (2025)]. Biohydrogen production stands out for its low energy requirements and its ability to valorize organic waste. In particular, coffee grounds, a waste product generated in large quantities by the coffee industry, serve as an ideal substrate for this process due to their high organic matter and carbon content. Effectively utilizing coffee grounds in microbial or dark fermentation processes not only provides environmental benefits by addressing a significant waste management issue but also offers an economical alternative for sustainable energy production. The fundamental scientific challenge is to develop efficient, low-cost, and environmentally compatible biotechnological systems that can convert this valuable waste into hydrogen with maximum yield.

According to research and survey results, coffee – one of the most consumed beverages worldwide and a product of substantial industrial importance – generated approximately 11 million tons of spent coffee grounds during the 2022–2023 coffee year [International Coffee Organization (2023)]. This represents a significant amount of biomass residue. Coffee by-products and wastes have considerable economic potential due to their composition, which includes valuable constituents such as fatty acids, polysaccharides, polyphenols, and minerals [Yusufoğlu et al. (2024)]. These materials can be repurposed across various industries, including pharmaceuticals, cosmetics, food, and energy. This supports a circular economy in which such by-products gain renewed value by being converted into biofuels, biopolymers, biofertilizers, food additives, or construction materials [Yusufoğlu et al. (2024); Chatzimitakos et al. (2023); Islam et al. (2024)]. Due to their lignocellulosic structure, high carbon content, and abundance of organic components, coffee grounds are considered a significant biomass feedstock suitable for energy conversion. However, most of this waste is disposed of by landfilling or incineration, practices that lead to environmental issues such as methane emissions and soil contamination. Although the literature includes studies on biogas and compost production from coffee waste, there is insufficient research on carbon synthesis via hydrothermal carbonization and on evaluating hydrolysis–methanolysis performance using such waste. This highlights a gap in the literature and underscores the originality of the present study.

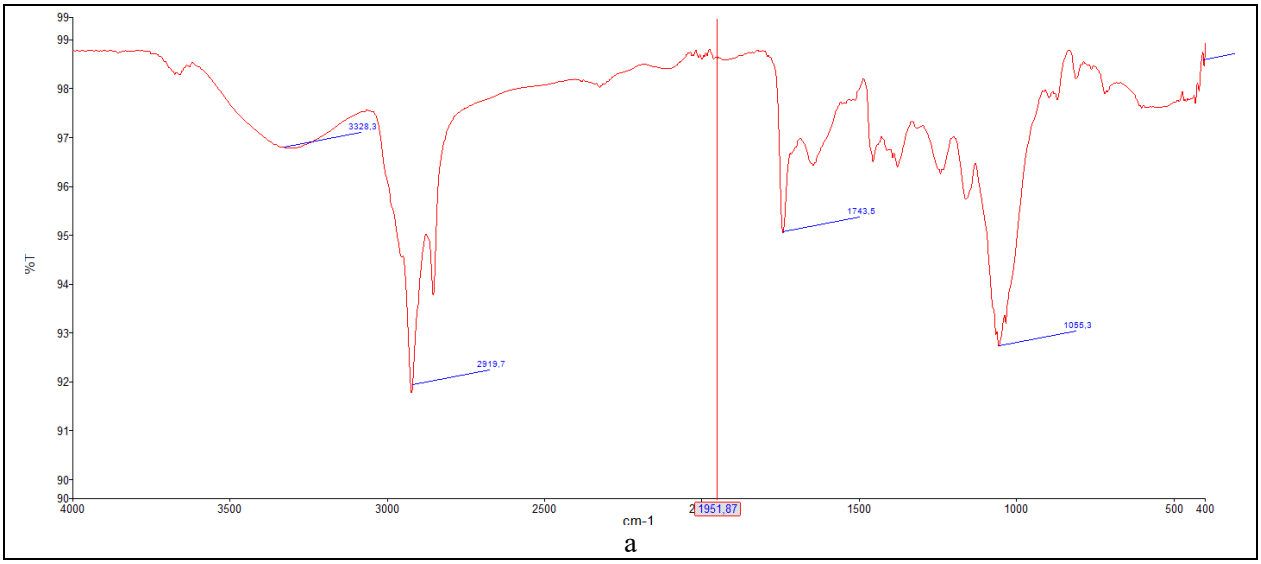
Borohydride compounds such as $NaBH_4$ (sodium borohydride) and KBH_4 (potassium borohydride) offer significant advantages when reacted with alcoholic solvents such as methanol or ethanol (alcoholysis), compared to aqueous media. These alcohols can accelerate reaction kinetics and limit the formation of undesirable secondary products. However, despite these advantages, the reaction rate between $NaBH_4$ and ethanol remains notably low [Gurdal (2024)].

In this study, spent coffee grounds – an abundant waste material –are converted into activated carbon using the hydrothermal carbonization method to synthesize a cobalt (Co)-doped catalyst and comprehensively investigate the catalytic performance of this material in methanolysis reactions.

To incorporate coffee waste into an activated carbon structure via hydrothermal carbonization; to synthesize cobalt-loaded catalysts by impregnating and reducing the obtained hydrochar; to analyze the biochar and synthesized catalysts using SEM and FTIR characterization techniques to determine the pore structure of the synthesized catalysts. By integrating all experimental findings, the study aims to demonstrate the applicability of coffee-ground-supported Co–B catalysts as sustainable and efficient materials for hydrogen production.

MATERIALS AND METHODS

For the supported catalyst synthesis, spent coffee grounds collected from coffee shops were used and initially dried at 105°C for 24 hours to remove water content. Six grams of biomass and 24 mL of deionized water were mixed in a stainless-steel autoclave. The autoclave was placed in an oven for 90 minutes at 220°C. At the end of the carbonization period, the autoclave was immediately cooled, and the mixture was filtered. The hydrochar samples were dried in the oven at 105°C for 24 hours. The dry hydrochar samples were then mixed with KOH at a KOH/hydrochar ratio of 2. The samples were washed with 0.1 M HCl and deionized water until the pH of the filtrate reached 7. The samples were dried a second time in the oven at 105°C for 24 hours. The carbonized biomass was used as support material for the synthesis of Co catalysts using the impregnation and reduction method. The appropriate amount of $CoCl_2$ solution was prepared in a stoichiometric ratio with distilled water. The cobalt content in the supported catalysts was adjusted to 20% by weight. After impregnating the cobalt onto the supports at 75°C for one hour at 1000 rpm, $NaBH_4$ solution was added dropwise for the chemical reduction process to reduce Co^{2+}. An excess amount of borohydride was used to achieve complete reduction, with a molar ratio of $NaBH_4$:$CoCl_2$ of 3:1, and the reduced solution was stirred at 600 rpm for three hours at 25°C. The sample was then filtered and washed with an ethanol/water mixture (volume ratio 1:1) to remove insoluble inorganics from the catalyst. The sample was placed in the oven at 105°C for 24 hours. The resulting powder was stored for use in the methanolysis reaction.



Scanning electron microscopy (SEM) was employed to examine the surface morphology of the manufactured catalyst. The chemical structure of the catalyst was analyzed using Fourier transform infrared (FTIR) spectroscopy (PerkinElmer) with a wavenumber range of 400–4000 cm^{-1}.

The methanolysis reactions were conducted in a 150 mL jacketed reactor. In a typical H_2 generation experiment, 0.05–0.1 g $NaBH_4$ and 10-30 mg catalyst was initially placed in the reactor. The methanolysis reaction was initiated by injecting 10 mL methanol into the reactor at 25ºC. The cumulative volume of generated hydrogen over time was measured using the water displacement method.

RESULTS and DISCUSSION

Characterization Results

In order to define the functional groups FT-IR analysis was undertaken for the SCG and Co/HTCC catalyst (Fig. 1). The FTIR spectra illustrating the transformation of spent coffee grounds (SCG) into the Co/HTCC catalyst reveal systematic changes in the material's functional group composition. The spectra for the raw biomass (SCG) (Fig.1a) and the post-hydrothermal carbonization (HTC) (Fig. 1b) product show a rich surface chemistry typical of a lignocellulosic matrix, with prominent absorption bands corresponding to hydroxyl (-OH) stretching vibrations in the 3300–3400 cm^{-1} region, aliphatic C–H stretching around 2920 cm^{-1}, and strong carbonyl (C=O) and C–O–C vibrations within the 1000–1750 cm^{-1} range. These features confirm the hydrophilic nature and the presence of oxygenated sites available for metal coordination. In contrast, the spectrum for the Co/HTCC catalyst (Fig 1c) shows a marked reduction in these band intensities and a flattened profile – most notably, the disappearance of hydroxyl and aliphatic functionalities – demonstrating that the material underwent extensive deoxygenation, dehydration, and decarboxylation during catalytic activation and thermal treatments. This process ultimately yields a highly stable, condensed carbonaceous framework with a dominant aromatic character.

a

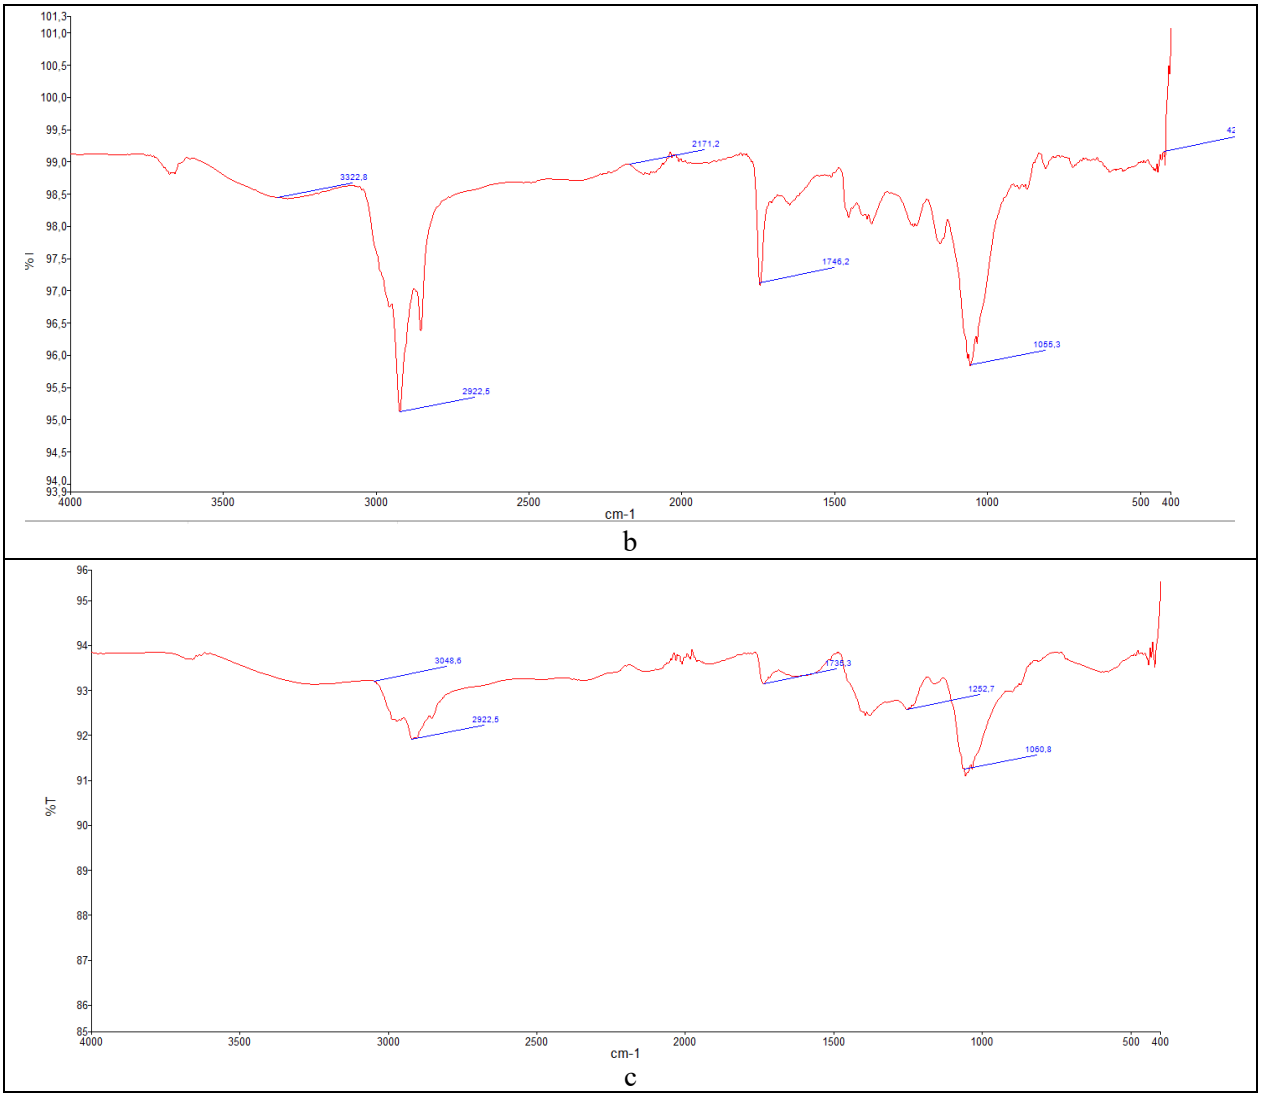


Figure 1. FTIR analysis of a) spent coffee ground, b) after hydrothermal carbonization c) Co/HTCC catalyst.

SEM-EDS and mapping images of coffee grounds and Co/HTCC catalyst were given in Table 1 and Fig. 2. The EDS results show that cobalt loading and methanolysis cause significant changes in the surface chemistry of HTCC. In the raw HTCC sample, the surface consists entirely of carbon (100% C), with no detectable oxygen or other elements. After cobalt is loaded onto the HTCC, the carbon content decreases to 82.31%, while the oxygen content increases to 17.69%, indicating the formation of new oxygen-containing functional groups on the surface due to the binding of cobalt salt or cobalt species. Following methanolysis, the carbon content further decreases to 77.81% and the oxygen content rises to 21.15%, suggesting that the surface has undergone additional oxygenation or that oxygenated species from methanol have bound to the surface. Additionally, the low concentration of Al (1.04%) detected on the surface after methanolysis indicates possible trace element contamination from equipment or chemicals used during the process. These findings suggest that the surface structure of HTCC is sensitive to both cobalt loading and methanolysis, and that its functional group structure changes significantly.

Table 1. EDS results of the samples HTCC, Co/HTCC and Co/HTCC (After Methanolysis).

Sample	C(Wt%)	O(Wt%)	Al (Wt%)
HTCC	100	-	-
Co/HTCC	82.31	17.69	-
Co/HTCC (After Methanolysis)	77.81	21.15	1.04

The Scanning Electron Microscopy (SEM) micrographs systematically illustrate the structural evolution and morphological stability of spent coffee grounds (SCG) from their raw state through the post-catalytic cycle. The untreated SCG sample (a) shows a heterogeneous morphology with compact, irregular block-like aggregates with limited porosity. After hydrothermal carbonization (b), the loss of cellular integrity due to hydrolytic degradation of the lignocellulosic matrix and removal of volatiles results in a rougher, sheet-like surface that promotes pore development. In the synthesized Co/HTCC catalyst (c), the incorporation of metal precursors onto the carbon skeleton, along with thermal activation, produces a more granular and complex surface topography that facilitates reactant diffusion. The micrograph after the methanolysis reaction (d) shows that, despite exposure to harsh reaction conditions – including solvent interaction and mechanical agitation – the catalyst largely maintains its macroscopic structural integrity. However, minor surface attrition, slight aggregation, or morphological deformations attributed to reaction dynamics are observed, providing important insights into the material's mechanical stability and potential for reuse.

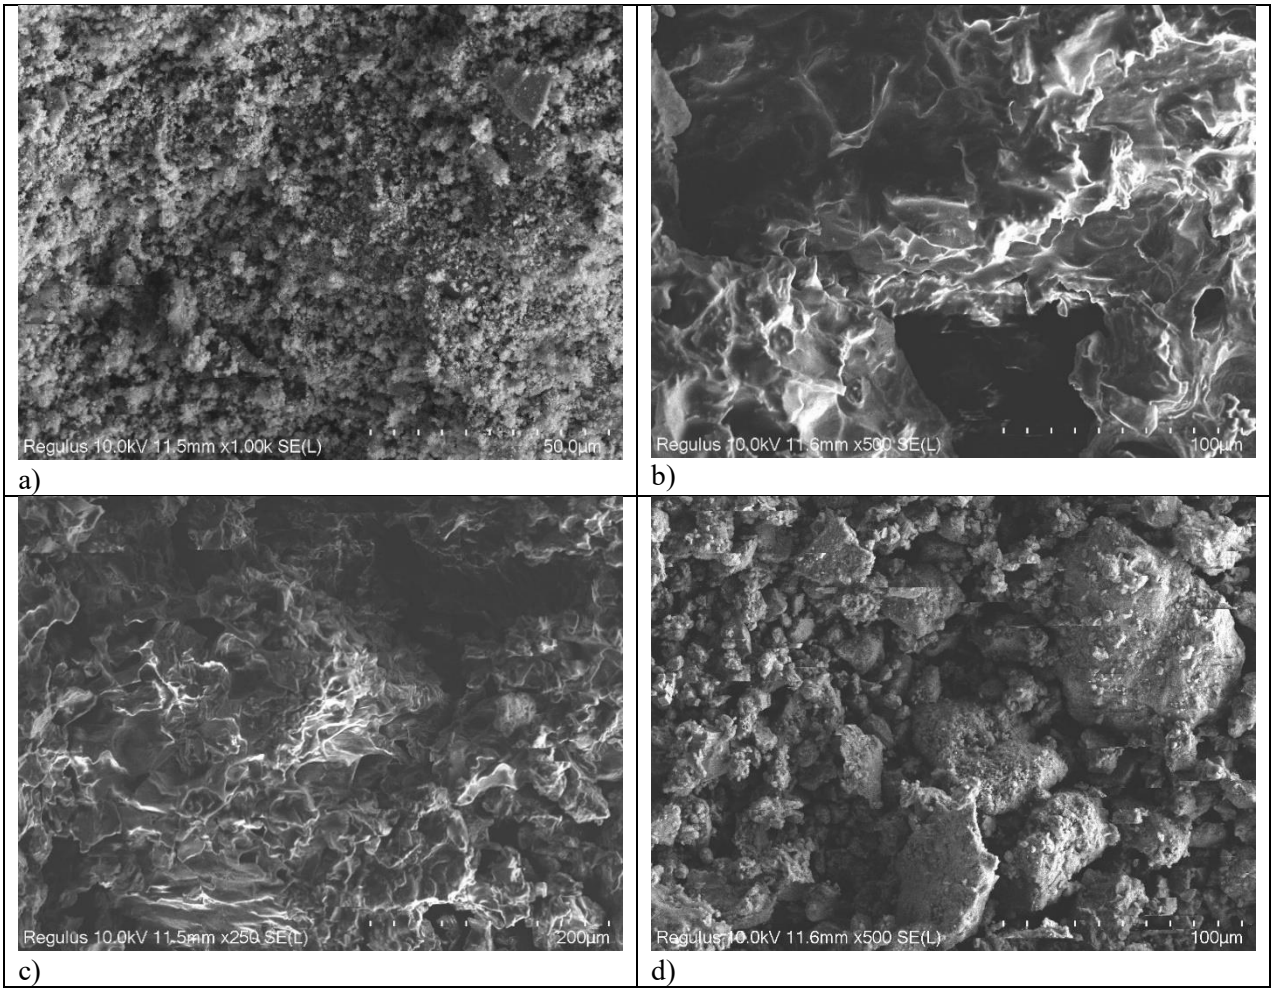

Figure 2. SEM analysis of a) spent coffee ground, b) after hydrothermal carbonization c) Co/HTCC catalyst d) Co/HTCC catalyst after methanolysis.

Catalytic Activity Results

The effect of catalyst amount and reactant concentration on hydrogen production performance in the catalytic hydrolysis of $NaBH_4$ is clearly shown in the Table 2. Data on the catalytic hydrolysis of $NaBH_4$ show that hydrogen production performance is significantly affected by both the catalyst amount and the $NaBH_4$ concentration. At a constant $NaBH_4$ concentration (0.27 M), increasing the catalyst amount significantly shortened the reaction time: the reaction, which was completed in 300 seconds with 10 mg of catalyst, was completed in 180 seconds with 30 mg of catalyst. However, the total hydrogen volume produced (285 mL) remained unchanged, while the hydrogen production rate per unit catalyst decreased, indicating that the mass yield decreased with increasing catalyst loading. On the other hand, increasing the $NaBH_4$ concentration directly increased hydrogen production; the hydrogen volume, which was 285 mL at 0.27 M, increased to 540 mL at 0.53 M and 830 mL at 0.79 M. The same trend was observed for the hydrogen production rate, with the highest value (8882 mL $g_{cat}.min^{-1}$) obtained at a 0.79 M $NaBH_4$ concentration and 10 mg catalyst. These findings suggest that the amount of catalyst has a limited effect on the reaction kinetics, while the $NaBH_4$ concentration is the main parameter determining hydrogen production capacity.

Table 2. Hydrogen generation rate of the methanolysis reaction via Co/HTCC at different reaction conditions.

Catalyst amount (mg)	$NaBH_4$ concentration (M)	Reaction Time (sec)	Generated Hydrogen Volume (mL)	Hydrogen Generated Rate (mL $g_{cat}.min^{-1}$)
10	0.27	300	285	5700
20	0.27	240	285	3562
30	0.27	180	285	3166
10	0.53	426	540	7605
10	0.79	560	830	8882

CONCLUSION

In this study, a cost-effective and sustainable cobalt-based catalyst supported on hydrothermally carbonized carbon (Co/HTCC) derived from spent coffee grounds was successfully synthesized using a simple impregnation–chemical reduction method. The catalytic performance was rigorously evaluated for hydrogen generation via the methanolysis of sodium borohydride (NaBH4). The Co/HTCC catalyst showed remarkable activity at an ambient temperature of 25 °C, demonstrating its viability for on-demand hydrogen production, particularly in low-temperature environments where energy efficiency is critical. The results show that the reaction kinetics in the catalytic hydrolysis of $NaBH_4$ are controlled by the $NaBH_4$ concentration rather than the catalyst dosage. Although increasing the catalyst amount at a constant $NaBH_4$ concentration (0.27 M) significantly decreased the reaction completion time (10 mg: 300 s; 30 mg: 180 s), the total hydrogen volume produced remained unchanged (285 mL), and the hydrogen production rate per unit mass decreased, indicating that the unit active surface efficiency decreased as the catalyst amount increased. In conclusion, the key parameter determining hydrogen production performance in the catalytic hydrolysis of $NaBH_4$ is the $NaBH_4$ concentration. While increasing the amount of catalyst shortens the reaction time, it has a limited effect on the yield per unit of catalyst. The highest hydrogen production rate was achieved with 0.79 M $NaBH_4$ and 10 mg of catalyst as 8882 mL $g_{cat}.min^{-1}$.

Abstract

The success of scaffolds used in bone tissue engineering directly depends on how precisely the designed micro-architecture can be achieved after fabrication. Although Fused Deposition Modeling (FDM) technology stands out for its low cost and accessibility, it can lead to dimensional deviations in the production of complex geometries. This study aims to compare the manufacturability of different topological architectures produced by the FDM method. Scaffolds with irregular Voronoi, Schwarz (TPMS), and Diamond (Lattice) architectures were designed and fabricated using Polylactic Acid (PLA) material at four different porosity rates (50%, 60%, 70%, and 80%). Production quality was evaluated by deviation analysis between theoretical and fabricated models through mass measurements. The results showed that geometric architecture has a decisive effect on production accuracy. While regular Schwarz and Diamond structures exhibited high production stability (with a 0 deviation at Diamond and 70% porosity), Voronoi structures showed a mass increase of up to 10.05% due to their stochastic nature. This study demonstrates that TPMS and Lattice structures provide higher dimensional accuracy compared to Voronoi in FDM-based production, shedding light on geometric selection criteria for clinical applications.

Keywords: FDM, PLA, Manufacturability, Design fidelity.

1. INTRODUCTION

Bone tissue engineering offers a promising strategy for the repair of critical-sized bone defects, resulting from trauma, tumor resection, or congenital anomalies that are incapable of spontaneous healing (Tariverdian et al., 2019). Scaffolds utilized within this field are anticipated to mimic the natural extracellular matrix (ECM) to support cell adhesion, proliferation, and new tissue formation (Abbasi et al., 2020). An ideal bone scaffold must not only be biocompatible but also exhibit high porosity with an interconnected pore structure, facilitating the transport of nutrients and waste products (Lee et al., 2022). Fused Deposition Modeling (FDM) technology, paired with biocompatible Polylactic Acid (PLA), is a prevalent choice for fabricating patient-specific scaffolds due to its cost efficiency, accessibility, and geometric flexibility (Chalgham et al., 2021). Nevertheless, the clinical success of PLA scaffolds produced via FDM relies not solely on material characteristics, but fundamentally on the degree to which the designed geometric architecture is maintained under manufacturing constraints.

In recent years, scaffold design has undergone a transition from simple grid structures to advanced architectures that more closely replicate the complex morphology of natural bone. In this context, distinct architectures have emerged as prominent candidates: Voronoi structures, which biomimetically replicate trabecular bone through irregular pore distribution (Herath et al., 2021); Diamond lattice structures, composed of regular and repeating unit cells (Chen et al., 2021); and Schwarz Triply Periodic Minimal Surface (TPMS) structures, defined by their mathematically continuous curvature (Poltue et al., 2021). While Voronoi structures offer the potential to enhance nutrient transport and cell infiltration via heterogeneous porosity (Wang et al., 2018), Diamond lattice structures are noted for their superior load-bearing capacity, and Schwarz TPMS structures are distinguished by their high stiffness and extensive surface area (Guo et al., 2022). However, although existing literature has predominantly focused on the theoretical mechanical performance of these architectures, the impact of geometric constraints imposed by the manufacturing technique on the final scaffold quality is frequently overlooked.

Geometric discrepancies between idealized scaffold models generated in Computer-Aided Design (CAD) environments and the physical specimens obtained post-fabrication are unavoidable due to the inherent limitations of FDM technology. Parameters such as nozzle diameter, layer thickness, and temperature can adversely affect fabrication quality, particularly in complex structures with intricate details (Kuznetsov et al., 2018; Triyono et al., 2020). Specifically, the sharp angles and unsupported overhangs characteristic of stochastic structures, such as Voronoi, can induce sagging of the molten filament during cooling or result in unwanted material accumulation (stringing) during rapid nozzle transitions. These fabrication defects can lead to a reduction in designed porosity and pore occlusion, potentially impeding cellular migration. Conversely, although the continuous and self-supporting nature of TPMS and regular lattice structures offers an inherent advantage for additive manufacturing (Afshar et al., 2016), this potential benefit necessitates experimental validation regarding dimensional accuracy, specifically within the context of FDM.

The primary objective of this study is to compare the dimensional and mass deviations between idealized models generated in a CAD environment and the physical specimens obtained after fabrication. In this work, Voronoi, TPMS (Schwarz), and Lattice (Diamond) scaffolds manufactured from PLA via FDM were evaluated through mass measurements. By revealing which geometric architecture can be produced with the highest fidelity to the digital design (beyond mechanical strength), the findings aim to determine the most reliable design and fabrication strategy for clinical applications.

2. MATERIALS AND METHODS

In this study, bone scaffolds featuring irregular (Voronoi) and regular (TPMS: Schwarz; Lattice: Diamond) architectures were designed and subsequently fabricated from PLA material using FDM technology. The quality of the resulting production was evaluated through dimensional and morphological analyses.

2.1. Scaffold Design

Three distinct topological architectures were selected for bone substitution applications: Voronoi, Schwarz Primitive, and Diamond. Voronoi models were generated using the Grasshopper parametric design tool integrated within Rhinoceros 3D software, employing a cellular tessellation algorithm based on randomly distributed seed points. Conversely, the Schwarz models were developed based on Triply Periodic Minimal Surface (TPMS) functions, while the Diamond models were constructed to adhere to a regular lattice architecture using SolidWorks software. The CAD representations of these designed architectures and their corresponding unit cells are illustrated in Figure 1.

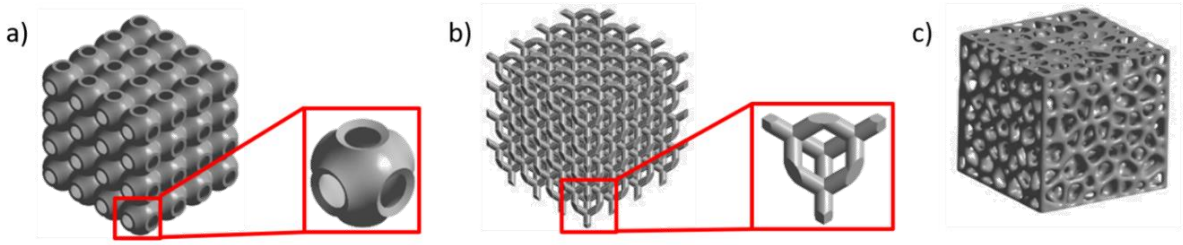

Figure 1. CAD model of three groups of scaffolds with related unit cells (60% porosity): a) Schwarz, b) Diamond, and c) Voronoi

To ensure comparability across all groups, each scaffold model was confined within a standard cubic volume measuring 15 mm × 15 mm × 15 mm. Four distinct theoretical porosity levels (50%, 60%, 70%, and 80%) were targeted for each architecture, achieved by parametrically adjusting the strut thickness. Surface optimization and pre-fabrication mesh refinement of the designed models were conducted using nTop and Meshmixer software, after which the files were exported in STL format.

2.2. Fabrication of the Scaffolds

The scaffolds were fabricated utilizing a FlashForge Creator 3 Pro (FlashForge, China) FDM 3D printer. Commercial FlashForge PLA filament, a biocompatible thermoplastic polymer, served as the feedstock material.

Throughout the manufacturing process, critical printing parameters influencing geometric accuracy were maintained constant across all experimental groups. The nozzle diameter, layer height, printing speed, and nozzle temperature were set to 0.4 mm, 0.18 mm, 60 mm/s, and 210°C, respectively. To preserve the intrinsic porosity of the scaffold architecture, the infill density was set to 100%; however, to evaluate the self-supporting capability of the structures, no additional support material was employed.

2.3. Dimensional Accuracy and Characterization

The 'design fidelity' of the fabricated scaffolds was assessed through mass measurements and microscopic imaging techniques.

• **Mass Deviation Analysis:** Theoretical mass values calculated in the CAD environment were compared with physical mass values measured post-production using a precision balance. This comparison was used to determine the printer's accuracy in reproducing the designed void volume and to identify potential issues with material over-extrusion or under-extrusion.

3. RESULTS and DISCUSSION

3.1. Macroscopic Observation and Fabrication Success

The Voronoi, Schwarz, and Diamond scaffold architectures designed for this study were successfully fabricated via the FDM method across four distinct porosity levels, ranging from 50% to 80%. The general appearance of the specimens is presented in Figure 2.

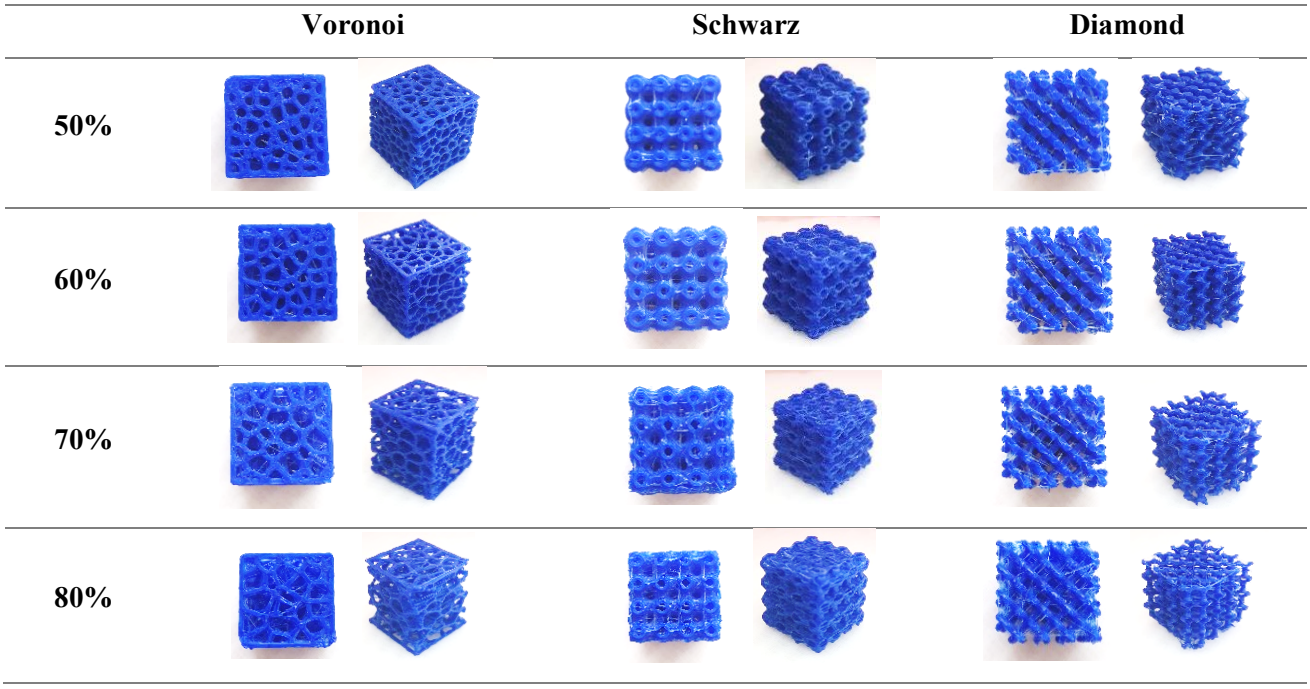

Figure 2. FDM fabricated PLA bone scaffold specimens.

Visual inspection of the specimens revealed that all models maintained their structural integrity and exhibited self-supporting characteristics. While the geometric regularity of the TPMS-based Schwarz and Lattice-based Diamond structures was clearly discernible to the naked eye, the stochastic and irregular nature of the Voronoi structures was distinctly prominent. Specifically, within the high-porosity Voronoi specimens, potential sagging issues associated with printing thin strut details were scrutinized at the macroscopic level; however, no major deformations compromising the integrity of the specimens were observed. Nevertheless, the dimensional accuracy underlying this apparent macroscopic success was subjected to a more detailed analysis through mass measurements.

3.2. Mass Deviation and Manufacturability Analysis

The manufacturability of the scaffolds was quantitatively assessed based on the percentage deviation between the theoretical mass calculated in the CAD environment and the actual mass measured after fabrication. While this difference is expected to be negligible in an ideal manufacturing scenario, deviations were observed due to the inherent nature of the FDM process. The obtained data are presented in Table 1.

Table 1. Comparison of theoretical and measured masses of the scaffolds showing deviation percentages

Geometry	Porosity (%)	Theoretical Mass (g)	Measured Mean Mass (g)	Difference (g)	Deviation (%)
Diamond	50	1,941	1,769	-0,172	-8,86
Diamond	60	1,553	1,596	0,043	2,77
Diamond	70	1,165	1,165	0	0
Diamond	80	0,776	0,779	0,003	0,39
Schwarz	50	1,941	1,7745	-0,1665	-8,58
Schwarz	60	1,553	1,5905	0,0375	2,41
Schwarz	70	1,165	1,1545	-0,0105	-0,9
Schwarz	80	0,776	0,827	0,051	6,57
Voronoi	50	1,941	2,022	0,081	4,17
Voronoi	60	1,553	1,5925	0,0395	2,54
Voronoi	70	1,165	1,2365	0,0715	6,14
Voronoi	80	0,776	0,854	0,078	10,05

Examination of Table 1 reveals that the geometric architecture has a decisive impact on fabrication accuracy:

Systematic Mass Increase in Voronoi Structures: All Voronoi scaffolds exhibited a measured mass exceeding the theoretical value (positive deviation). Notably, the deviation reached a critical level of 10.05% in the 80% porosity sample. This phenomenon can be attributed to the frequent retraction requirements of the printer nozzle, resulting from the stochastic and irregular nature of the Voronoi architecture. The oozing of residual molten PLA from the nozzle tip while traveling between irregular branches, or the formation of stringing, artificially increased the mass of the specimens.

Stability of TPMS and Lattice Structures: The regular Diamond (Lattice) and Schwarz (TPMS) architectures yielded more consistent results compared to Voronoi. A notable highlight is the Diamond structure at 70% porosity, which achieved perfect design fidelity with 0 deviation. The mathematically continuous and fluid surface nature of the Schwarz structure facilitated an uninterrupted toolpath (continuous path) for the nozzle, thereby stabilizing material extrusion and minimizing fabrication errors.

Negative Deviation at Low Porosity: Negative deviations (approximately 8.86% and -8.58%, respectively) were observed in the 50% porosity groups of the Diamond and Schwarz structures. This indicates a problem of incomplete filling of interlayer voids or under-extrusion associated with the increased material fill density in these denser structures.

4. CONCLUSION

This study comparatively investigated the manufacturability and dimensional fidelity of Voronoi (irregular), Schwarz (TPMS), and Diamond (Lattice) scaffold architectures designed for bone tissue engineering applications, fabricated using PLA via FDM technology. Deviations between the developed models and the physical specimens produced were evaluated through mass measurements and microscopic morphological analyses. In light of the findings, the following conclusions were drawn:

Design Fidelity: Thanks to their continuous and fluid geometric configurations, the TPMS-based Schwarz and Lattice-based Diamond architectures demonstrated superior compatibility with the FDM fabrication process, exhibiting significantly lower mass deviation rates compared to Voronoi structures. Notably, the Diamond structure achieved ideal manufacturing accuracy with a 0 deviation at 70% porosity.

Manufacturing Challenges of Voronoi: Despite their biomimetic advantages, Voronoi structures presented significant fabrication challenges due to their stochastic nature and inherent sharp directional changes. Mass increases reaching up to 10% and intense stringing defects.

Clinical Implication: In clinical scenarios where dimensional accuracy and pore patency are critical, prioritizing TPMS (specifically Schwarz) structures for FDM-based production represents a more reliable strategy to ensure the faithful translation of designed properties to the final product. For Voronoi architectures, alternative high-precision fabrication methods should be considered.

Özet

Et ve et ürünlerinin *Klebsiella* spp. ve *Citrobacter* spp. ile kontaminasyonu, bu bakterilerin antimikrobiyal direnç ve biyofilm oluşturma yetenekleri nedeniyle önemli bir halk sağlığı tehdidi oluşturmaktadır. Bu çalışmanın amacı, Amasya ilindeki market ve restoranlardan toplanan çiğ kıyma ve köfte örneklerinden izole edilen *Klebsiella* spp. ve *Citrobacter* spp. izolatlarının biyofilm oluşturma kapasiteleri ile β-laktamaz direnç genlerinin (*blaTEM*, *blaSHV*, *blaCTX-M*) varlığını araştırmaktır. Toplam 51 izolat (16 *Klebsiella* spp., 35 *Citrobacter* spp.) biyokimyasal testlerle identifiye edilmiştir. Biyofilm oluşumu, Kongo Kırmızı Agar (CRA) testi ve mikrotitrasyon yöntemi ile değerlendirilmiş; β-laktamaz genlerinin varlığı ise Polimeraz Zincir Reaksiyonu (PZR) ile tespit edilmiştir. Bulgulara göre, CRA testi *Klebsiella* spp. izolatlarının %75'inde pozitif sonuç verirken, *Citrobacter* spp. izolatlarının hiçbiri pozitif sonuç vermemiştir. Mikrotitrasyon yöntemi ise daha detaylı bir profil ortaya koymuştur. *Klebsiella* spp. izolatlarının %87.5'i (zayıf, orta, yüksek) biyofilm oluşturma kapasitesi sergilerken, bu oran *Citrobacter* spp. izolatlarında %100 olarak bulunmuştur. *Citrobacter* spp. izolatlarının %14.3'ü yüksek düzeyde biyofilm oluştururken, *Klebsiella* spp.'da bu oran %12.5 olarak tespit edilmiştir. Moleküler analizler, antibiyotik direnci açısından çarpıcı sonuçlar göstermiştir. İncelenen tüm izolatlarda (%100) *blaTEM* geni saptanmıştır. *blaSHV* geni *Klebsiella* spp. ve *Citrobacter* spp. izolatlarında sırasıyla %87.5 ve %94.3 gibi oldukça yüksek oranlarda tespit edilmiştir. *blaCTX-M* geni ise yalnızca *Citrobacter* spp. izolatlarının %11.4'ünde belirlenmiştir. Sonuç olarak, çalışılan et örneklerinden izole edilen *Klebsiella* spp. ve *Citrobacter* spp. suşlarının yüksek oranlarda biyofilm oluşturma yeteneğine ve yaygın β-laktamaz gen varlığına sahip olduğu ortaya konmuştur. Özellikle tüm izolatlarda *blaTEM* geninin bulunması, bu gıdaların halk sağlığı ve gıda güvenliği açısından potansiyel bir risk oluşturduğuna ve antimikrobiyal direnç yayılımında rezervuar görevi görebileceğine işaret etmektedir.

Anahtar Kelimeler: *Klebsiella* spp., *Citrobacter* spp., Biyofilm, β-Laktamaz Genleri

Antibiotic resistance genes and biofilm formation in *Klebsiella* spp. and *Citrobacter* spp. isolates from raw ground meat and meatballs

Abstract

The contamination of meat and meat products with *Klebsiella* spp. and *Citrobacter* spp. poses a significant public health threat due to their antimicrobial resistance and biofilm-forming abilities. This study aimed to investigate the biofilm formation capacity and the presence of β-lactamase resistance genes (*blaTEM, blaSHV, blaCTX-M*) in *Klebsiella* spp. and *Citrobacter* spp. isolates obtained from raw minced meat and meatball samples collected from markets and restaurants in Amasya province. A total of 51 isolates (16 *Klebsiella* spp., 35 *Citrobacter* spp.) were identified by biochemical tests. Biofilm formation was assessed using the Congo Red Agar (CRA) test and the microtiter plate method; the presence of β-lactamase genes was detected by Polymerase Chain Reaction (PCR). According to the findings, the CRA test yielded positive results for 75% of the *Klebsiella* spp. isolates, while none of the *Citrobacter* spp. isolates tested positive. The microtiter plate method revealed a more detailed profile. While 87.5% of the *Klebsiella* spp. isolates exhibited biofilm-forming capacity (weak, moderate, or strong), this rate was

100% for the *Citrobacter* spp. isolates. Among the *Citrobacter* spp. isolates, 14.3% were strong biofilm producers, whereas this rate was 12.5% for *Klebsiella* spp. Molecular analyses showed striking results regarding antibiotic resistance. The *blaTEM* gene was detected in all isolates (100%) examined. The *blaSHV* gene was found at very high rates in *Klebsiella* spp. and *Citrobacter* spp. isolates, at 87.5% and 94.3%, respectively. The *blaCTX-M* gene was identified only in 11.4% of the *Citrobacter* spp. isolates. In conclusion, it was demonstrated that the *Klebsiella* spp. and *Citrobacter* spp. strains isolated from the meat samples studied possessed a high capacity for biofilm formation and a high prevalence of β-lactamase genes. The detection of the *blaTEM* gene in all isolates, in particular, indicates that these foods pose a potential risk to public health and food safety and could act as a reservoir for the spread of antimicrobial resistance.

GİRİŞ

Et ve et ürünlerinin *Klebsiella* spp. ve *Citrobacter* spp. ile kontaminasyonu, özellikle bu bakterilerin patojenitesi ve antimikrobiyal direnç özellikleri göz önüne alındığında, giderek artan bir halk sağlığı sorunu olarak değerlendirilmektedir. Her iki bakteri cinsi de gıda üretim ortamlarında yaygın biçimde bulunabilmekte ve antimikrobiyal direnç genlerini edinme, koruma ve yayma kapasiteleriyle öne çıkmaktadır. Bu durum, gıda güvenliği zincirinin bütün aşamalarında risklerin yeniden değerlendirilmesini gerekli kılmaktadır (Madhup ve ark., 2021; Enferad ve Mahdavi, 2021).

Özellikle *Klebsiella pneumoniae*, çeşitli gıda maddelerinde, işlenmiş et ürünleri dâhil olmak üzere, sık karşılaşılan bir kontaminanttır ve birçok çalışmada çok ilaca dirençli (MDR) suşların varlığı bildirilmiştir. Polonya'da yürütülen bir araştırmada, işlenmiş et örneklerinde *K. pneumoniae*'nin yüksek prevalansı belirlenmiş ve izole edilen suşların büyük bölümünün çoklu antibiyotik direnci gösterdiği ortaya konmuştur (Madhup ve ark., 2021). Benzer şekilde İran'da gerçekleştirilen çalışmalar, *K. pneumoniae*'nin çiğ süt ve süt ürünlerini de kontamine edebildiğini ve bu kontaminasyonun gıda kaynaklı hastalıklar üzerinde önemli etkiler oluşturduğunu göstermiştir (Enferad ve Mahdavi, 2021).

Citrobacter spp. türleri, özellikle *Citrobacter freundii*, son yıllarda önemli gıda kaynaklı fırsatçı patojenler olarak öne çıkmıştır. Et ve diğer gıda ürünlerinden düzenli olarak izole edilen bu bakteriler, çeşitli antibiyotiklere direnç kazandıran genetik belirteçleri taşıyabilmektedir (Witaningrum ve ark., 2022). Plazmid aracılı direnç faktörlerinin varlığı, bu bakterilerin farklı ortamlarda hızla yayılabilmesine ve direnç özelliklerini diğer Enterobacteriaceae üyelerine aktarabilmesine olanak sağlamaktadır (Husna ve ark., 2023; Cortés-Sánchez ve ark., 2023).

β-laktamaz genlerinin (ör. *blaSHV, blaTEM, blaCTX-M*) varlığı *Klebsiella* spp. ve *Citrobacter* spp. türlerinde antibiyotik direnç profilinin temel belirleyicileri arasında yer almaktadır. *K. pneumoniae* suşlarında genişlemiş spektrumlu β-laktamaz (GSBL) üretiminin yaygın olduğu, özellikle *blaSHV* ve *blaCTX-M* genlerinin et kaynaklı izolatlarda yüksek oranda tespit edildiği bildirilmektedir (Junaid ve ark., 2022; Silva ve ark., 2025). *Citrobacter* spp. türlerinde de GSBL üretiminin artmakta olduğu ve bu bakterilerin tarımsal üretimden tüketiciye kadar uzanan süreçte direnç genlerinin rezervuarı hâline gelebileceği ifade edilmektedir (Witaningrum ve ark., 2022; Husna ve ark., 2023). Gıda kaynaklı bu bakterilerin oluşturduğu risk, yalnızca kontaminasyonun yaygınlığından değil, aynı zamanda bu bakterilerin çok ilaca dirençli enfeksiyonlara neden olabilme potansiyelinden kaynaklanmaktadır. MDR fenotipine sahip suşların varlığı, özellikle gastrointestinal enfeksiyonların tedavisini zorlaştırmakta ve halk sağlığı açısından ek önlemleri gerekli kılmaktadır (Beamud ve ark., 2023). Bu nedenle, et ve et ürünlerinde *Klebsiella* spp. ve *Citrobacter* spp. türlerinin varlığını, biyofilm oluşum kapasitesini ve direnç mekanizmalarını izlemeye yönelik moleküler ve klasik yöntemleri kapsayan kapsamlı sürveyans programlarının geliştirilmesi büyük önem taşımaktadır (Bneed ve ark., 2025).

Türkiye'deki yerel gıda pazarlarında ve Amasya yöresinde, bu bakterilerin biyofilm oluşturma kapasiteleri ve direnç genleri konusunda daha fazla çalışmaya ihtiyaç duyulmaktadır. Bu çalışmanın amacı Amasya İli yerel market ve restoranlarında satışa sunulan çiğ kıyma ve köfte örneklerinden izole edilen *Klebsiella* spp. ve *Citrobacter* spp. izolatlarında biyofilm oluşumunun fenotipik olarak, β-laktamaz gen direnç genlerinin ise moleküler yöntemlerle değerlendirilmesidir.

MATERYAL VE METOT

2.1. Örnek Toplama ve Bakteriyel İzolasyon

Çalışmada kullanılan toplam 50 adet çiğ kıyma ve köfte örneği, Amasya ilindeki yerel market ve restoranlardan Eylül 2025 tarihinde temin edilmiştir. Her bir örnekten alınan 10 gram, 90 mL steril %0.1'lik tamponlanmış peptonlu su içinde homojenize edilerek 1:10'luk bir başlangıç dilüsyonu hazırlanmıştır. Hazırlanan bu süspansiyondan alınarak Chromocult Coliform Agar (Merck Milipore 110426) besiyerine yayma yöntemiyle ekim yapılmıştır. Plakalar 37°C'de 24 saat süreyle inkübe edilmiştir. İnkübasyon sonucunda, besiyerinin önerdiği şekilde kromojenik özelliklerine dayanarak; pembe renkli koloniler *Citrobacter* spp., mavi renkli koloniler ise *Klebsiella* spp. olarak ön tanı almış ve saf kültür elde etmek amacıyla Tryptic Soy Agar (TSA) besiyerine pasajlanmıştır.

2.2. Biyokimyasal İdentifikasyon

Saf kültürlerden elde edilen izolatların tanımlanması için bir dizi konvansiyonel biyokimyasal test gerçekleştirilmiştir. Testler, standart mikrobiyolojik prosedürlere uygun olarak yürütülmüştür. Kullanılan testler şunlardır; MacConkey Agar, Üre Agar, Triple Sugar Iron (TSI) Agar ve IMViC Testleri.

2.3. Biyofilm Oluşum Yeteneğinin Belirlenmesi

2.3.1. Kongo Kırmızısı Agar (CRA) Testi

İzolatların ekzopolisakkarit (slime) üretim yetenekleri, %0.08 Kongo kırmızısı ve %5 sükroz içeren Brain Heart Infusion (BHI) agar besiyeri kullanılarak değerlendirilmiştir. İnoküle edilen plakalar 37°C'de 24 saat inkübe edilmiştir. İnkübasyon sonunda siyahımsı, kuru ve kristalize koloni görünümü slime üretimi pozitif, pembe-beyaz renkli koloniler ise slime üretimi negatif olarak değerlendirilmiştir.

2.3.2. Mikrotitrasyon Plak Yöntemi ile Kantitatif Biyofilm Analizi

Biyofilm oluşumunun kantitatif olarak belirlenmesi için kristal viyole (KV) boyama yöntemi uygulanmıştır. Gece boyu (18-24 saat) besiyerinde geliştirilen bakteriyel kültürlerin optik dansiteleri (OD) 600 nm dalga boyunda ölçülerek OD600=0.1 olacak şekilde seyreltilmiştir. Hazırlanan bu süspansiyondan 96 kuyucuklu mikrotitrasyon plaklarına 20 µL eklenmiş ve üzerine 180 µL %1'lik glikozlu TSB ilave edilerek toplam 200 µL'lik hacim sağlanmıştır. Steril besiyeri içeren kuyucuklar negatif kontrol olarak kullanılmıştır. Plaklar 37°C'de 24 saat statik olarak inkübe edilmiştir. İnkübasyon sonunda, kuyucuklardaki süpernatantlar dikkatlice uzaklaştırılmış ve yapışmayan hücreleri temizlemek için kuyucuklar steril fizyolojik tuzlu su ile üç kez yıkanmıştır. Plaklar oda sıcaklığında 15 dakika kurumaya bırakılmıştır. Kuruyan biyofilmler 200 µL %99'luk metanol ile 15 dakika süreyle fikse edilmiştir. Metanol uzaklaştırıldıktan sonra plaklar tekrar kurutulmuş ve biyofilmler 200 µL %0.1'lik (a/h) kristal viyole çözeltisi ile 20 dakika boyanmıştır. Fazla boya, plaklar steril distile su ile yıkanarak uzaklaştırılmıştır. Bağlanan kristal viyole, 200 µL etanol:aseton (80:20) çözeltisi ile çözündürülmüştür. Çözeltinin optik dansitesi, mikroplaka okuyucu cihazı (Multiscan GO, Thermo Scientific) kullanılarak 570 nm dalga boyunda ölçülmüştür. Deney 3 tekrar şeklinde gerçekleştirilmiştir. Biyofilm üretimi, negatif kontrolün optik dansite (OD) ortalaması referans alınarak sınıflandırılmıştır. Eşik değer (ODc), negatif kontrollerin ortalama OD'sinin üç standart sapma üstü olarak tanımlanmıştır. İzolatlar, bu değere göre aşağıdaki şekilde kategorize edilmiştir: biyofilm üretmeyen ($OD \leq ODc$), zayıf biyofilm üreticisi ($ODc < OD \leq 2xODc$), orta derecede biyofilm üreticisi ($2xODc < OD \leq 4xODc$) ve kuvvetli biyofilm üreticisi ($4xODc < OD$).

2.4. Moleküler Analizler

2.4.1. Genomik DNA İzolasyonu

İzolatların genomik DNA'ları, modifiye edilmiş bir kaynatma yöntemi ile ekstrakte edilmiştir. TSA'da 24 saat boyunca üretilen taze bakteriyel kültürlerden bir öze dolusu, 100 µL nükleaz içermeyen steril distile su içine süspansiyon haline getirilmiştir. Süspansiyon, kuru blok ısıtıcıda 95°C'de 10 dakika boyunca inkübe edilerek hücre lizisi sağlanmıştır. Ardından, örnekler 12.000 xg'de 10 dakika santrifüjlenmiş ve süpernatant, polimeraz zincir reaksiyonu (PZR) için şablon DNA olarak kullanılmak üzere alınmıştır.

2.4.2. β-Laktamaz Genlerinin PZR ile Tespiti

blaTEM, *blaSHV* ve *blaCTX-M* gen varlığı, spesifik primerler kullanılarak polimeraz zincir reaksiyonu (PZR) ile araştırılmıştır (Tablo 1). PZR reaksiyonları, 25 µL'lik bir hacimde gerçekleştirilmiştir. Reaksiyon karışımı, 1X PZR tamponu, 2 mM dNTP karışımı, 3.4 pmol her bir primer, 2.5 mM $MgCl_2$, 1 U Taq DNA polimeraz ve 1 µL şablon DNA içermiştir. Amplifikasyon, bir termal döngür cihazında (TurboCycler Lite 9020, Blue-Ray, Biotech) aşağıdaki protokole uygun olarak yapılmıştır: 95°C'de 5 dakika ilk denatürasyon; ardından 94°C'de 1 dakika, 56°C'de 40 saniye (*blaTEM* ve *blaCTX-M*) veya 58°C'de (*blaSHV*) 40 saniye, 72°C'de 1 dakika olmak üzere 30 döngü; ve son olarak 72°C'de 10 dakika son uzatma. Amplifiye olan PZR ürünleri, %1'lik (a/h) agaroz jel elektroforezinde, 1X TAE tamponu içinde, 80 V sabit voltajda yaklaşık 1 saat süreyle yürütülmüştür. DNA bantları, jel redörü içerisine eklenen etidyum bromür ile boyanmış ve UV transillüminatör altında görüntülenmiştir. Bantların molekül ağırlıkları, 100 bp'lik DNA markır ile karşılaştırılarak doğrulanmıştır.

Tablo 1. *Klebsiella* spp. ve *Citrobacter* spp.'de β-laktamaz genlerinin tespiti için kullanılan primerler

BULGULAR

İzolasyon ve Biyokimyasal İdentifikasyon

İzolasyon çalışması sonucunda, 16'sı *Klebsiella* spp. ve 35'i *Citrobacter* spp. olmak üzere toplam 51 izolat elde edilmiştir. Bu sonuçlara göre, izole edilen türlerin prevalansı %31.4 *Klebsiella* spp. ve %68.6 *Citrobacter* spp. olarak hesaplanmıştır. *Klebsiella* spp. izolatlarının (n=16) biyokimyasal karakterizasyonu, bu cins için beklenen tipik profille uyumlu sonuçlar vermiştir. Tüm izolatlar MacConkey Agar'da pembe koloniler oluşturmuş ve üre agarın rengini pembeye dönüştürerek pozitifleştirmiştir. IMViC test profili incelendiğinde, tüm *Klebsiella* spp. izolatlarının - + - + (İndol negatif, Metil Kırmızısı pozitif, Voges-Proskauer negatif, Sitrat pozitif) şeklinde sonuç verdiği belirlenmiştir. Triple Sugar Iron Agar'da izolatların 14'ü (%87.5) hem eğik yüzey hem de dip kısmında sarı renk oluşturarak glukoz, laktoz ve sükrozu tamamen fermente ettiğini göstermiş, iki izolatta (%12.5) ise glukoz fermentasyonuna bağlı dip kısmının sarı, laktoz/sükroz fermentasyonunun olmamasına bağlı eğik yüzeyin kırmızı kaldığı atipik bir reaksiyon gözlemlenmiştir. *Citrobacter* spp. izolatları (n=35) ise benzer bir biyokimyasal profil sergilemiştir. Tüm *Citrobacter* spp. izolatları MacConkey Agar'da pembe koloni oluşturmuş ve üre agarda pozitif reaksiyon vermiştir. IMViC test profili aynı şekilde - + - + olarak belirlenmiştir. Triple Sugar Iron Agar testinde ise tüm *Citrobacter* spp. izolatları (%100) hem eğik yüzey hem de dip kısmında sarı renk oluşturmuştur.

Biyofilm Oluşum Yeteneğinin Belirlenmesi

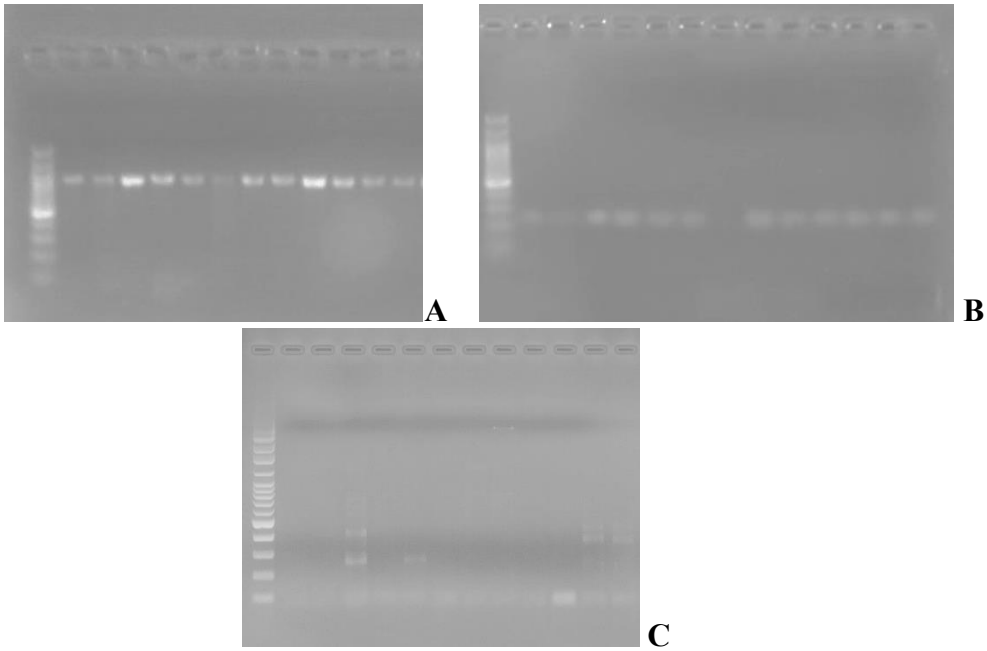
Bu çalışmada, izolatların slime oluşturma potansiyelini değerlendirmek için kullanılan CRA testi, *Klebsiella spp.* ve *Citrobacter spp.* cinsleri arasında farkı ortaya koymuştur. *Klebsiella* spp. izolatlarının 12'sinde (%75) CRA testi pozitif sonuç verirken, *Citrobacter* spp. izolatlarının tamamı (35/35, %100) negatif olarak değerlendirilmiştir (Şekil 1 A ve B).

A

B

Şekil 1. A. *Klebsiella spp.* izolatlarının CRA görüntüsü **B.** *Citrobacter* spp. izolatlarının CRA görüntüsü

Mikrobiyal yüzeylere tutunma ve biyofilm oluşturma yeteneği, patojen bakterilerin virülansında ve kronik enfeksiyonların gelişiminde kritik bir faktördür. Bu çalışmada, *Klebsiella* spp. ve *Citrobacter* spp. cinslerine ait izolatların biyofilm oluşturma kapasiteleri mikrotitrasyon yöntemi kullanılarak değerlendirilmiştir. Değerlendirme sonuçlarına göre, *Klebsiella* spp. izolatları arasında biyofilm oluşumu dağılımı heterojendir. İncelenen 16 *Klebsiella* spp. izolatından 2'si (%12.5) biyofilm oluşturamazken, 2 izolat (%12.5) zayıf, 10 izolat (%62.5) orta düzeyde ve 2 izolat (%12.5) ise yüksek düzeyde biyofilm oluşturma kapasitesi sergilemiştir. Bu veriler, *Klebsiella* spp. izolatlarının yaklaşık %85,5'inin (zayıf, orta ve yüksek düzeyde pozitiflik toplamı) biyofilm oluşturabildiğini ortaya koymaktadır. *Citrobacter* spp. izolatlarında ise daha yüksek bir biyofilm oluşturma eğilimi gözlemlenmiştir. Toplam 35 *Citrobacter* spp. izolatının 14'ü (%40) zayıf, 16'sı (%45.7) orta ve 5'i (%14.3) yüksek düzeyde biyofilm oluşturmuştur. Mikrotitrasyon testi, *Citrobacter* spp. izolatlarının %80'inden fazlasının biyofilm oluşturduğunu açıkça göstermektedir.



β-Laktamaz Genlerinin PZR ile Tespiti

PZR analizleri sonucunda, incelenen tüm bakteri izolatlarında (%100) *blaTEM* geni tespit edilmiştir. *Klebsiella* spp. izolatlarının %87.5'inde (14/16) ve *Citrobacter* spp. izolatlarının %94.3'ünde (33/35) *blaSHV* geni belirlenirken, *Citrobacter* spp. izolatlarının %11.4'ünde (4/35) *blaCTX-M* geni saptanmıştır. İzolatların β-laktamaz gen bölgelerine ait agaroz jel elektroforezi görüntüleri Şekil 2 (A-C) de gösterilmiştir.

TARTIŞMA

Bu çalışmada, Amasya ilinde satışa sunulan çiğ kıyma ve köfte örneklerinden izole edilen *Klebsiella* spp. ve *Citrobacter* spp. türlerinin biyofilm oluşturma kapasiteleri ile β-laktamaz direnç genleri sistematik biçimde değerlendirilmiştir. Elde edilen bulgular, her iki bakteri cinsinin de gıda zincirinde önemli bir kontaminasyon ve direnç rezervuarı olduğunu ortaya koymaktadır.

Literatürde çiğ etlerde β-laktamaz üreten Enterobacteriaceae üyelerinin yaygınlığı daha önce farklı çalışmalarla da ortaya konmuştur. Tekiner ve Özpınar (2016), çiğ et ürünlerinde GSBL üreten *Klebsiella* spp. türlerinin yüksek prevalans gösterdiğini ve diğer Enterobacteriaceae türleriyle birlikte *Citrobacter freundii* tespit edildiğini bildirmiştir. Bu bakterilerin gıda kaynaklı enfeksiyonlar için önemli bir tehdit oluşturduğu vurgulanmıştır. Türkiye'de, Tekirdağ köfte gibi geleneksel et ürünlerinin çeşitli patojen bakterilere ev sahipliği yaptığı bildirilmiş olup, sonuçlar bu ürünlerin gıda güvenliği mevzuatıyla belirlenen mikrobiyal limitleri aşabildiğini göstermektedir (Can ve ark., 2013). Polonya'da, Wasiński ve arkadaşları (2013) tarafından yapılan bir çalışma, mezbahalardan toplanan çiğ et örneklerinde GSBL üreten mikroorganizmaların varlığını bildirmiştir. Bu patojenlerin yaygınlığı, et tedarik zincirindeki uygun olmayan işleme, kesim uygulamaları ve hijyen koşulları ile ilişkilendirilebilir. Benzer şekilde Gwida ve ark. (2014), perakende çiğ etlerde *Klebsiella* spp. oranlarının yüksekliğini hijyenik olmayan kesim ve işlemeyle ilişkilendirmişlerdir. Ayrıca, Güney Çin'de yapılan çalışmalar, çiğ domuz etinden izole edilen genişlemiş spektrumlu β-laktamaz (GSBL) üreten *Klebsiella* spp. suşlarını karakterize etmiş ve etin antibiyotiğe dirençli bakteriler için bir rezervuar görevi gördüğünü doğrulamıştır (Li ve ark., 2016).

Şekil 2. A. Bazı izolatlara ait *blaTEM* PZR ürünlerinin agaroz jel elektroforezi görüntüsü. **B.** Bazı izolatlara ait *blaSHV* PZR ürünlerinin agaroz jel elektroforezi görüntüsü. **C.** Bazı izolatlara ait *blaCTX-M* PZR ürünlerinin agaroz jel elektroforezi görüntüsü.

Biyofilm oluşumu açısından elde edilen sonuçlar da hem gıda güvenliği hem de direnç ekolojisi bakımından kritik önemdedir. CRA testinde *Klebsiella* spp. izolatlarının %75'inin pozitif olmasına karşın *Citrobacter* spp. türlerinde hiçbir pozitifliğin görülmemesi, bu iki cinsin slime üretimi davranışlarında belirgin bir fark olduğunu göstermektedir. Ancak mikrotitrasyon testinde her iki cinste de %80–100 arasında biyofilm oluşturma kapasitesinin bulunması, CRA testinin biyofilm yeteneğini tek başına yansıtmakta yetersiz kalabileceğini göstermektedir. Özellikle *Citrobacter* spp. izolatlarının %14.3'ünde yüksek düzeyde biyofilm oluşturma yeteneği tespit edilmesi, bu türün gıda işleme yüzeylerinde uzun süre kalıcılık gösterebileceğini düşündürmektedir.

Biyofilm oluşumunun direnç gelişimiyle güçlü bir ilişkisi olduğu bilinmektedir. Biyofilm içindeki bakterilerde EPS matrisi nedeniyle antibiyotik penetrasyonu azalmakta, yatay gen transferi artmakta ve bu durum direnç genlerinin toplum içinde hızla yayılmasına yol açmaktadır (Poyrazoğlu ve Onur, 2023; Vuotto ve ark., 2017). Literatürde *K. pneumoniae*'nin tip 1 ve tip 3 fimbriyaları aracılığıyla yüzeylere güçlü adezyon sağladığı, bu nedenle dezenfektanlara ve antibiyotiklere karşı biyofilm modunda yüksek direnç gösterdiği belirtilmektedir (Schroll ve ark., 2010). *Citrobacter* spp. türlerinde de benzer şekilde curli lifleri ve selüloz içeren biyofilm matrisinin, mikroorganizmanın çevresel stres faktörlerine dayanımını artırdığı gösterilmiştir (Zogaj ve ark., 2003; Pereira ve ark., 2010). Çalışmamızdaki en güçlü bulgulardan biri, biyofilm oluşumu ile direnç genleri arasındaki paralelliktir. Hem *Klebsiella* spp. hem de *Citrobacter* spp. izolatlarında yüksek oranda biyofilm oluşumunun yanında *blaTEM* ve *blaSHV* genlerinin baskın şekilde bulunması, gıda zincirinde bu iki mekanizmanın birlikte hareket ettiğini düşündürmektedir. Bu durum, sadece et işleme ortamlarında değil, tüketici aşamasında da riskin devam ettiğini göstermektedir. Nitekim Manoharan ve ark. (2011), β-laktamaz genleri taşıyan Enterobacteriaceae suşlarının biyofilm içinde karbapenemlere dahi direnç gösterebildiğini bildirmiştir. Bizim çalışmamızda *Klebsiella* spp. izolatlarının %87.5'inde *blaSHV* geninin pozitif bulunması suşların genişlemiş spektrumlu direnç profili taşıyabileceğini göstermektedir. Özellikle incelenen tüm izolatlarda *blaTEM* geninin %100 oranında tespit edilmesi, çiğ et ürünlerinin antimikrobiyal direnç açısından kritik bir risk kaynağı olduğuna işaret etmektedir. *Citrobacter* spp. izolatlarının %94.3'ünde *blaSHV* ve %11.4'ünde *blaCTX-M* genlerinin saptanmış olması, bu türlerin de et ürünlerinde önemli bir direnç taşıyıcı olduğunu göstermektedir. Literatürde *Citrobacter freundii*'nin gıda kaynaklı antimikrobiyal direnç genlerini taşıdığı ve GSBL üretme kapasitesine sahip olduğu çeşitli çalışmalarla ortaya konmuştur (Shahid, 2010). Ayrıca Geser ve ark. (2012), gıda hayvanlarında *blaSHV* ve *blaTEM* genlerinin hızla yayılmasının, işlenmiş etlerin tüketiciye ulaşıncaya kadar dirençli bakteriler için bir rezervuar oluşturduğunu bildirmektedir.

Genel olarak değerlendirildiğinde, bu çalışma Amasya yöresindeki çiğ et ürünlerinde yüksek biyofilm potansiyeline sahip, direnç genleri taşıyan Enterobacteriaceae suşlarının varlığını net biçimde ortaya koymuştur. Bulgular hem yerel hem de ulusal düzeyde daha sıkı gıda güvenliği denetimlerine, moleküler sürveyans çalışmalarına ve et üretim işleme zincirinde hijyen protokollerinin güçlendirilmesine ihtiyaç olduğunu göstermektedir.

SONUÇ

Bu çalışmada, Amasya ilinde satışa sunulan çiğ kıyma ve köfte örneklerinden izole edilen *Klebsiella spp.* ve *Citrobacter spp.* türlerinin biyofilm oluşturma kapasiteleri ile β-laktamaz direnç gen profilleri ayrıntılı olarak değerlendirilmiştir. Elde edilen sonuçlar, her iki bakteri cinsinin de gıda güvenliği açısından yüksek risk taşıdığını ortaya koymaktadır. Özellikle tüm izolatlarda *blaTEM* geninin %100 oranında tespit edilmesi, bölgede satılan çiğ et ürünlerinin antimikrobiyal direnç açısından önemli bir rezervuar görevi gördüğünü göstermektedir. Buna ek olarak, *Klebsiella spp.* izolatlarında *blaSHV* geninin (%87.5) ve *Citrobacter spp.* izolatlarında hem *blaSHV* (%94.3) hem de *blaCTX-M* (%11.4) genlerinin bulunması, genişlemiş spektrumlu β-laktamaz üretimi açısından dikkate değer bir direnç yükünü işaret etmektedir.

Biyofilm oluşturma yeteneğinin hem *Klebsiella spp.* hem de *Citrobacter spp.* türlerinde yüksek oranlarda görülmesi, bu bakterilerin gıda işleme ekipmanlarında, tezgâhlarda ve dağıtım zinciri boyunca yüzeylerde uzun süre hayatta kalabilme potansiyeline sahip olduğunu göstermektedir. Özellikle mikrotitrasyon yöntemiyle elde edilen sonuçlara göre izolatların büyük bölümünün zayıf–orta–yüksek düzeyde biyofilm oluşturabilmesi, bu bakterilerin dezenfektanlara ve çevresel stres faktörlerine karşı direnç geliştirmesine katkıda bulunmakta ve kontaminasyonun süregen bir hale gelebileceğini düşündürmektedir.

Genel olarak değerlendirildiğinde, çiğ et ürünlerinde tespit edilen yüksek biyofilm potansiyeli ile β-laktamaz genlerinin yaygınlığı, tüketici sağlığı açısından ciddi bir risk oluşturmaktadır. Bu nedenle et üretim zincirinin tüm basamaklarında kesim, işleme, depolama ve satış aşamalarında hijyen uygulamalarının güçlendirilmesi, çapraz kontaminasyonun önlenmesine yönelik standartların sıkılaştırılması ve özellikle antimikrobiyal direnç açısından düzenli moleküler sürveyans çalışmalarının yürütülmesi büyük önem taşımaktadır. Ayrıca, gıda kaynaklı Enterobacteriaceae üyelerinde direnç genlerinin yayılımını sınırlamak için ulusal düzeyde kontrol stratejilerinin oluşturulması gerekmektedir.

Bu çalışma, Amasya yöresinde satılan çiğ et ürünlerinin direnç profili ve biyofilm potansiyeline ilişkin önemli bir veri seti sunmakta olup, ileride yapılacak daha geniş kapsamlı epidemiyolojik araştırmalar ve gıda güvenliği politikaları için temel oluşturmaktadır.

TEŞEKKÜR

Tekniker Melda Türk'e, çalışmanın veri toplama ve deneysel süreçlerindeki değerli katkıları için içten teşekkürlerimizi sunarız.

Abstract

This study explores a low-energy way to prepare hemp fibres for textile use by bleaching them at room temperature with the help of a bimetallic iron oxide catalyst. Hemp normally requires strong chemicals and high energy because it contains large amounts of lignin and pectin. In this work, the fibres were first treated with a mild NaOH solution and then bleached with hydrogen peroxide, either with or without the catalyst. FT-IR results showed that the alkali step begins to remove unwanted plant materials, while the catalyst and hydrogen peroxide together remove much more lignin and expose the cellulose structure. Tests on hydrogen peroxide breakdown showed that it stays mostly unchanged without the catalyst but decomposes completely within a few hours when the catalyst is present. These results show that the catalyst makes it possible to bleach hemp fibres effectively at room temperature, offering a simpler and more environmentally friendly alternative to traditional high-temperature bleaching.

Keywords: Catalytic bleaching, hemp fiber, alkali treatment

INTRODUCTION

One of the major sustainability issues today is directly related to energy consumption across all manufacturing industries (Dursun and Yıldız, 2022; El-Kheir et al., 2014). The textile industry is no exception, as it is also highly energy intensive. One of the primary raw materials used in yarn production for clothing is natural fibres. To make natural fibres usable, they must undergo a bleaching process to remove unwanted compounds such as pectin, lignin, and other naturally occurring chemicals. In addition to significant energy consumption, bleaching also requires various chemicals to extract cellulose, which is the essential component of yarn. However, some of these bleaching agents are hazardous to the environment due to the harmful by-products they generate. Consequently, the high energy demand and extensive chemical use in bleaching natural fibres remain key challenges for the textile industry.

The bleaching process of some natural fibres, such as hemp, jute, and others from the bast fiber family, can be difficult in terms of obtaining cellulose because their lignin, pectin, and wax content is significantly higher than that of cotton. According to studies in the literature, the composition of a typical hemp plant includes approximately 60–80% cellulose, 7–15% hemicellulose, 1–9% pectin, and 1–10% lignin by mass (Tulaphol et al., 2021; Koohestani et al., 2019). The relatively high lignin content of hemp fibres causes difficulties in bleaching because it reduces the wettability of the structure, which plays a crucial role in the decomposition of lignin and pectin by bleaching agents. Due to that delignification of hemp fibres are difficult and costly, industrial application of hemp is restricted although its fibres are stronger than most of other natural fibres (Koohestani et al., 2019).

The traditional bleaching process is carried out at high temperatures (100–150 °C) and elevated pressures (3–4 bar) using oxidative chemicals such as hypochlorite, sodium sulfite, and hydrogen peroxide (Fattahi and Salehi, 2023; Dursun and Yıldız, 2022). These process conditions lead to significant energy consumption to obtain natural fibres primarily in cellulose form. Hypochlorite- and sulfite-based oxidants are major pollutants in industrial wastewater generated during bleaching. In contrast, hydrogen peroxide decomposes into water and oxygen, which are harmless

to downstream water systems (Farr et al.,2003). In addition, it seems that hydrogen peroxide prices can be comparable with the other bleaching agents as shown in Table 1.

Catalytic bleaching of natural fibres can be a good solution for yarn production with reduced energy consumption as the process is operated at room temperature and atmospheric pressure conditions. Some studies have shown that H_2O_2 can decompose, which is essential for the degradation of lignin and other materials in the structure of natural fibres- in the presence of catalytic materials such as transition metal oxides at lower temperatures (Pędziwiatr et al., 2018; Weiss, 1935; Lousada et al., 2013). The mechanism of the decomposition reaction occurs in a way that H_2O_2 molecules adsorb/interact with the metal oxides. As a result of interaction/surface reaction either ·OH or HO_2· radicals are produced according to the studies in the literature (Lin and Gurol, 1998). These types of reactions are known as Fenton-like reactions (Ensing et al., 2003; Andrade et al., 2009; Yang et al., 2016). The radicals that are produced through the catalytic decomposition of H_2O_2 directly attack the molecules in the structure of the natural fiber. As a result of the interaction, the degradation/oxidation of unwanted substances occurs. This characteristic of the H_2O_2 can offer an opportunity for carrying out the process with lower energy consumption.

Table 1. Price comparison of mostly used bleaching agents in textile industry

Chemical	Approx. Bulk Price (USD/MT)	References
Hydrogen Peroxide	$356 -797	İMARC Group, (2025)
Sodium Hypochlorite	$250–360	İNTRATEC, (2025)
Sodium Chlorite	$600–1,600	Made-in-China, (2025)
Sodium Sulfite	$2,000–4,600	Tridge, (2025)

In this study, the catalytic bleaching of hemp fibres and the decomposition behavior of H_2O_2 during the bleaching process were investigated. The influence of alkaline treatment and subsequent bleaching with H_2O_2 on lignin degradation, as well as on the structural and morphological changes of other fiber constituents such as cellulose, hemicellulose, and pectin, was examined using FT-IR spectroscopy. Additionally, the variation in H_2O_2 concentration throughout the bleaching process was monitored to assess the catalytic performance of the bimetallic oxide catalyst. The findings obtained under various experimental conditions are systematically presented and discussed in this contribution.

MATERIAL AND METHODS

Hemp was obtained from the producers. The hemp samples used in this study were subjected to mechanical opening after harvesting. H_2O_2 (Isolab, 35% w/w) was used as the bleaching agent. NaOH pellets (Merck, pure) were used as the pre-treatment (alkali) agent.

Bleaching without Catalyst

In order to obtain cellulose-based hemp fibres, two treatments were applied to the raw hemp materials. During the experiments, firstly alkali treatment was carried out inside NaOH baths. The alkali treatment bath was prepared with 300 mL of 0.2 M NaOH solution (Merck, pure). Prior to the alkali treatment, hemp fibres were cut to a length of 30 mm and weighed to 4-5 g. They were then treated in NaOH solution at 80 °C for 5 hours at a stirring speed of 300 rpm under atmospheric pressure. The temperature ramp from room temperature to 80 °C was determined as ca. 2 °C/min. After the pretreatment process, the fibres were washed several times with deionized water at room temperature.

After the alkali treatment, the bleaching of hemp fibres was carried out with H_2O_2 (Isolab, 35% w/w). The bleaching of hemp fibres in the presence of H_2O_2 at high temperature is considered as a reference treatment. The hemp fibres were bleached with 0.2 M 300 mL H_2O_2 at 80 °C, for one hour at a stirring rate of 300 rpm and under atmospheric pressure. The temperature ramp from room temperature to 80 °C was determined as ca. 2 °C/min. The bleached hemp fibres were washed with deionized water several times and dried overnight at room temperature.

Bleaching with Catalyst

To obtain cellulose by bleaching hemp fibres at room temperature and atmospheric pressure, a bimetallic catalyst was used. The other parameters of the experiments were the same as the experiments that were performed in the absence of a catalyst. Prior to catalytic bleaching, alkali treatment was performed with 0.2 M, 300 mL NaOH solution at 80 °C. After alkali treatment, hemp fibres were bleached in the presence 16 mg catalyst/L solution of 0.2 M H_2O_2. In addition, similar trials were performed to prove catalytic activity.

Kinetic Study

The decomposition of H_2O_2 with respect to time in the presence of bimetallic metal oxide catalyst were followed by titration of the bleaching solution with 0.03 M KMnO4 solution in acidic conditions at room temperature and under atmospheric pressure. Acidity of the titration solution was obtained with 2.5 M H_2SO_4. Titration was performed with 1 mL of bleaching solution, which contains H_2O_2, 25 mL of deionized water and 25 mL of 2.5 M H_2SO_4 solution.

Characterization

ATR-FTIR analyses were performed in a Perkin Elmer Spectrum Two spectrometer. 32 scans were recorded with 4 cm^{-1} resolution in the range of 4000–450 cm^{-1}. The change of amounts of components within the content of hemp fibres such as lignin, pectin, hemicellulose and cellulose compounds were detected by IR spectra of hemp fibres that were treated in different conditions.

RESULTS AND DISCUSSION

FT-IR Results

Comparison of untreated and NaOH & H_2O_2–treated hemp fibres reveals extensive chemical restructuring as shown in Figure 1. The treated fiber shows a broadened and slightly shifted O–H stretching band (3600–3200 cm^{-1}), consistent with increased hydrogen bonding due to removal of sterically hindering lignin and hemicellulose. The decline in C–H stretching at ~2920 and 2850 cm^{-1} suggests degradation of aliphatic lignin substituents. The 1730 cm^{-1} carbonyl band nearly disappears in the treated fiber, indicating efficient removal of hemicellulose acetyl groups and oxidation of lignin side-chain esters at high temperature. Aromatic skeletal vibrations at ~1600 and 1510 cm^{-1} are significantly reduced, confirming breakdown of lignin aromatic structures. The C–O–C asymmetric stretching at ~1160 cm^{-1} and the 1050–1030 cm^{-1} cellulose backbone peaks intensify and sharpen, while the peak centered at ~895 cm^{-1} becomes more prominent. Together, these changes point to high delignification and hemicellulose removal efficiencies and reveal a cellulose-enriched structure.

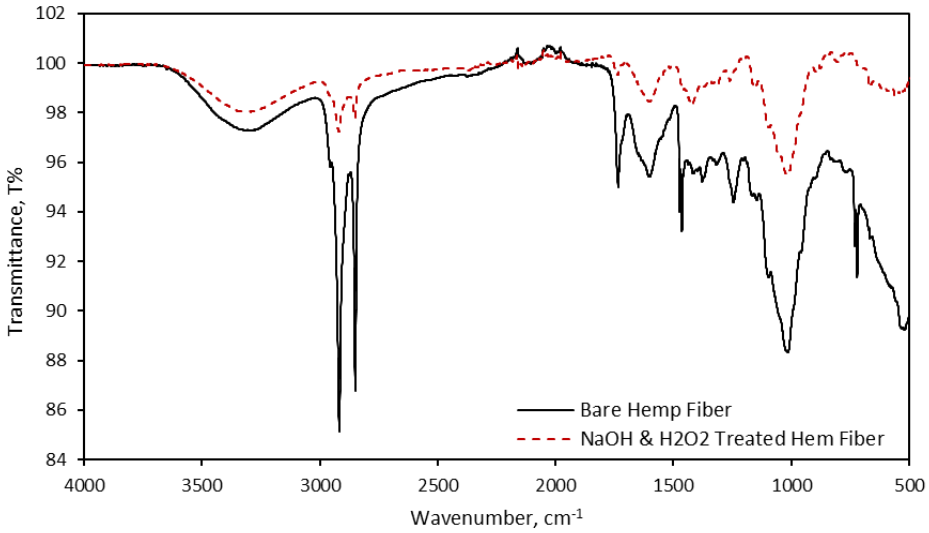

Figure 1. FT-IR spectra of bare (untreated) hemp fiber and hemp fiber after treatment with 0.2 M NaOH and 0.2 M H_2O_2 at 80 °C for 1 h.

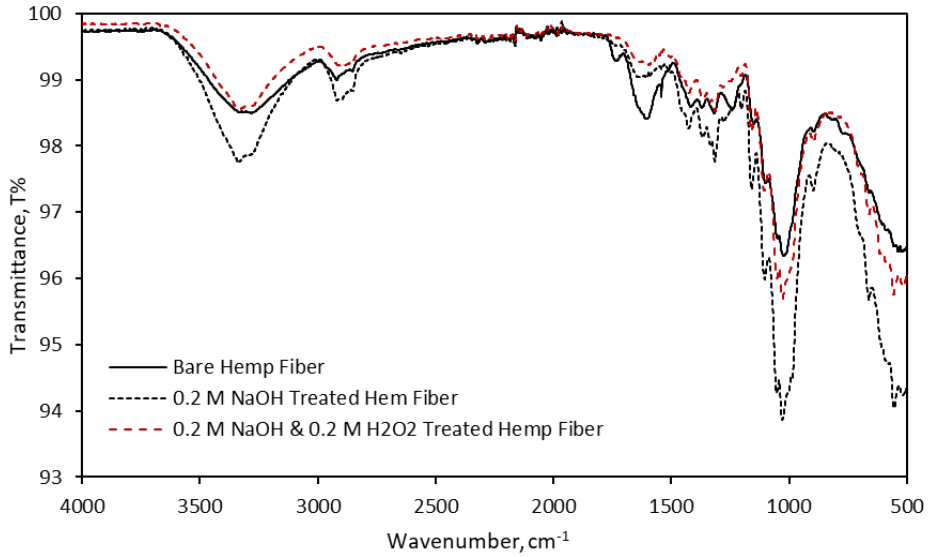

Figure 2. FT-IR spectra of bare hemp fiber (straight line), hemp fiber after treatment with 0.2 M NaOH at 80 °C (small gap - dashed line) and hemp fiber after consecutive treatments with 0.2 M NaOH at 80 °C and 0.2 M H_2O_2 at 25 °C in the presence of 16 mg bimetallic oxide catalyst (red-long gap dashed line).

The transition from bare fiber to NaOH-treated fiber to NaOH & H_2O_2-treated fiber shows a clear progression of lignocellulosic fraction removal as it can be seen clearly in Figure 2. NaOH treatment alone produces a moderate increase in the O–H stretching intensity and a noticeable decrease in the 1730 cm^{-1} carbonyl peak, indicating saponification of hemicellulose esters but limited oxidative lignin cleavage. Lignin aromatic peaks at ~1600 and ~1510 cm^{-1}, as well as the phenolic C–O band at ~1260 cm^{-1}, decrease but remain clearly visible after NaOH treatment. When H_2O_2 (with catalyst) is introduced after the NaOH step, these lignin-related bands undergo strong attenuation, demonstrating substantial aromatic ring disruption. The cellulose fingerprint peaks at 1160, 1100, and 1030 cm^{-1} become progressively sharper from NaOH to NaOH + H_2O_2, while the band at ~895 cm^{-1} intensifies, signaling improved cellulose accessibility and relative enrichment. The C–H stretching decrease and the overall flattening of the lignin-associated region in the H_2O_2 spectrum highlight the strong oxidative capability of the catalyst-assisted peroxide treatment

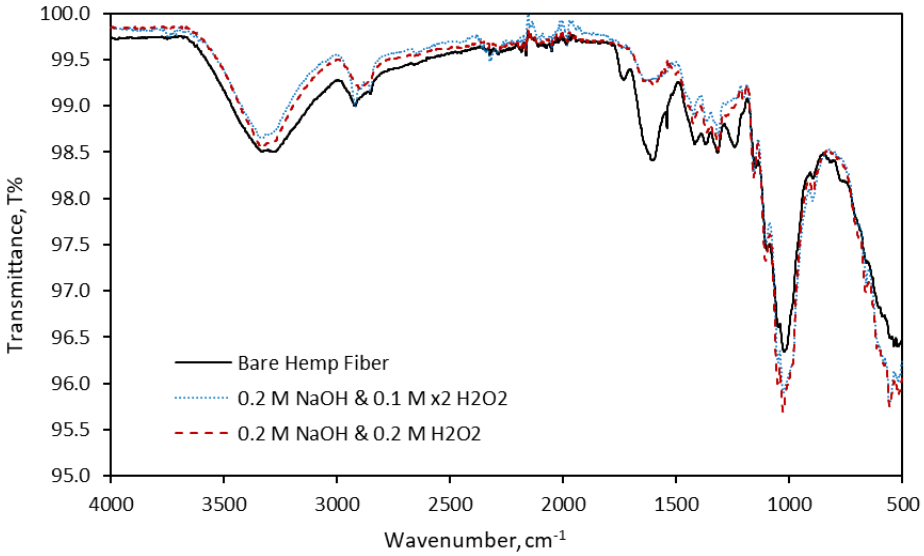

Figure 3. FT-IR spectra of: (i) untreated hemp fiber (solid line); (ii) hemp fiber treated sequentially with 0.2 M NaOH at 80 °C and 0.1 M H_2O_2 twice at 25 °C (short-dash line); and (iii) hemp fiber treated with 0.2 M NaOH at 80 °C followed by 0.2 M H_2O_2 at 25 °C (long-dash red line), all in the presence of 16 mg bimetallic oxide catalyst.

The FT-IR spectra, which is given in Figure 3, show consistent structural evolution of the hemp fiber after alkaline–peroxide treatments. Relative to the untreated fiber, both treated samples display an increase in the broad O–H stretching region at 3600–3200 cm^{-1}, indicating enhanced fiber swelling and greater exposure of cellulose hydroxyls following removal of matrix components. The C–H stretching bands at ~2920 and ~2850 cm^{-1} decrease in intensity for both peroxide-treated fibres, reflecting the loss of aliphatic side chains in lignin. The carbonyl peak at ~1730 cm^{-1}, arising from hemicellulose acetyl groups and lignin-bound esters, is strongly reduced in both treatments, with the most pronounced suppression observed in the 0.2 M H_2O_2 sample. Lignin aromatic ring vibrations at ~1510 cm^{-1} and C–O bands at ~1260 cm^{-1} also diminish progressively from the bare fiber to the two-step 0.1 M H_2O_2 treatment and most significantly in the 0.2 M H_2O_2 treatment. In the fingerprint region (1100–1000 cm^{-1}), cellulose-related C–O–C and C–O stretching bands become sharper and more intense with increasing oxidation strength, while the band at ~895 cm^{-1} becomes more distinct, confirming the increased exposure of the cellulose backbone. These observations indicate that NaOH initiates lignin and hemicellulose disruption, whereas the catalyst-assisted H_2O_2 steps produce deeper oxidative modification.

Across all three FT-IR comparisons, the combined results confirm that NaOH initiates structural loosening and partial removal of hemicellulose and lignin, while the catalyst-assisted H_2O_2 oxidation is responsible for most of the lignin degradation and deep purification of the hemp fiber. NaOH produces moderate reductions in the 1730 cm^{-1} carbonyl band and slight decreases in aromatic lignin signatures, consistent with ester cleavage and partial disruption of lignin–carbohydrate complexes. However, only upon introduction of H_2O_2 in the presence of the 16 mg catalyst do the spectra show strong suppression of the lignin aromatic bands (1600–1510 cm^{-1}), C–O–C lignin ether peaks (1270–1210 cm^{-1}), and aliphatic C–H bands (2920–2850 cm^{-1}), indicating oxidative scission of both aromatic rings and side chains. The broadening and strengthening of the O–H region across treatments suggests increasing exposure of cellulose hydroxyls as the matrix is removed. The fingerprint region further illustrates this trend: cellulose-associated peaks (1160–1030 cm^{-1}) sharpen progressively, and the band centered at 895 cm^{-1} becomes more defined, confirming enhanced cellulose accessibility. Notably, treatments with higher H_2O_2 concentration (0.2 M) consistently show the largest decreases in lignin-related peaks and the most pronounced cellulose band sharpening, demonstrating that oxidative delignification efficiency correlates directly with peroxide strength under catalytic conditions. Collectively, the three figures establish a clear mechanistic sequence: NaOH opens the structure and removes esters, while catalyst-assisted H_2O_2 drives deep lignin oxidation, resulting in a highly purified, cellulose-rich hemp fiber.

Figure 4. From left to right: untreated hemp fibres, hemp fibres treated with alkali, and hemp fibres treated with alkali followed by H_2O_2.

As seen in Figure 4 the evolution of bleaching states is in accordance with the found FT-IR results. The third picture from left shows that treating hemp fibres with alkali as well as H_2O_2 gives the best results in desired color and texture, while in the second picture from left it can be seen that while the results are better than untreated hemp fiber, they still lack the qualities of the two-times treated fiber.

Kinetic Results

The time-dependent decomposition of H_2O_2 under various conditions, both in the presence and absence of hemp fibres intended for bleaching, is presented in Figure 5. No significant change in H_2O_2 concentration was observed after approximately 4 hours, indicating that the solution reached a near-steady state. A similar experiment was also conducted using alkali-treated hemp fibres. Although a slightly greater decrease in H_2O_2 concentration was detected compared to the experiment performed without fibres, the extent of decomposition remained minimal overall.

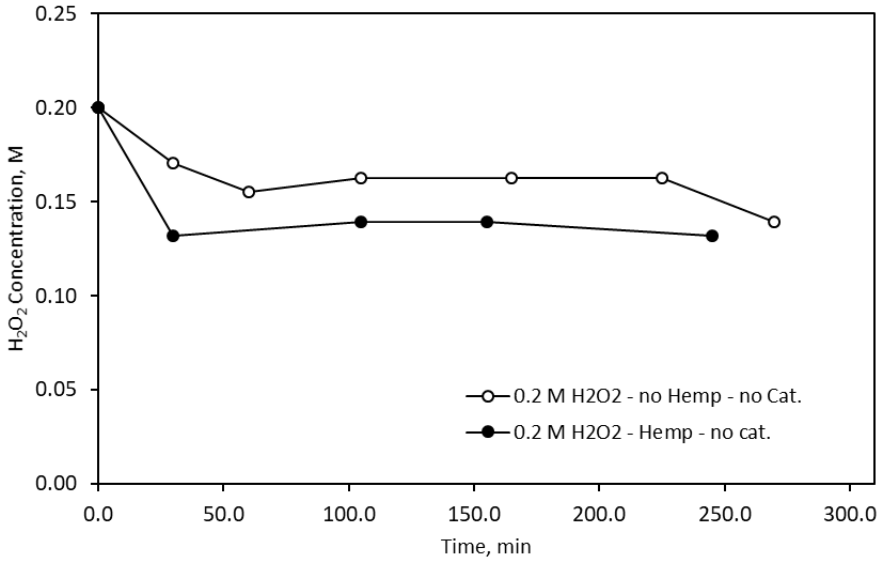

Figure 5. Variation of aqueous H_2O_2 concentration as a function of time, measured with and without hemp fibres at room temperature and atmospheric pressure

The change of concentration of H_2O_2 with time in bleaching solution was also followed in the presence of a bimetallic metal oxide catalyst as given in Figure 6. Two distinct experiments were performed which are decomposition of H_2O_2 in the presence and of absence of already alkali treated hemp fibres. It can be easily seen that the decomposition of H_2O_2 was completed in both experiments after almost 5 h. The experiment, which was performed in the absence of hemp fibres, was performed to check the influence of hemp fiber on the decomposition rate of H_2O_2. The results showed that decomposition rate was not a significant function of presence of hemp fibres.

To further examine the effect of initial H_2O_2 concentration on its decomposition rate, an experiment was conducted using a 1.0 M H_2O_2 solution in the presence of 40 mg of the bimetallic oxide catalyst. The time-dependent percentage decomposition of H_2O_2 is presented in Figure 7, along with results from analogous experiments performed with an initial concentration of 0.2 M H_2O_2 and 16 mg of catalyst. The findings indicate that, within the

experimental conditions employed, the initial concentration of H_2O_2 does not significantly influence its decomposition rate.

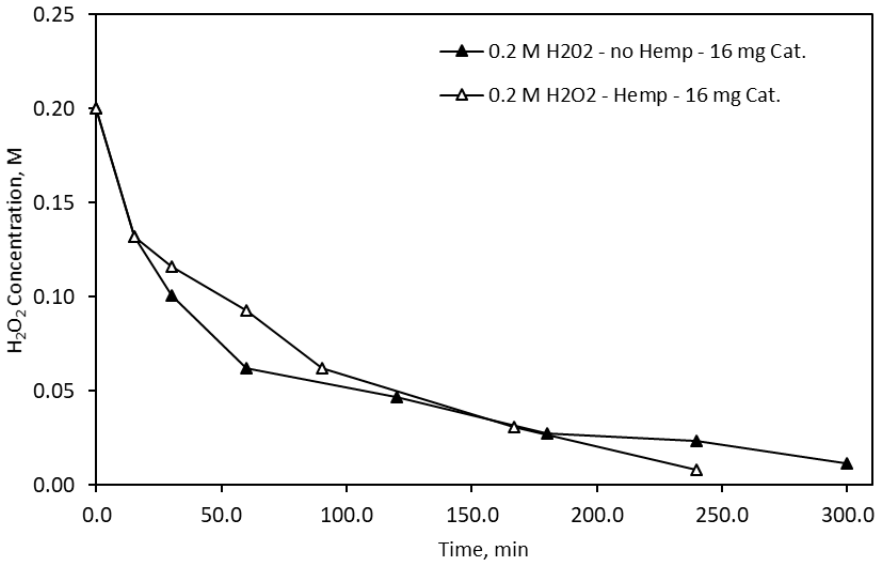

Figure 6. Variation of aqueous H_2O_2 concentration as a function of time, recorded both with and without hemp fibres, in the presence of 16 mg bimetallic oxide catalyst at room temperature and atmospheric pressure.

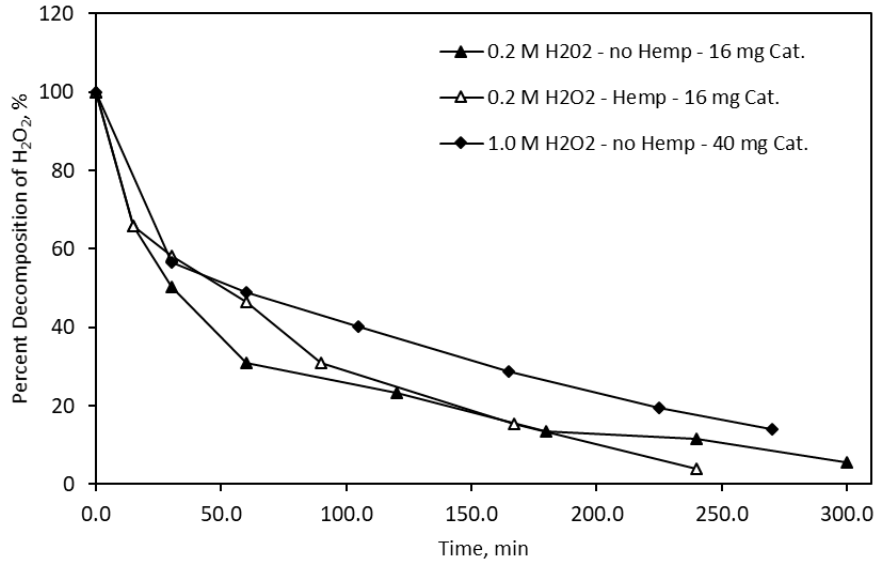

Figure 7. Percent decomposition of H_2O_2 with respect to initial concentration of H_2O_2 with respect to time in the presence of the bimetallic oxide catalyst at room temperature.

The decomposition behavior of H_2O_2 under the examined conditions provides insight into the dominant reaction pathways governing peroxide stability during hemp fiber bleaching. In the absence of the bimetallic oxide catalyst (Figure 5), Neither untreated nor alkali-treated hemp fibres produced a measurable catalytic effect, indicating that fiber components such as lignin fragments, phenolic groups, or trace metals do not significantly promote Fenton-like or peroxidase-type reactions (Wright et al., 2001). Upon addition of the bimetallic oxide catalyst (Figure 6), the decomposition of H_2O_2 accelerated markedly, reaching completion within 5 hours, demonstrating that heterogeneous catalysis dominates the reaction pathway. Such behavior is consistent with surface-mediated redox cycles in metal oxides, where adsorbed hydroperoxo and oxo intermediates undergo rapid electron-transfer-driven disproportionation (Lin and Gurol, 1998). The similar decomposition profiles in the presence and absence of alkali-treated fibres indicate that H_2O_2 consumption occurs primarily at the catalyst surface, with minimal contribution

from fiber-associated pathways (Plauck et al., 2016; Finocchiaro et al., 2023; Wang et al., 2018). Furthermore, varying the initial H_2O_2 concentration from 0.2 M to 1.0 M (Figure 7) did not significantly alter the decomposition kinetics, suggesting that the process proceeds under pseudo-first-order conditions and those catalyst surface sites remain far from saturation (Salem et al., 2000; Lousada et al., 2012). Collectively, these mechanistic insights confirm that the bimetallic oxide catalyst governs the decomposition of H_2O_2, while fiber-related reactions and solution-phase pathways play secondary roles under the bleaching conditions investigated.

CONCLUSION

The preliminary results of this study demonstrate that hemp fibres can be effectively bleached and prepared for textile applications using a catalyst-assisted hydrogen peroxide process operated entirely at room temperature. The FT-IR analyses clearly show that the alkali treatment loosens the fibre structure, removes some hemicellulose, and helps expose internal regions, but it does not remove enough lignin on its own. When hydrogen peroxide is added in the presence of the bimetallic iron oxide catalyst, far deeper changes occur. Lignin-related peaks decrease sharply, cellulose bands become sharper and more pronounced, and the overall fibre structure shifts toward a cleaner, cellulose-rich form suitable for cottonization.

Kinetic measurements support these findings. Without the catalyst, hydrogen peroxide remains largely stable and decomposes only slowly. With the catalyst, however, hydrogen peroxide breaks down in a moderate rate even at room temperature, showing that the reaction mainly occurs on the catalyst surface through a Fenton-like mechanism. The decomposition rate was not significantly influenced by the initial peroxide concentration or the presence of fibres, indicating that the catalyst controls the process and provides consistent performance.

Overall, this work shows that catalytic bleaching is a promising approach for producing cottonized hemp fibres in a more environmentally friendly and energy-efficient way. By allowing the process to occur at room temperature and atmospheric pressure, it has the potential to reduce production costs, decrease environmental impact, and encourage the broader use of hemp as a sustainable raw material in the textile industry. Future studies may further improve catalyst performance, optimise process times, or explore scaling strategies for industrial applications.

ACKNOWLEDGEMENTS

The authors would like to express their gratitude to Prof. Dr Serdar Akbayrak for providing bimetallic oxide catalysts, Doç. Dr. Eren Öner for providing hemp samples, Kübranur Ekin and Seher Kaya for contributing to the initial stages of the study for hemp bleaching.

Abstract

Chlorpyrifos (CPF), a widely used organophosphate pesticide, induces systemic toxicity through acetylcholinesterase inhibition and oxidative stress generation. Recent studies highlight its nephrotoxic potential via mitochondrial dysfunction, inflammation, and reactive oxygen species (ROS)-mediated injury. Syringic acid (SA), a naturally occurring phenolic acid abundant in fruits and medicinal plants, exhibits potent antioxidant, anti-inflammatory, and cytoprotective properties, including notable renoprotective effects in chemical-induced kidney injury models. This study investigated whether SA can mitigate CPF-mediated cytotoxicity in human embryonic kidney (HEK293) cells. Cells were exposed to CPF (400 µM) with or without SA (10, 25, 50 µM) for 24 h, and cell viability (MTT), cytotoxicity (LDH leakage), total antioxidant capacity (TAC), total oxidant status (TOS), and DNA fragmentation were evaluated. CPF significantly reduced cell viability and TAC while increasing LDH release, TOS, and DNA fragmentation ($p < 0.05$). SA co-treatment markedly alleviated these changes in a dose-dependent manner, restoring redox balance and reducing DNA damage. These findings suggest that syringic acid provides substantial protection against CPF-induced oxidative nephrotoxicity and may represent a promising therapeutic candidate for pesticide-associated renal injury.

Keywords: Chlorpyrifos, syringic acid, kidney, cytotoxicity

INTRODUCTION

Chlorpyrifos (CPF) is a broad-spectrum organophosphate pesticide extensively used in agriculture and household insect control. Although effective, CPF exhibits well-documented toxicity in humans and animals through inhibition of acetylcholinesterase (AChE), generation of reactive oxygen species (ROS), and induction of mitochondrial dysfunction. Beyond classical neurotoxicity, recent studies highlight its renal toxicity, characterized by increased oxidative stress, inflammatory signaling, and apoptosis in kidney tissues and renal-derived cell lines (Bai et al., 2023, Balakrishnan et al., 2025). Kidney cells are particularly susceptible to CPF due to high metabolic activity and abundant xenobiotic-metabolizing enzymes. CPF induces cellular injury through excessive ROS production, depletion of antioxidant defenses, lipid peroxidation, mitochondrial depolarization, and DNA fragmentation (Tanvir et al., 2016, Xu et al., 2018). These events contribute to nephrotoxicity and impair renal epithelial integrity, thereby increasing the risk of acute or chronic kidney damage.

Natural polyphenols have been widely studied for their capacity to attenuate xenobiotic-induced renal injury. Syringic acid (SA) is a methoxyphenolic acid naturally present in black currants, olives, dates, grapes, and several medicinal plants. SA exhibits potent free-radical scavenging, anti-inflammatory, anti-apoptotic, and mitochondrial protective effects (Sancak et al., 2016, Ogut et al., 2022;). Renal protection by SA has been reported in different chemical-induced nephrotoxicity models, where it reduces ROS, restores antioxidant enzymes, and inhibits DNA damage (Singh et al., 2021).

However, no study to date has evaluated whether SA can protect against chlorpyrifos-induced renal oxidative stress or DNA fragmentation. Therefore, the present study aimed to investigate the protective effects of SA in CPF-exposed HEK293 cells. We hypothesized that SA would ameliorate CPF-induced cytotoxicity, restore antioxidant balance, and reduce DNA fragmentation.

MATERIALS AND METHODS

2.1. Chemicals and reagents: Chlorpyrifos (≥98%) and syringic acid (≥98%) were purchased from Sigma-Aldrich (USA). MTT reagent, dimethyl sulfoxide (DMSO), and Triton X-100 were obtained from Merck (Germany). TAC and TOS kits were purchased from Rel Assay Diagnostics (Gaziantep, Turkey).

2.2. Cell culture: HEK293 cells were maintained in DMEM supplemented with 10% fetal bovine serum (FBS) and 1% penicillin–streptomycin at 37 °C in 5% CO_2. Cells between passages 5–15 were used.

2.3. Experimental design: Cells were seeded at densities of 1×10^5 cells/well (96-well plates) for MTT and LDH assays, and 2×10^5 cells/well (6-well plates) for oxidative and molecular analyses. After 24 h stabilization, the following groups were established: (1) Control (0.1% DMSO), 2) SA 10 µM 3) SA 25 µM 4) SA 50 µM 5) CPF 400 µM 6) CPF 400 µM + SA 10 µM 7) CPF 400 µM + SA 25 µM 8) CPF 400 µM + SA 50 µM

2.4. MTT Cell-Viability Assay

Cell viability was measured by the colorimetric MTT method. After exposure to treatments for 48 h, 10 µL of MTT solution (0.5 mg/mL) was added to each well of a 96-well plate and incubated for 3 h at 37 °C. Formazan crystals were dissolved in 100 µL DMSO and absorbance was read at 570 nm (reference 630 nm) using a microplate reader. Cell viability was expressed as % of control.

2.5. Lactate Dehydrogenase (LDH) Release Assay

LDH release was determined with a commercial kit (Abcam ab102526) following the supplier's protocol. Briefly, 100 µL of culture supernatant was mixed with 100 µL of LDH reaction solution in a new 96-well plate and incubated for 30 min at room temperature. Absorbance was recorded at 490 nm. Total LDH release was calculated relative to cells lysed with 2 % Triton X-100 (positive control) and expressed as % of control (n = 3 biological replicates with triplicates each).

2.6. Total Antioxidant Capacity (TAC) and Total Oxidant Status (TOS)

TAC and TOS were measured using Rel Assay Diagnostics kits (RL0017 and RL0024, Gaziantep, Turkey). For TAC, 30 µL of sample was added to 500 µL of Reagent 1, and absorbance was measured at 660 nm after 30 s. Then 75 µL of Reagent 2 was added and the absorbance was recorded again after 5 min. Values were calibrated with Trolox and expressed as mmol Trolox eq./L.

For TOS, 75 µL of sample was added to 500 µL of Reagent 1 and initial absorbance recorded at 530 nm; 15 µL of Reagent 2 was added and a second reading was taken after 5 min. Results were expressed as µmol H_2O_2 eq./L. All values were normalized to protein content and used to calculate the oxidative stress index.

2.7. DNA Fragmentation (DPA Colorimetric Assay)

DNA fragmentation was quantified by the diphenylamine (DPA) colorimetric assay (Burton method, modified). After treatments, cells were lysed in a hypotonic lysis buffer (10 mM Tris-HCl, 10 mM EDTA, 0.5 % Triton X-100, pH 7.4) and centrifuged at 13 000×g for 20 min at 4 °C to separate fragmented DNA (supernatant) from intact chromatin (pellet). Both fractions were precipitated overnight with 12.5 % TCA at 4 °C and hydrolyzed in 5 % TCA at 90 °C for 15 min. After cooling, 1 mL of fresh DPA reagent (150 mg DPA in 10 mL glacial acetic acid + 150 µL H_2SO_4 + 50 µL 1.6 % acetaldehyde) was added. Samples were incubated at 37 °C for 4 h and absorbance read at 600 nm.

2.9. Statistical analysis: Statistical analyses were conducted using IBM SPSS Statistics (Version 25.0, IBM Corp., Armonk, NY, USA). Differences among multiple groups were evaluated by one-way analysis of variance (ANOVA) followed by Tukey's post hoc test to determine pairwise significance. All experiments were performed in triplicate (n=3 per group), and the results were expressed as mean ± standard deviation (SD). A probability value of $p < 0.05$ was considered statistically significant.

RESULTS and DISCUSSION

The present study investigated the protective effects of SA, a naturally occurring phenolic compound, against CPF-induced cytotoxicity, oxidative stress, and DNA damage in HEK293 cells. CPF is known primarily for its neurotoxicity; however, emerging evidence highlights that the kidney is a major secondary target due to CPF accumulation, oxidative metabolism, and the kidney's high vulnerability to electrophilic xenobiotics. In this

context, HEK293 cells represent a suitable in vitro model for elucidating CPF-triggered nephrotoxic responses and evaluating potential renoprotective agents.

Exposure to CPF (50 µM, 48 h) significantly decreased cell viability, as shown by a reduction in MTT metabolic activity to 58.3 ± 3.1% compared to the control (100 ± 4.2%). The decline in mitochondrial metabolic capacity reflects CPF's known ability to inhibit mitochondrial respiratory complexes, impair ATP production, and generate excessive reactive oxygen species (ROS), all of which contribute to mitochondrial dysfunction and apoptotic signaling. A parallel increase in LDH release (199.6 ± 10.2%) further demonstrated that CPF caused substantial membrane damage, suggesting that both necrotic leakage and late-stage apoptotic processes were induced (Fig. 1).

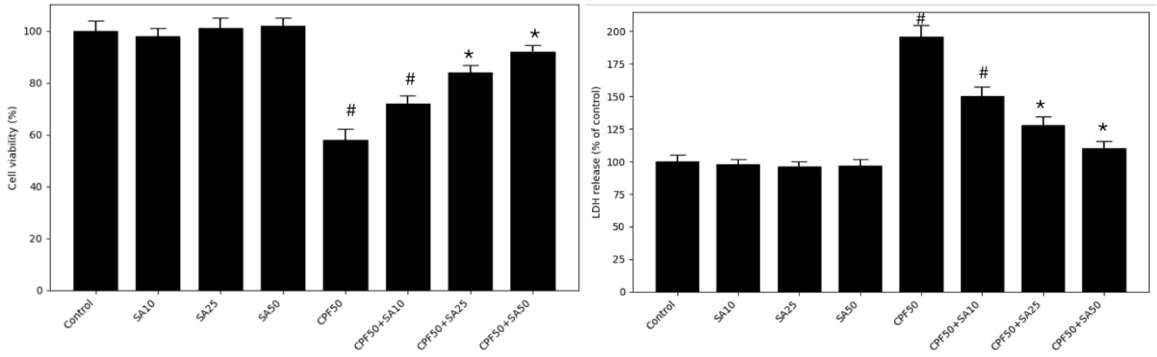

Figure 1. Effect of syringic acid on chlorpyrifos-induced cytotoxicity in HEK293 cells. Cell viability determined by the MTT assay and lactate dehydrogenase (LDH) release following 48 h exposure to chlorpyrifos (CPF, 400 µM) alone or in combination with SA (SA, 10–50 µM). CPF significantly decreased cell viability and increased LDH leakage compared with control ($p < 0.05$). Co-treatment with SA dose-dependently restored mitochondrial activity and reduced membrane damage, demonstrating its protective role against CPF-induced cytotoxicity. Data are expressed as mean ± SD (n = 3); *$p < 0.05$ versus control, # $p < 0.01$ versus control.

Co-treatment with SA significantly improved mitochondrial metabolic activity in a dose-dependent manner (from 72.4% at 10 µM to 92.3% at 50 µM) and markedly reduced LDH release (from 152.4% at 10 µM to 110.8% at 50 µM). These findings indicate that SA protects both mitochondrial and plasma membrane integrity. The improvements in MTT and LDH align with the well-documented antioxidant and cytoprotective actions of SA, which has been shown to stabilize lipid membranes, inhibit lipid peroxidation, and preserve mitochondrial function in toxin-exposed renal and hepatic cells (Sabahi et al., 2021, Mirza et al., 2022).

CPF treatment produced a pronounced oxidative shift characterized by a sharp decrease in total antioxidant capacity (TAC: 0.89 ± 0.05 mmol Trolox eq/L) and a more than twofold increase in total oxidant status (TOS: 18.7 ± 1.1 µmol H_2O_2 eq/L). This pattern is consistent with CPF's known ability to generate ROS through cytochrome P450 metabolism, mitochondrial complex inhibition, and oxidative biotransformation of chlorpyrifos-oxon. Oxidative stress is a key mechanism driving CPF-induced nephropathy, contributing to lipid peroxidation, protein oxidation, and DNA fragmentation (Fig. 2).

SA effectively counteracted CPF-induced redox imbalance. TAC increased progressively with SA concentration, reaching 1.92 ± 0.05 mmol Trolox eq/L at 50 µM, exceeding even the control mean value. This suggests not only restoration but enhancement of antioxidant defense, consistent with literature reporting SA's ability to modulate Nrf2 activation, upregulate antioxidant enzymes (SOD, CAT, GSH-Px), and regenerate redox cofactors (Ramachandran et al., 2012; Rashedinia et al., 2021; Demir et al., 2024). Correspondingly, TOS decreased dose-dependently to 10.3 ± 0.5 µmol H_2O_2 eq/L at the highest SA concentration, approaching near-control levels.

These results collectively indicate that SA efficiently suppresses CPF-generated ROS and restores intracellular redox equilibrium. Mechanistically, this effect may involve direct ROS scavenging, interruption of radical chain reactions, enhancement of endogenous antioxidants, and stabilization of mitochondrial redox centers.

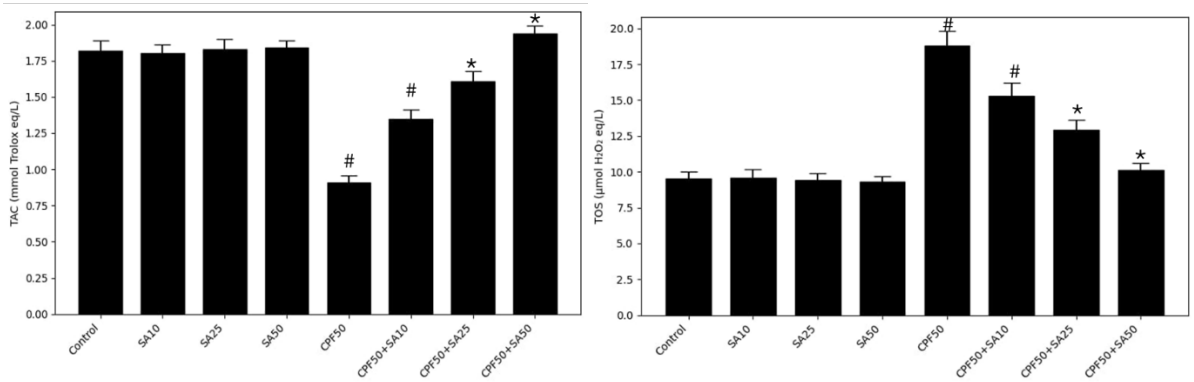

Figure 2. Effects of syringic acid on total antioxidant capacity (TAC) and total oxidant status (TOS) in CPF-treated HEK293 cells. SA co-treatment markedly reversed CPF-induced oxidative imbalance. TAC levels increased while TOS values decreased in a concentration-dependent manner, approaching control levels at 50 µM SA. These findings indicate that SA enhances the antioxidant defense system and mitigates CPF-triggered oxidative stress. Values are mean ± SD (n = 3); *p < 0.05 versus control, # p < 0.01 versus control.

CPF exposure resulted in a dramatic increase in DNA fragmentation (39.1 ± 2.8%) compared with the control (6.4 ± 0.6%), confirming that CPF induces substantial genomic instability. CPF-related DNA damage is attributed to ROS-induced strand breaks, oxidative modification of nucleotides, and activation of intrinsic apoptotic pathways, including cytochrome c release and caspase-dependent DNase activation. The magnitude of DNA fragmentation observed here is consistent with prior reports demonstrating CPF-induced genotoxicity in renal, hepatic, and neuronal cells (Fig. 3).

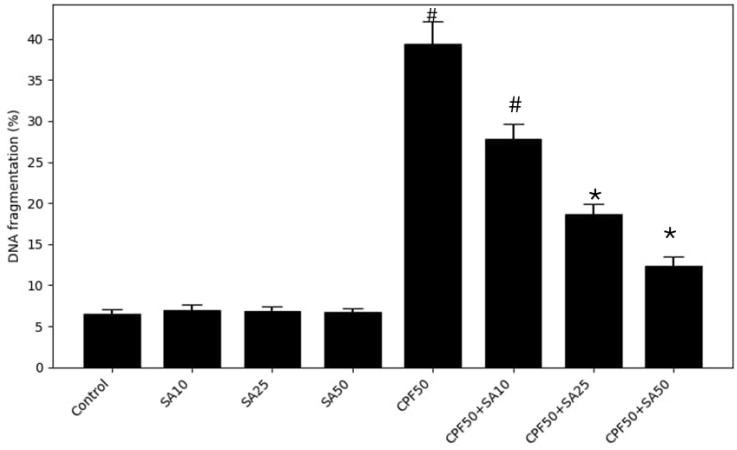

Figure 3. Effect of syringic acid on CPF-induced DNA fragmentation in HEK293 cells. CPF exposure significantly increased DNA fragmentation. SA markedly reduced DNA fragmentation in a dose-dependent manner. Data represent mean ± SD (n = 3); *p < 0.05 versus control # p < 0.01 versus control.

SA significantly reduced DNA fragmentation in a concentration-dependent manner. At 50 µM, fragmentation decreased to 12.2 ± 1.0%, representing nearly a 70% reduction in CPF-induced genomic damage. This effect may stem from SA's ability to inhibit ROS-driven DNA oxidation, protect nuclear chromatin, and prevent apoptotic nuclease activation. Moreover, the mitochondrial-protective action of SA likely prevents cytochrome c leakage and downstream caspase activation, thereby limiting apoptotic DNA cleavage (Mihanfar et al., 2021, Akarsu et al., 2024).

CONCLUSION

The integrated results strongly suggest that SA exerts potent protective effects against CPF-induced oxidative stress, cytotoxicity, and DNA damage in HEK293 cells. Through restoration of redox balance, stabilization of mitochondrial and plasma membranes, and suppression of genomic injury, SA emerges as a promising renoprotective agent. These findings warrant further mechanistic studies and in vivo evaluations to explore SA's therapeutic potential in environmental nephrotoxic exposures.

Abstract

Paraquat (PQ) is a highly toxic bipyridyl herbicide known to induce dopaminergic neuronal degeneration primarily through excessive production of reactive oxygen species (ROS), mitochondrial dysfunction, and apoptotic DNA injury. Although its neurodegenerative effects are well documented, there is currently no effective therapeutic strategy for attenuating PQ-induced oxidative and cholinergic toxicity. Vanillic acid (VA), a naturally occurring phenolic acid abundant in edible plants, possesses potent antioxidant, anti-inflammatory, and mitochondrial protective properties, suggesting potential neuroprotective efficacy. This study investigated the protective effects of VA against PQ-induced cytotoxicity in human neuroblastoma SH-SY5Y cells. Cells were exposed to PQ (100 μM) alone or in combination with VA (10, 25, 50 μM) for 24 hours. Cell viability (MTT), cytotoxicity (LDH release), oxidative stress status (TAC, TOS), DNA fragmentation, and acetylcholinesterase (AChE) activity were assessed. PQ markedly reduced viability, TAC, and AChE activity while significantly elevating LDH release, TOS, and DNA fragmentation. VA co-treatment ameliorated all alterations in a dose-dependent manner, restoring redox balance, reducing apoptotic injury, and improving cholinergic enzyme function. These findings provide the first evidence that vanillic acid mitigates PQ-induced neurotoxicity via antioxidant and anti-apoptotic mechanisms, highlighting its potential as a natural neuroprotective candidate.

Keywords: Paraquat, vanilic acid, neurotoxic, protective effect

INTRODUCTION

Paraquat (PQ) is a widely used herbicide that remains a major public health concern due to its severe systemic and neurotoxic effects. PQ readily crosses neuronal membranes using the dopamine transporter (DAT) and accumulates in dopaminergic neurons, where it undergoes redox cycling and generates excessive superoxide radicals. This results in mitochondrial complex I inhibition, ATP depletion, lipid peroxidation, and oxidative DNA damage that mechanisms strongly associated with Parkinsonian neurodegeneration (Liu et al., 2022). Experimental studies have shown that PQ exposure induces ROS overproduction, mitochondrial membrane depolarization, and activation of intrinsic apoptotic pathways in models of dopaminergic toxicity. In addition to oxidative collapse, PQ disrupts cholinergic signaling through oxidative inhibition of acetylcholinesterase (AChE), further amplifying neuronal dysfunction. Despite extensive research, no clinically effective neuroprotective therapy exists for PQ-induced oxidative and apoptotic injury. Therefore, there is increasing interest in plant-derived phenolic compounds with strong antioxidant capacity that may counteract PQ-mediated toxicity (Colle et al., 2021, Xiao et al., 2022).

Vanillic acid (VA; 4-hydroxy-3-methoxybenzoic acid) is a naturally occurring phenolic acid found in numerous fruits, vegetables, and medicinal plants. VA exhibits potent antioxidant, free radical-scavenging, anti-inflammatory, and anti-apoptotic activities (Ingole et al., 2021). It has been shown to attenuate oxidative injury in models of renal, hepatic, and cardiovascular toxicity, and to prevent mitochondrial damage by suppressing lipid peroxidation and promoting endogenous antioxidant defense (Bains et al., 2022, Kaur et al., 2022). Although VA has demonstrated protective potential in several oxidative stress models, its effect on PQ-induced neuronal toxicity has not been previously investigated.

Given the strong mechanistic overlap between PQ-driven oxidative injury and the antioxidant properties of VA, we hypothesized that VA could mitigate PQ-induced cytotoxicity through restoration of redox homeostasis and attenuation of apoptotic DNA degradation. Therefore, this study was designed to evaluate the protective effects of

vanillic acid against PQ-induced neurotoxicity in SH-SY5Y cells using assays of viability (MTT), membrane damage (LDH), oxidative stress (TAC/TOS), DNA fragmentation, and AChE activity.

MATERIALS AND METHODS

2.1. Chemicals and reagents: Paraquat dichloride (≥98% purity) and vanillic acid (≥98%) were obtained from Sigma-Aldrich (USA). MTT (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide), dimethyl sulfoxide (DMSO), and all analytical-grade salts and buffers were purchased from Merck (Germany). Total antioxidant capacity (TAC) and total oxidant status (TOS) assay kits were supplied by Rel Assay Diagnostics (Gaziantep, Türkiye). DNA fragmentation was quantified using the diphenylamine (DPA) colorimetric method. Acetylcholinesterase (AChE) activity was determined using Ellman's colorimetric assay.

2.2. Cell culture: SHSY-5Ycells were maintained in DMEM supplemented with 10% fetal bovine serum (FBS) and 1% penicillin–streptomycin at 37 °C in 5% CO_2. Cells between passages 5–15 were used.

2.3. Experimental design: Cells were seeded at densities of 1×10^5 cells/well (96-well plates) for MTT and LDH assays, and 2×10^5 cells/well (6-well plates) for oxidative and molecular analyses. After 24 h stabilization, the following groups were established: (1) Control (0.1% DMSO), 2) PQ 100 µM 3) PQ + VA 10 µM 4) PQ + VA 25 µM 5) PQ + VA 50 µM

2.4. MTT Cell-Viability Assay

Cell viability was measured by the colorimetric MTT method. After exposure to treatments for 48 h, 10 µL of MTT solution (0.5 mg/mL) was added to each well of a 96-well plate and incubated for 3 h at 37 °C. Formazan crystals were dissolved in 100 µL DMSO and absorbance was read at 570 nm (reference 630 nm) using a microplate reader. Cell viability was expressed as % of control.

2.5. Lactate Dehydrogenase (LDH) Release Assay

LDH release was determined with a commercial kit (Abcam ab102526) following the supplier's protocol. Briefly, 100 µL of culture supernatant was mixed with 100 µL of LDH reaction solution in a new 96-well plate and incubated for 30 min at room temperature. Absorbance was recorded at 490 nm. Total LDH release was calculated relative to cells lysed with 2 % Triton X-100 (positive control) and expressed as % of control (n = 3 biological replicates with triplicates each).

2.6. Total Antioxidant Capacity (TAC) and Total Oxidant Status (TOS)

TAC and TOS were measured using Rel Assay Diagnostics kits (RL0017 and RL0024, Gaziantep, Turkey). For TAC, 30 µL of sample was added to 500 µL of Reagent 1, and absorbance was measured at 660 nm after 30 s. Then 75 µL of Reagent 2 was added and the absorbance was recorded again after 5 min. Values were calibrated with Trolox and expressed as mmol Trolox eq./L.

For TOS, 75 µL of sample was added to 500 µL of Reagent 1 and initial absorbance recorded at 530 nm; 15 µL of Reagent 2 was added and a second reading was taken after 5 min. Results were expressed as µmol H_2O_2 eq./L. All values were normalized to protein content and used to calculate the oxidative stress index.

2.7. DNA Fragmentation (DPA Colorimetric Assay)

DNA fragmentation was quantified by the diphenylamine (DPA) colorimetric assay (Burton method, modified). After treatments, cells were lysed in a hypotonic lysis buffer (10 mM Tris-HCl, 10 mM EDTA, 0.5 % Triton X-100, pH 7.4) and centrifuged at 13 000×g for 20 min at 4 °C to separate fragmented DNA (supernatant) from intact chromatin (pellet). Both fractions were precipitated overnight with 12.5 % TCA at 4 °C and hydrolyzed in 5 % TCA at 90 °C for 15 min. After cooling, 1 mL of fresh DPA reagent (150 mg DPA in 10 mL glacial acetic acid + 150 µL H_2SO_4 + 50 µL 1.6 % acetaldehyde) was added. Samples were incubated at 37 °C for 4 h and absorbance read at 600 nm.

2.8. Acetylcholinesterase (AChE) activity: AChE activity was determined using Ellman's colorimetric assay. Briefly, cell lysates were incubated with acetylthiocholine iodide and DTNB (5,5′-dithiobis-2-nitrobenzoic acid), and absorbance was read at 412 nm. Activity was expressed as % of control.

2.9. Statistical analysis: Statistical analyses were conducted using IBM SPSS Statistics (Version 25.0, IBM Corp., Armonk, NY, USA). Differences among multiple groups were evaluated by one-way analysis of variance (ANOVA) followed by Tukey's post hoc test to determine pairwise significance. All experiments were performed in triplicate (n=3 per group), and the results were expressed as mean ± standard deviation (SD). A probability value of $p < 0.05$ was considered statistically significant.

RESULTS and DISCUSSION

As shown in Fig. 1, paraquat (PQ, 100 µM) exposure induced marked neurotoxic alterations in SH-SY5Y cells, consistent with its established role as a mitochondrial complex I inhibitor and ROS generator. PQ alone significantly reduced mitochondrial metabolic activity (MTT) to 52.8 ± 3.4% of the control ($p < 0.05$) and increased LDH release to 221.6 ± 11.2%, demonstrating severe impairment of membrane integrity. These findings align with earlier reports showing that PQ triggers oxidative collapse and apoptotic-necrotic hybrid cell death via ROS overload and mitochondrial dysfunction (Menchinskaya et al., 2021).

Co-treatment with vanillic acid (VA) produced a clear, dose-dependent cytoprotective improvement. VA at 10, 25, and 50 µM restored MTT viability to 67.4 ± 2.9%, 79.3 ± 3.1%, and 91.5 ± 2.4%, respectively, while reducing LDH release to 176.3 ± 8.2%, 139.7 ± 7.1%, and 118.2 ± 6.4% ($p < 0.05$ vs. PQ). These improvements strongly indicate that VA attenuates PQ-driven mitochondrial dysfunction and membrane destabilization, likely through its phenolic structure's ROS-scavenging ability (Ay 2022, Surya et al., 2023).

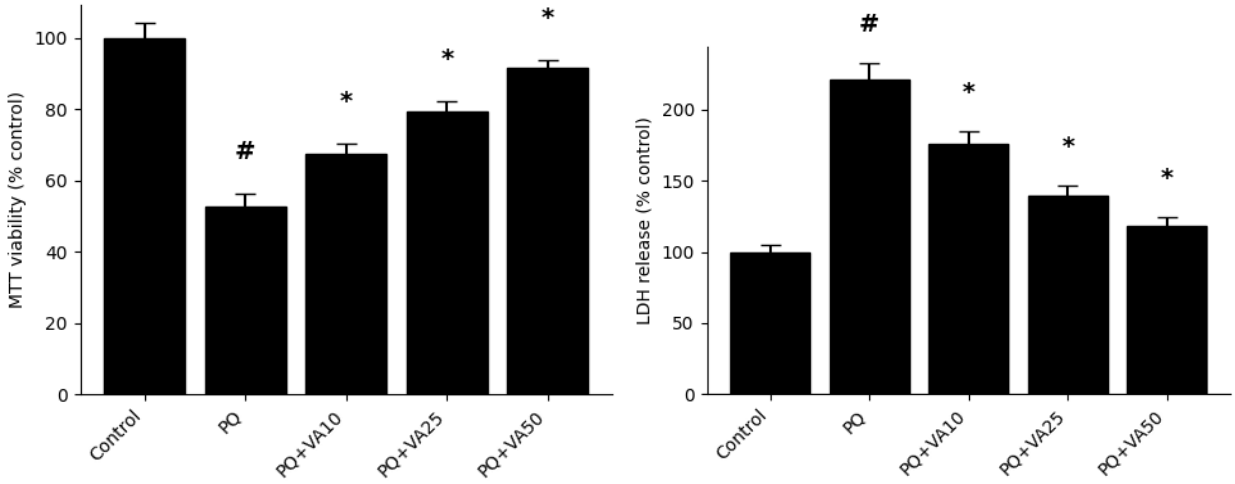

Figure 1. Effect of vanillic acid on paraquat-induced cytotoxicity in SH-SY5Y cells. Cell viability determined by the MTT assay and lactate dehydrogenase (LDH) release following 48 h exposure to paraquat alone or in combination with vanillic acid (10–50 µM). Data are expressed as mean ± SD (n = 3); *$p < 0.05$ versus PQ, # $p < 0.01$ versus control.

As shown Fig. 2, Oxidative stress markers further supported this protective mechanism. PQ significantly lowered total antioxidant capacity (TAC) from 1.48 ± 0.06 to 0.74 ± 0.04 mmol Trolox eq/L, while elevating total oxidant status (TOS) from 10.6 ± 0.7 to 21.8 ± 1.3 µmol H_2O_2 eq/L ($p < 0.05$). Co-administration of VA restored TAC values in a dose-dependent manner (10 µM: 1.12 ± 0.05, 25 µM: 1.34 ± 0.06, 50 µM: 1.56 ± 0.05) and simultaneously suppressed TOS (10 µM: 17.3 ± 0.9, 25 µM: 14.2 ± 0.8, 50 µM: 11.6 ± 0.7). These results confirm that VA effectively modulates PQ-induced oxidative imbalance by boosting endogenous antioxidant defenses and reducing ROS load (Colle and Farina, 2021, Alizadeh et al., 2022, Choi et al., 2024).

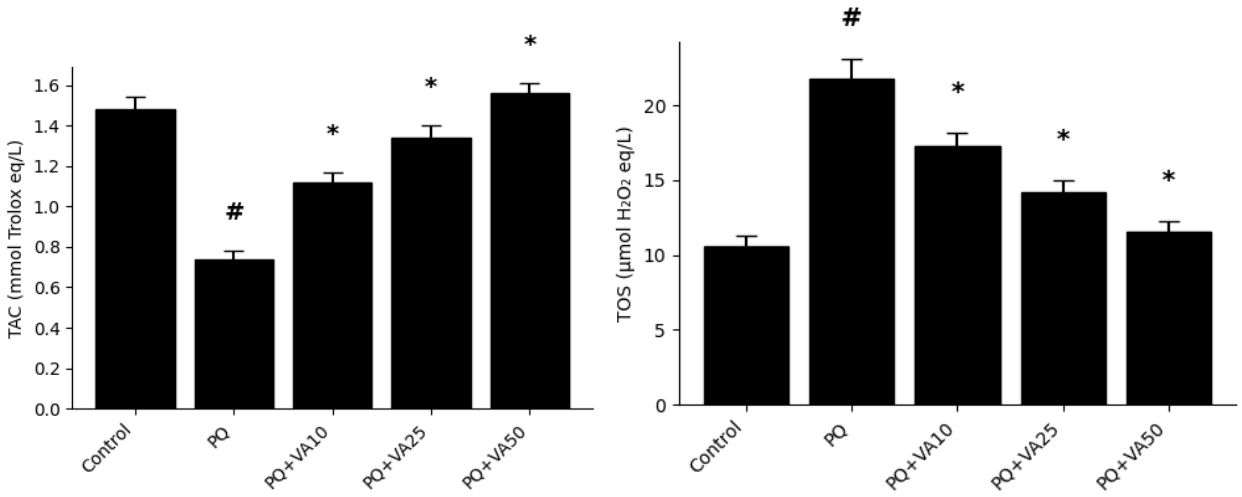

Figure 2. Effects of vanillic acid on total antioxidant capacity (TAC) and total oxidant status (TOS) in paraquat-exposed SH-SY5Y cells. Values are mean ± SD (n = 3); *p < 0.05 versus PQ, # p < 0.01 versus control.

PQ exposure also dramatically increased DNA fragmentation from 6.7 ± 0.6% to 44.1 ± 3.2%, reflecting extensive apoptotic DNA cleavage, which is consistent with PQ's known ability to generate hydroxyl radicals that directly damage DNA. VA significantly reduced fragmentation to 31.4 ± 2.2%, 21.7 ± 1.8%, and 13.9 ± 1.1% with 10, 25, and 50 μM treatments. This progressive attenuation suggests that VA suppresses mitochondrial-dependent apoptosis by stabilizing redox status and limiting ROS-mediated nuclear injury (Colle and Farina, 2021).

Finally, PQ caused substantial inhibition of acetylcholinesterase (AChE), lowering activity from 100 ± 4.5% to 47.2 ± 3.1% (p < 0.05), which may contribute to cholinergic dysfunction observed in PQ toxicity models (Fig. 3) (Ramalho et al., 2025). VA reversed this inhibition, restoring AChE activity to 59.8 ± 2.9%, 72.5 ± 2.6%, and 86.1 ± 2.4% across the three tested concentrations. This effect has not been previously documented and may involve VA's ability to reduce oxidative modification of AChE's catalytic residues.

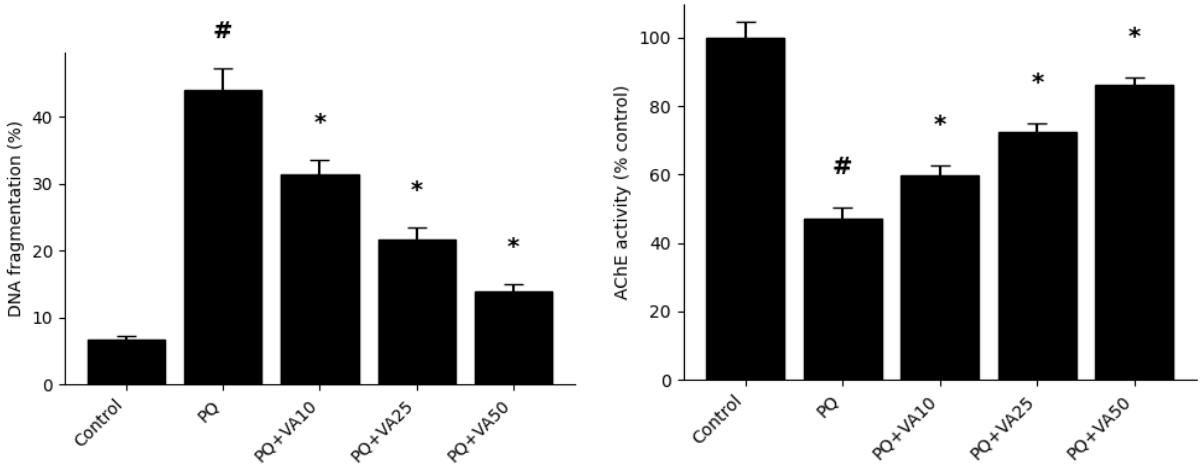

Figure 3. Effect of vanillic acid on DNA fragmentation and acetylcholinesterase (AChE) activity in paraquat-treated SH-SY5Y cells. Data represent mean ± SD (n = 3); *p < 0.05 versus PQ, # p < 0.01 versus control.

CONCLUSION

Collectively, these findings demonstrate that vanillic acid provides multi-level protection against paraquat-induced neurotoxicity by improving mitochondrial viability, reducing membrane leakage, restoring antioxidant status, inhibiting oxidative DNA fragmentation, and normalizing AChE function. Considering that no previous studies

have evaluated VA in PQ-induced neuronal injury, this work provides the first evidence supporting its therapeutic potential as a natural neuroprotective compound.

Abstract

Quetiapine is a poorly water-soluble atypical antipsychotic whose therapeutic performance is restricted by low dissolution rate, extensive hepatic first-pass metabolism, and variable oral bioavailability. These challenges contribute to fluctuating plasma concentrations and a narrow therapeutic window, necessitating advanced formulation strategies. Bilosomes—bile-salt-modified lipid vesicles—offer enhanced solubilization, permeability, and gastrointestinal stability for hydrophobic drugs. This study aimed to formulate quetiapine-loaded bilosomes and optimize their Critical quality attributes (CQAs) using a Central Composite Design (CCD) within a quality by design (QbD) framework. Sunflower phosphatidylcholine (SPC) and cholesterol were employed as lipid components, and STC as the bile salt modifier. Bilosomes were prepared using thin-film hydration followed by sonication. Amount of STC and sonication time served as independent variables, while particle size (PS), polydispersity index (PDI), Zeta potential (ZP), and Entrapment efficiency (EE%) were selected as CQAs. CCD revealed significant linear, quadratic, and interaction effects on all responses. Across the design space, PS ranged 148–340 nm, PDI 0.36–0.62, ZP −19.2 to −32.9 mV, and EE 61–84%. Optimal results were achieved with intermediate STC levels and moderate sonication times. Run 5 was identified as the optimal formulation, yielding PS 154.5 ± 9.2 nm, PDI 0.37 ± 0.02, ZP −28.2 ± 0.4 mV, and EE 83.0 ± 1.4%. These findings demonstrate the suitability of bilosomes as a robust nanocarrier platform for improving the oral delivery of quetiapine and similar poorly soluble drugs.

Keywords: Quetiapine; bilosomes; bile salts; QbD; CCD.

INTRODUCTION

Quetiapine is a widely prescribed atypical antipsychotic used for schizophrenia, bipolar disorder, and major depressive disorder, yet its clinical performance is restricted by major biopharmaceutical shortcomings. It exhibits extremely low aqueous solubility and undergoes extensive hepatic first-pass metabolism, resulting in oral bioavailability of only around 9% and substantial variability in systemic exposure (Narala & Veerabrahma, 2013). These characteristics place quetiapine within the Biopharmaceutics Classification System (BCS) Class II category, where absorption is primarily limited by dissolution rather than permeability. Additionally, rapid gastrointestinal absorption coupled with extensive metabolic conversion leads to low and unpredictable plasma levels, further contributing to highly variable therapeutic responses (Zubiaur et al., 2022). These limitations necessitate high oral doses to achieve effective plasma concentrations, increasing the likelihood of adverse effects such as sedation and metabolic disturbances. Collectively, these challenges highlight the urgent need for advanced drug delivery approaches capable of improving quetiapine's solubility, reducing first-pass metabolic loss, and ultimately enhancing its therapeutic effectiveness.

Lipid-based nanocarriers have become essential tools for improving the oral delivery of poorly soluble drugs, and among them, bilosomes have emerged as one of the most promising and advanced systems. Although structurally related to liposomes, bilosomes incorporate bile salts such as STC into the phospholipid bilayer, resulting in markedly enhanced membrane fluidity, elasticity, and stability under gastrointestinal conditions (Nayak et al., 2023). Unlike conventional liposomes—which rely primarily on cholesterol to reduce membrane permeability and

limit drug leakage (Torchilin, 2005)—bilosomes possess intrinsic resistance to bile salt exchange, enzymatic degradation, and pH fluctuations. Moreover, the presence of bile salts enhances mucosal penetration and facilitates lymphatic uptake, enabling drugs to partially bypass hepatic first-pass metabolism and significantly improve systemic exposure (Kaurav et al., 2024). While solid lipid nanoparticles (SLNs) also offer protection and controlled release, their relatively rigid and crystalline lipid matrices may limit adaptability in dynamic gastrointestinal environments (Müller et al., 2000). Taken together, these advantages position bilosomes as a superior oral nanocarrier platform, offering greater stability, enhanced permeability, and more efficient absorption compared with traditional liposomes and SLNs.

However, the fabrication of bilosomes is a complex process where the resulting physicochemical properties are highly sensitive to formulation composition and processing energy. To address this, the QbD approach offers a systematic framework for optimization. By utilizing statistical tools like the CCD, researchers can efficiently model the interactions between critical variables to ensure a robust final formulation (Chettupalli et al., 2025).

This study focuses on the formulation and optimization of Quetiapine-loaded bilosomes using SPC, cholesterol, and STC. Employing a CCD methodology, we investigated the influence of STC concentration and sonication time on CQAs, including PS, PDI, ZP, and EE. The primary objective of this work is to develop an optimized bilosome formulation that effectively mitigates the solubility and metabolic limitations of Quetiapine fumarate, thereby enhancing its oral bioavailability.

MATERIALS AND METHODS

Materials: SPC was obtained from Shankar (India). Cholesterol and STC were purchased from Sigma-Aldrich (St. Louis, MO, USA). Quetiapine was kindly provided by ILKO Pharmaceuticals (Ankara, Türkiye). All other reagents were of analytical grade.

Preparation Method for Quetiapine Bilosomes: Quetiapine bilosomes were prepared using a thin lipid film hydration method (Elkomy et al., 2022) followed by sonication. Briefly, 500 mg of SPC and 12 mg of cholesterol were dissolved in 20 mL of methanol in a round-bottom flask. Subsequently, 20 mg of quetiapine was added and stirred until fully dissolved. The organic solvent was evaporated under reduced pressure at 40°C using a rotary evaporator (IKA, RV 3 eco, Germany) to form a thin, uniform lipid film on the flask wall. The lipid film was hydrated with 30 mL of distilled water containing STC at amounts defined by the experimental design. The mixture was gently agitated to facilitate hydration. The hydrated lipid suspension was then sonicated in a bath sonicator (Ultrasonic Cleaner WUC-A, Germany) for specific times according to the DOE to produce a homogenous bilosomal dispersion. The bilosomal dispersions were stored at 4 °C until further characterization

Characterization of PS, PDI, ZP, and EE: PS, PDI, and ZP measurements were performed via dynamic light scattering (Aburahma, 2016) using a Zetasizer Nano ZS (Malvern Instruments Ltd., UK). Samples were diluted with distilled water and analyzed at room temperature. For the EE% calculation, 2 mL of bilosomal dispersion was centrifuged at 13,000 rpm for 1 hour. The supernatant containing free quetiapine was collected and analyzed by UV spectrophotometry at the drug's characteristic wavelength (254 nm). EE% was calculated using the equation (El Menshawe et al., 2020):

EE% = (Total amount of quetiapine – free quetiapine /Total amount of quetiapine used) x100

Experimental Design and Optimization: The formulation optimization was conducted using Design Expert® software (version 13, Stat-Ease Inc., Minneapolis, MN, USA) through a CCD approach. This systematic design evaluated the effects of the amount of STC (mg) and sonication time (minutes) on CQAs, including PS (nm), PDI, ZP (mV), and EE (%).

RESULTS and DISCUSSION

CCD provided a comprehensive understanding of how STC concentration and sonication time influence the CQAs of quetiapine-loaded bilosomes. Across the experimental design space, PS ranged from approximately 148 to 340 nm, PDI from 0.36 to 0.62, ZP from −19.2 to −32.9 mV, and EE from 61% to 84% as in table **1**. These broad response ranges clearly indicate that STC concentration and sonication time are genuinely critical formulation/process variables. The models confirmed statistically significant linear, quadratic, and interaction contributions for all CQAs, underscoring the suitability of QbD-based CCD for defining a scientifically justified design space. The observed behaviors can be interpreted in terms of phospholipid bilayer packing, bile-salt-induced membrane fluidity changes, cavitation-mediated fragmentation, and drug–bilayer interactions. These trends are

consistent with established findings in bilosomal (Zafar et al., 2022) and other lipid systems using QbD based optimized approaches (Cunha et al., 2020).

Table 1. CCD formulation runs and corresponding in vitro results of the responses (CQAs)

	Independent Variables		**Dependent variables (Responses)**			
Run	STC (mg)	Sonication time (minutes)	PS (nm)	PDI	ZP (mV)	EE (%)
1	20	10	175	0.48	-24.2	73
2	30	8	161	0.38	-27.9	82
3	20	5	243	0.46	-21.9	65
4	44	8	170	0.39	-32.9	78
5	30	8	148	0.36	-28.4	84
6	30	11	176	0.43	-29.4	79
7	40	5	288	0.55	-30.3	67
8	30	4	296	0.62	-27.0	61
9	16	8	340	0.53	-19.2	68
10	40	10	307	0.72	-27.1	80

Effects of independent variables on PS: The CCD revealed a distinct valley-shaped response surface for PS, wherein bilosomes produced under suboptimal conditions—particularly low STC concentrations and short sonication durations—were significantly larger, often approaching or exceeding 300 nm. This trend was evident in runs such as 8 and 9. At these conditions, the bilosomal bilayer is dominated by phosphatidylcholine and cholesterol, forming rigid, densely packed membranes with insufficient flexibility to form small vesicles upon hydration. As noted in lipid nanoparticle literature, rigid bilayers lacking adequate membrane-modifying agents tend to generate larger structures regardless of processing energy input (Cunha et al., 2020).

As STC concentrations increased into the intermediate range, PS decreased sharply due to reduced surface tension. This parallels that observed for bile-salt-modified bilosomes formulated with other drugs. Elkomy et al. (2022) demonstrated that the incorporation of sodium deoxycholate in soybean phosphatidylcholine bilosomes facilitated the formation of vesicles around 196.5 nm due to enhanced bilayer fluidization. Though the optimized quetiapine bilosomes in the present study achieved slightly smaller PS (~148–170 nm), the difference can reasonably be attributed to differences in phospholipid source (sunflower versus soybean), drug structure (quetiapine versus berberine), and bile-salt type (STC versus sodium deoxycholate). At the highest tested STC levels (near 44 mg), PS increased slightly relative to the optimum. This behavior can be explained by the classical bilayer solubilization model: once bile salts exceed a threshold concentration, they transition from acting as membrane-fluidizing amphiphiles to initiating bilayer solubilization and mixed micelle formation. This disrupts lamellar integrity, alters membrane curvature, and promotes the formation of larger or less stable vesicular structures. Similarly, the vesicle enlargement at excessive bile-salt concentrations has been attributed to the self-aggregation of bile salts (Elkomy et al. 2022).

Sonication time exhibited a clear nonlinear influence on bilosome formation. Short sonication durations (4–5 minutes) did not supply sufficient cavitational energy to fully disrupt multilamellar structures, resulting in larger and more heterogeneous vesicles. As sonication time increased toward an intermediate range (approximately 7–9 minutes), PS decreased markedly due to more efficient fragmentation and reorganization of the bilayers, consistent with the general pattern observed in lipid nanoparticle systems where extended sonication significantly reduces PS by enhancing cavitation-driven breakup of aggregates (Ali et al., 2010). However, when processing time exceeded the optimal window (beyond ~10–12 minutes), PS no longer decreased and PDI values began to widen, reflecting over-processing effects such as localized heating, membrane disruption, pore formation, and potential reaggregation of destabilized vesicles. Overall, these findings confirm that an intermediate sonication duration provides the optimal balance of mechanical energy to yield small, uniform, and physically stable bilosomes.

PDI values in the present study (0.36–0.62) reflected these structural and mechanical relationships. As STC concentration increased into the optimal region and sonication approached 8 minutes, PDI values decreased to ~0.36–0.39, indicative of more uniform nanoscale vesicles.

Effects of independent variables on ZP: ZP values ranged from −19.2 to −32.9 mV. Increasing STC concentration produced increasingly negative ZP values, reflecting the anionic nature of taurocholate and its sulfonate/carboxylate functional groups. Bile salts contribute directly to surface charge density and can dramatically improve electrostatic stabilization. The optimized quetiapine bilosomes in this study exhibited ZP around −28 to −29 mV, consistent with this stability threshold and comparable to the −30 mV reported for optimized berberine bilosomes in (Elkomy et al. 2022).

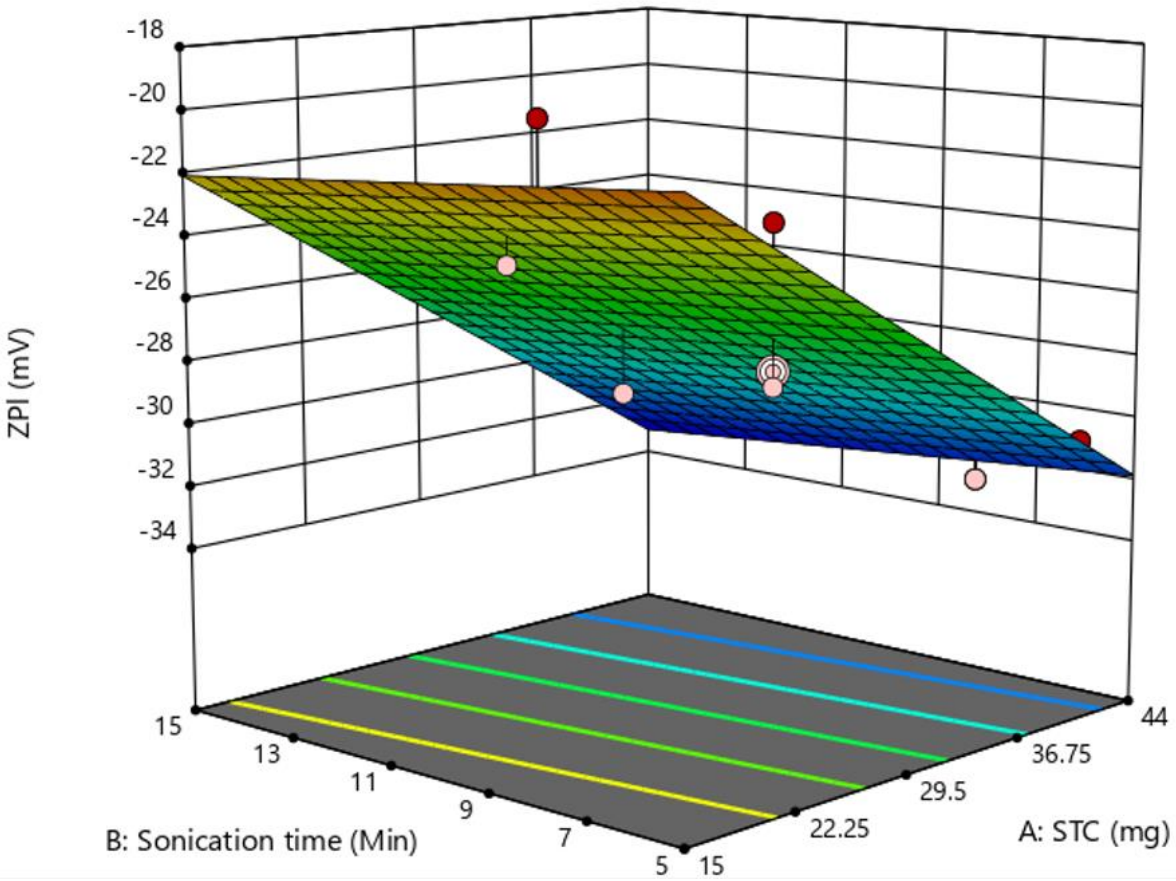

Figure 1. 3D response surface showing the effect of STC concentration and sonication time on ZP of bilosomes.

A clear trend is observed in Figure **1**, where increasing STC concentration and sonication time produces more negative ZP values, confirming that intermediate STC levels yield bilosomes with strong electrostatic stabilization capable of resisting aggregation during storage and gastrointestinal transit.

Effects of independent variables on Encapsulation Efficiency: EE% displayed a clear quadratic response to both STC concentration and sonication time, rising to an optimal region before declining when either factor exceeded its ideal range. Moderate levels of STC improved bilayer fluidity and drug accommodation, while intermediate sonication durations supported compact vesicle formation. However, excessive STC led to increased membrane permeability, and prolonged sonication caused structural disturbance—both resulting in reduced drug retention. This characteristic optimal window aligns with the established behavior of bile-salt-modified vesicular systems (Aburahma, 2016; Ahmed et al., 2020).

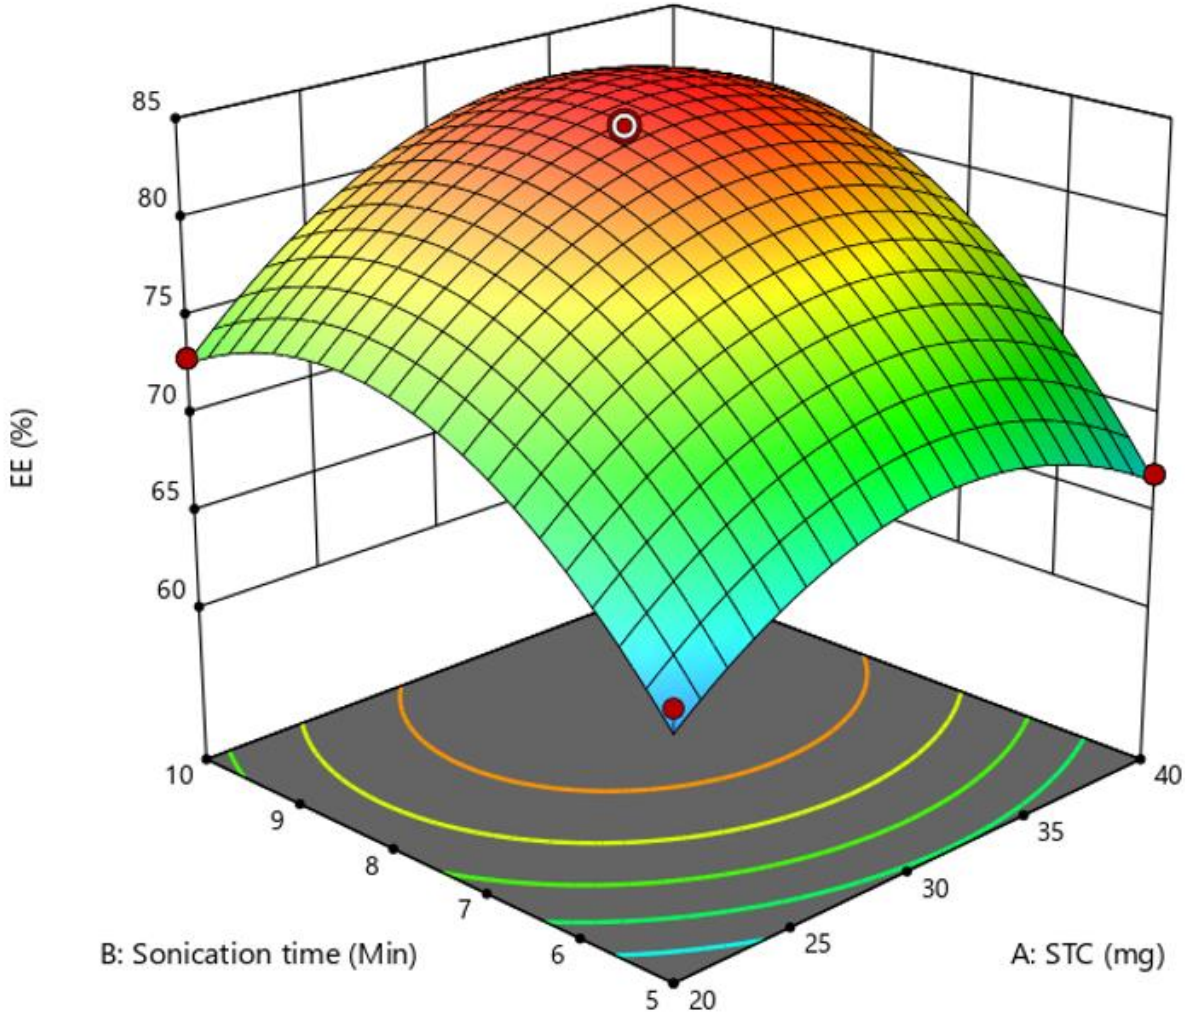

Figure 2. Response surface illustrating the combined effect of STC concentration and sonication time on EE% of quetiapine-loaded bilosomes.

Figure 2 shows a well-defined peak in EE% located at the center of the design space, confirming that the highest encapsulation is achieved only within a narrow combination of intermediate STC and sonication conditions. The curvature of the surface becomes steeper near the edges, indicating a rapid loss of EE as either variable moves away from the optimal range. The smooth gradient toward the apex reflects the strong synergistic contribution of both factors, while the lower regions demonstrate their destabilizing effect when present in excess.

Numerical Optimization and Experimental Validation of the Formulation:

Among all developed formulations, run 5 demonstrated the most optimal overall performance, combining the smallest PS with the highest encapsulation efficiency.

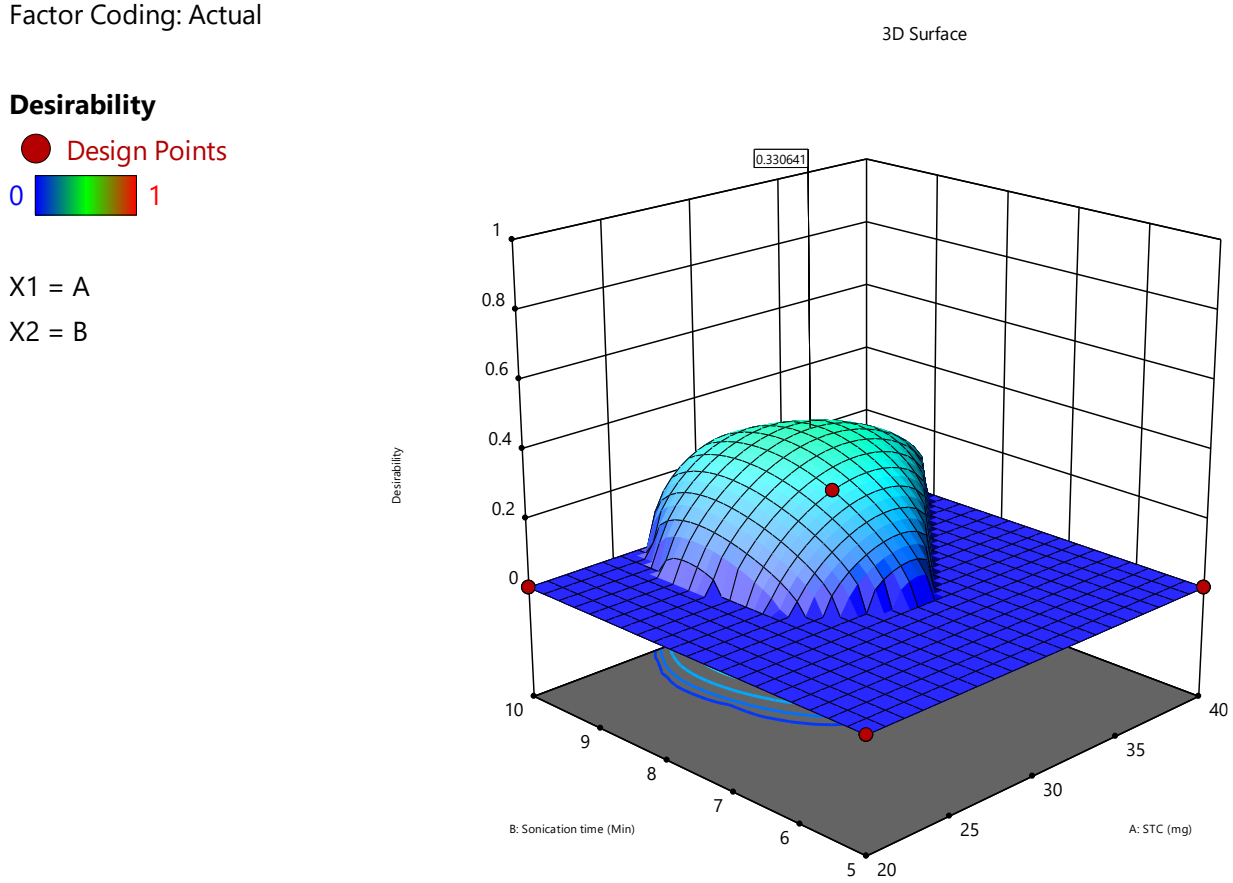

Figure 3. Numerical desirability plot showing the optimized combination of STC concentration and sonication time that provides the best overall PS, PDI, ZP, and encapsulation efficiency. The peak desirability value corresponds to the predicted optimal bilosome formulation.

Based on the desirability (Figure **3**) and point prediction method. The predicted and the observed values were very similar, and the target optimum was identified at an STC concentration of 32 mg and a sonication time of 9 minutes. This solution maximized overall desirability by simultaneously minimizing PS and PDI while maximizing ZP magnitude and EE. Optimum formulation yielded mean values of 154.5 ± 9.2 nm for PS, 0.37 ± 0.02 for PDI, −28.2 ± 0.4 mV for ZP, and 83.0 ± 1.4% for EE.

CONCLUSION

Quetiapine-loaded bilosomes were successfully formulated using SPC, cholesterol, and STC, and optimized systematically using a CCD. STC concentration and sonication time were shown to significantly affect PS, PDI, ZP, and EE, with both variables exhibiting pronounced nonlinear and interactive effects. Intermediate STC concentrations and moderate sonication times produced the most favorable bilosomal properties by balancing membrane fluidity, structural integrity, and energy input. The optimized bilosomes, with PS around 150–170 nm, PDI values below 0.4, ZP around −30 mV, and EE of approximately 80–84%, present a promising platform for enhancing the oral delivery of quetiapine. Future work should include comprehensive in vitro and permeability studies, as well as in vivo pharmacokinetic investigations to confirm the predicted improvements in bioavailability and therapeutic outcomes.

Özet

Son yıllarda genom teknolojilerindeki gelişmeler, epigenetik modifikasyonların kanatlılarda büyüme ve üretim performansı, bağışıklık fonksiyonu, hayvansal ürün kalitesi (et ve yumurta) gibi ekonomik açıdan önemli özellikler üzerinde kritik rol oynadığını göstermektedir. DNA metilasyonu, gen ekspresyonunu düzenleyen başlıca epigenetik mekanizmalar arasında yer almakta ve hem genetik hem de çevresel faktörlerden etkilenmektedir. Kanatlılarda DNA metilasyonu; büyüme, metabolik düzenleme, bağışıklık fonksiyonu ve çevresel adaptasyon gibi fizyolojik süreçlerin kontrolünde önemli bir mekanizma olarak bilinmektedir. DNA metilasyonu, sitozin bazlarına metil grubunun eklenmesiyle gerçekleşmekte ve tek karbon metabolizmasında yer alan metiyonin, kolin, betain, folat ve B vitaminleri gibi besin maddeleri tarafından etkilenmektedir. Bu besinler, hücresel metilasyon kapasitesini ve DNA metilasyon profillerini belirlemede kritik rol oynamaktadır. Ayrıca son çalışmalar, yem bileşimi, enerji ve protein düzeyleri, yağ asidi profilleri ile fitobiyotikler, antioksidanlar, probiyotikler ve prebiyotikler gibi fonksiyonel katkı maddelerinin epigenetik düzenlemeyi etkileyebileceğini ortaya koymaktadır. Özellikle embriyonik gelişim, yumurtadan çıkma öncesi ve sonrası ile karma yemlerdeki geçiş dönemleri gibi kritik gelişim aşamaları, epigenetik modülasyona karşı yüksek duyarlılık göstermektedir. Beslenme ile DNA metilasyonu arasındaki etkileşimlerin anlaşılması, kanatlılarda büyüme performansını, hayvan sağlığını ve refahını iyileştirmeye yönelik yeni bakış açısı sunmaktadır. Bu bildiride, kanatlılarda besleme uygulamalarının DNA metilasyonu üzerindeki güncel etkileri ele alınacak ve besin maddeleri, metabolik aktivite, epigenetik modifikasyonlar ile performans, hayvan sağlığı ve refahı arasındaki ilişkiler literatür ışığında incelenecektir. Elde edilen bilgiler, epigenetik temelli beslenme programlarının geliştirilmesi ve sürdürülebilir kümes hayvanı üretimi için potansiyel stratejiler sunmaktadır.

Anahtar Kelimeler: Besleme, DNA metilasyonu, epigenetik, kanatlı, performans.

Feeding and DNA methylation in poultry: Effects on performance, animal health, and welfare

Abstract

In recent years, advances in genomic technologies have shown that epigenetic modifications play a critical role in economically important traits in poultry, such as growth and production performance, immune function, and the quality of animal products (meat and eggs). DNA methylation is one of the main epigenetic mechanisms regulating gene expression and is influenced by both genetic and environmental factors. In poultry, DNA methylation is recognized as an important mechanism controlling physiological processes such as growth, metabolic regulation, immune function, and environmental adaptation. DNA methylation occurs through the addition of a methyl group to cytosine bases and is influenced by nutrients involved in one-carbon metabolism, including methionine, choline, betaine, folate, and B vitamins. These nutrients play a critical role in determining cellular methylation capacity and DNA methylation profiles. In addition, recent studies have shown that feed composition, dietary energy and protein levels, fatty acid profiles, and functional additives such as phytobiotics, antioxidants, probiotics, and prebiotics can affect epigenetic regulation. In particular, critical developmental stages such as embryonic development, the pre- and post-hatch periods, and transition phases in compound feeds exhibit high sensitivity to epigenetic modulation. Understanding the interactions between nutrition and DNA methylation provides a new perspective for improving

growth performance, animal health, and welfare in poultry. In this paper, the current effects of nutritional practices on DNA methylation in poultry are addressed, and the relationships among nutrients, metabolic activity, epigenetic modifications, and performance, animal health, and welfare are examined in light of the literature. The information obtained offers potential strategies for the development of epigenetic-based feeding programs and sustainable poultry production.

Keywords: Feeding, DNA methylation, epigenetics, poultry, performance.

Giriş

Hızla artan insan nüfusu ve küresel iklim değişikliğinin getirdiği zorluklar ile birlikte artan yüksek kaliteli hayvansal protein talebi sürdürülebilirliği elzem **hâle** getirmiştir. Bu nedenle hayvansal üretimde verimliliği artırmak, maliyeti düşürmek ve çevre dostu üretim sistemlerini geliştirmek amacıyla farklı yaklaşımlar geliştirmeye yönelik çalışmalara odaklanılmıştır (Capper ve Bauman, 2013; Scott, 2018; Wang ve Ibeagha-Awemu, 2021). Bu amaçla genotip analizler, genom dizilimleri ve haritası gibi ileri teknolojik uygulamalar kullanılmıştır. Bu da hayvancılıkta genetik iyileştirme programlarında önemli gelişmelere ve istenen hayvan özelliklerinin eldesine yol açmıştır (David ve ark., 2019; Soravia ve ark., 2021; Jianfang ve ark., 2025). Kanatlı yetiştiriciliğinde hızlı genetik ilerlemeler; yüksek büyüme hızı ve verim artışını mümkün kılmış olsa da, günümüz üretim modelleri hayvanların metabolik kapasitesi, bağışıklık sistemi ve stres yanıtı üzerinde önemli baskılar oluşturmaktadır. Bu nedenle, modern kanatlı üretiminde yalnızca klasik besleme stratejileri değil, aynı zamanda moleküler düzeyde besin–gen etkileşimlerini açıklayan **nutrigenomik** ve **epigenetik** yaklaşımlar giderek daha fazla önem kazanmaktadır (Zhang ve ark., 2015). Özellikle DNA metilasyonu, gen ekspresyonunu doğrudan etkileyen temel epigenetik mekanizmalardan biri olarak kabul edilmekte ve besin bileşenleri tarafından modüle edilebildiği bilinmektedir.

Metiyonin, kolin, betain, folik asit ve B_{12} vitamini gibi **metil vericiler**, kanatlılarda metilasyon döngüsünün temel bileşenlerini oluştururlar (Zhang ve ark., 2015). Bu bileşiklerin yetersizliği veya fazlalığı, büyüme ile üretim performansı, bağırsak sağlığı, lipit metabolizması ve stres yanıtı gibi fizyolojik süreçlerde önemli değişikliklere yol açabilmektedir. Dahası son çalışmalar, yem bileşimi, enerji ve protein düzeyleri, yağ asidi profilleri ile fitobiyotikler antioksidanlar, probiyotikler ve prebiyotikler gibi fonksiyonel katkı maddelerinin epigenetik düzenlemeyi etkileyebileceğini ortaya koymaktadır (Schreiber ve ark., 2025; Al Amaz ve ark., 2025). Ayrıca, epigenetik düzenlemelerin embriyonik gelişimden civciv çıkımına, bağışıklık sisteminin olgunlaşmasından yem değerlendirme kapasitesine kadar birçok fizyolojik aşamada kritik rol oynadığı bilinmektedir (Li ve ark., 2016; Zhu ve ark., 2020).

Son yıllarda yapılan çalışmalar, uygun besin bileşiminin yalnızca mevcut sürünün performansını değil, aynı zamanda **transgenerasyonel epigenetik aktarımla** gelecek nesillerin verim ve sağlık parametrelerini de etkileyebileceğini ortaya koymuştur (Yang ve ark., 2018; Ponsuksili ve ark., 2025). Bu bulgular, kanatlı besleme stratejilerinin artık sadece makro ve mikro besin gereksinimlerini karşılamanın ötesine geçerek, metabolik yolakları ve gen ekspresyon profillerini şekillendirecek biçimde tasarlanması gerektiğini göstermektedir. Bu bağlamda, DNA metilasyonunun kanatlı performansı, hayvan sağlığı ve refahı üzerindeki etkilerinin anlaşılması, hem bilimsel hem de sektörel açıdan önemli bir araştırma alanı haline gelmiştir. Epigenetik düzenlemelerin besleme ile modüle edilebilirliği, sürdürülebilir üretim modelleri ve refah odaklı yetiştiricilik açısından gelecek vaat eden bir yaklaşım sunmaktadır.

Bu bildiride, kanatlılarda besleme ve DNA metilasyonu: epigenetik, performans, hayvan sağlığı ve refahı üzerine etkilerine yönelik bilgilere ve önerilere yer verilmiştir.

Epigenetik

Epigenetik, ilk olarak Aristoteles yaklaşımı benimseyen Conrad Hal Waddington tarafından 1940'larda epigenez kelimesinden türetilmiş ve "DNA dizisinde değişiklik olmaksızın gen ifadesinde veya hücresel fenotipte meydana gelen değişiklikler" şeklinde tanımlamıştır (Zaccaria ve ark., 2025). Günümüzde ise epigenetik, "DNA dizisinde değişiklik olmaksızın bir kromozomdaki değişikliklerden kaynaklanan kararlı kalıtsal fenotip" ve "değişen aktivite durumlarını kaydetmek, sinyallemek veya sürdürmek için kromozomal bölgelerin yapısal adaptasyon" olarak ifade edilmektedir (Gibney ve Nolan, 2010; Schreiber ve ark., 2025). Epigenetik değişiklikler, genomun yapısal ve

fonksiyonel organizasyonunu etkileyerek hücrelerin hangi genleri ne zaman ve hangi düzeyde ifade edeceğini belirler.

Epigenetik süreçler; embriyonik gelişim, hücre farklılaşma, doku gelişim, metabolik süreçler, bağışıklık yanıtı ve çevresel uyaranlara adaptasyon gibi birçok biyolojik olayı yönlendiren temel mekanizmalardır (Carlberg ve Molnár, 2019). Son yıllarda hem insanlar hem de hayvanlar üzerine yapılan çalışmalarda, epigenetik süreçlerin canlı fizyolojisinde önemli roller üstlendiğini ifade etmişlerdir (Steffen ve Ringrose, 2014; Wang ve ark., 2022; Sindhu ve ark., 2024; Li ve ark., 2024). Çevresel koşullar, besleme stratejileri, stres faktörleri ve yetiştirme uygulamalarının epigenetik modifikasyonlar yoluyla gen ifadesini etkilemesi, hayvanların büyüme ve üretim performansı, ürün kalitesi, sağlık durumu ve refahı üzerinde belirleyici olabilmektedir (Ross ve ark., 2017; Zaccaria ve ark., 2025).

Epigenetik, birden fazla biyolojik mekanizma aracılığıyla gerçekleşmektedir. Bu mekanizmalardan histon modifikasyonları (PTM'ler), DNA metilasyonu (çoğunlukla CpG dinükleotidlerinde), kromatin değişiklikleri ve kodlamayan RNA **(miRNA, lncRNA vb.)** yaygın olarak kullanılmaktadırlar (Yakovlev, 2018; Wang ve Ibeagha-Awemu, 2021; Jianfang ve ark., 2025).

DNA metilasyonu

DNA metilasyonu en yaygın olarak kullanılan epigenetik mekanizmadır (Lindner ve ark., 2021; Garcia-Prieto ve ark., 2022; Ju ve ark., 2023). DNA metilasyonu, esas olarak sitozin kalıntılarının beşinci karbonunda bir metil (5mC) veya hidroksimetil (5hmC) grubunun eklenmesi ile gerçekleşir. Metilasyon çoğunlukla sitozin-fosfat-guanozin (CpG) dinükleotitlerinde görülse de, sitozin-fosfat-adenozin (CpA), sitozin-fosfat-timin (CpT) ve sitozin-fosfat-sitozin (CpC) dinükleotitlerinde de meydana gelebilir (Maiti ve Drohat, 2011). Bu süreç, DNA metiltransferazlar (DNMT'ler) olarak bilinen bir enzim sınıfının aktiviteleri tarafından katalize edilir. DNMT3A ve DNMT3B embriyonik gelişim sırasında veya çevresel uyaranlara yanıt olarak yeni metilasyon modellerinin kurulmasından sorumluyken, DNMT1 hücre bölünmesi sırasında mevcut metilasyon işaretlerini korur (Schmitz ve ark., 2019; Wang ve Ibeagha-Awemu, 2021). Kanatlı hayvanlarında DNA metilasyonu ile ilgili araştırmaların incelenmesi, üretimde bu mekanizmanın rolünü daha iyi anlamamıza ve belirli teorik temeller oluşturmamıza olanak tanımaktadır.

DNA metilasyonunu hayvanların çevresel faktörlere verilen biyolojik yanıtları şekillendirmede üstlendiği kritik rol göz önüne alındığında, özellikle besleme uygulamalarının bu epigenetik süreç üzerindeki etkilerini anlamak modern hayvancılık açısından büyük önem taşımaktadır. Bu mekanizmanın daha iyi anlaşılması; besleme stratejilerinin geliştirilmesi, büyüme ve üretim performansının artırılması, stresin azaltılması, hayvan sağlığının desteklenmesi ve hayvansal ürün kalitesinin iyileştirilmesi için yeni fırsatlar sunmaktadır. **Bu nedenle, beslemenin DNA metilasyonu üzerindeki etkisinin incelenmesi,** beslenme kaynaklı epigenetik düzenlemelerin hayvan performansı, sağlığı ve refahına nasıl yansıdığını anlamak açısından kritik rol oynamaktadır.

DNA metilasyonu üzerinde beslemenin rolü

Epigenom ile metabolom arasındaki yakın etkileşim, beslemenin bir hayvanın epigenetik düzenleme süreçlerinde belirleyici bir role sahip olduğunu göstermektedir (Gut ve Verdin, 2013; Carrillo ve ark., 2016). Bir organizmanın metabolomu, o organizmanın dokularında bulunan küçük moleküllü kimyasalları içerir ve temel besin maddelerinin yanı sıra temel olmayan bileşiklerin de dahil olduğu metabolizmanın ürünüdür; bu metabolizma, alınan besin maddelerini ve bileşikleri çok sayıda metabolitine dönüştürür (Schreiber ve ark., 2025). Bu metabolitlerin çoğu, epigenomu doğrudan veya dolaylı olarak etkileyebilir ve böylece gen ifadesini düzenleyebilir (Gut ve Verdin, 2013). Vücutta bulunan gerekli olan makro ve mikro besinlerin metabolizmasıyla ilişkili olan çeşitli metabolitler, aynı zamanda çeşitli epigenetik işlevler için ortak yardımcı faktörlerdir. Örnek olarak adenozin trifosfat (ATP), nikotinamid adenin dinükleotid (NAD^+), Asetil-CoA, S-Adenosilmetionin (SAM) ve α-ketoglutarat (αKG) verilebilir. Bu mekanizmalar, hayvanların çevresel koşullara yanıt verme kapasitesini belirleyen ve besleme-strateji-çevre etkileşimlerinin moleküler temelini oluşturan karmaşık bir düzenleme ağı ortaya çıkarır. Metiyonin, kolin, betain, folat ve B vitaminleri, yem bileşimi, enerji ve protein düzeyleri, yağ asidi profilleri ile fitobiyotikler,

antioksidanlar, probiyotikler ve prebiyotikler gibi fonksiyonel katkı maddelerinin epigenetik düzenlemeyi etkilemektedir.

Besleme DNA metilasyonunu üç şekilde etkilemektedir. Birincisi, uygun DNA metilasyonu için gerekli olan substratların sağlanması; ikincisi, DNMT'nin enzimatik aktivitesini düzenleyen kofaktörlerin sağlanması; üçüncüsü, tek karbon döngüsünü düzenleyen enzimlerin aktivitesinin değiştirilmesidir (Zhang ve ark., 2015). Önemli olan, bu üç mekanizmanın da birbirleriyle uyumlu olması ve zaman içinde birlikte çalışabilmesidir.

Metiyonin, kolin ve betain

Metiyonin, kolin ve betain gibi metil donörler, esas olarak tek karbon metabolizmasında görev alan ve biyokimyasal reaksiyonları, bağışıklık yanıtlarını, gen ekspresyonunu ve epigenetik olayları düzenleyen mikro besin maddeleridir (Kar ve ark., 2025). Esansiyel bir amino asit olan metiyonin, amino asitler arasında en iyi bilinen metil donörüdür. Metiyonin; DNA ve proteinler dâhil olmak üzere çeşitli moleküllere metil grubu aktararak temel biyolojik süreçlere katkı sağlar (Brosnan ve Brosnan, 2006). Betain (trimetilglisin), kolinden türeyen doğal bir bileşiktir ve üç metil grubu aktaran güçlü bir metil donörüdür. Betain; homosisteinin yeniden metiyonine dönüştürülmesi (remetilasyon) başta olmak üzere birçok metabolik reaksiyona katılır ve osmoregülasyon ile enerji metabolizmasında önemli bir rol oynar (Ducker ve Rabinowitz, 2017). Kanatlılarda karma yeme betain ilavesinin bağışıklık yanıtını güçlendirdiği de bilinmektedir (Yousefi ve ark., 2023). Kolin, betain sentezinin öncüsü olan, suda çözünebilen vitamin benzeri bir bileşiktir. Bir metil grubu aktarabilen kolin; DNA metilasyonu, lipid metabolizması ve nörotransmitter sentezinde görev alır (Kar ve ark., 2025). Bu metil donörleri bir metil grubunu diğer moleküllere aktararak gen ifadesini, lipit metabolizmasını, protein sentezini ve hücresel fonksiyonları etkilerler (Kar ve ark., 2025). Yapılan çalışmalarda kanatlı beslemede dengeli oranda metil donörlerinin bulunması, büyüme performansı, yem tüketimi, et kalitesi, bağışıklık fonksiyonlarını iyileştirirken sıcaklık stresinin olumsuz etkisini azalttığını belirtmişlerdir (Café, ve Waldroup, 2006; Su ve ark., 2009; Yang ve ark., 2017; Kar ve ark., 2025). Ayrıca yağlı karaciğer sendromunun oluşumunu önlediği ve yumurta tavuklarında sağlıklı tüylerin gelişimini ve yumurta üretimini teşvik ettikleri bildirmişlerdir (Zhang ve ark., 2022). Kanatlılarda üretim performansını, sağlığı ve refahı iyileştirmek için metil donörlerinin dikkate alınması ve dengelenmesi gerekecektir.

Folat, B_2, B_6 ve B_{12} vitaminleri

Folat B_2, B_6 ve B_{12} vitaminleri, folat döngüsündeki enzimlerin katalitik aktivitesinin düzenlenmesinde rol oynayan ve böylece SAM biyoyararlanımını belirleyen kofaktörlerdir. B_2 vitamini, 5,10-metilen THF'nin 5-metil THF'ye dönüşümünde metilentetrahidrofolat redüktazın (MTHFR) kofaktörü olan FAD'nin öncüsüdür. B_6 vitamini tetrahidrofolatın (THF) 5,10-metilen THF'ye dönüşümünde serin hidroksimetiltransferazın (SHMT) kofaktörüdür. Folat (B_9) ve kobalamin (B_{12}), sırasıyla DNA metilasyonu ve metiyonin sentezi için esansiyeldir (Kar ve ark., 2025). Folat, 5-metiltetrahidrofolat formunda bir metil grubunu homosisteine aktarır; bu reaksiyon vitamin B_{12}'nin kofaktör olarak görev yapmasını gerektirir ve

böylece metiyoninin yeniden oluşumunu sağlayarak tek-karbon metabolizmasını destekler. B_{12} vitamini, homosisteinin (Hcy) SAM'nin doğrudan öncüsü olan metiyonine dönüşümünü katalize eden 5-metiltetrahidrofolat-homosistein metiltransferazın (MTR) kofaktörüdür. Bu durumda, bu yardımcı faktörlerin biyoyararlanımı, tek karbon döngüsünün aktivitesini ve SAM üretimini değiştirerek DNA metilasyonunu etkileyebilir (Feil and Fraga, 2012; Zhang, 2015). Bu nedenle, karma yemlerin bu vitaminlerle desteklenmesin DNA metil işaretlerinin korunmasına veya yerleşmesine katkıda bulunacağı düşünülebilir (Farias ve ark., 2015).

Fonksiyonel katkı maddeleri

Bağırsak ortamındaki modülasyon epigenetik mekanizmaların düzenlenmesinde önemli bir rol oynamaktadır (Sharma ve ark., 2020). Bu nedenle mikrobiyom-konak etkileşimleri gen ifadesinin modülasyonunu etkilemektedir. Bağırsak mikrobiyotası metabolizma, immünomodülasyon ve nörolojik fonksiyonlar gibi hayati mekanizmalarda önemli rol oynamaktadır (Zheng ve ark., 2020). Fitobiyotikler, antioksidanlar, probiyotikler ve prebiyotikler gibi mikrobiyotayı düzenleme potansiyeline sahip yem katkı maddeleri kanatlılarda epigenetiği doğrudan veya dolaylı etkileyebilirler. Bu bileşiklerin bağırsak ortamında oluşturduğu değişiklikler, mikroorganizma metabolitlerinin

çeşitliliğini artırarak DNA metiltransferazların aktivitesi, metil donörlerinin biyoyararlanımı ve metilasyon kalıplarının yeniden düzenlenmesi üzerinde belirgin rol oynar. Özellikle kısa zincirli yağ asitleri gibi mikrobiyota kaynaklı metabolitler, gen promotör bölgelerindeki metilasyon düzeylerini etkileyerek hücresel farklılaşma, bağışıklık yanıtı ve metabolik fonksiyonlarla ilişkili genlerin ifade düzeylerinde değişikliklere yol açabilmektedir (Ponsuksili ve ark., 2025). Bu nedenle fonksiyonel katkı maddeleri, sadece besin öğesi olarak değil, aynı zamanda epigenetik birer düzenleyici olarak kanatlılarda büyüme performansı ve sağlık göstergeleri üzerinde önemli etkilere sahiptir (Dunislawska ve ark., 2020).

DNA metilasyonu ve Performans

DNA metilasyonu, gen ekspresyonunun çevresel ve beslenme faktörlerine yanıt olarak dinamik biçimde modüle edilmesini sağlayan önemli bir epigenetik mekanizmadır. Bu yaklaşım, kanatlılarda bir hayvanın gerçek fizyolojisini düzenleyen mekanizmaların daha iyi anlaşılmasını sağlar ve canlı ağırlık, canlı ağırlık artışı, yem tüketimi ve yemden yararlanma oranı gibi üretim performansına ilişkin karmaşık özelliklerin altında yatan biyolojik mekanizmaları yorumlamaya olanak tanır (Zaccaria ve ark., 2025).

Karma yemlerde metiyonin kısıtlaması büyüme performansını ve aminoasit metabolizmasını etkiler. Bu nedenle metil vericisi olarak bazı durumlarda betain ilavesi eklenir (Yang ve ark., 2017; Ju ve ark., 2023). Kazlarda yapılan bir çalışmada metiyonin ve betain kısıtlaması ile LOC106032502'nin karaciğer DNA metilasyonunu değiştirdiğini ve kazların transkripsiyonel düzenleyici ağını etkilediğini belirtmişlerdir (Yang ve ark., 2018).

Yapılan başka bir çalışmada ise yumurtacı tavuklarda embriyonik dönemin 11. gününde C vitaminin in ovo ile verilmesinin yumurtadan çıktıktan sonraki performansını ve bağışıklık durumunu iyileştirdiğini, antioksidan kapasitesini artırdığını bildirmişlerdir. Dahası enzimler ile ilgili DNA metilasyonu ve demetilasyonunun ekspresyon profili, dalak DNA metilasyon seviyesinin artmış olabileceğini düşündürmektedir, ancak anti-inflamatuar ve pro-inflamatuar sitokinlerde gözlenen ifade değişikliklerinin DNA metilasyonundaki değişikliklerle ilişkili olup olmadığı daha fazla araştırma gerektirmektedir (Zhu ve ark., 2020). Zhang ve ark. (2022) Jinghai Sarı tavuklarında ZP2 promotör metilasyonunun yumurta üretimi üzerindeki etkisi araştırılmıştır. ZP2 geninin eksik promotör vektörü oluşturularak, ZP2 geninin çekirdek bölgesinin -1.552 ile -1.348 arasında yer aldığı tahmin edilmiştir . *ZP2* gen promotör bölgesindeki mC-20 ve mC-21 bölgelerinin metilasyonu, mRNA ekspresyonu ile negatif korelasyon göstermiştir ($P < 0.05$). Her iki bölge de Sp1 transkripsiyon faktörü bağlanma bölgesinde yer almaktadır ve Sp1'in DNA'ya bağlanması engellenebilir, bu da ZP2 geninin transkripsiyonunu ve yumurta üretimini etkileyebilir (Zhang ve ark., 2022).

Kaz ciğeri, eşsiz aromasını veren çok sayıda doymamış yağ asidi içerir (Hermier et al., 2003; Dawail et al., 2003). Kazların karma yemine betain ilavesinin karaciğer ağırlığını artırdığı ve karaciğerindeki S14α mRNA ekspresyonun kontrol grubuna kıyasla yüksek olduğunu belirtmişlerdir. Bu bölgedeki tek bir alel (transkripsiyon başlangıç noktasına göre +374 ile -8 baz çifti arasında), 33 CpG dinükleotid içeren sodyum sülfit ile dizinlenmiştir. Yüksek düzeyde yem tüketen grupta daha yüksek S14α transkriptleri gözlenmesine rağmen, 33 CpG bölgesinin ortalama metilasyon oranı %87.9 olarak ölçülmüştür; kontrol grubunda bu oran %69.6 olup genin daha düşük ekspresyonunu olduğunu belirtmişlerdir ($P<0.01$). Bu sonuçlar, S14α geninin transkripsiyon başlangıç bölgesindeki DNA metilasyon modellerinin, betain ilavesinden sonra mRNA ekspresyon düzeylerinden bağımsız olabileceğini ifade etmişlerdir.

Sonuç olarak, belirli gen promotör bölgelerindeki metilasyon değişimleri, ilgili genlerin ekspresyonunu doğrudan baskılayabilir veya artırabilir; bu mekanizma özellikle büyüme ve üretim performansında kritik rol oynar. Bu bulgular, özellikle besleme ve mikrobiyota kaynaklı epigenetik modülasyonun, kanatlılarda performans özelliklerini optimize etmede potansiyel bir araç olduğunu göstermektedir.

DNA metilasyonu ile hayvan sağlığı ve refahı

Hayvansal üretim işletmelerinde, sağlık durumu kârlılık ve sürdürülebilirliği doğrudan etkilemektedir. Etlik piliçlerde yaygın olarak görülen bir beslenme ve metabolik bozukluk olan asit sendromu (AS), hayvan endüstrisinde önemli ekonomik kayıplara neden olmaktadır (Balog ve ark., 2003; Zhang ve ark., 2026). Zhang ve

ark. (2026) AS'li ve normal etlik piliçleri rutin hematolojik muayeneler ve kan parametrelerini karşılaştırmışlardır. Sonuç olarak, AS grubundaki etlik piliçlerde kalp doku hasarının artığı, kalp dokusundaki 891 ve akciğer dokusunda 1424 genin ekspresyon seviyelerinin promotör metilasyonu ile negatif korelasyon olduğunu tespit etmişlerdir. qPCR ve bisülfit sekanslama yoluyla yapılan doğrulama, HEMK1 ve PMEPA1'in ekspresyon seviyeleri ile promotör CpG adalarının metilasyon seviyeleri arasında anlamlı bir negatif korelasyon olduğunu doğrulayarak, bunların AS patogenezinde aday genler olarak rollerini desteklediğini ifade etmişlerdir.

Kuş lökoz virüsü alt grubu J (ALV-J) ve *Salmonella enterica serovar enteritidis* (SE), kanatlı üretimini etkileyerek endüstrisinde ciddi ekonomik kayıplara yol açabilecek ve halk sağlığı için tehdit oluşturabilecek potansiyele sahiptir (Wang et al., 2020; Ju ve ark., 2023). Yapılan çalışmalarda, hastalığın görülme sıklığındaki artış DNA metilasyonundaki değişikliklerle ilişkili olduğunu belirtmişlerdir (Bosilevac ve ark., 2009; Guibourdenche ve ark., 2010; Ju ve ark., 2023). Wang et al. (2020) tavuklarda SE reaksiyonunun tüm genom DNA metilasyon profilini analiz edilmiş ve SE aşılama kör bağırsak dokularında DNA metilasyonunu teşvik ederek bağışıklık ve metabolizma ile ilişkili genlerde metilasyon değişikliklerine yol açtığını bildirmişlerdir.

DNA metilasyonu, stresli koşullar sırasında aktive olan spesifik genlerin aktivitesini baskılayarak strese uyum sağlamak için potansiyel bir mekanizmadır (Mifsud ve ark., 2011; Al Amaz ve ark., 2025). Karaciğerde DNMT1, DNMT3A ve DNMT3B ekspresyonunun aşağı regülasyonu, tavuklarda beslenme stresi göstergesi olarak değerlendirilmektedir (Kang ve ark., 2017). Yüksek sıcaklık ortamında kuru erik takviyesi ile beslenen hayvanlarda DNMT1 ve DNMT3A'nın önemli ölçüde yukarı regülasyonu ($P<0.05$) gözlenmiş ve bu durum kuru erik ilavesi ile beslenmenin strese karşı koruyucu etkisi olabileceğini belirtmişlerdir. Aktif DNA demetilasyonun katalize eden evrimsel olarak korunduğu ve TET proteinleri (Tet1, Tet2 ve Tet3), 5-metilsitozin (5mC) üzerinde ardışık oksidasyonlar gerçekleştirerek 5-hidroksimetilsitozin (5hmC), 5-formilsitozin (5fC) ve 5-karboksilsitozin (5caC) oluşumunu sağladığını bildirmişlerdir. Sonuç olarak bu mekanizmalar, piliçlerde stres ve hastalık koşullarına yanıt olarak gen ekspresyonunun epigenetik olarak düzenlenmesinde merkezi bir rol oynadığını ifade etmişlerdir.

Sonuç

Kanatlılarda besleme-DNA metilasyonu arasındaki etkileşim performans, sağlık ve refahı doğrudan etkilemektedir. Özellikle metil donörleri (metiyonin, kolin, betain, folat ve B vitaminleri) ve mikrobiyotayı doğrudan etkileyen fonksiyonel katkı maddeleri (fitobiyotikler, probiyotikler ve prebiyotikler gibi) DNA metilasyonu etkileyerek büyüme, metabolizma, bağışıklık fonksiyonu ve stres yanıtı ile ilişkili genlerin ekspresyonunu modüle edebilmektedir. Bu nedenle; kanatlılarda karma yem hazırlanırken makro ve mikro besin madde ihtiyacını göz önünde bulundururken aynı zamanda epigenetik düzenlemeleri desteklemeyi de hedeflemek önerilmektedir. Metil donörlerinin dengeli ve yeterli düzeylerde karma yemlere dahil edilmesi, fonksiyonel yem katkı maddelerinin bağırsak mikrobiyotası ve epigenetik mekanizmalar üzerindeki etkilerinin dikkate alınması, hayvan performansı, sağlığı ve refahı iyileştirebilir. Ayrıca, farklı gelişim dönemlerine özgü epigenetik yanıtların ortaya konulması ve bu yanıtların gen–besin etkileşimleri temelinde değerlendirilmesi, daha hassas ve sürdürülebilir besleme stratejilerinin geliştirilmesine katkı sunacaktır. Gelecekte yapılacak çalışmaların, transgenerasyonel epigenetik etkiler ve uzun dönemli üretim sonuçları üzerine odaklanması, epigenetik temelli besleme yaklaşımlarının pratik uygulamalara aktarılmasını kolaylaştıracaktır.

Abstract

Basil (*Ocimum basilicum* L.) is an important aromatic herb rich in biologically active compounds, including pigments, phenolics, flavonoids, and antioxidants, and is widely recognized for its significant economic value in culinary and industrial applications. Glucose, a soluble sugar present in many plants, not only serves as a universal carbon source but also functions as a signaling molecule that regulates various metabolic processes in plants. This study investigated the effects of exogenous glucose treatment on color and pigment composition, primary and secondary metabolite accumulation, and antioxidant capacity in the leaves of two purple basil cultivars (Dark Opal and Red Boza). Following glucose treatment, L* and b* values decreased slightly, whereas a* values increased in both cultivars. Glucose also induced cultivar-specific metabolic responses: Dark Opal exhibited enhanced anthocyanin accumulation, resulting in more intense purple leaf coloration, while Red Boza showed increased chlorophyll and carotenoid accumulation, leading to darker green leaves. Although total phenolics content and CUPRAC activity were not significantly affected by glucose treatment, FIC capacity and starch accumulation increased significantly in both cultivars. These findings indicate that glucose acts not only as an energy source but also as a signaling molecule influencing pigment biosynthesis, antioxidant capacity, and carbohydrate metabolism in a genotype-dependent manner. The distinct metabolic responses observed between Dark Opal and Red Boza highlight the role of sugar signaling in regulating cultivar-specific physiological and biochemical processes.

Keywords: Anthocyanin, Antioxidant capacity, Chlorophyll, Leaf color, Starch content, Total phenolics

1. Introduction

Basil (*Ocimum basilicum* L.) belongs to the Lamiaceae family, which comprises annual and perennial herbs and shrubs native to tropical and subtropical regions. The basil is an aromatic plant and the market value of basil leaves is projected to increase from approximately US$ 1.5 million in 2024 to US$ 2.3 million by 2034 (FMI, 2025). Although basil has numerous varieties that do not differ markedly in morphology, they vary significantly in their chemical compositions. The leaves contain essential oils, flavonoids, phenolic acids, triterpenes, steroids, and other nutraceutical compounds, as well as abundance of vitamins and minerals (Cruz et al., 2020). In addition to being cultivated as a medicinal herb and as a vegetable, basil is widely used in both fresh and dried forms to enhance the flavor and aroma of food products, such as tomato paste, ketchup, sauces, and soups (Lupton et al., 2016). Furthermore, basil leaves have been reported to possess antidiabetic (Mousavi et al., 2018), antimicrobial (Stefan et al., 2013), antibacterial (Stanojevic et al., 2017), antioxidant, and anti-inflammatory properties (Dhama et al., 2023). Today, basil retains high commercial value due to its diverse applications in medicinal, nutritional, ornamental, cosmetic, religious, and insecticidal or insect-repellent uses.

Glucose serves as a primary precursor for many biomolecules in plants, including complex sugars, amino acids, and nucleic acids (Sami and Hayat, 2019). It plays a central role in regulating numerous physiological processes under both stress and normal conditions. In recent years, increasing attention has been given to the role of glucose as a major signaling molecule that promotes plant growth, including its involvement in photosynthesis (Jiang et al.,

2012), hypocotyl elongation (Gibson, 2005), seed germination (Price et al., 2004), flowering (Moghaddam and Ende, 2013), and the onset of senescence (Wingler et al., 2009). Previous studies on glucose-induced plant growth have demonstrated that exogenous glucose treatment increases plant height, root length, and root and shoot biomass under normal conditions (Gauchan, 2012; Singh et al., 2014). Moreover, sugar treatments have been shown to influence photosynthetic performance by enhancing chlorophyll biogenesis (Hill et al., 2011). A positive correlation has also been observed between exogenous glucose and carotenoid accumulation in tomato leaves (Mortain-Bertrand et al., 2008). Additionally, glucose is reported to improve photosynthesis under various abiotic stress conditions (MengYun et al., 2009; Jiang et al., 2012). Therefore, glucose treatment is considered an environmentally friendly and valuable approach to improve plant growth, pigment content, and bioactive compounds.

Foliar treatments offer a promising strategy to optimize crop performance, particularly in crops such as basil, where effective nutrient delivery is essential for vigorous growth and enhanced production of bioactive metabolites (Noroozlo et al., 2019). Foliar treatment of sugar-based biostimulants, including glucose, has attracted considerable attention due to their potential to improve plant growth, nutrient uptake, and overall productivity. Sugar molecules such as glucose can enhance both physiological and biochemical responses in plants.

Although glucose is recognized as a fundamental energy source supporting nearly all physiological processes in plants, information regarding the effects of exogenous glucose on basil growth, pigment content, and functional metabolites remains limited. Therefore, this study was designed to investigate the potential effects of foliar glucose treatment on the pigment composition, biochemical compounds, and antioxidant capacity of basil leaves.

2. Materials and Methods

2.1. Plant Materials and Treatments

This study was conducted in a greenhouse of the Rose and Aromatic Plants Application and Research Center of Isparta University of Applied Sciences (Isparta, Türkiye). Seeds of two purple basil (*Ocimum basilicum* L.) cultivars (Dark Opal and Red Boza) were purchased from commercial suppliers and sown to obtain seedlings. The seeds were sown in 1 L plastic pots filled with a perlite–peat mixture (1:1) on May 11, 2024. All plants were fertilized with an NPK solution (20-20-20) once during vegetative growth. Two treatments were applied twice with one-week intervals to plants before flowering. Before flowering, the control (distilled water) and 330 mM glucose (prepared with distilled water) solutions were applied by foliar spraying twice at 1-week intervals (10 mL per plant). Distilled water was sprayed to control plants under the same conditions. For each treatment, 15 plants (one plant per pot) were used, and each replication contained 5 plants. Plants were harvested on September 10, 2024 (Fig. 1). Leaf color parameters were measured immediately using fresh leaves, and the remaining samples were stored in deep-freeze conditions until further analyses.

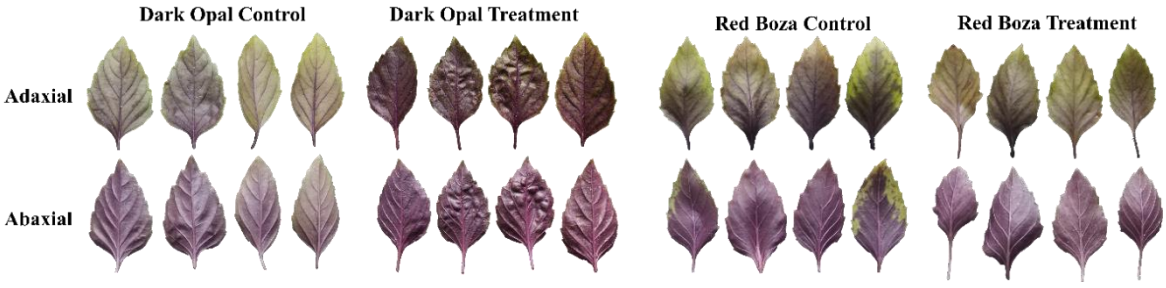

Fig. 1. Effect of glucose treatment on leaf color of Dark Opal and Red Boza cultivars.

2.2. Leaf Color Measurement

Color parameters of fresh basil leaves were determined using a portable colorimeter (Chroma Meter CR-400, Konica Minolta, Japan). Measurements were performed by placing leaf samples directly onto the measurement

port. Hunter's International Commission on Illumination color values (L^*, a^*, b^*) were recorded from three different points on the adaxial leaf surface.

2.3. Determination of Total Phenolic, Flavonoid and Antioxidant Capacity

Leaf samples (2 g) were extracted with 20 mL of 80% methanol in an ultrasonic bath at 40 °C for 30 min (Önder et al., 2023). The homogenate was centrifuged at 10.000 × g for 10 min, and aliquots of the supernatant were used to determine total phenolics, flavonoids, and antioxidant capacity. Total phenolics content was measured using the Folin-Ciocalteu method (Folin and Ciocalteu, 1927). To 100 µL of methanol extract, 2.5 mL of deionized water and 100 µL of Folin-Ciocalteu reagent (2 N) were added, and the mixture was incubated in the dark for 6 min. Then, 500 µL of 20% sodium carbonate was added, followed by a dark 30-min incubation. The color development in the samples was determined at a wavelength of 760 nm (Shimadzu UV-1280). Results were expressed as gallic acid equivalents (GAE) in mg g^{-1} fresh weight (FW).

Flavonoid content was determined using the aluminum chloride method (Sakanaka et al., 2005). To a 250 µL of methanolic extract, 1.25 mL of deionized water and 75 µL of 5% sodium nitrite were added and incubated for 6 min in the dark. Then, 150 µL of 10% aluminum chloride was added and incubated for 5 min, followed by the addition of 500 µL of 1 M NaOH and 275 µL of deionized water. After a 15-min incubation in the dark, absorbance was recorded at a wavelength of 510 nm. Results were expressed as (±)-catechin equivalent in mg g^{-1} FW.

Antioxidant capacity was measured by two different methods (CUPRAC and FIC). The CUPRAC assay was performed as described by Apak et al. (2006). A mixture of 1 mL of 10 mM Cu(II), 1 mL of 7.5 mM neocuproine, and 1 mL of 1 M ammonium acetate buffer (pH 7.0) was prepared. Then, 0.5 mL of diluted extract and 0.6 mL of distilled water were added to reach a final volume of 4.1 mL. After 30 min at room temperature, absorbance was measured at 450 nm. Results were expressed as Trolox equivalents (µmol Trolox g^{-1} FW).

Ferrous ion-chelating (FIC) ability was determined following Decker and Welch (1990). Sample extract (1 mL), 3.7 mL of distilled water, 100 µL of 2 mM iron (II) chloride, and 200 µL of 5 mM ferrozine was incubated for 20 min. Absorbance was measured at 562 nm against a blank, contained distilled water instead of methanolic extract and ferrozine solution. Results were expressed as EDTA equivalents (µmol EDTA g^{-1} FW).

2.4. Anthocyanin Content Measurement

Total anthocyanin content of leaves was determined using the pH differential method (Giusti and Wrolstad, 2001). Leaf samples (1 g) were homogenized in 10 mL ethanol containing 0.1% HCl in the dark. The homogenate was centrifuged at 10.000 × g for 20 min at 4 °C, and the supernatant was used for analysis. Two dilutions were prepared simultaneously: one adjusted to pH 1.0 with 0.025 M KCl and the other to pH 4.5 with 0.4 M sodium acetate. After 15 min of dark incubation, absorbance was recorded at 510 and 700 nm. Absorbance (A) of the samples was calculated as:

$$A = (A_{510} - A_{700})_{pH1.0} - (A_{510} - A_{700})_{pH4.5}$$

Monomeric anthocyanin concentration was calculated as cyanidin-3-glucoside equivalent using:

$$\text{Monomeric anthocyanin pigment (mg L}^{-1}) = \frac{A \times M_a \times DF \times 1000}{\varepsilon \times 1}$$

Where Ma =449.2, DF = dilution factor, and $\varepsilon = 26{,}900$

2.5. Total Chlorophyll and Carotenoid Content Measurement

Total chlorophyll (Zhang and Huang, 2013) and carotenoid (Torres et al., 2014) contents were determined spectrophotometrically. Leaf tissue (1 g) was homogenized with 10 mL dimethylformamide (100%). After centrifugation at 10.000 × g for 10 min at 4 °C, absorbance was recorded at 480, 647, and 664 nm wavelengths.

Chlorophyll and carotenoid contents were calculated using the following equations:

$$\text{Chlorophyll a } (\mu g\ mL^{-1}) = 12.7 \times A_{664} - 2.79 \times A_{647}$$

$$\text{Chlorophyll b } (\mu g\ mL^{-1}) = 20.7 \times A_{647} - 4.62 \times A_{664}$$

$$\text{Total Chlorophyll } (\mu g\ mL^{-1}) = 17.9 \times A_{647} + 8.08 \times A_{664}$$

$$\text{Total Carotenoids } (\mu g\ mL^{-1}) = (1000 \times A_{480} - 0.89 \times \text{Klorofil a}) / 245$$

2.6. Starch Content Measurement

Starch content was quantified using the Anthrone method (Sadasivam and Manickam, 1996). Leaf samples (0.5 g) were homogenized in 25 mL of 80% ethanol, boiled at 90 °C for 20 min, and centrifuged at 13,000 rpm for 10 min. The procedure was repeated three times. The pellet was washed, air-dried overnight, and then suspended in 5 mL deionized water and 6.5 mL of 52% cold perchloric acid. After incubation at 0 °C for 20 min, samples were centrifuged twice at 13,000 rpm for 10 min at 4 °C, and supernatants were combined and diluted to 100 mL with deionized water. After filtration (Whatman No. 42), 1 mL extract was mixed with 4 mL Anthrone reagent and heated in boiling water for 10 min. Absorbance was recorded at 630 nm. Results were expressed as glucose equivalents (mg g^{-1} FW).

2.7. Statistical analysis

Data were subjected to one-way analysis of variance (ANOVA) using SPSS Statistics 27 program (IBM, Armonk, NY, USA). Differences between the treatment means were separated using Tukey's test. Results are presented as mean ± standard deviation. Means sharing the same letter(s) are not significantly different at $P \leq 0.05$ significance level.

3. Results and Discussion

Color parameters measured from the adaxial surface are presented in Table 1. Following glucose treatment, the *L** value (brightness) decreased slightly in both cultivars; however, the reduction was not significant. The *a** value in Dark Opal significantly increased by 3.52-fold after glucose treatment, indicating a more intense red/purple coloration compared to the control. In Red Boza, the *a** value also increased by 2.21-fold, but the change was not statistically significant. The *b** value decreased in both cultivars; however, the decrease was significant only in Dark Opal. Comparison between the cultivars after glucose treatment showed that Dark Opal had lower *L** and *b** and higher *a** values, suggesting a stronger purple pigmentation.

Table 1. Effect of foliar treatment of 330 mM glucose on color parameters of Dark Opal and Red Boza (L*: black [−] with white [+]; a*: green [−] to red [+], b*: blue [−] to yellow [+])

		L*	***a****	***b****
Dark Opal	Control	32.71±5.27^{ab}	1.35±2.94^{b}	7.58±3.62^{a}
	Treatment	28.85±2.88^{b}	4.75±3.06^{a}	3.91±1.80^{b}
Red Boza	Control	32.77±7.13^{a}	1.55±5.59^{b}	7.45±5.69^{a}
	Treatment	31.44±4.55^{ab}	3.43±2.20^{ab}	5.60±3.09^{ab}

Basil is well known for its richness in bioactive compounds such as phytopigments, phenolics, flavonoids, and antioxidants. Glucose acts both as a key metabolite and as a signaling molecule in higher plants. Though total phenolics content increased in both cultivars following glucose treatment, the increases were not statistically significant (Fig. 2a). Total phenolics content increased from 6.41 (control) to 7.78 mg GAE g^{-1} in Dark Opal and from 7.79 (control) to 8.17 mg GAE g^{-1} in Red Boza. Consistent with our findings, glucose treatment increased total phenolics by 20% in Chinese cabbage sprouts and 25% in pak choi sprouts, whereas no effect was observed

in radish sprouts (Wei et al., 2011).

Total flavonoid content in the leaves ranged from 4.45 to 5.18 mg catechin g^{-1} (Fig. 2b). In Red Boza, any significant difference was not detected between the control (5.18 mg catechin g^{-1}) and glucose-treated plants (5.10 mg catechin g^{-1}). In Dark Opal, total flavonoid content decreased 1.16-fold following glucose treatment. Similarly, Hassanpouraghdam et al. (2022) reported that foliar application of 2 g L^{-1} D-glucose in *Tanacetum balsamita* did not alter flavonoid content under non-stress conditions.

The CUPRAC and FIC assays are widely used to evaluate antioxidant capacity. Glucose treatment did not significantly affect CUPRAC activity (Fig. 2c). While CUPRAC activity increased by 4.83% in Dark Opal relative to the control, it decreased by 4.79% in Red Boza. In contrast, glucose treatment significantly boosted FIC capacity in both cultivars (Fig. 2d). FIC capacity increased from 0.49 to 2.44 µmol EDTA g^{-1} (4.98-fold) in Dark Opal and from 1.42 to 3.09 µmol EDTA g^{-1} (2.18-fold) in Red Boza. These results suggest that basil cultivars differ in their response to sugar application and glucose appears to enhance total phenolic content, CUPRAC activity, and FIC capacity. Variations among antioxidant assays are common due to the involvement of diverse antioxidants compounds including tocopherols, polyphenols, sugars, and organic acids in overall antioxidant mechanisms (Cruz et al., 2020). Glucose has also been shown to enhance antioxidant content in *Brassica* sprouts (Wei et al., 2011).

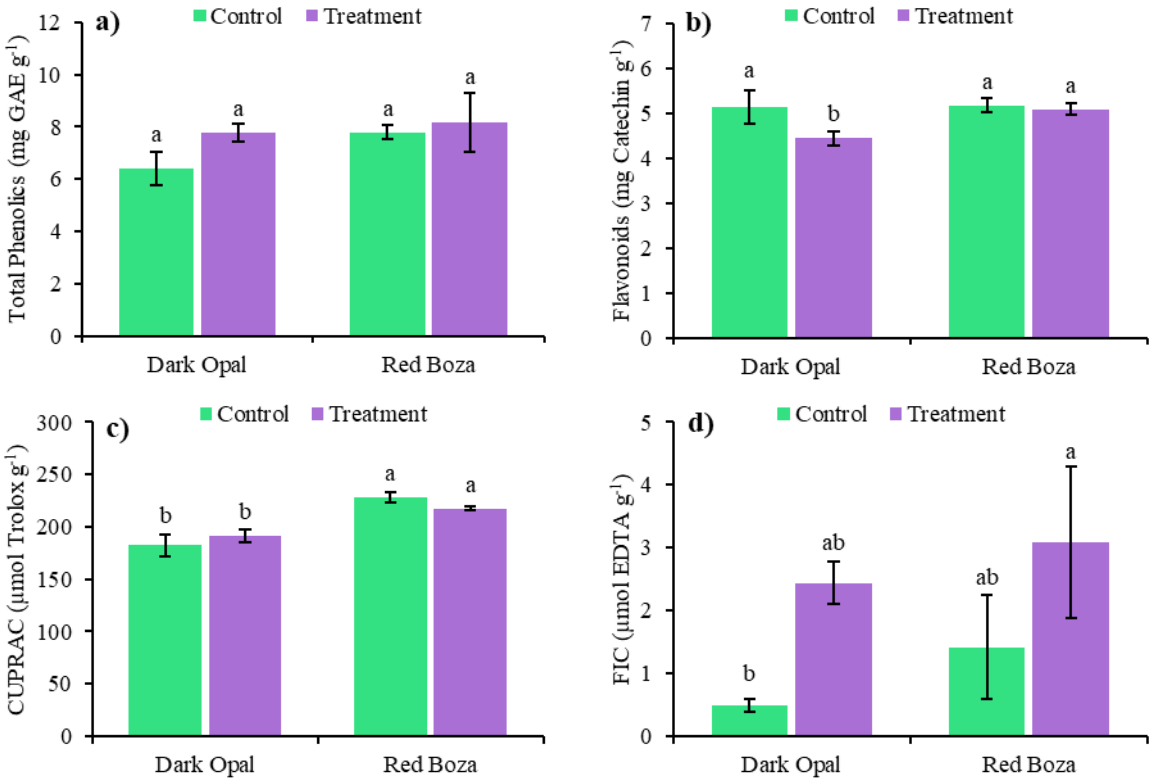

Fig 2. Effects of foliar treatment of 330 mM glucose to Dark Opal and Red Boza on a) total phenolic, b) flavonoid, c) CUPRAC and d) FIC. Vertical bars represent mean values ± SD.

Glucose treatment exerted genotype-dependent effects on total anthocyanin content (Fig. 3a). In Dark Opal, total anthocyanin content increased from 23.90 to 55.14 mg L^{-1}, whereas total anthocyanin content decreased from 14.76 to 9.21 mg L^{-1} in Red Boza. This demonstrates that sugar signaling operates differently between the genotypes. Glucose has been reported to significantly enhance anthocyanin biosynthesis in tree peony by activating the *PsMYB2* transcription factor (Zhang et al., 2022), supporting the idea that glucose acts not only as a carbon source but also as a signaling molecule.

Analysis of photosynthetic pigments revealed that total chlorophyll decreased significantly (18.08%) in Dark Opal

after 330 mM glucose treatment, whereas it increased significantly (39.40%) in Red Boza (Fig. 3b). Although glucose is a minor product of photosynthesis, its exogenous application can modify photosynthesis-related properties. For instance, glucose stimulated chlorophyll synthesis in dark-grown rice seedlings (Sheen, 1990), whereas 4 and 20 mM glucose significantly reduced chlorophyll levels in *Arabidopsis thaliana* (Stevenson and Harrington, 2009). High glucose concentrations can inhibit chloroplast development (To et al., 2003) and accumulation of non-structural carbohydrates can suppress photosynthesis (Araya et al., 2006). Reduced chlorophyll content may result from glucose- or sucrose-mediated repression of photosynthetic gene transcription (Sinha and Roitsch, 2002). Further investigation is required to determine whether the decline observed in this study is sufficient to impair photosynthetic efficiency.

A similar trend was observed for total carotenoid content. Carotenoid levels decreased from 8.07 to 7.36 μg L^{-1} in Dark Opal following glucose treatment but increased from 4.08 to 5.26 μg L^{-1} in Red Boza (Fig. 3c). Carotenoids, plant pigments with photoprotective functions and precursors of abscisic acid biosynthesis (Eldahshan and Singab, 2013) may be reduced under glucose treatment due to glucose-mediated repression of carotenoid pathway genes (Mortain-Bertrand et al., 2008). In contrast, β-carotene content can increase following glucose exposure (Prasanna et al., 2004). These findings further support the regulatory role of glucose in photosynthesis-associated processes.

No significant difference was detected between the control groups of Dark Opal (0.90 mg glucose g^{-1}) and Red Boza (0.53 mg glucose g^{-1}) with respect to total starch content (Fig. 3d). However, glucose treatment led to a marked increase in total starch levels in both basil cultivars. Following the treatment, total starch content increased 4.49-fold in Dark Opal, reaching 4.04 mg glucose g^{-1}, whereas Red Boza exhibited a 6.11-fold increase, reaching 3.24 mg glucose g^{-1}. After spraying 3% and 6% glucose solution to watermelon seedlings stored in the dark at low temperature for 6 days, starch content decreased continuously in control plants, while it increased significantly in glucose-treated seedlings on the 2nd and 4th days of storage (Jiang et al., 2012). This suggests that glucose can be effectively absorbed and stored and used as an alternative substrate for metabolism and energy expenditure. Exogenous carbon treatment can also lead to starch storage without photosynthetic carbon fixation. However, it is also known that high doses of sugar treatment can suppress photosynthetic pigments and change the resource distribution (carbon partitioning) between photosynthesis and storage (Lv et al., 2022). This may explain the decreased chlorophyll and carotenoid values alongside the increased starch in Dark Opal. The results obtained indicate that glucose is easily absorbed in leaves and may play a role in the coloration of basil plants.

Comparison of the two cultivars after glucose treatment revealed that total phenolics content and antioxidant capacity increased more prominently in Dark Opal. This may be attributed to its higher anthocyanin content, the key pigment responsible for purple, red, and blue hues. As shown in Fig. 1, control Dark Opal leaves appeared green, but turned purple following glucose application. This observation aligns with the steep increase in anthocyanins and reduction in chlorophyll and carotenoids levels. In contrast, Red Boza leaves, which were originally light green to reddish, turned dark green after glucose treatment, consistent with increased chlorophyll and carotenoid levels and reduced anthocyanins.

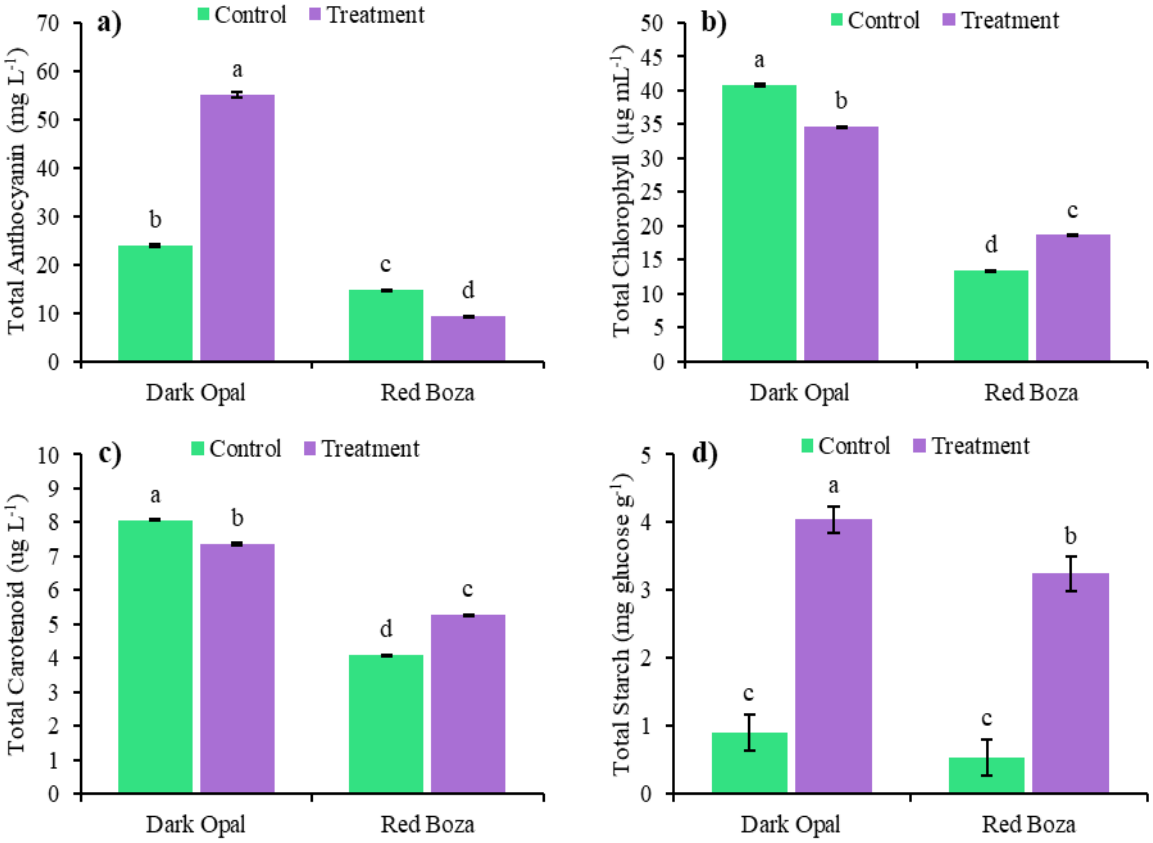

Fig 3. Effects of foliar treatment of 330 mM glucose to Dark Opal and Red Boza on a) total anthocyanin, b) total chlorophyll, c) total carotenoid, and d) total starch. Vertical bars represent mean values ± SD.

4. Conclusions

Sugars are key metabolic substrates that actively modulate various metabolic processes throughout different developmental stages in plants. Glucose treatment induced different metabolic responses in the two cultivars, indicating that sugar signaling operates in a genotype-specific manner. Anthocyanin accumulation increased in Dark Opal, resulting in more intense purple leaf coloration, whereas chlorophyll and carotenoid content increased in Red Boza, leading to cultivar-specific differences in pigment composition and leaf appearance. These findings highlight the significance of genetic background in glucose signal-metabolite interactions. Although total phenolic content and CUPRAC activity were not significantly affected, FIC capacity increased markedly in both cultivars, suggesting that glucose enhances specific components of antioxidant defense. Furthermore, glucose application significantly promoted starch accumulation in both cultivars, demonstrating that exogenously applied glucose can be efficiently absorbed and stored in leaf tissues. Overall, the results indicate that glucose functions not only as an energy source but also as a signaling molecule regulating pigment biosynthesis, antioxidant capacity, and carbohydrate metabolism. This study contributes to the development of sustainable cultivation practices and the production of high-quality basil. Additionally, it provides valuable insights for strategies aimed at improving leaf visual quality and enhancing bioactive compounds, with potential applications in the pharmaceutical, culinary, and industrial sectors. Future studies should explore a broader range of glucose concentrations and genotypic variation to further our understanding of the effects of glucose application on secondary metabolite accumulation.

Abstract

Aquasomes are emerging as highly promising nanocarriers for delivering fragile and poorly soluble therapeutics, owing to their unique tri-layered architecture and exceptional structural stability. This study optimized the synthesis of calcium phosphate cores, the fundamental scaffold of aquasomes. Quality by Design (QbD) based Central Composite Design (CCD) was used in this study. By systematically varying diammonium hydrogen phosphate and calcium acetate concentrations along with sonication time, their influence on particle size, PDI, and zeta potential was evaluated. All parameters significantly shaped core formation, and the optimal conditions (279 nm, PDI 0.39, −15 mV) were achieved at 2 M phosphate, 3 M calcium acetate, and 30 minutes of sonication. These results provide a robust, reproducible pathway for engineering uniform and stable aquasome cores, strengthening their potential as advanced drug delivery systems.

Keywords: Aquasome, Calcium phosphate, CCD,QbD, Drug delivery

INTRODUCTION

Effective delivery of fragile and poorly water-soluble therapeutic molecules remains a significant challenge in pharmaceuticals. Nanoparticulate drug delivery systems offer promising solutions by enhancing drug stability, solubility, targeting, and controlled release (Bwalya et al., 2025). Due to their large surface area, high surface-to-mass ratio, and stable water-like core, aquasomes allow superior drug adsorption, deeper penetration into cells, and an extended drug release profile, making them an effective platform for delivering sensitive therapeutic molecules (Kulkarni et al., 2024). Aquasomes are nanosized, versatile drug delivery systems (60–300 nm) (Kossovsky et al., 1994) distinguished by a unique three-layered structure consisting of a solid crystalline core, a carbohydrate coating, and an outer layer of adsorbed therapeutic agents (Damera et al., 2019). A wide variety of core materials have been investigated for aquasome fabrication, including , and calcium phosphate, hydroxyapatite (HAP), ceramic nanocrystals, nanodiamonds, silica nanoparticles (Banerjee & Sen, 2018). Calcium phosphate due to its biocompatibility is fundamental to aquasome structure and dictates critical properties like particle size, entrapment efficiency, drug loading, and release kinetics. However, precise control over calcium phosphate core synthesis is complex, with input variables significantly impacting final core quality attributes. To ensure reproducible and efficient aquasome performance, this study employed a Quality by Design (QbD) approach. We systematically optimized key process parameters in the core synthesis, specifically reactant ratios and sonication time, to precisely control critical quality attributes including particle size, polydispersity index (PDI), and zeta potential, thereby enhancing the foundational basis for aquasome-based delivery systems (Shanmugam & Srinivasan, 2024).

MATERIALS AND METHODS

Materials

Diammonium hydrogen phosphate and calcium acetate were procured from Tekkim Kimya Sanayi ve Ticaret Ltd. Şti. (Turkey) and used as precursors for the calcium phosphate core synthesis. Distilled water served as the reaction medium. All procedures were performed using standard laboratory glassware, a bath sonicator, a centrifuge, a drying oven, and 0.2 µm cellulose acetate membrane filters.

Synthesis of Calcium Phosphate Core

Calcium phosphate cores were synthesized via a precipitation by sonication method (Dahir et al., 2020). Design-Expert version 13, a Central Composite Design (CCD) was employed to investigate experimental runs, varying the critical process parameters: the molar ratios of diammonium hydrogen phosphate and calcium acetate, and the sonication time during synthesis. Diammonium hydrogen phosphate and calcium acetate were separately dissolved in 20 mL of distilled water with continuous stirring. The calcium acetate solution was then subjected to sonication, maintaining the bath temperature with ice packs. The diammonium hydrogen phosphate solution was added dropwise under constant stirring to the sonicated calcium acetate solution, initiating the formation of calcium phosphate and ammonium acetate. Following the reaction, the resulting suspension underwent sonication for the specific duration defined by the experimental design. The suspension was then filtered through a 0.2 µm cellulose acetate membrane with triple washes of distilled water to remove unreacted species and residual ammonium acetate. The filtered product was centrifuged at 4000 rpm for 1 hour, and the precipitate was washed again with distilled water for further purification. Finally, the purified calcium phosphate cores were dried in an oven at 100°C for one day (Bwalya et al., 2025).

Characterization of Calcium Phosphate Cores

The dried cores were characterized for particle size, PDI, and zeta potential using a ZetaSizer (Malvern Instruments, UK). Samples were diluted with distilled water, placed in cuvettes, and analyzed in triplicate at room temperature. These parameters were used to evaluate the stability and uniformity of the synthesized cores (Makavana & Dudhat, 2025).

RESULTS and DISCUSSION

Twenty experimental runs were designed using a Central Composite Design to investigate the influence of Diammonium hydrogen phosphate (Factor A), Calcium acetate (Factor B), and Sonication time (Factor C) on the particle size, polydispersity index (PDI), and zeta potential of aqueousome core particles. Particle size ranged broadly, PDI varied from narrow to wide distributions, and zeta potential spanned from moderately to highly negative values, reflecting the sensitivity of the system to all three factors. Surface plots indicated that increasing A and B generally led to larger particle sizes, broader PDI, and less negative zeta potential (figure **1**-**3**), likely due to accelerated nucleation and ionic shielding effects. Despite the trend suggesting low A and B concentrations might favor better characteristics at a fixed sonication time, experimental findings revealed that Sonication time played a pivotal role. Its interaction with A and B significantly impacted nanoparticle properties by influencing nucleation, growth, and potential aggregation or breakdown. The optimum conditions were achieved at high concentrations of A (2 M) and B (3 M) with a sonication time of 30 minutes, yielding the smallest particle size (279 nm), lowest PDI (0.39), and most negative zeta potential (-15 mV). This highlights the necessity of optimizing all three factors simultaneously to produce uniform, stable, and nanosized aquasomes.

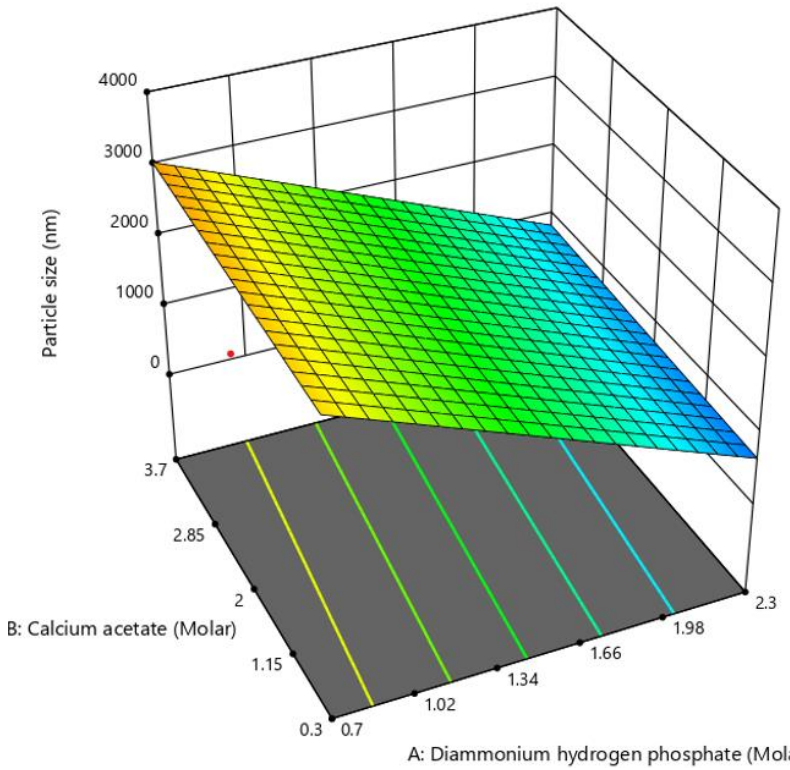

Figure 1. 3D Surface of Diammonium hydrogen phosphate and calcium acetate concentration on the particle size of calcium phosphate core

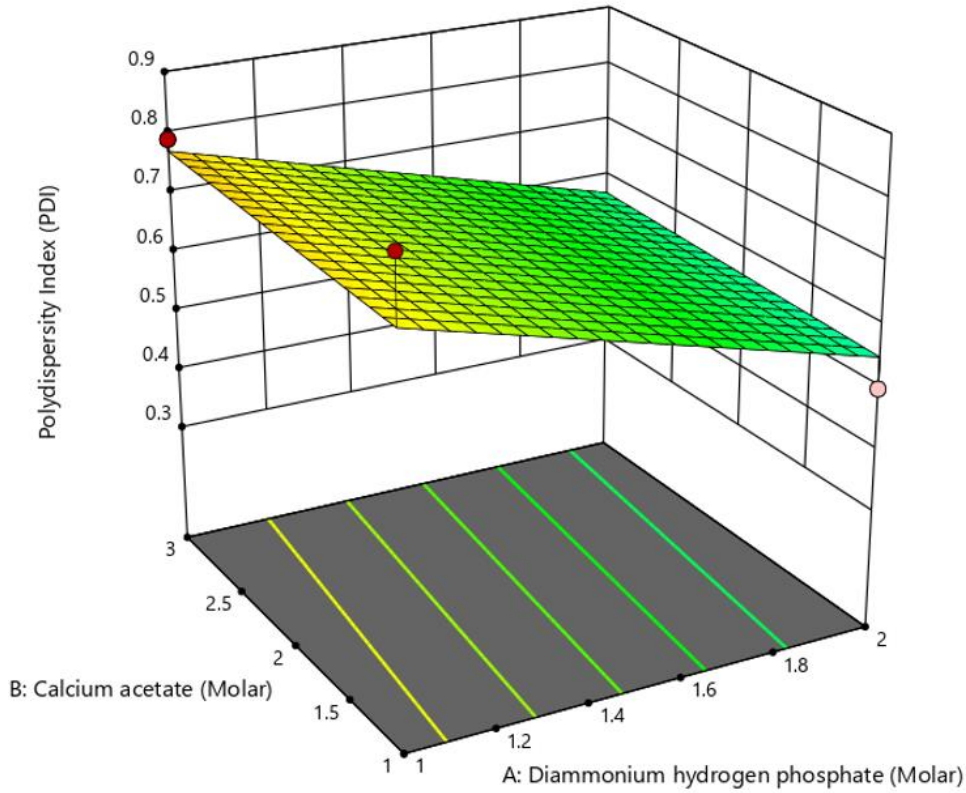

Figure 2. 3D Surface of Diammonium hydrogen phosphate and calcium acetate concentration PDI of calcium phosphate core

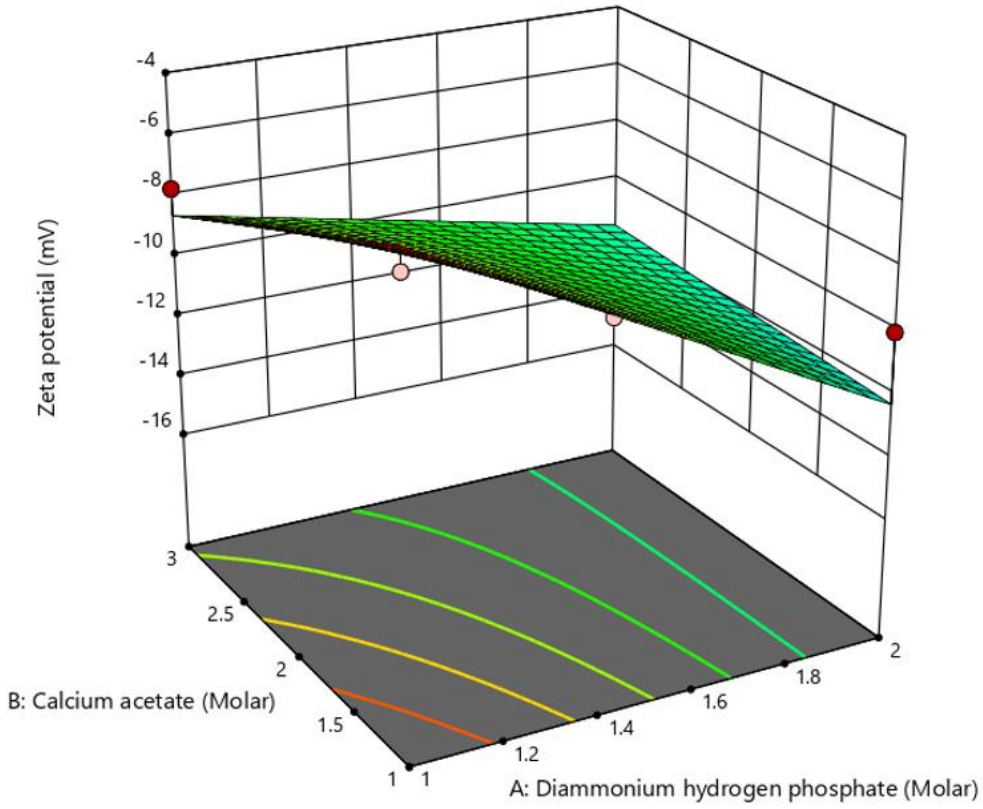

Figure 3. 3D Surface of Diammonium hydrogen phosphate and calcium acetate concentration on Zeta potential of calcium phosphate core

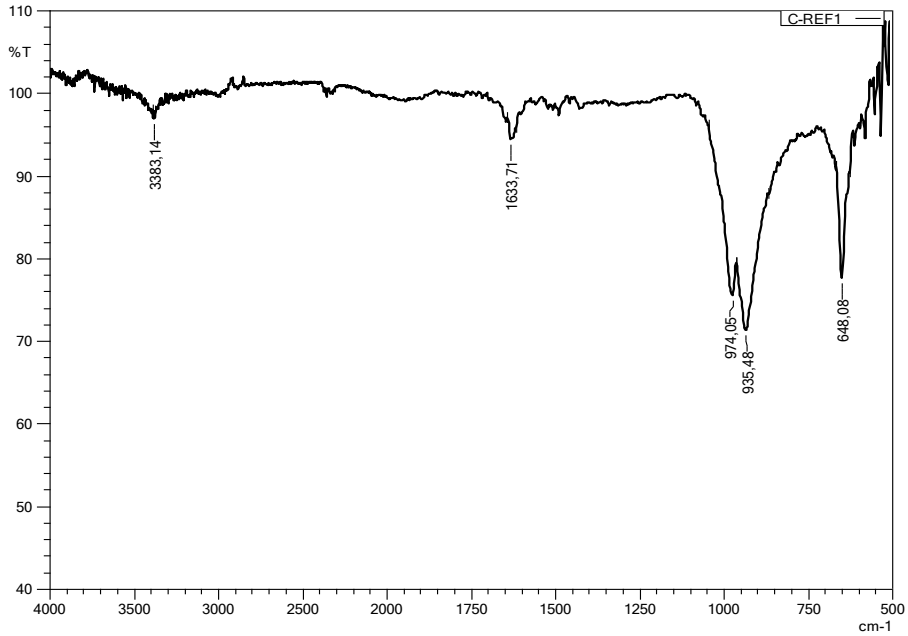

Figure 4. FTIR of optimum Calcium phosphate core

The FTIR spectrum of the optimized calcium phosphate core displays the characteristic vibrational signatures of phosphate-based nanocrystals (figure 4). The broad band at 3383 cm^{-1} corresponds to O–H stretching from surface-bound or lattice-associated water, while the peak at 1633 cm^{-1} represents H–O–H bending, confirming the hydrated nature commonly observed in calcium phosphate and hydroxyapatite structures. The prominent phosphate stretching band at 974 cm^{-1}, along with the secondary peak at 935 cm^{-1}, verifies the presence of PO_4^{3-} groups, and

the deformation band at 648 cm^{-1} reflects O–P–O bending vibrations. When compared to literature-reported hydroxyapatite (HA) spectra—characterized by PO_4^{3-} bands at 473, 564, 602, 962, 1033, and 1093 cm^{-1}, and an OH^- bending peak around 633 cm^{-1}—the observed peaks show clear correspondence, particularly the PO_4^{3-} stretching region near 974 cm^{-1}, which closely matches the HA band at 962 cm^{-1}. The bending vibration at 648 cm^{-1} is also consistent with the HA-associated OH^- deformation near 633 cm^{-1}, indicating partial structural similarity. Although the lower-wavenumber phosphate modes typical of highly crystalline HA are less pronounced, the overall spectral profile confirms the successful formation of a phosphate-rich, nanocrystalline calcium phosphate core, consistent with the broader and slightly shifted bands expected for nanoscale or less crystalline calcium phosphate materials (Goyal et al., 2008).

CONCLUSION

This study demonstrated that diammonium hydrogen phosphate concentration, calcium acetate concentration, and sonication time significantly influence the particle size, PDI, and zeta potential of aquasome core particles. Among the tested conditions, the precursor ratio of 2:3 (diammonium hydrogen phosphate: calcium acetate) combined with 30 minutes of sonication yielded the most optimal formulation, producing small, uniform, and stable nanoparticles. In addition to confirming the critical contribution of each parameter, this work highlights the strong interactive effects between precursor ratio and sonication energy, which collectively govern nucleation, growth behavior, and surface charge development. These findings underscore the importance of systematically optimizing formulation parameters to achieve desirable physicochemical characteristics.

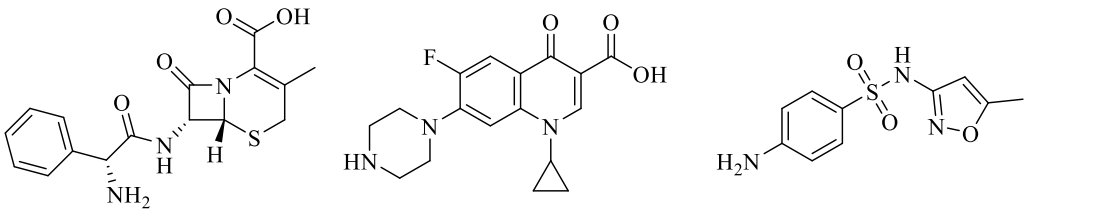
Abstract



Oxazolidinone antibiotics, featuring five-membered heterocyclic rings, are effective against Gram-positive pathogens, including resistant strains like Methicillin-Resistant *Staphylococcus aureus* and Vancomycin-Resistant Enterococci. Delpazolid, a novel oxazolidinone, exhibits promising activity against resistant bacteria and *Mycobacterium tuberculosis* by inhibiting protein synthesis through binding to the 50S ribosomal subunit. This study explored Delpazolid's interactions with *Mycobacterium tuberculosis* shikimate kinase, an essential enzyme in the shikimate pathway absent in mammals, making it an attractive drug target. Density functional theory calculations assessed Delpazolid's electronic properties, revealing a small HOMO–LUMO gap, high chemical softness, and notable electrophilicity, indicating strong reactivity and potential for ligand–target interactions. In the comparative molecular docking analysis, Delpazolid was evaluated against the reference drug Teridizone. Delpazolid showed a binding energy of –5.60 kcal/mol, stabilized by hydrogen bonds, hydrophobic and π-interactions, and halogen bonding, while Teridizone exhibited slightly higher binding (–6.35 kcal/mol). Overall, results suggest Delpazolid has favorable structural and electronic features, supporting its potential as a candidate against drug-resistant *Mycobacterium tuberculosis* and Gram-positive pathogens.

Keywords: Oxazolidinones, Delpazolide, Tuberculosis, *Mycobacterium tuberculosis*, DFT, Molecular Docking

INTRODUCTION

Heterocyclic compounds are organic molecules that contain ring systems with heteroatoms such as nitrogen, oxygen, or sulfur in addition to carbon. These structures play a significant role in modern drug design due to the selectivity advantage they provide in interactions with biological targets (Jampilek, 2019). Their three-dimensional architectures facilitate more selective binding of molecules to specific biological targets (Aldeghi et al., 2014). Heteroatom-containing frameworks form the basis of many naturally occurring bioactive compounds and are frequently employed in the design of new drugs in medicinal chemistry (Heravi et al., 2020). Therefore, heterocyclic structures serve as guiding scaffolds in the development of numerous therapeutic molecules, including antibacterial agents (Mustafa, 2018).

Antibiotics are essential for treating bacterial infections (Ekinci et al., 2025a). The term "antibiotic" was first defined by Selman Waksman in 1941 (Davies & Davies, 2010). Antibiotics discovered between 1940 and 1960, such as penicillin, streptomycin, tetracycline, and chloramphenicol, were effective in treating infections, but emerging resistance has limited their efficacy (Foti et al., 2021). Many antibiotics owe their activity to the heterocyclic groups they contain (Shivaji & Kasabe, 2021). For example, β-lactams inhibit cell wall synthesis (Cho et al., 2014), Tetracyclines bind to the 30S ribosomal subunit, thereby inhibiting protein synthesis (Chukwudi, 2016), macrolides target the 50S subunit (Dinos, 2017), and aminoglycosides bind the 30S subunit for bactericidal effects (Krawczyk et al., 2024). Other classes include quinolones, which inhibit DNA replication (Drlica et al., 2009), glycopeptides targeting cell wall synthesis (Zeng et al., 2016), and sulfonamides with trimethoprim, which interfere with folate metabolism (Ovung & Bhattacharyya, 2021). Increasing antibiotic resistance drives the development of new classes, such as oxazolidinones, which are synthetic antibiotics effective against resistant pathogens (Foti et al., 2021). Some key antibiotic classes are illustrated in Figure 1.

Cephalexin
(Beta-Lactam-derived antibiotic)

Ciprofloxacin
Quinolone-derived antibiotic)

Sulfamethoxazole
(Sulfonamide-derived antibiotic)

Figure 1. Some important antibiotic derivatives

Oxazolidinone antibiotics are particularly effective against Gram-positive pathogens due to their five-membered heterocyclic rings and inhibit protein synthesis, making them clinically important for resistant bacteria such as Methicillin-Resistant *Staphylococcus aureus* (MRSA) and Vancomycin-Resistant Enterococci (VRE) (Bozdogan & Appelbaum, 2004; Aytaç et al., 2025). For instance, Tedizolid is effective against MRSA, VRE, and other Gram-positive pathogens and is used in the treatment of skin and soft tissue infections (Iqbal et al., 2022). Radezolid is FDA-approved due to its strong antibacterial activity (Wang et al., 2023). Posizolid is a promising candidate against *Staphylococcus*, *Enterococcus*, and *Streptococcus pneumoniae* (Almalki et al., 2022). Contezolid shows in vitro efficacy against MRSA and VRE by binding to 23S rRNA and inhibiting protein synthesis (Ekinci et al., 2025a). Sutezolid, a thio-morpholino derivative of linezolid, has shown high efficacy against *Mycobacterium tuberculosis* (MTB), (Kiran et al., 2025).

Tuberculosis (TB), caused by MTB, remains one of the deadliest infectious diseases globally (Tawfick et al., 2023). High mortality rates highlight the need for shorter, safe, and effective treatment regimens (Kou et al., 2025). Current TB treatments, particularly for drug-resistant strains, rely on drugs such as isoniazid, rifampin, pyrazinamide, and ethambutol (Lee et al., 2024). However, prolonged treatment protocols negatively affect both therapeutic efficacy and patient compliance (Kim et al., 2022; Minja et al., 2025). Therefore, developing new treatment candidates with lower toxicity and activity against resistant MTB strains is critical (Hoagland et al., 2016). The robustness of the MTB cell wall enables survival under harsh environmental conditions and exposure to chemotherapeutic agents (Xu et al., 2022), making essential structural and metabolic pathways such as cell wall biosynthesis and protein synthesis strategic therapeutic targets (Kuang et al., 2022).

In this context, the shikimate pathway is vital for MTB and represents an ideal target for TB therapy because it is absent in mammals (Ducati et al., 2007). This pathway, which extends from carbohydrate metabolism to the synthesis of aromatic compounds, plays a key role in producing metabolites essential for bacterial survival. One of the pathway's critical enzymes, shikimate kinase (SK), converts shikimate to shikimate-3-phosphate using ATP, and the MTB genome contains a single gene encoding this enzyme (Rajput et al., 2023). This makes SK both a selective and high-potential drug target.

Delpazolid (DPZ), a novel member of oxazolidinones gaining attention for its activity against Gram-positive pathogens, contains a cyclic amidrazone group and is a promising candidate against resistant pathogens such as MRSA, VRE, and MTB (Koh et al., 2024). DPZ's mechanism of action involves binding to the 50S ribosomal subunit, preventing the formation of the initiation complex where *N*-formylmethionyl-tRNA (fMet-tRNA) joins the 70S ribosome, thereby inhibiting protein synthesis (Lee et al., 2024). Its rapid elimination reduces toxicity risk, and preclinical and Phase 1 studies indicate safety and potential advantages in MDR-TB treatment with 14-day early bactericidal activity (Kim et al., 2022).

In this study, the interactions of DPZ with the bacterial enzyme SK were investigated in detail. Molecular docking analyses were performed to determine potential binding sites, binding energies, and interaction types, with Terizidone (TRD), a second-line drug recommended for drug-resistant TB, used as a reference compound (Mulubwa & Mugabo, 2019; Sahoo et al., 2022). Additionally, DPZ's electronic properties contributing to its antibacterial activity were examined using density functional theory (DFT) calculations, including HOMO-LUMO energy gaps, global reactivity parameters, and molecular electrostatic potential distribution. These analyses aim to comprehensively elucidate the mechanism of DPZ-SK interactions and their role in the antibacterial efficacy of DPZ against TB.

MATERIALS AND METHODS

Global reactivity descriptors

Molecular geometry was optimized, and harmonic vibrational frequencies were calculated using the B3LYP functional (Becke, 1993; Lee et al., 1988) with the 6-311++G(d,p) basis set (Frisch, 1984) with method DFT. Global reactivity parameters were analyzed to assess chemical reactivity and kinetic stability, providing insights into electronic properties and potential interactions with biological receptors. All calculations were performed using Gaussian 16.

Molecular docking analysis

Molecular docking studies play a crucial role in drug design and pharmacology. This technique is widely employed and recognized as a reliable method for rapidly identifying protein–ligand interactions and determining binding sites (Gündoğdu Aytaç et al., 2025). In this study, *Mycobacterium tuberculosis* Shikimate Kinase in complex with Shikimate (PDB ID: 1U8A) was selected for molecular docking, and TRD was used as the standard drug for comparison of docking results. Docking studies were performed using AutoDock Tools to evaluate the interactions of DPZ and TRD with the target protein. Steps including ligand and protein preparation, active site identification, and grid parameter selection were carried out according to the reference method (Gündoğdu Aytaç et al. 2025). Target protein were obtained from the Protein Data Bank (https://www.rcsb.org/). Grid parameters were set to 40 × 40 × 40 Å³ in x, y, z dimensions, with 0.353 Å spacing and centers at 36.677, –34.542, 31.093. The resulting molecular docking scores are presented in Figures 5-6.

RESULTS AND DISCUSSION

Molecular Geometry

Geometric optimization of the DPZ molecule was performed using the B3LYP functional and the 6-311++G(d,p) basis set within the scope of DFT (Figure 2). The optimization resulted in the lowest-energy stable conformation of the molecule. The absence of negative frequencies observed during frequency analysis confirmed that the optimized structure was located at a true energy minimum. This structure formed the basis for subsequent electronic property evaluations, molecular orbital analyses, and docking studies.

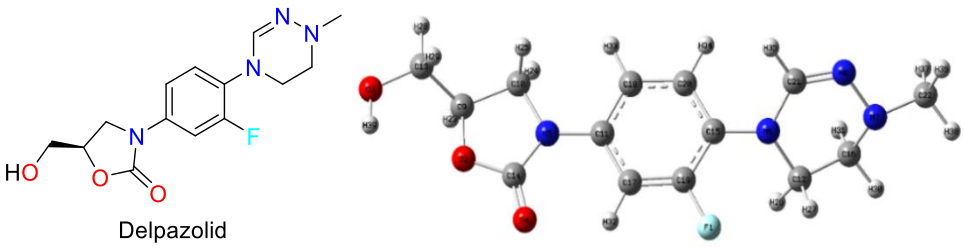


Figure 2. 2D and 3D structure of the DPZ molecule

Global reactivity descriptors

The electronic properties and chemical reactivity of DPZ were evaluated using calculated quantum chemical parameters, shown in Table 1.

Table 1. Global reactivity parameters in (eV) for DPZ

Parameters	Values
E_{HOMO} (eV)	-0.278
E_{LUMO} (eV)	-0.178
Energy gap $\|E_{HOMO}- E_{LUMO}\|$	0.100
Ionization potential ($I = -E_{HOMO}$)	0.278
Electron affinity ($A = -E_{LUMO}$)	0.178
Chemical hardness ($\eta = (I- A)/2$)	0.050
Chemical softness ($\sigma = 1/\eta$)	20.044
Electronegativity ($\chi = (I+A)/2$)	0.228
Chemical potential ($\mu = -(I+A)/2$)	-0.228
Electrophilicity ($\omega = \mu 2/2\eta$)	0.522

Based on the calculated quantum chemical parameters, the HOMO and LUMO energies of the DPZ molecule were –0.278 eV and –0.178 eV, respectively (Figure 3). The small energy gap (Egap = 0.100 eV) suggests high chemical reactivity and facile electronic transitions. Low ionization potential (I = 0.278 eV) and electron affinity (A = 0.178 eV) indicate strong electron-donating and -accepting abilities. The low chemical hardness (η = 0.050 eV) implies kinetic instability but high reactivity, while the high chemical softness (σ = 20.044 eV^{-1}) suggests adaptability with biological receptors (Ekinci et al., 2025b). Furthermore, the electronegativity (χ = 0.228 eV) and chemical potential (μ = –0.228 eV) values support the molecule's electron-attracting tendency and potential for electrophilic interactions. The notable electrophilicity index (ω = 0.522 eV) indicates that DPZ may strongly accept electrons and initiate interactions with target molecules in biological systems.

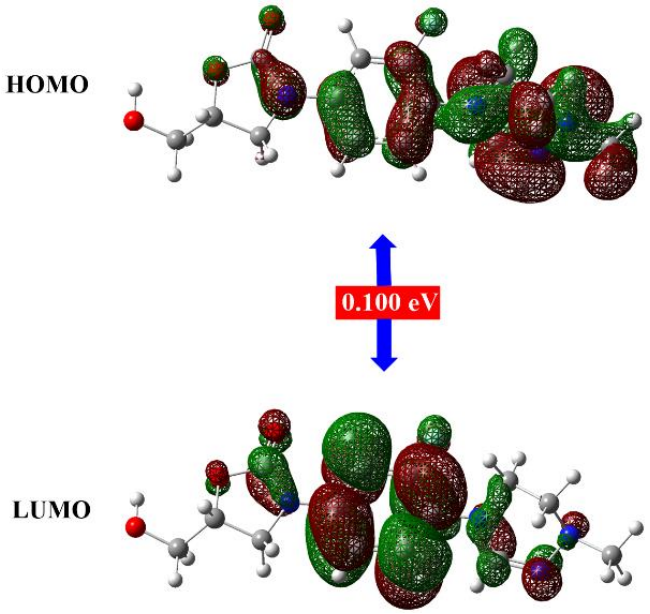

Figure 3. The frontier molecular orbitals of DPZ obtained at the B3LYP/6-311++(d,p) level.

Molecular Electrostatic Potential (MEP) Maps

The MEP map (Figure 4) illustrates the heterogeneous distribution of electrostatic potential on the DPZ molecule surface. The most negative regions (red) are around the ester carbonyl (C=O) on the left side and the carbonyl group of the oxazolidinone ring, representing the primary electrophilic centers that act as hydrogen bond acceptors and are critical for electron donation, ionic interactions, and hydrogen bonding with receptors. Slight blue regions around the oxazolidinone ring nitrogen and the secondary amine nitrogen in the side chain indicate hydrogen bond donors and protonatable sites. The central aromatic ring shows a generally neutral potential (greenish-turquoise),

while the slightly negative potential near the aromatic fluorine atom suggests its contribution to the molecule's electronic character. Overall, DPZ's electrostatic interactions are primarily mediated by electron acceptance via the carbonyl groups and proton donation and hydrogen bonding via the amine and ring nitrogens.

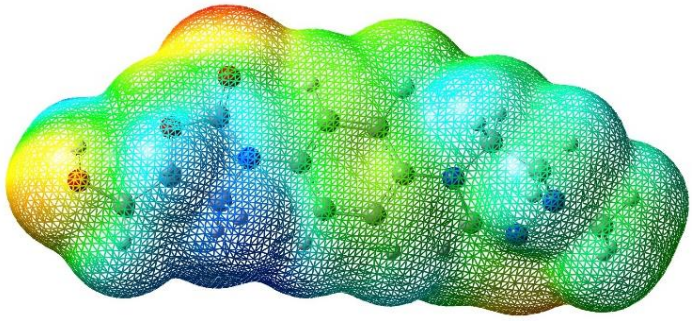

Figure 4. MEP map of DPZ obtained at the B3LYP/6-311++(d,p) level.

Molecular Docking Studies

In this study, a comparative molecular docking analysis was performed to evaluate the antibacterial properties of DPZ and the reference drug TRD. SK from MTB in complex with shikimate (PDB ID: 1U8A) was selected as the target protein. DPZ exhibited a total binding energy of –5.60 kcal/mol, indicating moderate affinity for the active site. The stability of the ligand–protein complex was primarily supported by hydrogen bonding and hydrophobic interactions. DPZ formed conventional hydrogen bonds with ARG117 (2.48 Å), GLY81 (2.11 Å), and ARG58 (2.64 and 2.13 Å), along with carbon–hydrogen bonds with GLU38 at distances of 2.92 and 3.24 Å. Non-polar interactions further stabilized the complex, including a π–anion interaction with ASP34 (3.14 Å), an alkyl contact with ILE45 (4.85 Å), and a π–alkyl interaction with ILE45 (4.82 Å). Additionally, halogen bonding between the fluorine atoms of DPZ and ARG117 (2.48 Å) and ASP34 (3.68 Å) contributed to overall stabilization. Van der Waals interactions were observed with PHE57, GLU61, GLY79, PHE49, GLY80, PRO11, ARG136, LEU132, LEU119, PRO118, and VAL35. These detailed interactions highlight the multifaceted binding mechanism of DPZ within the SK active site (Figure 5).

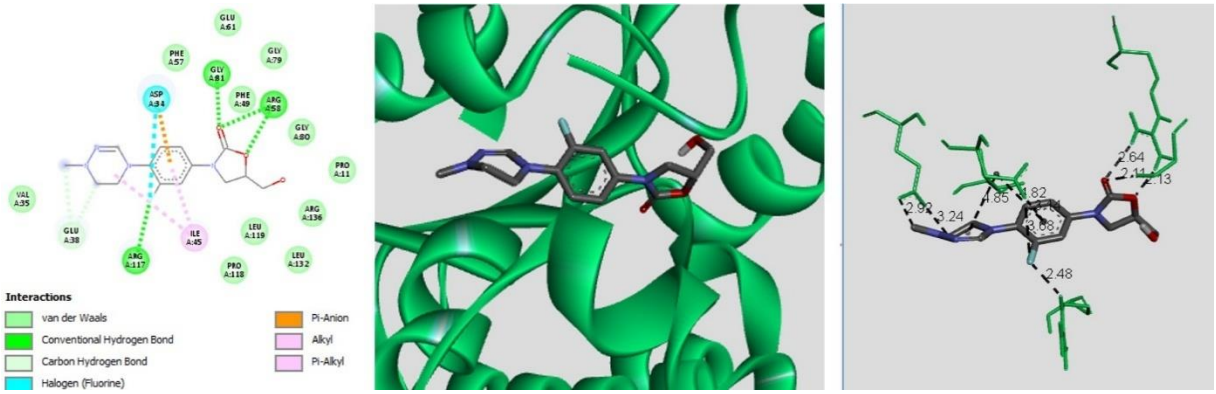

Figure 5. Docking interactions between the protein 1U8A and the DPZ

Analysis of TRD interactions within the active site of SK (PDB ID: 1U8A) revealed a total binding energy of –6.35 kcal/mol, indicating a slightly stronger affinity compared to DPZ. Conventional hydrogen bonds were observed with LEU120 (2.42 Å) and LEU119 (2.13 Å). Additionally, a π–sigma interaction was detected with ILE45 (3.57 Å), along with a π–alkyl interaction involving PRO118 (5.35 Å). Van der Waals interactions with PHE49, PHE59, ARG117, VAL35, GLU38, ASP34, VAL116, ARG58, ARG136, LEU132, and PRO11 further contributed to the stability of the protein–ligand complex. These interactions collectively provide a detailed insight into TRD's binding mechanism within the SK active site (Figure 6).

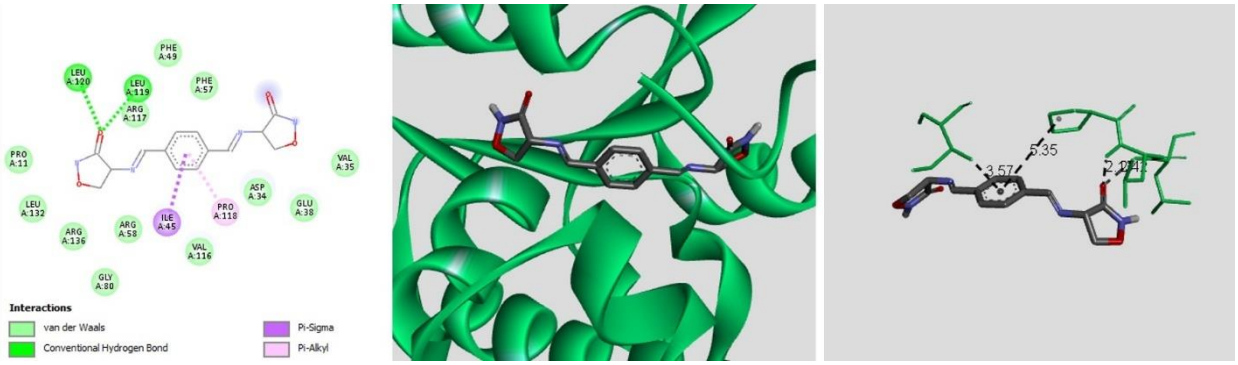

Figure 6. Docking interactions between the protein 1U8A and the TRD

CONCLUSION

This study investigated the structural and electronic properties of Delpazolid (DPZ), a novel oxazolidinone antibiotic, and its interactions with *Mycobacterium tuberculosis* shikimate kinase (SK) using computational methods. DFT analyses showed that DPZ adopts a stable, low-energy conformation, with a small HOMO–LUMO gap, high chemical softness, and significant electrophilicity, indicating strong chemical reactivity and suitability for binding interactions. Molecular electrostatic potential maps identified regions capable of hydrogen bonding and electrostatic interactions, supporting selective recognition by the target enzyme. Molecular docking results revealed that DPZ binds to the SK active site with a binding energy of –5.60 kcal/mol, stabilized by multiple hydrogen bonds, halogen bonds, hydrophobic contacts, π–anion, and Van der Waals interactions. Compared to the reference compound Terizidone (TRD), which exhibited a slightly higher binding energy of –6.35 kcal/mol, DPZ demonstrated a versatile interaction profile, suggesting its potential as an effective antibacterial agent. Overall, the findings highlight DPZ's favorable electronic and structural characteristics, as well as its ability to form stable and multifaceted interactions with SK, supporting its development as a candidate against drug-resistant *M. tuberculosis* and other Gram-positive pathogens.

Özet

Bu çalışma, resveratrolün FOXP3 geni üzerindeki potansiyel etkilerini değerlendirmeyi amaçlamaktadır. FOXP3, düzenleyici T (Treg) hücre fonksiyonunun temel belirleyicisidir. Resveratrol (RSV), özellikle üzüm kabuğu, çekirdeği ve kırmızı meyveler gibi çeşitli bitkisel kaynaklarda bulunan doğal bir polifenoldür. Antioksidan, antikanser, antiinflamatuar ve immünomodülatör özellikleri sayesinde biyolojik olarak aktiftir. RSV, eikosanoid üretimi, oksidatif stres yanıtları ve mTOR, STAT3, AhR gibi sinyal yolaklarını modüle ederek bağışıklık sistemi üzerinde çok yönlü düzenleyici etkiler gösterir.

FOXP3, Treg hücrelerinin gelişimi ve immünosupresif fonksiyonu için kritik bir transkripsiyon faktörüdür. Çalışmalar, RSV'nin FOXP3 ekspresyonunu ve stabilitesini doğrudan veya dolaylı olarak etkileyebildiğini göstermektedir. Farklı deneysel modellerde resveratrol uygulamasının $FOXP3^+$ Treg hücre sayısını artırdığı, Treg/Th17 dengesini Treg lehine kaydırdığı, proinflamatuar sitokin seviyelerini azalttığı ve FOXP3 lokusundaki düzenleyici bölgeleri epigenetik olarak modüle ettiği bildirilmiştir. Obezite ve metabolik sendrom modellerinde RSV'nin SIRT1 aracılığıyla FOXP3 ekspresyonunu koruduğu ve inflamasyonu azalttığı gösterilmiştir. Astım ve otoimmün hastalık modellerinde ise RSV'nin miR-34a'yı baskılayarak FOXP3 aktivitesini artırdığı ve AhR/Notch1 aksını inhibe ederek Treg farklılaşmasını desteklediği bulunmuştur.

Kanser modellerinde RSV'nin etkileri daha karmaşıktır. Hepatoselüler karsinomda resveratrol, immünosupresif $CD8^+CD122^+$ Treg alt kümelerini azaltmış ve IFN-γ üreten $CD8^+$ T hücrelerini artırarak antitümör yanıtları güçlendirmiştir. Ayrıca TGF-β1 ve IL-10 gibi immünosupresif sitokinler azalırken, TNF-α ve IFN-γ gibi antitümör sitokinler artmıştır. Sınırlı klinik çalışmalar da resveratrolün Treg ve γδ T hücre popülasyonlarını artırdığını, proinflamatuar sitokinleri azalttığını ve antioksidan kapasiteyi yükselttiğini göstermektedir.

Sonuç olarak, resveratrol FOXP3 ve Treg fonksiyonlarını düzenleyerek otoimmün ve metabolik hastalıklarda immün dengenin korunmasına katkı sağlamakta, immünosupresif tümör mikroçevresini modüle ederek antitümör yanıtları güçlendirmektedir. Bu bulgular, resveratrolün FOXP3 ve Treg modülasyonu üzerinden potansiyel antikarsinojenik etkileri olan değerli bir molekül olduğunu göstermektedir. Ancak, uzun dönem etkileri ve optimal dozun belirlenmesi için daha kapsamlı preklinik ve klinik çalışmalara ihtiyaç vardır.

Anahtar Kelimeler: Resveratrol, FOXP3, Düzenleyici T hücreleri (Treg), İmmün modülasyon, Antikanser etkiler.

The regulatory role of resveratrol on the FOXP3 gene

Abstract

This study aims to evaluate the potential effects of resveratrol on the FOXP3 gene, a key determinant of regulatory T (Treg) cell function. Resveratrol (RSV) is a natural polyphenol found in various plant sources, particularly grape skins, seeds, and red fruits. It is biologically active due to its antioxidant, anticancer, anti-inflammatory, and immunomodulatory properties. RSV exerts multifaceted regulatory effects on the immune system by modulating eicosanoid production, oxidative stress responses, and signaling pathways such as mTOR, STAT3, and AhR.

FOXP3 is a critical transcription factor for the development and immunosuppressive function of Treg cells. Studies have shown that RSV can directly or indirectly influence FOXP3 expression and stability. In various experimental models, resveratrol treatment has been reported to increase the number of $FOXP3^+$ Treg cells, shift the Treg/Th17 balance toward Treg dominance, reduce proinflammatory cytokine levels, and modulate regulatory regions within the FOXP3 locus epigenetically. In obesity and metabolic syndrome models, RSV maintained FOXP3 expression via SIRT1 and reduced inflammation. In asthma and autoimmune models, RSV enhanced FOXP3 activity by downregulating miR-34a and promoted Treg differentiation by inhibiting the AhR/Notch1 axis.

In cancer models, RSV effects are more complex. In hepatocellular carcinoma, resveratrol reduced immunosuppressive $CD8^+CD122^+$ Treg subsets and increased IFN-γ–producing $CD8^+$ T cells, enhancing antitumor responses. Additionally, immunosuppressive cytokines such as TGF-β1 and IL-10 decreased, while antitumor cytokines TNF-α and IFN-γ increased. Limited clinical studies have also shown that resveratrol increases Treg and γδ T cell populations, reduces proinflammatory cytokines, and enhances antioxidant capacity.

In conclusion, resveratrol regulates FOXP3 and Treg functions, supporting immune balance in autoimmune and metabolic diseases and enhancing antitumor responses by modulating the immunosuppressive tumor microenvironment. These findings indicate that resveratrol is a valuable molecule with potential anticarcinogenic effects via FOXP3 and Treg modulation. However, more comprehensive preclinical and clinical studies are needed to determine its long-term effects and optimal dosing.

Keywords: Resveratrol, FOXP3, Regulatory T cells (Treg),Immune modulation, Anticancer effects.

GİRİŞ

Bağışıklık sistemi, etkili ve dinamik bir hücresel ağ olarak, canlıları patojenlere karşı koruma görevini üstlenmektedir. Bu nedenle, bağışıklık sistemi, gereksiz ve kendine zarar veren bağışıklık tepkilerini önlemek için kendi yapılarını yabancı yapılardan ayırmalı, ancak aynı zamanda zararlı olan ile zararsız olan yabancı antijenler (Ag'ler) arasında da ayrım yapabilmelidir (Jonuleit ve Schmitt,2003). Düzenleyici T hücreleri (Treg'ler), kendi antijenlerine (self-Ag'ler) karşı immünolojik tepkisizliği sürdürmede ve konağa zarar veren aşırı bağışıklık tepkilerini baskılamada vazgeçilmez bir rol oynayan benzersiz bir T hücresi soyudur (Sakaguchi ve ark., 2008). Treg hücrelerinin immün toleransın devamı için kritik rolleri nedeniyle, bu hücrelerin gelişimini ve fonksiyonunu kontrol eden moleküler mekanizmaların anlaşılması modern immünolojinin temel araştırma alanlarından biri hâline gelmiştir.FOXP3 geni, Forkhead/Winged-Helix (FOX) transkripsiyon faktörleri ailesine ait olup, düzenleyici T hücrelerin (Treg) gelişimi ve immün baskılayıcı fonksiyonlarını göstermeleri için temel bir gen olarak görev yapar. Treg hücrelerinin baskılayıcı işlevi için FOXP3'ün yapısal olarak ifade edilmesi gerekir; bu genin mutasyonu veya eksikliği otoimmün hastalıkların ortaya çıkmasına yol açar(Ziegler, 2006). T hücreleri, timusta $CD4^+CD25^+$ T hücrelerinin bir alt grubu olan doğal Treg'ler (nTreg'ler) olarak bilinen $Foxp3^+CD4^+$ T hücrelerine farklılaşır. Periferik lenfoid organlarda ise TGF-β, $CD4^+CD25^-$ T hücrelerinin adaptif veya indüklenmiş Treg'lere dönüşmesini sağlar (Fu ve ark., 2004). Ancak, nTreg'ler ile TGF-β ile indüklenen Treg'ler farklı işlevsel özellikler taşır (Tran ve ark., 2007). Bu ayrım, immün homeostazın farklı koşullara göre ince bir şekilde düzenlenmesini sağlar.FOXP3 geni, $CD4^+CD25^+$ Treg'lerin gelişimi, kimliği ve işlevi için merkezi bir role sahiptir(Floess ve ark., 2007; Lal ve ark., 2009; Lal ve Bromberg, 2009).FOXP3 ve Treg fonksiyonu, epigenetik ve post-translasyonel mekanizmalarla da düzenlenir; histon modifikasyonları, metilasyon/demetilasyon ve mikroRNA'lar Treg stabilitesi ve işlevi üzerinde etkili olur (Lal ve ark., 2009). FOXP3'ün sürekli ekspresyonu olmadan Treg hücreleri ya oluşamaz ya da baskılayıcı işlevlerini stabil şekilde sürdüremez. FOXP3 lokusunda, "Treg-specific demethylated region (TSDR)" adı verilen epigenetik olarak hassas bir bölge bulunur; bu bölgedeki CpG metilasyonu, FOXP3 ekspresyonunun kararlılığı ve Treg kimliğinin korunması açısından kritiktir (Floess ve ark., 2007; Lal ve ark., 2009; Lal ve Bromberg, 2009). Treg hücreleri, bağışıklık sisteminde fren rolü üstlenir; aşırı veya uygunsuz immün yanıtları baskılayarak, otoimmüniteyi engeller ve dokularda immün toleransın sürdürülmesine katkıda bulunur. FOXP3, Treg'lerde baskılayıcı genlerin (IL-10, TGF-β) aktivasyonunu sağlarken inflamatuvar genlerin (IL-2, IFN-γ) ifadesini azaltan bir transkripsiyon faktörüdür (Ohkura ve Sakaguchi, 2020). FOXP3 geninde meydana gelen mutasyon veya genin silinmesi, $CD4^+CD25^+$ Treg hücrelerinin oluşamamasına yol açarak hem farelerde hem de insanlarda ciddi otoimmün hastalıkların ortaya çıkmasına sebep olur (Bennett ve Ochs, 2001;

Fontenot, Gavin ve Rudensky, 2003). Bu nedenle FOXP3, immün toleransın sürdürülebilirliği açısından merkezi bir moleküler belirleyici olarak kabul edilmektedir. Bağışıklık sistemi üzerinde resveratrol, eikosanoid üretimi, oksidatif stres mekanizmaları ve çeşitli sinyal yolları (mTOR, STAT3, AhR gibi) aracılığıyla çok yönlü etkiler gösterir (Malaguarnera, 2019). Resveratrol (RSV) (3,4,5-trans-trihidroksi-stilben), başta üzüm kabuğu, çekirdeği, sapı ve posası olmak üzere kırmızı meyveler ile çeşitli meyvelerde bulunan doğal bir fenolik bileşiktir (Vincenzi ve ark., 2016). RSV; antioksidan, antikanser, antiinflamatuvar, nöroprotektif, kardiyoprotektif ve yaşlanma karşıtı etkiler gösteren biyolojik olarak aktif bir polifenoldür (Li ve ark., 2017; Cheng ve ark., 2020). Bu flavonoid, kemoradyoterapi kaynaklı toksisitelerin azaltılmasında etkili olabilir (Mortezaee ve ark., 2020). Terapötik açıdan önemli bir özelliği, hasarlı bölgelere hücre göçünü artırabilmesidir (Hajinejad ve ark., 2018). Ayrıca, tümör mikroçevresi üzerinde düzenleyici etkiler göstererek kanser hücrelerinin gelişimini etkileyebilir (Najafi ve ark., 2021). Bu polifenol, karaciğer metabolizmasının korunmasına katkı sağlar (Wang ve ark., 2020). Bağışıklık sistemiyle etkileşime girerek onun işlevini güçlendirir (Sebastiano ve ark., 2018). Son yıllarda resveratrolün bağışıklık sistemi üzerindeki düzenleyici mekanizmaları giderek daha fazla araştırılmakta, özellikle Treg hücreleri ve FOXP3 gen ekspresyonu üzerindeki etkileri bilimsel olarak dikkat çekmektedir. Resveratrolün FOXP3'ün epigenetik düzenleyicileri, sinyal yolları ve Treg stabilitesine katkıda bulunma potansiyeli, bu bileşiğin otoimmün hastalıklar, inflamatuvar patolojiler, metabolik bozukluklar ve kanser gibi geniş bir hastalık yelpazesinde terapötik hedef olarak değerlendirilmesini mümkün kılmaktadır. Bu bağlamda, resveratrolün FOXP3 üzerinden bağışıklık yanıtını nasıl modüle ettiği, farklı hastalık modellerinde ortaya çıkan sonuçların ortak biyolojik mekanizmalarını anlamak açısından önemli bir araştırma alanı oluşturmaktadır.

Bulgular ve Tartışma

Treg hücreleri bağlamında resveratrol kullanımını değerlendiren çalışmalar, bu molekülün immün sistemi çok yönlü olarak modüle edebildiğini göstermektedir. Düzenli resveratrol tüketen sağlıklı bireylerde "$CD3^+CD4^+CD25^+CD127^-$" Treg hücrelerinin anlamlı düzeyde arttığı, proinflamatuvar sitokin düzeylerinin (TNF-α, MCP-1) azaldığı ve antioksidan kapasitenin yükseldiği bildirilmiştir. İnflamasyona dayalı hastalık modellerinde, örneğin kolit gibi durumlarda resveratrol Treg/Th17 dengesini Treg yönüne kaydırarak Treg hücre popülasyonunu artırmış; IL-17/Th17 ekseninin ve proinflamatuvar sinyallerin aktivitesini azaltmıştır.
(Yao ve ark., 2015).Bu sonuçlar, resveratrolün mukozal inflamasyon süreçlerinde Treg aracılı immün düzenlemeyi desteklediğini göstermektedir.Astım modeli üzerinde yapılan deneysel çalışmalarda resveratrol uygulamasının miR-34a düzeylerini düşürdüğü ve buna bağlı olarak FOXP3 ekspresyonunun arttığı tespit edilmiştir. (Alharris ve ark., 2018). Bu durum RSV'nin mikroRNA aracılı düzenleme mekanizmaları yoluyla FOXP3 ekspresyonunu dolaylı olarak kontrol edebildiğini ortaya koymaktadır..Resveratrolün nanoemülsiyon formunun (Res-mNE) kullanıldığı bir otoimmün hastalık modelinde Th17/Treg dengesi ve FOXP3 ekspresyonu üzerinde önemli etkiler saptanmıştır. Res-mNE, aryl hydrocarbon receptor (AhR) ve Notch1 sinyal eksenlerini baskılayarak FOXP3 düzeyini artırmış ve Treg farklılaşmasını desteklemiştir. (Cheng ve ark., 2023). Bu bulgular, resveratrolün immün hücre farklılaşmasını düzenleyen sinyal yolları üzerinde hedefe yönelik etkiler oluşturabileceğini göstermektedir.Bu çalışmalara bakıldığında, FOXP3'ün epigenetik düzeyde düzenlenmesi açısından Treg hücre kimliğinin korunması için FOXP3 lokusundaki demetilasyon ve histon asetilasyonu gibi epigenetik değişikliklerin gerçekleşmesinin kritik olduğu görülmektedir. Literatürde, resveratrolün bu epigenetik süreçler üzerinde dolaylı etkiler gösterebileceği ileri sürülmektedir(Lal ve ark., 2009).Resveratrol (RSV) uygulamasının, $CD4^+$ hücreler arasında $CD4^+CD25^+$ hücre popülasyonunu baskılayabildiği, TGF-β üretimini azalttığı ve hem ex vivo hem de in vivo koşullarda $CD8^+$ T hücrelerinde IFN-γ düzeylerini artırarak immün yanıtı uyarabildiği bildirilmiştir.Ayrıca, resveratrolün otoimmün hastalık modellerinde T hücre aktivasyonunu baskılayabildiği; tümör modellerinde ise Treg hücrelerinin baskılayıcı kapasitesini sınırlayarak antitümör immün yanıtı güçlendirebildiği de rapor edilmiştir (Zunino ve Storms, 2009). Bu veriler, resveratrolün bağlam ve hastalık modeline bağlı olarak immün sistemi hem baskılayıcı hem de uyarıcı yönlerde modüle edebilen çift yönlü bir immünomodülatör olduğunu desteklemektedir.Obezite ve metabolik sendrom modellerinde resveratrol, bağışıklık sistemi üzerinde düzenleyici etkiler göstermektedir. Yüksek yağlı diyete maruz kalan farelerde yapılan çalışmalar, resveratrol uygulamasının $FOXP3^+$ Treg hücrelerinin sayısını artırdığını ve inflamasyonu azalttığını ortaya koymuştur (Shabani ve ark., 2020). Ayrıca, resveratrolün SIRT1 aracılığıyla Th17/Treg dengesini düzenlediği ve FOXP3 ekspresyonunu koruduğu, bunun sonucunda insülin direncinin azaldığı bildirilmiştir (Chen ve ark., 2025). Bu veriler, resveratrolün obeziteye bağlı metabolik bozukluklarda Treg aracılığıyla bağışıklık yanıtını düzenleyebileceğini göstermektedir

.Kanser modellerinde ise resveratrolün etkileri daha karmaşık bir yapı göstermektedir. Hepatoselüler karsinom fare modelinde yapılan çalışmalarda, resveratrol $CD8^+CD122^+$ Treg hücrelerini azaltmış ve IFN γ üreten $CD8^+$ T hücrelerini artırarak antitümör yanıtı güçlendirmiştir .Ayrıca immünsüpresif sitokinler (TGF β1, IL 10) azalırken, antitümör sitokinler (TNF α, IFN γ) artmış ve M2-benzeri makrofaj oranı düşmüştür. İn vitro olarak resveratrol, $CD8^+CD122^-$ hücrelerden Treg farklılaşmasını engellemiştir. (Zhang ve ark., 2020). Bu bulgular, resveratrolün tümör mikroçevresinde immünsüpresif ortamı tersine çevirebileceğini ve bağışıklık yanıtını güçlendirebileceğini göstermektedir.Klinik öncesi çalışmalar, resveratrolün otoimmün bozukluklar ve kanser üzerinde immünomodülatör etkiler gösterebileceğini ortaya koymuştur. Klinik öncesi veriler umut verici olmakla birlikte, insan çalışmaları sınırlıdır; sınırlı sayıda katılımcıyla yapılan bir klinik çalışmada, 28 gün boyunca resveratrol uygulanmış ve γδ T ile Treg hücrelerinde artış, proinflamatuvar sitokinler düzeylerinde azalma ve antioksidan aktivitesinde yükselme gözlemlenmiştir (Espinoza ve ark., 2017). Ancak katılımcı sayısının düşük olması, sonuçların genellenebilirliğini sınırlamaktadır. Bu bulgular, resveratrolün Treg ve γδ T hücrelerini artırarak bağışıklık yanıtını dengeleyebileceğini ve proinflamatuvar sitokinleri azaltarak inflamasyonu kontrol altına alabileceğini göstermektedir .Bütün bulgular bir arada değerlendirildiğinde, resveratrolün FOXP3 ve Treg hücreleri üzerinden immün tolerans, inflamasyon kontrolü ve antitümör yanıtlar üzerinde önemli rol oynadığı görülmektedir. Bununla birlikte mevcut çalışmaların çoğu hücre kültürü ve hayvan modeli düzeyinde olup, resveratrolün biyoyararlanımı, doza bağlı etkileri ve klinik karşılığı hâlen net değildir.

SONUÇ

Mevcut literatür, resveratrolün FOXP3 geni üzerinde bağlama duyarlı ve çok yönlü bir düzenleyici etkiye sahip olduğunu göstermektedir. Resveratrol, FOXP3 ekspresyonunu artırarak Treg hücrelerinin farklılaşmasını, stabilitesini ve immün baskılayıcı fonksiyonlarını desteklemekte; otoimmün hastalıklar, kronik inflamasyon ve metabolik bozukluklar gibi durumlarda immün homeostazın yeniden sağlanmasına katkı sunmaktadır. Metabolik sendrom modellerinde $FOXP3^+$ Treg hücrelerindeki artış, inflamasyonun azalması ve immün-metabolik eksende gözlenen iyileşme, resveratrolün terapötik potansiyelini güçlendirmektedir.

Kanser modellerinde ise resveratrolün etkisi farklılaşmakta; tümör mikroçevresindeki immünsüpresif Treg birikimini azaltarak $CD8^+$ T hücre aktivitesini güçlendirmekte, proinflamatuvar ve antitümör sitokin yanıtlarını artırarak tümör progresyonunu baskılamaktadır. Bu bağlamda resveratrol, tümör ortamında immün toleransı azaltan, sistemik inflamatuvar hastalıklarda ise toleransı artıran çift yönlü bir immünomodülatör olarak öne çıkmaktadır. Bununla birlikte, bu etkilerin doku tipi, hastalık bağlamı, doz ve uygulama süresine göre değişebileceği unutulmamalıdır.

Resveratrolün FOXP3 aracılı immün düzenleme üzerindeki etkilerinin; Treg/Th17 dengesinin yeniden kurulması, miRNA profillerinin değiştirilmesi, epigenetik düzenlemelerin (demetilasyon ve histon modifikasyonları gibi) yönlendirilmesi ve özellikle SIRT1 aracılı sinyal yolaklarının modülasyonu ile ilişkili olduğu bildirilmektedir. Bu veriler, resveratrolün FOXP3–Treg ekseninde hem doğuştan hem de edinilmiş bağışıklıkta anlamlı biyolojik etkiler oluşturabildiğini desteklemektedir.

Her ne kadar klinik öncesi bulgular güçlü ve tutarlı olsa da, mevcut insan çalışmalarının sayısı sınırlıdır ve uzun dönem etkiler, optimal doz aralıkları, biyoyararlanım profili ve güvenlilik gibi kritik parametreler net değildir. Bu nedenle, resveratrolün klinik bir immün düzenleyici ajan olarak değerlendirilebilmesi için daha geniş örneklemli, kontrollü, çok merkezli ve uzun süreli klinik çalışmalara ihtiyaç duyulmaktadır.

Genel olarak değerlendirildiğinde resveratrol, FOXP3 üzerinden bağışıklık sistemini modüle edebilen, hastalık bağlamına göre hem immün uyarıcı hem de immünsüpresif yanıtlar oluşturabilen, geniş bir hastalık yelpazesinde terapötik potansiyel taşıyan bir molekül olarak öne çıkmaktadır. FOXP3'ün Treg hücre stabilitesi ve immün tolerans açısından merkezi bir regülatör olduğu göz önüne alındığında, resveratrolün bu gen üzerindeki etkilerinin daha kapsamlı çalışmalarla desteklenmesi, gelecekteki klinik uygulamalar için önemli bir yol haritası oluşturacaktır.

Abstract

Acute nausea and vomiting are among the most common non-specific clinical presentations in emergency settings, typically attributed to food poisoning or gastroenteritis. However, this clinical picture frequently mimics the early stages of pesticide intoxications, specifically cholinesterase inhibitors (organophosphates and carbamates) and metal phosphides (aluminum/zinc phosphide). The diagnostic gap is critical; epidemiological analysis indicates case fatality rates for aluminum phosphide (60%) and organophosphates (20%) are significantly higher than for other agents like pyrethroids (<3%), yet initial symptoms are frequently misinterpreted, leading to fatal premature discharge. This review aims to establish a clinical differential diagnosis algorithm to rapidly distinguish between foodborne illness, cholinergic intoxication, and phosphide poisoning in patients presenting with acute gastrointestinal symptoms, while ruling out common confounders like pyrethroid exposure. A review of current toxicological literature and case report series was conducted, focusing on the toxidrome triage markers: pupillary response, hemodynamic stability, respiratory secretions, and olfactory cues. The review identifies three distinct clinical pathways: the wet toxidrome of organophosphates and carbamates, characterized by miosis, bronchorrhea, and hypersecretion; for which the atropine challenge serves as a definitive physiological screen. The shock toxidrome of metal phosphides lacks a specific rapid assay and presents with a dry initial phase, but is characterized by early, refractory hypotension and metabolic acidosis; signs that are absent in typical food poisoning. Here, the silver nitrate test provides immediate chemical confirmation of phosphine gas. The irritant toxidrome of pyrethroids is identified primarily through paraesthesia and respiratory irritation rather than systemic shock. Reliance on patient history alone is insufficient. We propose a "Vomiting Triage Algorithm" that prioritizes hemodynamic assessment and pupillary examination, utilizing point-of-care testing with both chemical (silver nitrate) and physiological (atropine challenge) to rule out toxic pesticidal exposure. Implementation of this workflow can reduce the diagnostic gap responsible for iatrogenic errors regarding preventable mortality in pesticide poisoning.

Keywords: Differential Diagnosis, Toxidrome, Food Poisoning, Pesticide Exposure, Aluminum Phosphide, Organophosphates

INTRODUCTION

The catalyst for this review was the recent fatal incidents in the hospitality sector, specifically the tragic case of the Böcek family who were exposed to pesticide fumigants, namely aluminum phosphide in a hotel setting. In this and similar documented cases, patients presented to emergency departments with acute nausea, vomiting, and malaise—symptoms indistinguishable from common foodborne illness. Notably, the mother reported that her children were "lying motionless", a sign of profound lethargy and early central nervous system (CNS) depression distinct from the restlessness of simple gastroenteritis. Tragically, the absence of specific toxidrome recognition led to a diagnosis of food poisoning, resulting in premature discharge. This decision proved fatal, as the patients returned to the contaminated environment or succumbed to delayed systemic toxicity. These events underscore a critical failure in current triage protocols: the inability to rapidly distinguish between benign gastrointestinal illness and lethal chemical exposure in the absence of a clear history.

Beyond individual tragedies, pesticide poisoning remains a significant global public health challenge, accounting for approximately 150,000 deaths annually (Eddleston, 2024). While the majority of these fatalities occur in lower- and middle-income countries where agricultural chemicals are readily accessible, the clinical challenge of diagnosing acute intoxication is universal. Regulations aimed at restricting access to highly hazardous pesticides have reduced incidence in some regions (Gunnell et al., 2017), yet in the emergency setting, the "vomiting patient" remains a diagnostically ambiguous presentation. The overlap in symptoms between benign foodborne gastroenteritis and life-threatening pesticide exposure creates a dangerous "diagnostic gap". This gap is particularly evident in cases involving organophosphates (OPs), carbamates, and metal phosphides, which often present initially with non-specific gastrointestinal distress such as nausea, vomiting, and abdominal pain.

The consequences of misdiagnosis are severe. Epidemiological data indicates that case fatality rates vary drastically by chemical class. While pyrethroids have a low fatality rate of approximately 3.28% (Zheng et al., 2025), aluminum phosphide carries a catastrophic mortality rate often exceeding 60% due to the lack of a specific antidote (Mathai et al., 2010; Mew et al., 2017). Similarly, organophosphates remain highly lethal, with fatality rates around 17-20% depending on the agent (Zheng et al., 2025). In contrast to accidental poisoning, which often involves smaller doses via inhalation or dermal contact, intentional or incidental ingestion of these agents leads to rapid systemic toxicity.

Critically, initial symptoms are frequently misinterpreted, leading to premature discharge, delayed decontamination, and secondary complications such as aspiration pneumonia and multi-organ failure (Shi et al., 2023). A retrospective study of 553 poisoned patients revealed that delayed arrival at a toxicology center significantly impacts survival; patients arriving more than 8 hours post-exposure had 2.2 times higher odds of mortality compared to those arriving earlier (Kebede et al., 2025). Furthermore, survival in phosphide poisoning is entirely dependent on early recognition and aggressive supportive care, which is often delayed when symptoms are mistaken for common gastroenteritis. This review analyzes the pathophysiological distinctions between these toxidromes to propose a triage algorithm that moves beyond unreliable patient history and focuses on objective clinical phenotyping.

The Common Mimic: Bacterial and Viral Gastroenteritis

The primary diagnostic competitor in the "vomiting patient" is acute gastroenteritis caused by foodborne pathogens. In the emergency setting, this condition effectively acts as a diagnosis of exclusion for toxicology cases. The etiology is typically infectious, driven by viral agents (e.g., Norovirus, Rotavirus) or bacterial pathogens (e.g., *Salmonella*, *Escherichia coli*, *Campylobacter*). The pathophysiology involves either local mucosal invasion or the release of enterotoxins that disrupt the intestinal epithelial barrier, stimulating the enteric nervous system to trigger emesis and diarrhea as expulsion mechanisms (CDC, 2004). Unlike the systemic metabolic blockade seen in phosphide poisoning or the synaptic saturation of organophosphates, the pathology of foodborne illness is primarily localized to the gastrointestinal tract. Systemic symptoms, when present, are usually secondary consequences of volume depletion rather than direct cellular toxicity.

The clinical hallmark of uncomplicated gastroenteritis is hemodynamic stability relative to the severity of symptoms. While patients may present with profound misery, retching, and abdominal cramping, their cardiovascular reflexes typically remain intact. Unless dehydration is catastrophic, which may occur at late-stage, the patient maintains a normal blood pressure or exhibits a responsive tachycardia that resolves with fluid resuscitation. This stands in stark contrast to the "refractory hypotension" of metal phosphide poisoning, where the heart’s pumping function itself fails regardless of fluid volume (Shi et al., 2023).

Crucially, the patient with food poisoning remains alert and oriented (GCS 15). While they may appear lethargic due to exhaustion, they do not exhibit the rapid loss of consciousness, sudden coma, or fasciculations associated with toxic pesticidal exposures (Ntelios et al., 2013). The "Stable" phenotype is clinically "Dry." Mucous membranes are tacky or dry due to fluid loss, and the lungs are clear on auscultation. There is no evidence of the pathological hypersecretion (bronchorrhea, salivation) that defines the "Wet" organophosphate toxidrome.

Two specific features often serve as reliable differentiators between infectious and toxic etiologies: Pyrexia and event history.

Fever is a common systemic response to infection (e.g., Salmonellosis, Shigellosis) but is rare in the early stages of non-inflammatory pesticide poisoning. While aspiration pneumonia can cause delayed fever in poisoned patients, a patient presenting initially with high fever and vomiting is statistically more likely to have an infectious etiology than a toxic one (Shi et al., 2023).

Both food poisoning and pesticide exposure often present as cluster events (multiple people sick at once). However, the timeline differs. Foodborne outbreaks typically have an incubation period ranging from hours to days after a shared meal. In contrast, inhalational pesticide exposure (e.g., hotel fumigation) affects victims almost simultaneously or within minutes of entering the contaminated zone, without the delay unlike the incubation period in bacterial food poisonings (Eddleston, 2024). Clinicians must carefully interrogate the timeline of symptom onset so as to distinguish "shared meal" from "shared air."

The diagnosis of gastroenteritis should not be made solely on the presence of vomiting. It is a specific clinical entity characterized by hemodynamic stability (or fluid-responsive hypotension), normal pupillary function, clear lungs, and often pyrexia. Deviations from this "Stable" profile—specifically shock, miosis, or coma—must trigger an immediate search for toxicological causes.

The "Wet" Toxidrome: Organophosphates and Carbamates

Organophosphates (OPs) and Carbamates are potent insecticides widely utilized in commercial agriculture and, in some regions, for domestic pest control. Consequently, exposure most often results from occupational accidents or intentional ingestion of liquid concentrates. They represent the most significant class of pesticides requiring immediate differentiation from simple gastroenteritis. While both etiologies present with acute nausea, vomiting, and abdominal cramping, the underlying mechanism of OP toxicity creates a distinct "Wet" clinical phenotype characterized by hypersecretion and miosis (Eddleston, 2024). Unlike bacterial food poisoning, which acts through local mucosal irritation, both OPs and carbamates act systemically by inhibiting the enzyme acetylcholinesterase (AChE) (Lorke and Oz, 2025). This inhibition leads to an accumulation of acetylcholine (ACh) at the neuromuscular junctions and autonomic synapses, resulting in the overstimulation of muscarinic and nicotinic receptors (Zoofaghari et al., 2024). While the clinical presentation is nearly identical, the chemical bond formed by carbamates is transient and reversible, whereas OPs cause irreversible aging of the enzyme, often leading to more prolonged toxicity. Additionally, recent reviews suggest that oxidative stress and mitochondrial dysfunction play a significant role in the neurotoxicity of these agents, contributing to long-term sequelae. The pharmacokinetics of these compounds often involve rapid absorption and distribution, necessitating immediate recognition before the toxin binds to the enzyme.

The resulting "Cholinergic Crisis" is defined by a massive secretory response. Muscarinic overstimulation leads to the classic "SLUDGE" or "DUMBELS" symptoms: Salivation, lacrimation, urination, defecation, gastrointestinal distress, and emesis (Zoofaghari et al., 2024). While vomiting is the shared symptom with food poisoning, the accompanying signs are diametrically opposed. A patient with bacterial gastroenteritis is typically dehydrated with a dry mouth; conversely, patient poisoned by cholinesterase inhibitors presents with bronchorrhea, profound sweating, and hypersalivation (Eddleston, 2024). A case report by Bashyal et al. (2023) illustrates this distinction perfectly: a 39-year-old male presented with vomiting and epigastric pain but was noted to have a moist axilla and tongue and pinpoint pupils. This "moist axilla" sign is a critical triage marker, as patients with simple vomiting and dehydration should not be diaphoretic.

When clinical signs remain ambiguous, the "Atropine Challenge" serves as a definitive physiological bedside screen. The clinician administers a bolus of atropine IV (1 mg for adults). In a patient with benign gastroenteritis, this dose will block normal vagal tone, causing rapid tachycardia and a noticeably dry mouth. However, in a patient poisoned by cholinesterase inhibitors, the massive accumulation of acetylcholine at the synapses neutralizes the competitive antagonism of the atropine. Consequently, the patient will exhibit no significant change in heart rate or secretion status. This "negative response" confirms the toxic mechanism and justifies the immediate escalation to high-dose atropine therapy.

Once the toxidrome is identified, the immediate therapeutic goal is the reversal of muscarinic toxicity using aggressive atropine titration, followed by the administration of oximes (e.g., pralidoxime) to reactivate the phosphorylated enzyme before the chemical bond "ages" and becomes irreversible. While carbamate poisoning is generally reversible and may not strictly require oxime therapy, the initial emergency management—prioritizing

airway clearance and atropinization to dry secretions—remains identical to that of organophosphates (Eddlestone, 2024).

The "Shock" Toxidrome: Aluminum and Zinc Phosphides

Aluminum phosphide (AlP) and zinc phosphide are solid fumigants primarily used to protect stored grain from rodents and insects in silos, warehouses, and transport vessels. Unlike liquid insecticides, they are deployed as tablets or pellets that release lethal phosphine gas (PH_3) upon exposure to moisture in the air or stomach acid (Shi et al., 2023). While ingestion is a common method of self-harm, unintentional inhalation exposure represents a significant and insidious public health threat. Fatalities have been documented in families and hotel guests exposed to off-gassing from adjacent rooms or fumigated storage areas, often without their knowledge (Ntelios et al., 2013).

Unlike the "Wet" cholinergic crisis of organophosphates and carbamates, poisoning with aluminum phosphide (AlP) or zinc phosphide presents a distinct and arguably more deceptive clinical picture. Often referred to as the "Dry/Shock" toxidrome, this presentation is characterized by early gastrointestinal distress that rapidly progresses to refractory hypotension and cardiovascular collapse. The absence of dramatic initial signs like pinpoint pupils or hypersalivation makes this toxidrome particularly prone to being misdiagnosed as simple gastroenteritis, often with fatal consequences.

The toxicity of metal phosphides is driven by the liberation of phosphine gas (PH_3), a potent mitochondrial toxin. However, the pathway from exposure to systemic toxicity involves three distinct mechanisms that complicate the clinical presentation and contribute to the diagnostic confusion with gastrointestinal illness.

The first mechanism is "direct alveolar absorption". When phosphine gas is inhaled in confined spaces, it rapidly diffuses across the alveolar membrane into the bloodstream. Once systemic, the gas non-competitively inhibits cytochrome C oxidase in the mitochondrial electron transport chain (Singh et al., 2007). This blockade halts oxidative phosphorylation, creating a state of cellular suffocation and anaerobic metabolism that leads to severe metabolic acidosis and myocardial failure, even in the presence of adequate oxygen saturation. The heart muscle becomes inflamed and weak, leading to cardiovascular collapse. Since the heart and vessels are paralyzed, patients are unresponsive to treatment with fluids unlike in other hypovolemia inducing toxidromes such as food poisoning, pyrethroids and cholinergic crisis.

The second mechanism, often termed the "mucociliary escalator" effect, explains why patients with primarily respiratory exposure still present with severe vomiting. When phosphide dust or particles are inhaled, they may be trapped in the mucus of the respiratory tract. The body’s natural clearance mechanism moves this mucus up the trachea, where it is subsequently swallowed. Once these particles reach the stomach, they react with gastric acid (HCl) to release a secondary wave of phosphine gas directly into the gastrointestinal tract (Proudfoot, 2009). This effectively converts an inhalation exposure into a systemic ingestion toxicity, triggering the intense nausea and epigastric pain that mimics food poisoning.

The third and perhaps most insidious mechanism is the "absorption of intact phosphides". Contrary to the belief that the poison only acts as a gas, evidence suggests that metal phosphides can be absorbed largely intact from the gut before hydrolysis occurs. These solid phosphide particles travel through the portal circulation to the liver. Once inside the hepatic tissue, hydrolysis occurs, releasing high concentrations of phosphine gas locally (Anand et al., 2011). This mechanism accounts for the severe hepatic damage often observed in survivors and explains why gastric decontamination remains critical even hours after ingestion, as unreacted particles may act as a continuous reservoir for systemic toxicity.

These mechanisms create a "Double Hit" effect: the patient suffers immediate hypoxic stress from gas inhalation, followed by a delayed, secondary metabolic assault from swallowed or absorbed particles reacting in the stomach and liver. This complex pharmacokinetic profile underscores why simple supportive care for gastroenteritis fails; without specific intervention to neutralize gastric acid or remove the particulate reservoir, the internal production of gas continues building up.

The clinical differentiation of phosphide poisoning from food poisoning relies on two major deviations from the standard gastroenteritis profile: hemodynamic instability and rapid loss of consciousness. While severe dehydration from food poisoning can cause hypotension, it typically responds to fluid resuscitation. In contrast, phosphide poisoning causes primary cardiogenic shock due to direct myocardial toxicity. In a reported case of incidental

exposure, a 25-year-old male presented with a blood pressure of 83/51 mmHg despite no history of massive fluid loss (Çakın et al., 2018). This rapid onset of shock (typically within minutes to hours), characterized by profound hypotension (Systolic BP < 90 mmHg) that is refractory to standard fluid resuscitation, is the single most critical "Red Flag" differentiating toxic exposure from benign food poisoning. Furthermore, while patients with gastroenteritis typically remain alert, phosphine gas induces rapid CNS depression. In the case of the 25-year-old male reported by Çakın et al. (2018), the patient was found unresponsive with a Glasgow Coma Scale (GCS) of 3 shortly after exposure. Similarly, a 15-year-old male patient described by Shi et al. (2023) suddenly lost consciousness while working. This rapid progression to coma in a vomiting patient rules out benign gastroenteritis and necessitates immediate airway protection.

The peril of relying on non-specific symptoms is best illustrated by the case of a 15-year-old male who suffered fatal complications due to an initial misdiagnosis. The patient first presented to a local hospital with "nausea and chest tightness"—symptoms easily attributed to viral illness or food intolerance—and was sent home without toxicological screening (Shi et al., 2023). This discharge allowed for continued absorption of the toxin, leading to a sudden loss of consciousness and coma the following day. The rapid CNS depression resulted in the loss of airway protection and subsequent aspiration pneumonia, confirmed by the presence of *E. coli* in sputum cultures. This case underscores that history taking alone is insufficient; young patients presenting with nausea and chest tightness must be screened for hemodynamic instability to prevent fatal discharge errors. To bridge this diagnostic gap, the bedside silver nitrate test offers a rapid screening mechanism. The reaction relies on the reduction of silver ions to metallic silver ($PH_3 + 6AgNO_3 \rightarrow Ag_3P,3AgNO_3 + 3HNO_3$), forming a black precipitate. While not chemically specific—gases such as hydrogen sulfide can cause false positives (Demange et al., 2000)—a color change to black in a hypotensive patient provides a critical presumptive positive result indicating potential presence of phosphides, or sulfides. This justifies immediate aggressive resuscitation hours before definitive gas chromatography (GC-MS) is available.

Unlike organophosphates, there is currently no specific antidote for metal phosphide poisoning. Consequently, management relies entirely on early gastric lavage to interrupt the toxicokinetic process at its source. This procedure utilizes specific chemical interventions to reduce bioavailability. First, sodium bicarbonate ($NaHCO_3$) is administered to neutralize stomach acid; by elevating the gastric pH, this intervention inhibits the acid-catalyzed hydrolysis of phosphide pellets, thereby slowing the production of new gas. Second, potassium permanganate ($KMnO_4$) is utilized as a lavage fluid to chemically attack the poison; as a strong oxidizing agent, it converts the highly toxic phosphine gas (PH_3) into much less toxic phosphate (PO_4), effectively disabling the toxin before systemic absorption occurs. Following lavage, activated charcoal is administered to adsorb any remaining phosphine gas within the gastrointestinal tract, acting as a final barrier against systemic uptake.

Crucially, this decontamination protocol is not limited to cases of direct ingestion. As detailed in the previous section, the unique mucociliary clearance mechanism can transport inhaled phosphide dust from the respiratory tract to the stomach, where it reacts with gastric acid to release a secondary wave of gas. Therefore, gastric lavage is indicated even in suspected inhalation exposures to remove these swallowed particulates and prevent the "Double Hit" phenomenon. This absence of a systemic reversal agent makes the initial triage decision critical; if the window for this early chemical decontamination is missed due to a misdiagnosis of gastroenteritis, mortality rates rise sharply (Çakın et al., 2018).

The "Red Herring" Toxidrome: Synthetic Pyrethroids

Synthetic pyrethroids, such as permethrin, deltamethrin, and cypermethrin, represent the most widely used class of insecticides in modern hospitality and residential settings due to their favorable safety profile compared to older agrochemicals. Unlike the systemic acetylcholinesterase inhibition seen in organophosphates and carbamates, pyrethroids act primarily by delaying the closure of voltage-gated sodium channels in neuronal membranes. This mechanism results in a clinical toxidrome defined largely by hyperexcitability and local irritation rather than the systemic cholinergic crisis or metabolic blockade associated with more lethal agents. Consequently, the clinical presentation of pyrethroid exposure is distinct, typically manifesting as paresthesia—a subjective stinging or burning sensation of the skin without erythema—along with upper respiratory tract irritation, cough, and mild gastrointestinal distress if ingested.

The critical relevance of pyrethroids in the differential diagnosis of the "vomiting patient" lies in their role as a clinical distracter or "red herring." Because these agents are ubiquitous, patient history often reveals recent exposure. However, attributing severe systemic symptoms such as refractory hypotension or profound miosis to pyrethroid exposure is a significant diagnostic error. Clinical studies have demonstrated that while organophosphate-pyrethroid combinations are highly toxic, pure pyrethroid poisoning is associated with extremely low fatality and minimal systemic signs compared to organophosphates. Epidemiological data strongly supports this distinction in severity. While pyrethroids account for a significant portion of insecticide exposures, their case fatality rate is consistently reported as low (<3%) (Zheng et al., 2025). In stark contrast, aluminum phosphide poisoning carries a mortality rate of up to 60% (Mathai et al., 2010), and organophosphates around 20% (Mew et al., 2017).

This disparity in mortality underscores the necessity of a triage algorithm that prioritizes physiological signs over exposure history. While pyrethroids can cause nausea and vomiting, they rarely precipitate the immediate cardiovascular collapse seen in metal phosphide poisoning or the profound bronchorrhea of organophosphate intoxication. Eddleston (2024) notes that newer agents, including pyrethroids, result in far fewer deaths globally compared to the older classes of pesticides. Therefore, in the emergency setting, a patient presenting with acute vomiting accompanied by shock or "wet" cholinergic signs should not be diagnosed with pyrethroid toxicity solely based on the presence of a spray can in the vicinity. Instead, the algorithm proposes that pyrethroids be treated as a diagnosis of exclusion, to be considered only after the life-threatening "shock" and "wet" toxidromes have been clinically ruled out.

Management for these cases is primarily supportive, focusing on skin decontamination to alleviate paresthesia. Since there is no specific antidote and systemic toxicity is rare, aggressive resuscitation is seldom required, allowing clinical resources to be redirected toward patients presenting with the more lethal 'Wet' or 'Shock' toxidromes (Eddleston, 2024).

DISCUSSION

The central hypothesis of this review is that the standard "gastroenteritis" diagnosis in the emergency department acts as a cognitive bias, blinding clinicians to the early signs of fatal pesticide toxicity. This "Diagnostic Trap" leads to iatrogenic mortality—death caused not solely by the poison, but by the medical decision to discharge a chemically compromising patient. This error of omission is well-documented in the literature. Fang et al. (1995) described a cluster of patients presenting with vomiting and diarrhea who were initially managed for foodborne illness; the correct diagnosis of Coumaphos (organophosphate) intoxication was only made after the delayed appearance of miosis. Similarly, fatal cases of aluminum phosphide poisoning have been recorded where initial treatment was solely for "acute gastritis," resulting in premature discharge and subsequent death from cardiogenic shock at home (Zhang et al., 2018). These cases demonstrate that the high mortality of phosphide poisoning is exacerbated by missing the "Golden Hour" for decontamination. When a physician misdiagnoses a toxic exposure as viral gastroenteritis, they unwittingly commit two errors: delaying gastric decontamination, which allows the phosphide pellets to continue generating gas, and removing the patient from cardiac monitoring, meaning the onset of refractory shock occurs in an unmonitored setting.

To bridge this gap, we propose a physiological phenotype-based algorithm for the emergency department (Figure 1). This decision tree allows for rapid stratification of the "vomiting patient" without relying on often unreliable exposure histories. The first step in this algorithm is the hemodynamic and neurological screen, or the "shock" node. The clinician must ask if the vomiting patient is hypotensive (SBP < 90 mmHg), in shock, or exhibiting altered mental status (GCS<15). Bacterial gastroenteritis rarely causes immediate cardiogenic shock or sudden coma; patients typically remain alert despite dehydration. Zoofaghari et al. (2024) identified a low GCS as a key prognostic indicator for severe poisoning outcomes. Therefore, the combination of vomiting with either refractory hypotension or a precipitous drop in consciousness suggests metabolic blockade (phosphides) or severe CNS toxicity. If these signs are present, the clinician should immediately suspect metal phosphide toxicity, initiate resuscitation, and perform silver nitrate test.

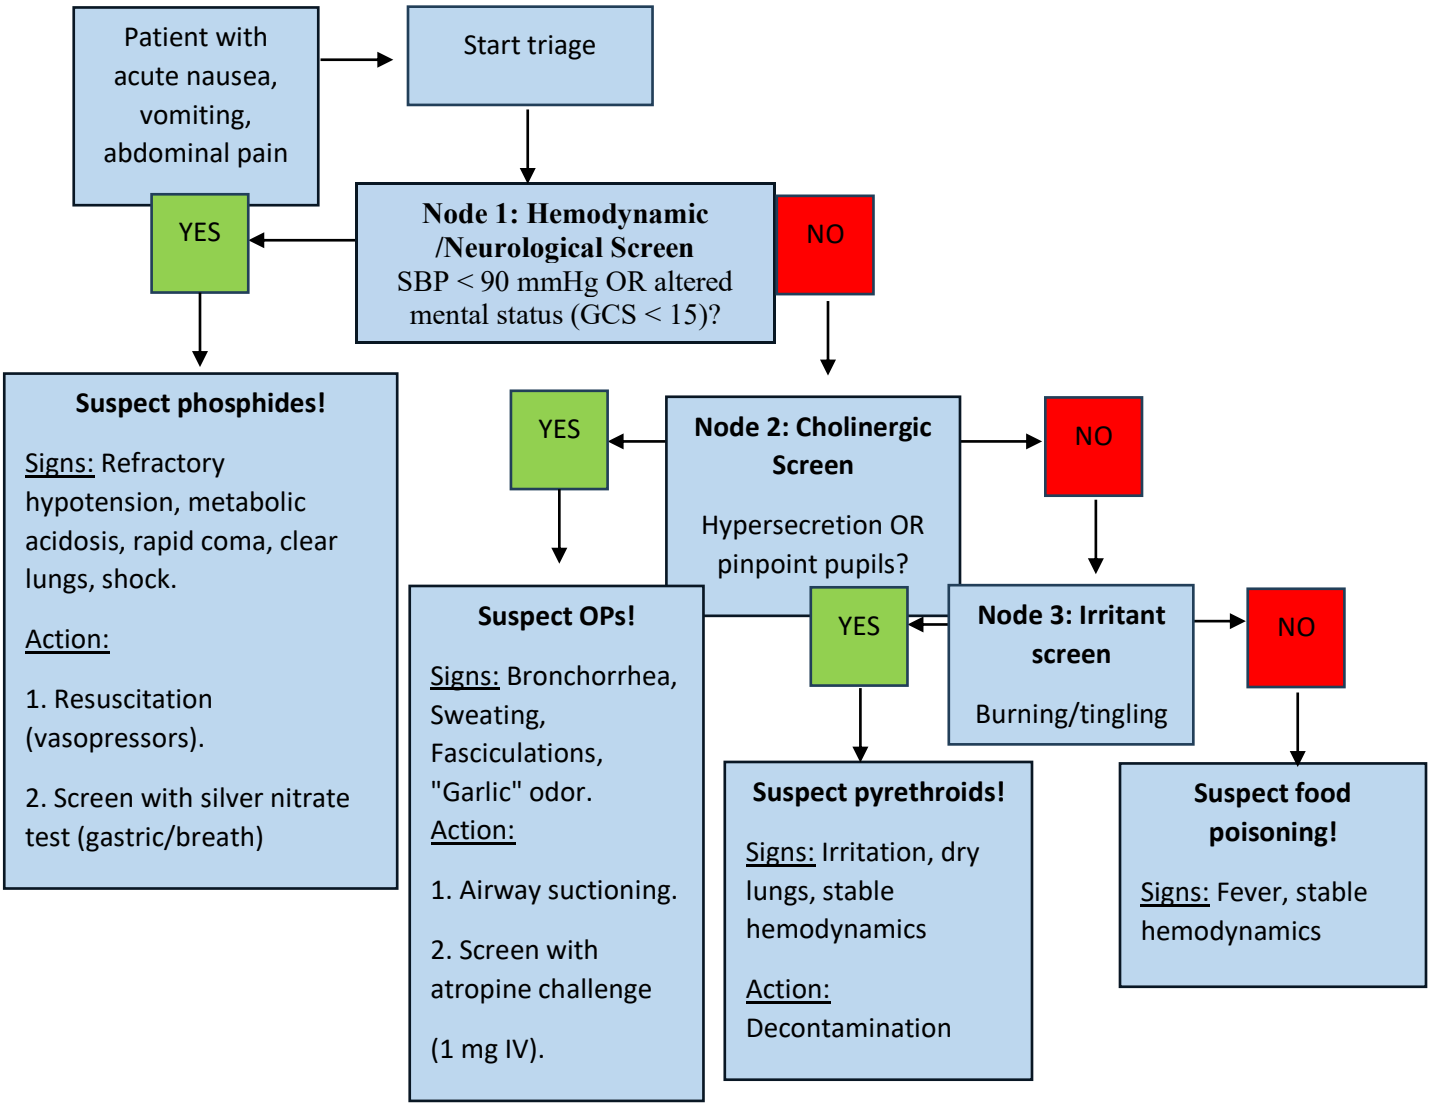

Figure 1. The Acute Gastrointestinal Toxidrome Triage Algorithm. This stepwise clinical decision tree facilitates the rapid differentiation of acute pesticide poisoning from benign gastroenteritis in the emergency department. Node 1 (Hemodynamic/Neurological Screen) prioritizes the identification of metal phosphide toxicity, defined by refractory hypotension (Systolic BP < 90 mmHg) or rapid central nervous system depression (GCS < 15), signs rarely seen in early foodborne illness. Node 2 (Cholinergic Screen) identifies organophosphate/carbamate poisoning through the "Wet" toxidrome of miosis and hypersecretion, confirmed via the physiological atropine challenge. Node 3 (Irritant Screen) classifies synthetic pyrethroids as a "Red Herring" or diagnosis of exclusion; despite their high prevalence, they are distinguished by cutaneous paresthesia and hemodynamic stability with a low fatality rate (~3.3%). Patients clearing all three nodes (stable, dry, alert) are triaged as presumptive gastroenteritis.

If the patient is hemodynamically stable, the algorithm moves to the cholinergic screen, or the "wet" node. The clinician checks for miosis (pinpoint pupils) or hypersecretion. Since food poisoning typically causes dehydration (dry mouth, tacky mucosa), the presence of "wet" signs such as sweating, salivation, or bronchorrhea alongside vomiting confirms a cholinergic crisis indicative of organophosphates or carbamates. In this scenario, the immediate action is to suspect OP toxicity and perform an atropine challenge (1mg IV) to confirm the diagnosis and begin aggressive atropinization.

If both shock and wet signs are absent, the algorithm proceeds to the irritant screen, or the "rule out" node. If the patient is stable, with normal pupils, but complains of skin burning or tingling (paresthesia), the clinician should suspect pyrethroid exposure. As these agents cause irritation and mild GI upset but rarely cause shock or cholinergic crisis, care is largely supportive. Finally, if the patient is hemodynamically stable, appears "dry" or dehydrated, has normal pupils, and presents with fever, the diagnosis of exclusion is likely foodborne illness or viral gastroenteritis, warranting standard rehydration protocols. It should be noted that this algorithm excludes organochlorines (e.g., Endosulfan) and anticoagulant rodenticides (e.g., Bromadiolone). Organochlorines were excluded because their primary presentation is typically neurological (seizures/status epilepticus) rather than the acute gastrointestinal/shock phenotype. Anticoagulants were excluded due to their delayed onset (3-5 days), which does not mimic the acute "vomiting patient" scenario in the ER. Future iterations of this algorithm could integrate these agents if rapid point-of-care coagulation testing becomes standard in low-resource settings.

CONCLUSION

The misdiagnosis of acute pesticide poisoning as benign gastroenteritis is a preventable cause of mortality in emergency medicine. By shifting the diagnostic focus from "history of exposure" to "clinical phenotyping", specifically through differentiating the "Wet" toxidrome of organophosphates and the "Shock" toxidrome of phosphides from the "Stable" profile of food poisoning, clinicians can identify intoxications early. Implementation of the proposed "Vomiting Triage Algorithm" and wider availability of point-of-care screening tools like the silver nitrate test are critical steps toward closing the diagnostic gap and preventing future fatalities in the hospitality and agricultural sectors.

Abstract

Tomato (*Solanum lycopersicum* L.) is among the most widely cultivated vegetable crops worldwide, yet its productivity and physiological performance are often constrained by abiotic stresses, particularly drought. Essential mineral nutrients such as zinc (Zn) and magnesium (Mg) play critical roles in plant growth, photosynthesis, and metabolic regulation. Their deficiencies can limit yield, whereas excessive supplementation may disrupt plant homeostasis or lead to environmental risks. Therefore, identifying optimal application dosage of these nutrients is of increasing importance in sustainable agriculture. In this study, Magnesium-doped Zinc-Tin-Oxide (Mg-ZTO) nanoparticles were synthesized via a hydrothermal method and its benefits on biochemical and physiological effects of tomato seedlings were evaluated under in vivo conditions. Plants were foliar-treated with 1.5% Mg-ZTO at concentrations of 25-2000 $mg \cdot L^{-1}$, and subsequently analyzed for photosynthetic pigments. While low concentrations (25-100 $mg \cdot L^{-1}$) enhanced pigment levels, in contrast, higher concentrations (200-2000 $mg \cdot L^{-1}$) caused a pronounced reduction in pigment levels, reflecting activation of oxidative stress pathways. In brief, Mg-ZTO nanoparticles clearly caused dose-dependent biochemical changes in tomato seedlings, with lower concentrations yielding advantageous stimulatory effects, while higher concentrations triggered more pronounced defense responses. This highlights the necessity of optimizing nanoparticle dosage for safe and effective agricultural applications, providing valuable insights into nanomaterial-plant interactions.

Keywords: Photosynthetic pigments, Mg-ZTO nanoparticles, Oxidative stress, *Solanum lycopersicum*, Tomato

INTRODUCTION

Tomato (*Solanum lycopersicum* L.) is one of the most widely cultivated vegetable crops worldwide and plays a significant role in human nutrition due to its high content of vitamins, minerals, and antioxidants. Moreover, tomato production constitutes an important source of agricultural income in major producing countries such as Türkiye, China, and the United States (Arah, 2015). Despite its economic and nutritional importance, , tomato cultivation is frequently challenged by abiotic stress factors such as drought, salinity, and insufficient light, which negatively effect growth, yield, and fruit quality (Adrees et al., 2015). Abiotic stresses disrupt water and nutrient uptake, impair photosynthetic efficiency, and promote oxidative damage, thereby limiting plant performance under unfavourable environmental conditions (Subbaiah et al., 2016). In this context, nanotechnology has emerged as a promising and sustainable approach to mitigate stress-induced limitations in crop production (Wang et al., 2016).

Metal oxide nanoparticles, when applied as nanofertilizers, nanonutrients, or nanopesticides, can enhance plant growth by improving essential micronutrient delivery efficiency, stimulating photosynthetic performance, and increasing tolerance to environmental (De la Rosa et al., 2017; Kamo et al., 2024a). However their biological effects are strongly dependent on chemical composition, particle size, concentration, and application method. Therefore, appropriate doses may promote growth, excessive exposure can induce phytotoxic effects (Verma et al.,

2018; Aasim et al., 2023; Kamo et al., 2024b). The research in the literature generally reports that metal oxide nanoparticles positively influence fundamental growth parameters such as seed germination, root and shoot development, and simultaneously enhance plant defense capacity against environmental stress factors (Rastogi et al., 2017; Sönmezoğlu et al., 2024). Magnesium-based nanoparticles have been shown to enhance chlorophyll synthesis and photosynthetic capacity, particularly under low-light conditions (Lavanya & Namasivayam, 2025). Similarly, zinc-containing nanoparticles (e.g., ZnO) support enzymatic activity and nutrient uptake, thereby improving growth and stress tolerance (Pedruzzi et al., 2020). Beyond their nutritional role, such nanoparticles can act as elicitors, activating plant defense pathways through reactive oxygen species (ROS) signaling and hormone-mediated responses (Haq et al., 2024).

The present study aims to evaluate the physiological effects of magnesium-, zinc-, and tin-containing Mg-doped Zn_2SnO_4 (1.5% Mg-ZTO) nanoparticles on tomato plants. Suspensions of 1.5% Mg-ZTO prepared at seven different concentrations were applied foliarly, and their effects on photosynthetic pigment composition were systematically investigated. The results are expected to contribute to a better understanding of Mg-ZTO–plant interactions and to support the development of nanotechnology-based strategies for sustainable tomato production.

The present study aims to evaluate the physiological effects of magnesium-, zinc-, and tin- containing Mg-doped Zn_2SnO_4 (1.5% Mg-ZTO) nanoparticles on tomato plants (*Solanum lycopersicum* L.). Suspensions of 1.5% Mg-ZTO prepared at seven different concentrations were applied foliarly, and their effects on photosynthetic pigment composition were systematically investigated. The results are expected to contribute to a better understanding of Mg-ZTO–plant interactions and to support the development of nanotechnology-based strategies for sustainable tomato production.

MATERIALS AND METHODS

The 1.5% Mg-ZTO nanoparticles were synthesized using the hydrothermal method. For synthesis, solutions of magnesium nitrate hexahydrate, zinc acetate dihydrate, and tin(V) chloride pentahydrate were prepared with a Mg:Zn:Sn:OH molar ratio of 0.03:1.97:1:4. The prepared solutions were combined in a beaker and mixed thoroughly to obtain a homogeneous solution, after which NaOH solution was added to adjust the pH to 9. The mixture was then autoclaved in a hydrothermal unit at 180 °C for 24 h. After synthesis, the product was washed and dried to obtain Mg-ZTO nanoparticles.

The synthesized ZTO nanoparticles were dispersed in distilled water (ddH2O) to prepare suspensions at concentrations of 25, 50, 100, 200, 500, 1000, and 2000 $mg \cdot L^{-1}$. Each suspension was sonicated for 2 h to ensure homogeneous dispersion.
The required amounts of 1.5% Mg-ZTO powder were weighed and dispersed in distilled water (

Tomato seeds were sterilized by immersion in a 5% sodium hypochlorite solution for 15 min. After sterilization, the seeds were rinsed five times with distilled water (modified from Oyebanji et al., 2009) and soaked in water for approximately 30 min. Twelve seeds were placed in each Petri dish lined with sterile filter paper.

Following sowing, the Petri dishes were kept in darkness for three days to ensure proper germination. Subsequently, they were transferred to a growth chamber maintained at 25 °C, with a 16/8 h light–dark photoperiod and 40% relative humidity, and allowed to germinate for 20 days. After germination, healthy and well-developed seedlings were selected and transferred to jars. Hoagland nutrient solution was added to meet the nutritional requirements of the seedlings. After 10 days of growth in the jars, experimental treatments were initiated, and 1.5% Mg-ZTO nanoparticle suspensions prepared at concentrations of 0, 25, 50, 100, 200, 500, and 1000 mg/L were applied to the leaves by spray method at five-day intervals, for a total of three applications.
Photosynthetic pigment contents were determined according to the method described by Lichtenthaler (1987). Chlorophyll a, chlorophyll b, and carotenoid contents were extracted from leaf tissues using 80% (v/v) acetone. For this purpose, 0.2 g of fresh leaf tissue was homogenized in a porcelain mortar with 5 mL of 80% acetone, and the homogenate was transferred to 15 mL centrifuge tubes. Samples were centrifuged at 3000 g for 5 min, and the supernatant was collected.

Absorbance values of the supernatant were measured at 645, 663, and 450 nm using a spectrophotometer. Pigment contents were calculated using the following equations:

$$\text{chlorophyll a} = 12{,}7 \times A663 - 2{,}69 \times A645$$
$$\text{chlorophyll b} = 22{,}9 \times A645 - 4{,}68 \times A663$$
$$\text{Total chlorophyll} = 20{,}2 \times A645 + 8{,}02 \times A663$$
$$\text{Carotenoids} = 4.07 \times A_{450} - (0.0435 \times \text{chlorophyll a} + 0.3367 \times \text{chlorophyll b})$$

Calculated pigment values were expressed as pigment content per leaf.

DISCUSSION

In this study, the effects of 1.5% Mg-ZTO nanoparticles applied at different concentrations on the photosynthetic pigment contents of tomato plants were investigated. The present study demonstrates that 1.5% Mg-ZTO nanoparticles modulate photosynthetic pigment metabolism in tomato plants in a dose-dependent manner.. Chlorophyll *a*, chlorophyll *b*, and carotenoid contents significantly increased at low 1.5% Mg-ZTO concentrations (25–100 mg/L), whereas pronounced decreases were observed at higher concentrations (200–2000 mg/L). In particular, the 100 mg/L treatment resulted in the highest values for all pigment parameters, confirming that 1.5% Mg-ZTO enhances photosynthetic capacity at this concentration (Figure 1). These findings are consistent with literature reports indicating that elements such as Mg and Zn enhance chlorophyll biosynthesis and photosynthetic efficiency at low doses.

One-way ANOVA analyses demonstrated that the changes in pigment contents were statistically highly significant (Chl *a*: $F = 107.77$, $p < 0.0001$; Chl *b*: $F = 75.40$, $p < 0.0001$; Carotenoids: $F = 167.02$, $p < 0.0001$). This indicates that 1.5% Mg-ZTO nanoparticles elicit a strong biological response depending on the applied dose. The increase observed at low concentrations may be attributed to a mild priming effect of 1.5% Mg-ZTO in plant tissues, enhanced bioavailability of Mg and Zn ions required for chlorophyll synthesis, and stimulation of photosynthetic enzyme activities. In contrast, the reduction in pigment content at higher concentrations can be explained by mechanisms frequently reported in the literature, such as nanoparticle-induced oxidative stress, accumulation of reactive oxygen species (ROS), and damage to chloroplast structure. The sharp decline in pigment levels observed particularly at 1000 and 2000 mg/L suggests that Mg-ZTO may exert toxic effects at high doses (Table 1). In conclusion, photosynthetic pigment analyses indicate that the optimal concentration of Mg-ZTO for tomato seedlings is 100 mg/L, a dose that enhances photosynthetic performance while higher doses trigger stress responses. These findings demonstrate that 1.5% Mg-ZTO can be used as a growth-promoting agent in agricultural applications at appropriate concentrations, while emphasizing that dose optimization is of critical importance.

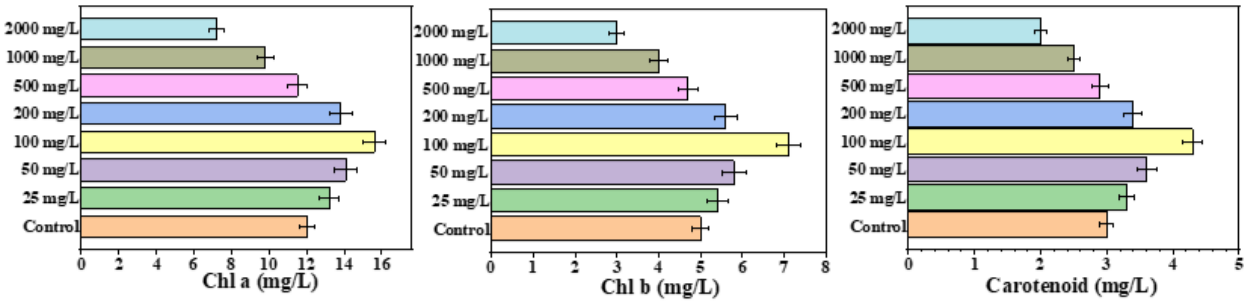

Figure 1. Effects of different Mg-ZTO concentrations on photosynthetic pigment contents in tomato seedlings: (a) chlorophyll a, (b) chlorophyll b, and (c) carotenoid levels (n = 5). All pigment parameters varied significantly depending on Mg-ZTO concentration (one-way ANOVA; Chl a: $F = 107.77$, $p \leq 0.0001$; Chl b: $F = 75.40$, $p \leq 0.0001$; carotenoids: $F = 167.02$, $p \leq 0.0001$). The highest pigment levels were consistently observed in the 100 mg/L 1.5% Mg-ZTO treatment.

Table 1. Effects of different 1.5% Mg-ZTO nanoparticle concentrations on chlorophyll *a*, chlorophyll *b*, and carotenoid contents in tomato seedlings (mean ± SD, $n = 5$). Different letters within the same column indicate significant differences according to one-way ANOVA followed by post hoc multiple comparison tests ($p < 0.05$).

1.5% Mg-ZTO	Chl a (mg/L)	Chl b (mg/L)	Carotenoids (mg/L)
0 mg/L	12.0 ± 0.4 d	5.0 ± 0.2 d	3.0 ± 0.1 d
25 mg/L	13.2 ± 0.5 c	5.4 ± 0.25 c	3.3 ± 0.12 c
50 mg/L	14.1 ± 0.6 ab	5.8 ± 0.28 ab	3.6 ± 0.15 ab
100 mg/L	14.6 ± 0.6 a	6.0 ± 0.3 a	3.7 ± 0.15 a
200 mg/L	13.8 ± 0.6 b	5.6 ± 0.27 b	3.4 ± 0.14 b
500 mg/L	11.5 ± 0.5 e	4.7 ± 0.23 e	2.9 ± 0.12 e
1000 mg/L	9.8 ± 0.43 f	4.0 ± 0.2 f	2.5 ± 0.1 f
2000 mg/L	7.2 ± 0.39 g	3.0 ± 0.13 g	2.0 ± 0.09 g

RESULTS

This study demonstrated that Mg-ZTO nanoparticles exert both beneficial and inhibitory effects on tomato physiology depending on the applied concentration. Increases in chlorophyll *a*, chlorophyll *b*, and carotenoid contents were observed at low concentrations (25–100 mg/L), with the highest values obtained at the 100 mg/L dose. In contrast, pigment levels decreased markedly at higher concentrations (200–2000 mg/L), indicating that excessive doses may adversely affect the photosynthetic apparatus. The ANOVA results confirmed that the differences among treatments were statistically significant ($p < 0.0001$). These findings underscore the importance of controlled application strategies for the safe integration of nanomaterials into sustainable agricultural practices.

Abstract

Piezocatalysis provides a sustainable pathway for environmental remediation by converting ambient mechanical energy into reactive oxygen species that drives catalytic degradation processes. This approach is particularly useful for degrading persistent organic dyes such as Rhodamine B (RhB), which pose significant environmental risks. In this study, we synthesized iron oxide (Fe_3O_4) nanoparticles via hydrothermal method and evaluated as piezocatalyst for degradation of Rhodamine-B organic pollutant. Comprehensive characterization techniques were employed to investigate their crystal structure, surface morphology, and defect-related properties of magnetite nanoparticles, enabling relationships of their structure with piezocatalytic property. Under low ultrasonic vibration, Fe_3O_4 achieved 98.33% RhB degradation within 180 minutes, with a reaction rate constant of 0.023 min^{-1}. The excellent piezocatalytic performance arises from the intrinsic magnetic behavior of Fe_3O_4, together with its small particle size, high surface area, and efficient charge-transfer properties. The results provide an effective strategy for designing iron oxide based piezocatalysts and contribute to advancing sustainable approaches for environmental remediation.

Keywords: Fe_3O_4 magnetite nanoparticles, Piezocatalysis, Rhodamine B.

INTRODUCTION

The increasing accumulation of persistent pollutant compounds in water, soil, and air has become a major environmental concern due to their toxicity, stability, and adverse effects on ecosystems and human health (Kamo et al., 2025). Advanced oxidation processes (AOPs), particularly semiconductor-based photocatalysis, have been widely investigated as sustainable remediation strategies by utilizing solar energy (Yi et al., 2018; Tong et al., 2012; kamo et al., 2024). However, their practical application is severely constrained by low photocatalytic efficiency arising from poor charge separation and the rapid recombination of photoinduced electron–hole pairs (Grabowska, 2016; kamo et al., 2024). These limitations have motivated the exploration of alternative catalytic approaches capable of operating efficiently under non-illumination conditions.

Piezocatalysis, which exploits mechanical energy to drive redox reactions via piezoelectric polarization, has recently emerged as a promising alternative, particularly when coupled with ultrasonic sounds (Akhundi et al., 2019). Ultrasound-enhanced piezocatalytic systems benefit from the synergistic effects of mechanical vibration and acoustic cavitation, leading to improved charge separation and increased reactive oxygen species (ROS) generation (Xu et al., 2019). While various piezoelectric nanomaterials, including ZnO-, MoS_2-, and perovskite-based structures, have demonstrated enhanced piezocatalytic performance (Liang et al., 2019; Ning et al., 2020), the majority of studies have focused on classical piezoelectric semiconductors. In contrast, the piezocatalytic potential of non-traditional materials, particularly iron oxide–based systems, remains largely unexplored.

Magnetite (Fe_3O_4) nanoparticles are attractive candidates for advanced catalytic applications due to their mixed-valence electronic structure, size-dependent charge transport properties, chemical stability, and magnetic recoverability (Ali et al., 2017; Dos Santos-Durndell et al., 2018; Mohajerani et al., 2019; Bhole et al., 2023). Nevertheless, the role of Fe_3O_4 in ultrasound-triggered piezocatalytic systems, as well as the underlying mechanisms governing ultrasonic–piezocatalytic synergy, has not been systematically investigated. In this study, we report an ultrasound-driven piezocatalytic system based on hydrothermally synthesized Fe_3O_4 nanoparticles for the efficient degradation of Rhodamine B in aqueous media. The novelty of this work lies in elucidating the synergistic contribution of ultrasonic vibration and Fe_3O_4-induced piezocatalytic effects to charge transfer and ROS generation, while establishing structure–property–performance relationships. These findings demonstrate the potential of Fe_3O_4 nanoparticles as efficient, magnetically recoverable, and sustainable piezocatalysts for environmental remediation.

MATERIALS AND METHODS

Synthesis of Fe_3O_4 Nanoparticles

Fe_3O_4 nanoparticles were synthesized using by the hydrothermal method. A stoichiometric amount of ferric chloride hexahydrate ($FeCl_3 \cdot 6H_2O$) was dissolved in ethylene glycol. Sodium acetate was subsequently added to the solution, and the mixture was stirred at room temperature for a period using a magnetic stirrer. The resulting homogeneous solution was transferred into a Teflon-lined stainless-steel autoclave and subjected to hydrothermal treatment in a closed system at 180°C for 8h.

After the reaction, the black Fe_3O_4 precipitate was collected and washed several times with deionized water and ethanol. Following the washing steps, the product was dried in an oven at 80 °C to obtain Fe_3O_4 nanoparticles.

Characterization of Fe_3O_4 Nanoparticles

The crystal structures of the Fe_3O_4 nanoparticles were analyzed using X-ray powder diffraction (XRD, Bruker D8 Advanced).

The surface morphology of the samples were examined using scanning electron microscopy (SEM, HITACHI SU5000).

Piezocatalytic Activity of Fe_3O_4 Nanoparticles

Piezocatalytic activity experiments were carried out in a temperature-controlled ultrasonic system operating at a power of 150 W. The piezocatalytic performance of Fe_3O_4 nanoparticles was evaluated through the degradation of a 5 ppm Rhodamine B (RhB) dye solution. Prior to ultrasonic irradiation, the dye solution containing the catalyst was stirred for 30 min to establish adsorption–desorption equilibrium without exposure to any external triggering source. During the degradation process, 3 mL aliquots were collected at 20 min intervals. The collected samples were centrifuged and subsequently analyzed using a UV–vis spectrophotometer.

Based on the UV–vis absorbance data, the C/C_0 plots were constructed and the degradation efficiency was calculated using the following equation:

$$\text{Degradation efficiency (\%)} = \left(\frac{C_0 - C}{C_0}\right) X\ 100 \quad (1)$$

where C_0 and C, represent the dye concentrations at time $t = 0$ and time $t = t$ respectively. The apparent rate constant (k) was calculated from the slope of the linear fit of the $\ln\left(\frac{C_0 - C}{C_0}\right)$ plot.

The degradation of such dyes generally follows first-order kinetics, which can be expressed as:

$$-\frac{dC}{dt} = kC \quad (2)$$

Integration of this equation yields:

$$\ln\left(\frac{C_0 - C}{C_0}\right) \quad (3)$$

Kinetic analyses were performed using the above equations.

RESULTS

XRD Analysis

The crystal structure of the synthesized Fe_3O_4 nanoparticles was investigated using X-ray diffraction (XRD). As shown in Figure 1, all diffraction peaks can be unambiguously indexed to the cubic spinel structure of magnetite (Fe_3O_4), in good agreement with standard JCPDS data (e.g., JCPDS No. 19-0629). No additional diffraction peaks associated with impurity phases such as hematite (α-Fe_2O_3) or maghemite (γ-Fe_2O_3) were observed, confirming the high phase purity of the synthesized material. The absence of secondary phases is critical for ensuring stable electronic properties and consistent catalytic behavior, as impurity phases may act as recombination centers for charge carriers. Moreover, the sharp and well-defined diffraction peaks indicate a high degree of crystallinity in the Fe_3O_4 nanoparticles. High crystallinity is known to facilitate efficient charge transport by reducing lattice defects that can trap charge carriers, thereby enhancing catalytic and piezocatalytic performance (Ali et al., 2017; Bhole et al., 2023). In the context of ultrasound-triggered piezocatalysis, a well-crystallized spinel structure is particularly advantageous, as it supports effective charge migration under mechanical stimulation and promotes the generation of reactive oxygen species. These structural characteristics suggest that the synthesized Fe_3O_4 nanoparticles provide a suitable crystalline framework for efficient catalytic activity in environmental remediation applications.

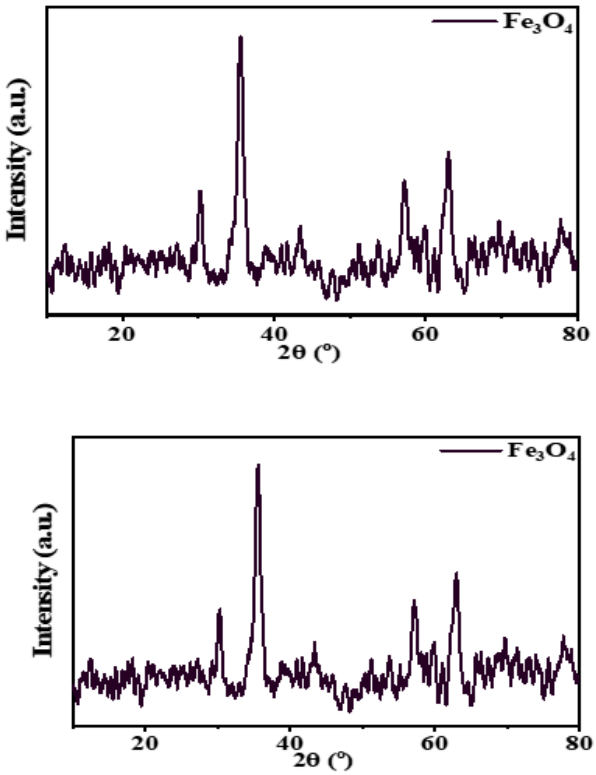

Figure 1. XRD pattern of synthesized Fe_3O_4 nanoparticles showing characteristic diffraction peaks of the spinel magnetite phase, indicating high crystallinity and phase purity.

SEM Analysis

The surface morphology and particle size of the synthesized Fe_3O_4 nanoparticles were investigated using scanning electron microscopy (SEM). As shown in Fig. 2, the nanoparticles predominantly exhibit a spherical to quasi-spherical morphology with nanoscale dimensions, accompanied by a moderate degree of agglomeration. This agglomeration behavior is commonly observed in magnetic nanoparticles and can be attributed to strong magnetic dipole–dipole interactions as well as the high surface energy inherent to nanosized Fe_3O_4 particles (Mohajerani et al., 2019; Dos Santos-Durndell et al., 2018). Despite partial agglomeration, the Fe_3O_4 nanoparticles remain relatively uniformly distributed, preserving their nanoscale features and providing a large effective surface area. Such morphological characteristics are advantageous for catalytic applications, as they increase the number of accessible active sites and promote interfacial reactions. Moreover, the nanoscale spherical morphology facilitates efficient coupling with ultrasonic waves, enabling effective transmission of mechanical vibrations to the catalyst surface. This enhanced mechanical energy transfer is expected to promote piezoelectric polarization and improve charge separation, thereby contributing to the generation of reactive oxygen species during ultrasound-assisted piezocatalytic processes (Xu et al., 2019; Liang et al., 2019).

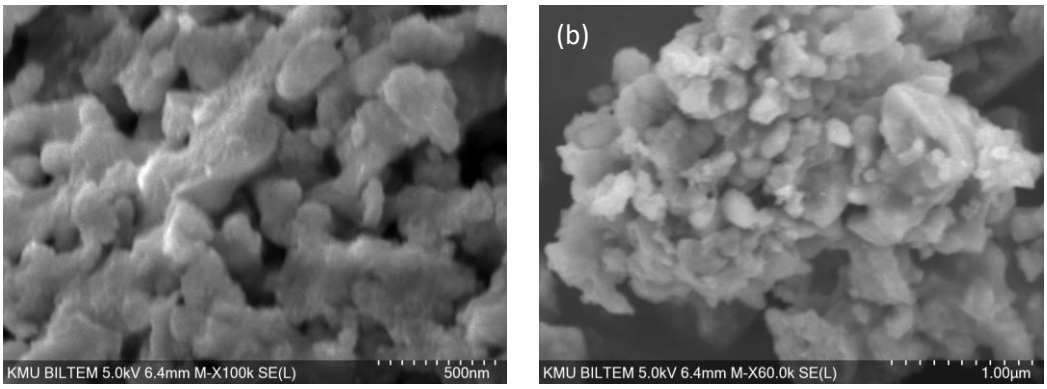

Figure 2. SEM images of Fe_3O_4 nanoparticles showing their surface morphology and particle aggregation behavior at different magnifications: (a) high-magnification image revealing quasi-spherical nanoparticles with nanoscale dimensions, and (b) low-magnification image illustrating agglomerated particle clusters resulting from magnetic interactions and high surface energy.

Piezocatalytic Activity

The piezocatalytic performance of the synthesized Fe_3O_4 nanoparticles was evaluated by monitoring the degradation of Rhodamine B (RhB) under low-intensity ultrasonic vibration. All experiments were conducted under dark conditions to eliminate any photocatalytic contribution and to isolate the ultrasound-induced piezocatalytic effect. RhB was selected as a representative organic pollutant due to its high chemical stability and widespread use as a model dye in catalytic degradation studies.

As shown in Fig. 3a, the RhB concentration decreased continuously with increasing reaction time in the presence of Fe_3O_4 nanoparticles, reaching a degradation efficiency of 98.33% after 180 min. In contrast, negligible RhB degradation was observed in control experiments performed without catalyst or with ultrasonic irradiation alone, confirming that dye removal predominantly resulted from the piezocatalytic activity of Fe_3O_4 rather than from sonolysis or adsorption effects. These results clearly demonstrate the ability of Fe_3O_4 nanoparticles to act as efficient piezocatalysts under ultrasonic excitation.

Kinetic analysis further revealed that RhB degradation followed a pseudo-first-order reaction model. As depicted in Fig. 3c, a linear relationship between $\ln(C_0/C)$ and reaction time was obtained, yielding an apparent rate constant (k) of 0.023 min^{-1}. This kinetic value is comparable to, or higher than, those reported for many Fe_3O_4-based catalytic systems, particularly considering the low ultrasonic energy input employed in this study. The enhanced piezocatalytic activity can be attributed to the transient polarization generated on the Fe_3O_4 nanoparticle surface

under mechanically induced stress from ultrasonic vibrations. This polarization promotes spatial separation of electrons and holes, suppresses their recombination, and facilitates the formation of reactive oxygen species such as •OH and $•O_2^-$, which are primarily responsible for RhB degradation (Xu et al.,

2019; Akhundi et al., 2019). Furthermore, acoustic cavitation associated with ultrasonic irradiation improves mass transfer and continuously refreshes surface-active sites, creating a synergistic effect that significantly enhances the overall catalytic performance.

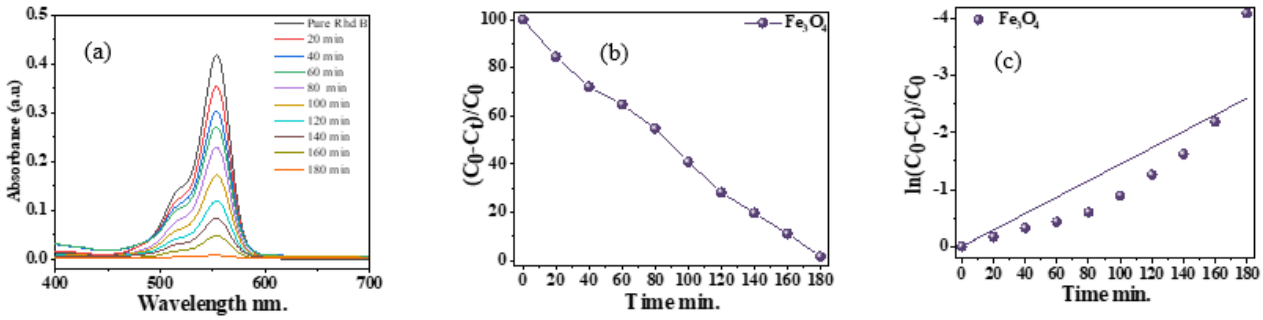

Figure 5. (a) Time-dependent UV–vis absorption spectra of Rhodamine B (RhB) during ultrasound-triggered piezocatalytic degradation in the presence of Fe_3O_4 nanoparticles, (b) variation of normalized concentration (C/C_0) as a function of irradiation time, and (c) pseudo-first-order kinetic plot of $\ln(C_0/C)$ versus time for RhB degradation under ultrasonic vibration.

CONCLUSION

In conclusion, Fe_3O_4 nanoparticles exhibited high piezocatalytic activity and favorable reaction kinetics under low-intensity ultrasonic vibration, achieving a RhB degradation efficiency of 98.33%. The combination of effective charge separation, ROS generation, and cavitation-assisted mass transfer highlights the strong potential of Fe_3O_4 nanoparticles as efficient and sustainable catalysts for ultrasound-triggered piezocatalytic environmental remediation.

Özet

Arı ürünleri, içerdiği doğal biyoaktif bileşikler sayesinde sağlık alanında geniş bir kullanım potansiyeline sahiptir. Bal, propolis, polen, arı sütü ve arı zehri gibi ürünler uzun süredir geleneksel tıpta değerlendirilmektedir. Arı ekmeği ise son dönemde artan bilimsel araştırmalarla öne çıkan ve kovandaki polenlerin arı salgılarıyla fermantasyona uğraması sonucu oluşan değerli bir kovan ürünüdür. Genç arılar ve larvalar için temel bir besin kaynağı olmasının yanı sıra, kolay sindirilebilir yapısı ve yüksek besin içeriği ile dikkat çeker. Ürün bileşimi, polen kaynağı, mevsim ve bölgesel farklılıklara bağlı olarak değişiklik gösterebilmektedir. Arı ekmeği, proteinler, serbest amino asitler, karbonhidratlar ve yağ asitlerinin yanı sıra fenolik ve flavonoid bileşenler bakımından zengindir. Bu bileşenler, ürünün güçlü antioksidan kapasitesine katkı sağlar. Yapılan araştırmalar, arı ekmeğinin oksidatif stresin azaltılmasına, inflamasyonun kontrolüne ve mikroorganizmalara karşı korunmaya destek olabileceğini göstermektedir. Bunun yanında bağışıklık sistemi üzerindeki düzenleyici etkileri, metabolik sağlık ve doku yenilenmesi açısından da potansiyel faydalar sunmaktadır. Bütün bu özellikler, arı ekmeğini yalnızca besin değeri yüksek bir kovan ürünü olmaktan öteye taşıyarak fonksiyonel gıda ve doğal terapötik ajan olarak değerlendirilmesini sağlamaktadır. Arı ekmeği ekstrelerinin içerik profili ve biyolojik aktivitelerinin belirlenmesi, ürünün gelecekte sağlık destekleyici uygulamalarda kullanılabilirliğine dair önemli bilgiler sunmaktadır. Bu nedenle, arı ekmeği hem bilimsel araştırmaların hem de uygulamalı sağlık çalışmalarının ilgi odağı haline gelmektedir.

HPLC-based component analysis and antioxidant potential of bee bread ethanolic extracts

Abstract

Bee products possess a wide range of potential applications in health due to their natural bioactive compounds. Products such as honey, propolis, pollen, royal jelly, and bee venom have long been utilized in traditional medicine. Bee bread, however, has recently gained attention in scientific research and is produced through the fermentation of pollen with bee secretions within the hive. In addition to serving as a primary nutrient source for young bees and larvae, bee bread is notable for its high nutritional value and easily digestible composition. Its chemical profile can vary depending on the pollen source, season, and regional factors. Bee bread is rich in proteins, free amino acids, carbohydrates, and fatty acids, as well as phenolic and flavonoid compounds. These constituents contribute to its strong antioxidant capacity. Studies indicate that bee bread may help reduce oxidative stress, regulate inflammation, and provide protection against microbial agents. Additionally, it may exert modulatory effects on the immune system and offer potential benefits for metabolic health and tissue regeneration. Collectively, these properties position bee bread beyond a nutrient-rich hive product, highlighting its potential as a functional food and natural therapeutic agent. Characterizing the composition and biological activities of bee bread extracts provides valuable insights into their future applicability in health-supportive interventions. Consequently, bee bread has become a focus of both scientific research and applied health studies.

GİRİŞ

Bal, propolis, polen, arı sütü ve arı zehri gibi arı ürünleri, güçlü terapötik özellikleri ve biyoaktif moleküller içermeleri nedeniyle halk hekimliğinde kullanılan en popüler doğal ürünler arasındadırlar (Mărgăoan ve ark., 2019). Arı ekmeği ise tüm bu kovan ürünleri arasında popülerliğini son dönemde kazanan ve bilimsel araştırma yayınlarına son yıllarda konu olmuş bir kovan ürünüdür. Arıların yaşamında, kolonilerin üreme dönemlerinde veya yüksek balmumu üretimi dönemlerinde olduğu gibi oldukça aktif oldukları zamanlar vardır. Bu dönemlerde polen talebi artar ve polen akışında bir azalma (sonbahar ve ilkbahar başı) veya besin değeri düşük polen varlığı, koloni için ciddi sonuçlar doğurur. Bu durum, arıları ihtiyaçları için arı ekmeği depolarına güvenmeye yönlendirir ki bu durumda kovanda arı ekmeğinin üretimi ile sonuçlanır (Bakour ve ark., 2022). Arı ekmeği kimyasal olarak, arılar tarafından bal bitkilerinin çiçeklerinden toplanan polenin laktik fermantasyon sonucu sindirim enzimleriyle karışması ve ardından kovana taşınarak ince bir bal ve balmumu tabakasıyla birlikte muhafaza edilmesiyle elde edilir. Arı ekmeği, özellikle arı sütü üreten larvalar ve genç arılar için kovandaki temel besindir (Kieliszek ve ark., 2018). Arı ekmeğinin kimyasal bileşimi üzerine yapılan çalışmalar, genellikle su, proteinler, serbest amino asitler, karbonhidratlar, yağ asitleri ve diğer biyoaktif moleküllerden oluştuğunu göstermiştir; bu bileşim, o bölgenin bal bitkilerine ve ayrıca iklim koşullarına ve mevsimsel değişime bağlı olarak bölgeden bölgeye değişmektedir. Bu ürün aynı zamanda fenolik bileşikler, α-tokoferol ve koenzim Q10 gibi antioksidan bileşiklerin de oldukça iyi bir kaynağı olarak değerlendirilmektedir (Urcan ve ark., 2017). Esasen arı ekmeğinin besin değeri arı poleninden daha yüksektir ve daha yüksek oranda serbest amino asit ve kolay sindirilebilen şekerler içerdiğinden daha kolay sindirilebilir (Kieliszek ve ark., 2018). Terapötik açıdan incelendiğinde arı ekmeği ve arı ekmeği ekstreleri çok yönlü bir biyofonksiyonel profil sergilemektedir. Bu kovan ürünü, antioksidan, antiinflamatuvar, antimikrobiyal ve immünomodülatör etkiler sergilemekte, özellikle metabolik sağlığın desteklenmesi, oksidatif stresin azaltılması ve doku yenilenmesinin hızlandırılması gibi alanlarda potansiyel uygulamalar sunmaktadır (Barta ve ark., 2022). Bu nedenle arı ekmeği, hem fonksiyonel gıda bileşeni hem de geleceğe dönük doğal bir terapötik ajan adayı olarak bilimsel ilgiyi giderek daha fazla üzerine çekmektedir. Bu çalışma da, arı ekmeği ekstrelerinin içerdiği biyoaktif bileşenlerin profilini, antioksidan potansiyelini ve olası kullanım alanlarına yönelik öngörüleri ortaya koymaktadır.

MATERYAL VE METOT

Arı Ekmeği Örneklerinin Elde Edilmesi

Arı ekmeği örnekleri, Ankara Yıldırım Beyazıt Üniversitesi Çubuk Kampüsü'nde yer alan Arılıkların Araştırma Kovanlarından elde edilmiştir. Örnekler ilkbahar mevsiminde arılıklardan taze olarak temin edilmiş ve analiz edilinceye kadar -18°C'de muhafaza edilmiştir.

Arı Ekmeği Ekstraktının Elde Edilmesi

Arı ekmeği etanol ekstraktının hazırlanması amacıyla öncelikle arı ekmekleri 5 gün süreyle liyofilize edilmiştir. Sonrasında liyofilize örnekler bir havan yardımıyla öğütülmüş ve elde edilen toz arı ekmeği örnekleri oda sıcaklığında bir su banyosunda ultrasonik güç uygulaması ile 30 dk boyunca %70'lik etanol ile muamele edilmiştir. Sonrasında Whatman No 1'den süzme işlemi gerçekleştirilerek ekstre amber renkli cam şişelerde +4°C'de saklanmıştır (Pérez-Pérez ve ark., 2018).

Arı Ekmeği Ekstraktının HPLC Analizi

Arı ekmeği ekstraktlarındaki polifenolik bileşenlerin analizi, Marhri ve ark. (2024) metodundan uyarlanarak geliştirilen laboratuvar içi bir ters faz HPLC yöntemi ile gerçekleştirildi. Analizler, Phenomenex Luna C18 (250 × 4.6 mm, 5 µm) kolon içeren bir HPLC sistemi (Shimadzu, Kyoto, Japonya) üzerinde, %0.2 asetik asit (A) ve asetonitrilden (B) oluşan gradyan mobil faz kullanılarak yürütüldü. Gradyan programı sırasıyla 0–15 dk %B 70→65, 15–20 dk 65→55, 20–30 dk 55→45, 30–35 dk %45, 35–45 dk 45→30 şeklinde uygulandı. Akış hızı 0.6 mL/dk, kolon sıcaklığı 40 °C olarak ayarlandı. Ekstraktlar ve standart çözeltiler 0.45 µm PTFE filtrelerden süzülerek 10 µL enjeksiyon hacmi ile sisteme verildi. PDA dedektörü ile 190–650 nm aralığında tarama yapıldı ve kantitatif analizler 280 nm'de gerçekleştirildi. Polifenollerin tanımlanması, referans standartlarla aynı koşullarda elde edilen alıkonma süreleri ve spektral özelliklerin karşılaştırılmasıyla doğrulandı. İstatistiksel değerlendirmeler Minitab 17 yazılımı ile yapılmıştır.

Antioksidan Aktivite Analizleri

2,2-Difenil-1-pikrilhidrazil (DPPH) radikali giderim aktivitesi ve Ferrik İndirgeme Antioksidan Gücü (FRAP) analizleri, arı ekmeği ekstrelerinin antioksidan kapasitesini belirlemek amacıyla gerçekleştirilmiştir. DPPH analizinde, metanollü DPPH çözeltisi ile ekstraktlar belirli oranlarda karıştırılmış, karışımlar karanlıkta inkübe edilmiş ve 517 nm'de absorbans ölçülmüştür. Radikal giderim yüzdesi, kontrol ve örnek absorbansları kullanılarak hesaplanmıştır. FRAP analizinde ise asetat tamponu, TPTZ (2,4,6-tripiridil-s-triazin) ve $FeCl_3$ çözeltilerinden hazırlanan FRAP reaktifi kullanılmış; ekstraktlarla karıştırılan reaktif 593 nm'de ölçülmüştür. Her iki analizde de kantitatif değerlendirme, ilgili standart kalibrasyon eğrileri üzerinden yapılmıştır (Rumpf ve Schulze, 2023).

Arı Ekmeği Biyoaktif Bileşenlerinin Farmakolojik Özellikleri

Arı ekmeğinde HPLC ile tanımlanan fenolik ve diğer biyoaktif bileşiklerin farmakolojik profilleri, güncel literatür verilerine dayanarak değerlendirilmiştir. Tanımlanan her bileşik için antioksidan, antienflamatuvar, antimikrobiyal ve potansiyel nöroprotektif etkiler gibi farmakolojik özellikler SCI indeksli çalışmalar ışığında taranmış ve özet bilgiler tabloya işlenmiştir. Değerlendirme, yalnızca benzer ekstraksiyon koşullarında incelenmiş, biyolojik olarak doğrulanmış çalışmalar dikkate alınarak yapılmıştır.

BULGULAR ve TARTIŞMA

Arı Ekmeği HPLC Analizi Sonuçları

Tablo 2'de, etanol ekstresi alınmış olan arı ekmeğinde tespit edilen 16 adet polifenolik bileşiğin tR (dakika) değerleri ve µg/g kuru madde cinsinden kantitatif değerleri sunulmuştur (Şekil 1). Öne çıkan bulgu olarak, trans 3-hydroxycinnamik asit bileşiği en yüksek miktarda (965 ± 12,65 µg/g) saptanmış olup, bu değer diğer bileşiklerin miktarlarının oldukça üzerindedir. Bu durum, söz konusu bileşiğin arı ekmeği içerisindeki baskın fenolik bileşiklerden biri olabileceğini düşündürmektedir.

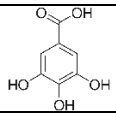
KA: kuru ağırlık , tR:Alıkonma zamanı

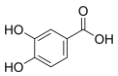
Bununla birlikte, protocateşik asit (75,98 ± 0,95 µg/g) ve p-kumarik asit (136,62 ± 3,87 µg/g) da görece yüksek düzeylerde bulunmuştur. Öte yandan, klasik olarak fenolik profil çalışmaları içinde sıkça rapor edilen kafeik asit yalnızca 0,98 ± 0,11 µg/g düzeyinde saptanmış; bu sonuç, arı ekmeğinin kaynağına, ekstraksiyon yöntemine ve analitik koşullara bağlı olarak kafeik asit miktarının oldukça düşük olabileceğini göstermektedir. Ayrıca kuersetin (115,32 ± 2,98 µg/g) düzeyi dikkat çekici olup, flavonoid sınıfında önemli bir yer tutmaktadır. Elde edilen bu veriler, literatürde bildirilenlerle uyumlu olduğu kadar farklılıklar da göstermektedir. Örneğin, arı ekmeği ürünlerinde fenolik bileşenlerin çeşitliliğinin ve miktarlarının coğrafi kaynak, botanik köken, ekstraksiyon yöntemi gibi değişkenlere bağlı olarak değişkenlik gösterdiği daha önce bildirilmiştir (Aksoy ve ark., 2024). Bu çalışmada da yüksek düzeyde trans 3-hidroksisinnamik asit saptanması, arı ekmeği örneklerinin muhtemelen sinnamik asit türevleri açısından zengin olduğunu ve bu yönüyle fonksiyonel gıda ya da nutrasötik materyal potansiyeli taşıdığını göstermektedir (Sawicki ve ark., 2024). Flavonoid sınıfındaki bileşiklerden naringenin (89,24 ± 2,65 µg/g) ve

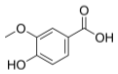
hesperidin (65,98 ± 2,16 µg/g) de makul miktarlarda gözlenmiştir. Bu bulgu, arı ekmeğinin sadece fenolik asitler değil aynı zamanda flavonoid yönünden de zengin olduğunu desteklemektedir. Literatürde arı ekmeğinin antioksidan, anti-inflamatuar, antimikrobiyal ve hücre koruyucu etkilerinin bu tip bileşenlerin varlığıyla ilişkilendirildiği de bildirilmiştir (Khalifa ve ark., 2020). Bu nedenle, kampüsümüzde yer alan arı ekmeklerinden elde ettiğimiz bu bulgular, arı ekmeği ekstraktlarının biyolojik aktiviteler yönünden incelenmesi için sağlam bir bileşen profili ve potansiyel sunmaktadır.

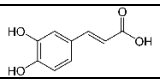
Antioksidan Aktivite Sonuçları

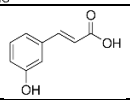
Çalışmanın bu kısmında, arı ekmeği etanol ekstresinin antioksidan kapasitesi, DPPH radikal giderme aktivitesi ve FRAP aktivite değerleri üzerinden değerlendirilmiştir. Elde edilen sonuçlar, numune konsantrasyonundaki artışa paralel olarak hem DPPH inhibisyon yüzdesinin hem de FRAP aktivitesinin belirgin şekilde yükseldiğini göstermektedir. DPPH analizinde en düşük konsantrasyon olan 0,1 mg/mL'de %78,4 inhibisyon görülürken, bu değer 1 mg/mL'de %90,89'a ulaşmıştır. Benzer şekilde, FRAP değerleri de 0,1 mg/mL'de %80 iken; en yüksek konsantrasyonda %93,25'e yükselmiştir (Şekil 2).

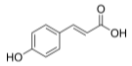


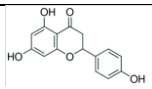


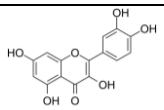


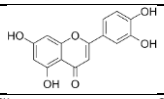


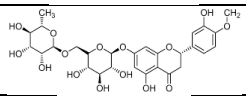


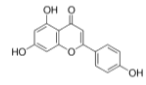


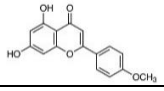












Şekil 2. Arı ekmeği antioksidan aktivite sonuç grafikleri

Bu bulgular, arı ekmeği ekstraktının güçlü bir elektron ve hidrojen donörü olduğunu ve konsantrasyon bağımlı bir antioksidan mekanizma sergilediğini göstermektedir. Literatürde arı ekmeği ve arı ürünlerinin yüksek polifenolik içerik nedeniyle güçlü radikal süpürücü özelliklere sahip olduğu daha önce vurgulanmıştır. Çalışmamızdan elde edilen veriler, özellikle yüksek DPPH inhibisyon oranları ile bu bulgularla uyumluluk göstermektedir (Mayda ve ark., 2020). Bazı çalışmalarda 80–85% aralığında bildirilen maksimum DPPH inhibisyon oranlarının aksine, bizim çalışmamızda >90% düzeyine ulaşılmış olması, ekstraksiyon yöntemimizin (etanolik ekstraksiyon) polifenolik bileşiklerin daha yüksek verimle kazanılmasını sağlamış olabileceğini düşündürmektedir (Bakour ve ark., 2019). FRAP sonuçları da benzer şekilde arı ekmeği ekstraktının güçlü indirgeme kapasitesine sahip olduğunu ortaya koymuştur. FRAP aktivitesinin %93,25 gibi yüksek bir değere ulaşması, ekstrakta bulunan sinnamik asit türevleri, flavonoidler (kuersetin, naringenin, hesperidin) ve fenolik asitlerin ferrik iyonları indirgeme potansiyelinin yüksek olduğuna işaret etmektedir. Bu yüksek antioksidan kapasite, HPLC analizinde belirlenen zengin polifenolik profile paralellik göstermektedir ve özellikle trans 3-hidroksisinnamik asit, p-kumarik asit ve kuersetin gibi bileşiklerin bu aktiviteye önemli katkıda bulunduğu değerlendirilebilir.

Arı Ekmeği Biyoaktif Bileşenlerinin Farmakolojik Özellikleri

HPLC sonuçlarının ışığında arı ekmeğinde yer alan biyoaktif bileşenlerin farmakolojik etkileri ve diğer terapötik özellikleri Tablo 3'te sunulmuştur. Elde edilen veriler arı ekmeğinin çok yönlü terapötik etkiler gösterebileceğini ve yalnızca bir fonksiyonel gıda değil aynı zamanda terapötik açıdan değerlendirilebileceğini de ortaya koymaktadır.

Tablo 3. Bileşenlerin terapötik özellikleri

Bileşik	Kimyasal Yapısı	Başlıca Farmakolojik Özellikler	Referanslar
Gallik asit		Güçlü antioksidan, antiinflamatuar, antimikrobiyal, antiproliferatif ve gastrointestinal koruyucu	(Kahkeshani ve ark., 2019)
Protokateşik asit		Antioksidan, hepatoprotektif, antiinflamatuar, antikanser	(Semaming ve ark., 2015)
Vanilik asit		Antidepresan, tansiyon düzenleyici, yara iyileştirme, anti-fungal aktivite	(Ingole ve ark., 2021)
Kafeik asit		Antiviral, antiinflamatuar, anti-tümör	(Lv ve ark., 2021)
trans 3-hidroksisinnamik asit		Antikanser, antioksidan, Antityrosinase	(Medini ve ark., 2015)
p-kumarik asit		Antioksidan, UV-koruyucu, antimikrobiyal, antikanser	(Ferreira ve ark., 2019)
Naringenin		Antidiyabetik, antiviral, kardiyovasküler ve nörolojik koruyucu etkiler	(Patel ve ark., 2018)
Kumarin		Antikoagülan, antimikrobiyal, antispazmodik	(Venugopala ve ark., 2013)
Kuersetin		Antialerjik, antiviral, kardiyoprotektif, nöroprotektif	(Wang ve ark., 2022)
Luteolin		Nöroprotektif, antioksidan, antikanser	(Nabavi ve ark., 2015)
Hesperidin		Venoprotektif, antihipertansif	(Li ve Schluesener, 2017)
Apigenin		Antiinflamatuvar, anksiyolitik	(Li ve ark., 2023)
Akasetin		Kardiyoprotektif, antikanser, antioksidan	(Li ve ark., 2023)

SONUÇ

Arı ekmeği, zengin besin içeriği ve çok yönlü biyofonksiyonel profili sayesinde hem kovandaki temel bir besin kaynağı hem de sağlık destekleyici potansiyele sahip fonksiyonel bir ürün olarak öne çıkmaktadır. Proteinler ve serbest amino asitlerin yanında fenolik ve flavonoid bileşenler de arı ekmeğinin biyolojik aktivitelerinde kritik rol oynamaktadır. Elde edilen veriler, arı ekmeği ve ekstrelerinin oksidatif stresin azaltılması, inflamasyonun kontrolü, immünomodülasyon ve metabolik sağlık gibi alanlarda potansiyel faydalar sunabileceğini göstermektedir. Bu nedenle, arı ekmeği hem bilimsel araştırmaların hem de fonksiyonel gıda ve doğal terapötik uygulamaların ilgi odağı haline gelmektedir. Gelecekte yapılacak çalışmalar, içerik profili ve biyolojik aktivitelerin daha ayrıntılı incelenmesi yoluyla, arı ekmeğinin sağlık destekleyici uygulamalarda etkin kullanımını daha iyi anlamamıza katkı sağlayacaktır.

TEŞEKKÜR

Abstract

In this study, three different catalyst supports were synthesized by the hydrothermal method using hazelnut shell–derived biochar, and their potential as support materials for the hydrolysis reaction of $NaBH_4$ was investigated. The effects of catalyst structure and composition were thoroughly examined to design suitable supports for heterogeneous catalyst synthesis. The highest hydrogen production rate was achieved at 30 °C with 30 mg of catalyst, using the hazelnut shell–based CoB catalyst supported on ACFK_1:1 (CoB/ACFK_1:1), reaching 3148.2 $mL \cdot g_{cat}^{-1} \cdot min^{-1}$. The activation energy for the hydrolysis reaction was calculated as 54.65 $kJ \cdot mol^{-1}$. Furthermore, the catalyst showed good reusability, retaining 90.14 % of its activity. Overall, these findings emphasize the importance of rational catalyst design and highlight the potential of agricultural residues, such as hazelnut shells, as efficient and sustainable catalyst support materials for $NaBH_4$ hydrolysis–based hydrogen generation.

Keywords: Hydrothermal carbonization, Hazelnut shell, Hydrolysis, CoB catalyst.

INTRODUCTION

Hydrogen is the most abundant gas in the universe and is classified by the World Energy Organization as the cleanest fuel in the world compared to other energy products. Therefore, it is considered essential for achieving the zero-fuel emissions strategy adopted by the largest countries. It is also projected that by 2050, hydrogen consumption will account for 24% of the global energy sector, with investments estimated at 2.5 trillion dollars, compared to only 139 billion dollars at present (Yousef 2021). For hydrogen to be used as an energy carrier, it must be produced from sources such as water (H_2O), fossil fuels (such as methane and coal), or biomass, and separated from these sources by suitable chemical or electrochemical processes (Levin and Chahine 2010). Thanks to these production processes, hydrogen can be considered a clean and sustainable energy source (Midilli et al., 2005). Once produced, hydrogen must be transported to the desired locations, used, and stored when demand decreases. Hydrogen can be stored in pure form in tanks as a liquid or gas, physically in nanotubes, or chemically as a hydride. Sodium borohydride ($NaBH_4$), one of the chemical hydride storage methods, is an excellent hydrogen storage material due to its stability in dry air, high hydrogen content, light weight, ability to produce hydrogen when reacting with alcohol, water, or an alcohol-water mixture at room temperature, and its non-toxic and non-flammable nature (Zhong 2025).

The hydrolysis of $NaBH_4$ was proposed by Schlesinger in the 1950s for hydrogen production under suitable conditions, and it was found that 90% of the stoichiometric hydrogen content was obtained. Sodium borohydride hydrolyzes with water in the presence of a suitable catalyst in an alkaline environment according to the reaction given in equation (i) (Hoşgün and Hoşgün,2024).

$$2H_2O + NaBH_4 \rightarrow 4H_2 + NaBO_2 \quad \text{(i)}$$

To increase the rate of hydrolysis of $NaBH_4$, suitable catalysts must be added to the reaction medium. It has been found that platinum, ruthenium, and other precious metal catalysts with various loading ratios and carrier forms significantly increase the hydrolysis and methanolysis rates of $NaBH_4$. However, the high cost and limited supply of these precious metals restrict their use. Various studies have been conducted and are ongoing to develop catalysts based on non-precious metals, which are more abundant on earth and have similar efficiencies, to replace these

precious metals. In these studies, cobalt-containing catalysts have been synthesized specifically for the use of $NaBH_4$ in hydrogen production reactions due to their low cost and high activity. Heterogeneous solid catalysts lose some catalytic activity because of metal agglomeration. To address this problem, the metals are deposited on a suitable support material. Carrier materials provide a larger, more accessible surface area for the active metals, thereby increasing catalytic activity. The most commonly used carrier materials are metal oxides, clay minerals, silica (SiO_2), aluminum oxide (Al_2O_3), and activated carbon. Most carrier materials have low surface energy and are hydrophobic, which makes it difficult for them to adhere to other materials (Wei et., 2017).

The potential of natural materials to enhance catalyst performance and promote environmental sustainability has been frequently highlighted, especially in studies on materials such as clay minerals. These materials can increase catalytic activity and support the development of sustainable chemical processes. In this context, biochar, produced by the thermochemical conversion of biomass through pyrolysis, gasification, or hydrothermal carbonization, has recently become an important research focus as a catalyst support material. Biochar is a carbon-rich material obtained by the controlled thermal degradation of biomass and is characterized by high porosity, large surface area, and chemical stability (Liu et al. 2015). These properties make biochar an ideal material for catalytic applications. Additionally, biochar produced from biomass conversion is considered an economical and environmentally friendly alternative. Biochar also provides environmental benefits such as waste management and carbon sequestration (Luo et al., 2023).

The surface chemistry of biochar, its functional groups, and its ability to bind metal ions can be optimized to increase catalytic activity. The oxygen-containing functional groups (e.g., carboxyl, hydroxyl) on the surface of biochar play an important role in binding metal ions and enhancing catalytic activity. These properties make biochar attractive as a carrier material in heterogeneous catalysts (Sun et al., 2016). Such applications increase the sustainability of energy production and minimize environmental impact (Li et al., 2021). These properties enable the effective use of biochar in catalytic applications and contribute significantly to the development of renewable energy systems. Biochar has a wide range of applications, especially in hydrogen production, chemical synthesis, and wastewater treatment.

Hydrothermal carbonization (HTC), the process of producing biochar from green biomass using pressure and heat, is an increasingly widespread and proven method. It is an environmentally friendly and cost-effective thermochemical conversion process used to convert green biomass and wastewater. Amongst emerging biomass conversion technologies, hydrothermal carbonization (HTC) stands out for its unique ability to process wet biomass without the need for energy-intensive drying. HTC operates at moderate temperatures (180–280 °C) and utilizes water, which is non-toxic, eco-friendly, and cost-effective, as a reaction medium. While HTC is widely known for producing energy-dense hydrochar, it also generates a liquid by-product known as process water, which contains large amounts of soluble organic and inorganic compounds (Boamah and Salaudeen 2025).

This study investigates the influence of hydrothermally produced biochar, derived from agricultural residues, as a catalyst support material on the catalytic performance of sodium borohydride ($NaBH_4$) hydrolysis. By examining how the structural and physicochemical properties of biochar affect hydrogen generation efficiency, the research aims to identify a sustainable and effective support medium capable of enhancing catalyst stability, activity, and reusability during the $NaBH_4$ hydrolysis reaction.

MATERIALS AND METHODS

The hazelnut shell residues used in the study were crushed, ground, and sieved to determine size distribution. Samples dried in an oven at 105°C for 6 hours and stored. 3 g of sample were mixed with 30 ml of pure water and Hydrothermal carbonization (HTC) was carried out in a pressurized reactor at 180°C for 6 hours. The samples were removed stirred with NaOH solution for 4 hours using the chemical activation method with a magnetic stirrer. After mixing, the solid was filtered, dried, and activated at 80°C for 24 hours with NaOH mass ratios of 1:1, 2:1, and 1:2. The samples were filtered and washed with distilled water until neutralized. The activated samples (ACFK) were separated from the NaOH solution, and the pH was adjusted. After the prepared biochars were dried and crushed, used as catalyst support material.

For the synthesis of ACFK-supported Co metal catalysts, $CoCl_2 \cdot 6H_2O$ solution was impregnated onto the support material and reduced with sodium borohydride. Metal impregnation was performed by dissolving 5 g of $CoCl_2 \cdot 6H_2O$, weighed according to the desired metal loading ratios, in 100 ml of water and adding it to the support

material. The mixture was stirred at 75°C and 400 rpm on a magnetic stirrer for 1 hour. After cooling to 25°C, $NaBH_4$ solution was added dropwise at the appropriate concentration with a molar ratio of 3:1 BH_4/Co. The temperature was maintained between 25°C and 30°C during the reduction process. After gas evolution, indicated by the formation of black precipitates, was complete, stirring continued at 400 rpm for 1 hour. The precipitates were filtered under vacuum through suitable filter paper and washed 2–3 times with a mixture of pure water and ethanol. After drying at 100°C for 24 hours, the material was ground and used for the hydrolysis reaction. The aim was to load 10–15% Co metal by weight onto the ACFK.

Experiments on the catalytic activity for hydrogen production by hydrolysis of sodium borohydride were conducted in a glass reactor equipped with a circulating water bath. Before each experiment, a measured amount of catalyst was added to the jacketed glass reactor designated for the NaBH4 hydrolysis reaction. Once the desired temperature was reached using the circulating water bath, a sodium borohydride solution of specified concentration was introduced into the reactor. The reactor was sealed, and the reaction was initiated by stirring with a magnetic stirrer at 400 rpm. The amount of hydrogen produced by catalytic hydrolysis was determined by the weight of water collected, as the released hydrogen displaced water from the gas wash bottle into a flask placed on a balance, due to the closed system of the apparatus. The volume of water collected in the flask was recorded at specific time intervals. Hydrogen volumes were calculated based on the density values measured at the beginning of the experiment according to ambient conditions. All experiments were performed in duplicate to verify the repeatability and accuracy of the data.

RESULTS AND DISCUSSION

Table 1 shows the hydrogen generation rate of the hydrolysis reaction in the presence of different Co/ACFK catalysts, with a catalyst amount of 30 mg, NaBH4 concentration of 0.79 M, and reaction temperature of 30°C. The hydrolysis experiments with Co/ACFK catalysts showed clear differences in catalytic performance depending on the Co/ACFK support materials NaOH ratio. Among the tested materials, the Co/ACFK_1:1 catalyst exhibited the highest hydrogen generation activity, achieving a 98% hydrogen yield, the fastest reaction completion time (540 min), and the highest hydrogen generation rate (3148.2 mL gcat·min^{-1}). In particular, Co/ACFK_1:2 showed the lowest performance, with a prolonged reaction time and a reduction in hydrogen generation rate to 2209.9 mL gcat·min^{-1}. These results indicate that an optimal NaOH: support ratio is crucial for maximizing hydrogen production efficiency. Overall, the findings suggest that Co/ACFK_1:1 provides the most favorable balance of catalytic activity and stability under identical reaction conditions, highlighting its potential as an effective catalyst for $NaBH_4$ hydrolysis–based hydrogen generation systems.

Table 1. Hydrogen generation rate of the hydrolysis reaction in the presence of different Co/ACFK catalysts (Catalyst amount 30 mg; $NaBH_4$ concentration 0.79 M; Reaction temperature 30°C).

Catalyst	Reaction Time (min)	Generated Hydrogen Volume (mL)	Hydrogen Generation Yield (%)	Hydrogen Generated Rate (mL g_{cat}.min^{-1})
Co/ACFK_1:1	540	850	98	3148.2
Co/ACFK_2:1	612	830	95.6	2712.4
Co/ACFK_1:2	724	800	92.5	2209.9

The cyclic activity results show that the catalyst maintains robust and stable performance over multiple consecutive runs (Fig .1). Although a gradual decline in activity is observed from the first to the fifth cycle, the decrease is controlled and predictable, indicating only minor deactivation during repeated hydrolysis reactions. The activity decreases slightly from 3148.20 mL·gcat^{-1}·min^{-1} in the first cycle to 3031.67 mL·gcat^{-1}·min^{-1} in the second cycle, and continues to decline progressively in subsequent cycles, stabilizing at 2837.89 mL·gcat^{-1}·min^{-1} in the fifth cycle. This corresponds to a retention of approximately 90% of the initial catalytic performance. The primary causes of activity loss may be partial surface blockage, slight structural changes, or limited leaching of active metal species. However, the absence of sharp or abrupt decreases between cycles confirms that the catalyst preserves its

structural integrity and retains a significant portion of its active sites even after multiple uses. Overall, the cyclic performance evaluation strongly supports the catalyst's reusability and highlights its potential for long-term operation in $NaBH_4$ hydrolysis–based hydrogen production systems. The catalyst's ability to sustain high activity over five consecutive cycles demonstrates its practicality and reliability, making it a promising candidate for sustainable and efficient hydrogen generation applications.

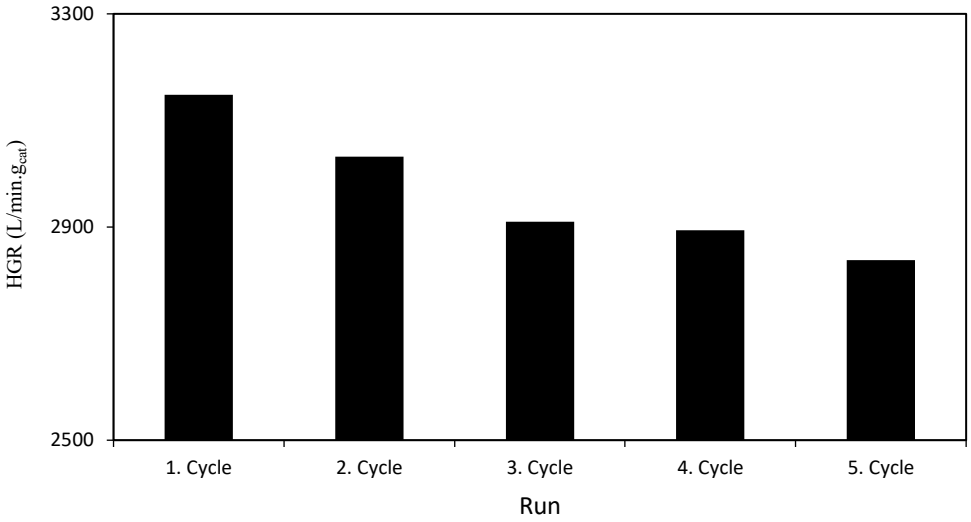

Fig 1. Reusability performance of Co/ACFK_1:1 catalyst (Catalyst amount 30 mg; $NaBH_4$ concentration 0.79 M; Reaction temperature 30°C).

CONCLUSION

The findings from this study show that hazelnut shell–derived biochar can be effectively used as a sustainable and functional support material for Co-based catalysts in the hydrolysis of $NaBH_4$. Among the synthesized supports, the ACFK_1:1 structure provided the most favorable catalytic environment, allowing the CoB/ACFK_1:1 catalyst to achieve the highest hydrogen production rate (3148.2 $mL \cdot g_{cat}^{-1} \cdot min^{-1}$) at 30 °C with 30 mg of catalyst. The activation energy of 54.65 $kJ \cdot mol^{-1}$ and the retention of 90.14 % catalytic activity upon reuse further confirm the efficiency and stability of this system. Additionally, the comparative evaluation of different Co/ACFK catalysts showed that deviations from the optimal support ratio led to reduced hydrogen yield, lower rate performance, and longer reaction times. The importance of optimizing both support material and catalyst composition, demonstrating that biomass-derived residues such as hazelnut shells offer a promising, renewable, and highly effective platform for designing next-generation catalysts for $NaBH_4$ hydrolysis–based hydrogen production technologies.

Özet

Küsküt bitkisi (*Cuscuta europaea* L.) ülkemizde ‘’Cinsaçı’’olarak da bilinir. Mardin yöresinde ise İksut otu olarak adı anılmaktadır. Geleneksel olarak mide ve bağırsak rahatsızlıklarında kullanılan bu bitkinin biyoteknolojik açıdan kullanıma yönelik çalışmalar bulunmamaktadır. Bitkiler son yıllarda gıdadan sağlığa pek çok alanda kullanım alanı bulunan nanopartiküllerin yeşil sentezinde yaygın şekilde kullanılmaktadır. Bu nanopartiküllerden metalik nanopartiküller stabilitesi, iletkenliği, antimikrobiyal özelliği, antikanserojen etkinliği gibi özellikleri nedeniyle sağlığa yönelik uygulamaların yanı sıra antioksidan özelliği nedeniyle gıda koruyucu ya da gıda endüstrisinde gibi çeşitli alanlarda da uygulama alanı bulabilmektedir. Metalik nanopartiküllerden olan çinko oksit nanopartiküller antimikrobiyal oluşları, UV koruma özelliği nedeniyle kozmetik sanayide, tekstilde kullanılmaya aday olmalarının yanı sıra gıda araştırmalarında da güvenilir gıda katkı maddesi olarak kabul edilebilmektedir. Bu çalışma da Küsküt (*Cuscuta europaea* L.) bitkisinden sentezlenen çinko oksit nanopartiküllerinin çeşitli patojenler üzerine etkisi araştırılacak ve aynı zamanda gıda üzerindeki etkisini belirlemek için ekmek küfü üzerine inhibisyon etkisi araştırılacaktır. Bu amaçla yeşil sentezle sentezlenen çinko oksit nanopartiküllerinin SEM, EDX, FTIR analizleri yapılarak bu nanopartiküllerin karakterizasyon analizi yapılacak ardından well difüzyon yöntemi ile patojenler üzerine inhibisyon etkisi ve çinko oksit kullanılarak hazırlanmış buğday ekmeklerinin küf değerlendirme yapılacaktır. Böylece Küsküt (*Cuscuta europaea* L.) bitkisinden hem sağlığa yararlı etkileri olan hem de funguslar üzerine etki araştırılmak istenmektedir.

Anahtar Kelimeler: *Cuscuta europaea* L., Çinko oksit nanopartikül, Antimikrobiyal, Antifungal, Ekmek raf ömrü

Determination of antimicrobial and mold (bread mold) effects of zinc oxide nanoparticles synthesized using ichthyosaur (*Cuscuta europaea* L.)

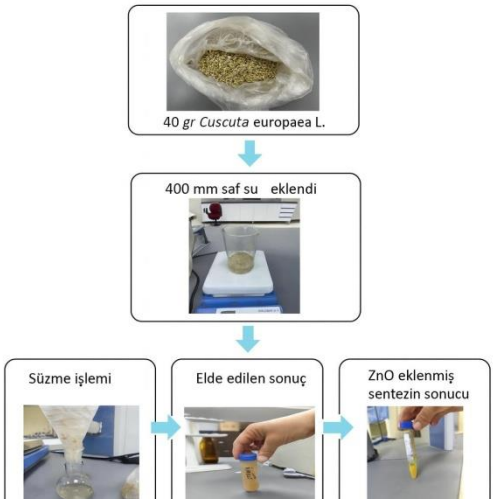
Abstract

The dodder plant (*Cuscuta europaea* L.) is also known as "Cinsaçı" (Cinsaçı) in Turkey. In the Mardin region, it is known as İksut herb. Traditionally used for stomach and intestinal disorders, there are no biotechnological studies on the use of this plant. In recent years, the plants have been widely used in the green synthesis of nanoparticles, which have applications in many areas from food to health. Among these nanoparticles, metallic nanoparticles, due to their stability, conductivity, antimicrobial properties, and anticarcinogenic activity, have found applications in various fields such as food preservatives and the food industry, as well as antioxidant properties. Zinc oxide nanoparticles, a type of metallic nanoparticles, are candidates for use in the cosmetics and textile industries due to their antimicrobial and UV-protective properties, and can be considered a reliable food additive in food research. This study will investigate the effects of zinc oxide nanoparticles synthesized from *Cuscuta europaea* L. on various pathogens and will also investigate their inhibitory effect on bread mold to determine their impact on food. For this purpose, characterization will be carried out using SEM, EDX, and FTIR analyses of zinc oxide nanoparticles synthesized through green synthesis. Following this, the inhibitory effect on pathogens and mold assessment of

wheat breads prepared using zinc oxide will be conducted using the well diffusion method. This study aims to investigate both the health benefits of *Cuscuta europaea* L. and its effects on fungi.

Keywords: *Cuscuta europaea L*, Zinc oxide nanoparticle, Antimicrobial, Antifungal, Bread shelf life

GİRİŞ



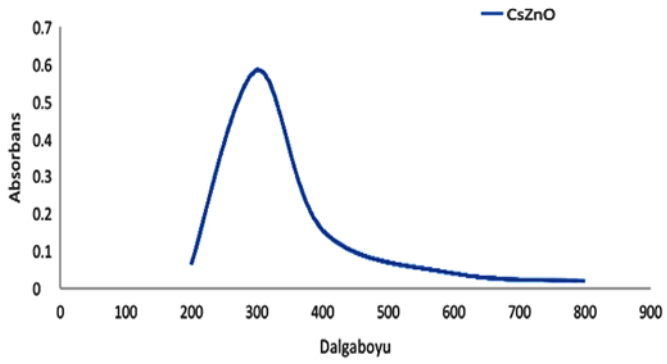
Nano, gözle görülemeyecek boyutlarda yapılan teknolojik çalışmaları kapsayan ve metrenin milyarda birine karşılık gelen bir ölçü birimidir (V. Yadav, 2013). Nanobilim kavramı ilk kez 1959 yılında Nobel Fizik Ödülü sahibi Richard Feyman tarafından bilim felsefesiyle ilgili bir sohbeti sırasında dile getirilmiştir (RP. Feyman, 1999) .“Nanoteknoloji” kavramı; nano ve teknoloji kelimelerinin birleşmesinden oluşmuştur. Teknoloji, yararlı ürünler üretmeye ve yeni ürünler tasarlamaya yarayan bilgilerin bütününe denir (Ayhan, A. 2002). Nanoteknoloji, maddenin atomik-moleküler boyutta mühendisliğinin yapılarak yepyeni özelliklerinin açığa çıkarılması; nanometre ölçeğindeki fiziksel, kimyasal ve biyolojik olayların anlaşılması, kontrolü ve üretimi amacıyla, fonksiyonel materyallerin, cihazların ve sistemlerin geliştirilmesine denir. Bir başka deyişle araçların, malzemelerin ve yapıların moleküler düzeyde işlenmesi, oluşturulması ve manipüle edilmesi olarak tanımlanmaktadır (Kut, D., Güneşoğlu, C. 2005). Nanoteknolojinin kullanım alanları başlıca ilaç sanayi, tekstil, sağlık, gıda, otomotiv, boya gibi farklı alanlardan örnek verilebilir (D. Şanoğlu, 2019). Günlük hayatta nanoteknolojinin öneminin artması ve sıkça kullanılmasından dolayı nanoteknoloji hızla gelişmiştir. Nanoteknolojinin hızla gelişmesi bu alanın özünü oluşturan nanopartikülleri dikkat çekici bir konu haline getirmiştir. Nanopartiküller sahip oldukları bu üstün özellikleri sayesinde enerji, fizik, kimya, biyoloji, biyoteknoloji, tıp, sanayi, teknoloji ve endüstri gibi çeşitli alanlarda kullanılır (A. Aygün, 2019). Nanopartiküllerin eldesinde fiziksel, kimyasal ve biyolojik metotlar kullanılmaktadır. Nanopartiküllerin sentez işlemlerinde fiziksel metotlar kullanılırken yüksek sıcaklık ve basıncın yanı sıra pahalı ekipmanlar gerektirmekte olup, kimyasal metotlar tercih edildiğinde ise, toksik kimyasallar kullanılmakta bunun sonucu olarak da doğaya kalıcı zararlar vermektedir (J. Singh ve ark ., 2018). Endüstriyel alanlarda toplu formlarından farklı olarak belirli elektriksel ve optik özelliklere sahip oldukları için nanopartiküller tarımsal, çevresel ve biyomedikal gibi farklı alanlarda faydalıdır (Nayak, V ve ark ., 2021). Dünya çapındaki bilimsel topluluk, olağanüstü katalitik etkinlikleri, yarı iletken yapıları ve ultraviyole filtrasyon yetenekleri sebebiyle çinko oksit nanopartiküllerine hayran kalmıştır (Nagajyothi, P. C. ve ark. 2013). Ayrıca, raporlar bu nanopartiküllerin biyolojik olarak uyumlu, toksik olmayan ve biyolojik sistemler için güvenli olduğunu göstermektedir (Anjum ve ark.,2021; Agarwal & Shanmugam., 2020; Bhuyan ve ark ., 2015). Çinko oksit nanopartikülleri UV-A ve UV-B gibi tehlikeli radyasyonu içine çekebildiği için güneş kremlerinde ve kozmetiklerde de kullanılır (Ramesh, P., ve ark. 2014). ABD Gıda ve İlaç Dairesi'ne göre çinko oksit güvenli olduğundan ilaç olarak kullanılabilir (Lopez De Romaña, D., ve ark. 2002). Bulaşıcı mikroorganizmaları ortadan kaldırmak için çinko oksit nanopartikülleri antibakteriyel bir madde olarak işlev görebilir. Şekil, partikül boyutu, konsantrasyon ve bakteri hücresiyle temas halinde olma süresi , hücre duvarına nasıl zarar verdiklerini, içeriye nasıl sızdıklarını, hücre zarında nasıl biriktiklerini ve sonunda metabolik aktivitelere müdahale ederek nasıl ölüme neden olduklarını etkiler (Siddiqi, K. S., ve ark., 2018). Canlılardaki önemli eser elementler olan çinko ve selenyum, insanlarda bağışıklık sistemi işlevi, antioksidan savunma ve antitümör aktivitesi için hayati önem taşır. Biyosentezlenen çinko ve selenyum nanopartikülleri daha biyolojik olarak parçalanabilir, daha az toksik ve vücuttan kolayca atılım sağlandığından çok avantajlıdırlar ((Zhuang ve ark ., 2007; Schomburg, 2017). Bitkiler, sadece doğayı güzelleştiren özelliklerinin yanı sıra doğanın en önemli ve en estetik öğelerinden biridir. Yaşamın temel taşlarını oluşturan oksijen üretimi, besin zinciri ve ekosistem dengesine sağladığı katkılarla dünyamızın vazgeçilmez birer parçaları haline gelmişlerdir. Ayrıca bitkiler birçok çeşitli alanlarda kullanılmaktadır. Bitkiler; tıbbi kullanım, gıda üretimi, sanayi, tekstil, süs bitkileri, inşaat, çevre düzenlemesi, kimya, kozmetik, biyoyakıt ve enerji gibi pek çok alanlarda kullanılmaktadır. Küsküt, Cuscutacea e familyasının tek üyesi olan Cuscuta cinsindendir. Güneydoğu Anadolu bölgesinde kullanımı yaygın bir öneme sahip olan iksut otu (*Cuscuta europaea L.*) yoğun aroması, hoş tadı ile ilgi çekmektedir (Nemli,1982). İpliksi gövdeli ve pullu yapraklı bir yapıya sahip olan küsküt, klorofilsiz tam parazit bir bitki olarak yeşil bitkilerin iletim demetlerine emeçlerini göndererek beslenir ve tırmanıcı bir yaşam sürer.(Zeybek ve Zeybek, 1994).Türkiye'de tarımsal üretim ve geleneksel halk hekimliği için mühim parazitik bitkiler olan Cuscuta türleri, Mardin bölgesinde ‘İksut’ olarak bilinir ve diğer bölgelerde ‘bostanbozan, canavar otu, bağbozan, cinsaçı, eftimon, gelin saçı, kızıl sarmaşık ve şeytansaçı’ gibi isimlerle adlandırılırlar (Baytop, 1997).Bitkinin gelişme dönemi yetiştiği bölgenin iklim şartlarına bağlı olarak Mayıs ile Ekim ayları arasıdır (Jamshid ve Esther 2011). Küsküt bitkisi (*Cuscuta europaea L.*)’nin çiçekli dallarının idrar

söktürücü, mushil, gaz ve safra söktürücü etkilere sahip olduğu bildirilmektedir.*Cuscuta chinensis Lam.*'ın tohumları karaciğer ve böbrek rahatsızlıklarında, cinsel fonksiyonları iyileştirmek için, bulanık görme, yorgunluk gibi göz şikayetlerini gidermek için, ve klinik olarak yaşlanmayı geciktirmek için kullanılmıştır. Yapılan in vitro ve in vivo çalışmalar Cuscuta türlerinin farklı farmakolojik etkilere sahip olduğunu ortaya koymuştur. Araştırmalara göre *C. chinensis* antikanser (Nisa ve ark. 1986; Umehara ve ark., 2004), immunostimulation, ve antioksidan etkilere sahip olduğu ortaya çıkmıştır. (Bao ve ark. 2002). *C. chinensis* glikozidlerinin yaşlanmaya karşı etkiler gösterdiği ve PC12 hücre farklılaşmasını uyararak hafızayı güçlendirdiği gösterilmiştir (Liu ve ark. 2003). İlerleyen çalışmalarda ise *C. reflexa* gövdelerinin metanol ekstresinin antibakteriyel (Pal ve ark. 2006) ve *C. chinensis* etil asetat ve metanol ekstresinin antioksidan (Yen ve ark. 2008); *C. japonya*'nın major bileşenlerinin antihipertansif (Oh ve ark., 2002) etkileri olduğu keşfedilmiştir. Ayrıca Cuscuta türlerinin flavonoidler, glikozitler ve alkaloidler, tanenler, ligninler ve diğer organik maddelerde dahil olmak üzere çeşitli fitokonsitüentler içerdiği bildirilmiştir.Bunların yanı sıra uçucu yağ ve eser elementler içermektedir (D.Garvey ve ark., 2010).*Cuscuta europaea L.* bitkisinde yapılan araştırmada bu türlerin metanol özütlerinin fenolik bileşenleri keşfedilmiştir. Diğer cuscuta türlerinin yanı sıra, özütlerde kafeik asit, p-kumarik asit, isorhamnetin ve isorhamnetin 3-0 glikozit tespit edilmiştir (P.Hrıbova ve ark. 2009).*Cuscuta europaea L.* bitkisinin içerdiği bileşenlerinin nanopartikül sentezinde indükleyici bir özellik gösterebileceği düşünülüyor.Gıda paketlemenin ana işlevi,ürünü mikrobiyal bozulmalarla kimyasal kirleticilerle, nem ve oksijen gibi olumsuz çevresel etkilere karşı korumaktır. Ekmek bozulmalarının temel sebepleri mikroorganizmaların yol açtığı bozulmalar ile kimyasal ve fiziksel değişikliklerdir. Ekmek taze olarak tüketilen bir ürün olmasına rağmen ne yazık ki piştikten sonra sadece birkaç saat taze kalabilmektedir (Alhendi ve Choudhary, 2013). Ekmekler için küf sayısının büyüklüğü ile nem absorbsiyonu veya desorpsiyonu raf ömrünü ve kalite özelliklerini belirleyen temel kriterlerdir. Ekmeğin bayatlamasında etken olan nişasta retrogradasyonunun temel sebebide nem kaybıdır. Bu yüzden ekmekler yüksek su bariyeri özelliğine sahip materyallerle paketlenmelidir (Petersen ve ark., 1999).Ekmeğin Bayatlaması mikrobiyolojik olmayan fiziksel ve kimyasal değişiklikler nedeniyle kabul edilebilirliğinin azalması olarak tanımlanır. Bu durumdan dolayı çok büyük ekonomik kayıplara neden olmaktadır (Ronda ve ark., 2011). Mikrobiyal bulaşı kaynakları ekmeklere üretim öncesinde, üretim sırasında ve depolama esnasında kontamine olmaktadırlar (Değirmencioğlu ve ark., 2011). Ekmeklerde bozulmaya neden olan üç çeşit mikroorganizma grubu vardır. Bunların birincisi küfler olup ekmekteki bozulmaların temel sebebidir.Küfler fırın ısısında inaktif olduklarından, pişirme işleminden sonraki dilimleme ve paketleme gibi aşamalarda kontamine olmaktadırlar (Alhendi ve Choudhary, 2013). Küfler ekmeklerde aroma kayıplarına, mikotoksin oluşumuna ve alerjik bileşiklerin oluşumuna sebep olmaktadırlar (Değirmencioğlu ve ark., 2011). Literatürde *Cuscuta europaea L.*bitkisinden çinko oksit nanopartikül sentezi bulunmamaktadır. Yapılan çalışmada iksut bitkisi (*Cuscuta europaea L.*) bitkisinden sentezlenen çinko oksit nanopartiküllerin çeşitli patojenler üzerine etkisi araştırılmıştır.Aynı zamanda gıda üzerine etkisini araştırmak için ekmek küfü üzerinde çalışma yapıldı.Bu amaçla yeşil sentezle sentezlenen çinko oksit nanopartiküllerinin SEM, EDX, FTIR analizleri yapılarak bu nanopartiküllerin karakterizasyon analizi yapıldı ardından well difüzyon yöntemi ile patojenler üzerine inhibisyon etkisi incelendi.

MATERYAL VE METOT:

Deneyde kullanılan bitki Mardin'de aktardan kurutulmuş örneği alınan iksut otudur.

Cuscuta Europaea L.Ekstraktının Hazırlanması: iksut otu örneğin 40 gr alınarak 400 milimetre su ilave edildi. Özüt elde etmek için manyetik karıştırıcıda 70°C'de 3 saat karıştırıldı. Sıvı faz süzgeç kâğıdı vasıtasıyla ayrıldıktan sonra 300 milimetrelik ekstrakta 200 mililitre 0.1 Molar çinko asetat dihidrat çözeltisi eklenerek 3 saat 60°C'de karıştırma işlemi yapıldı. Reaksiyon sonucunda özütün renginde bir açılma (açık sarı) gözlemlendi.



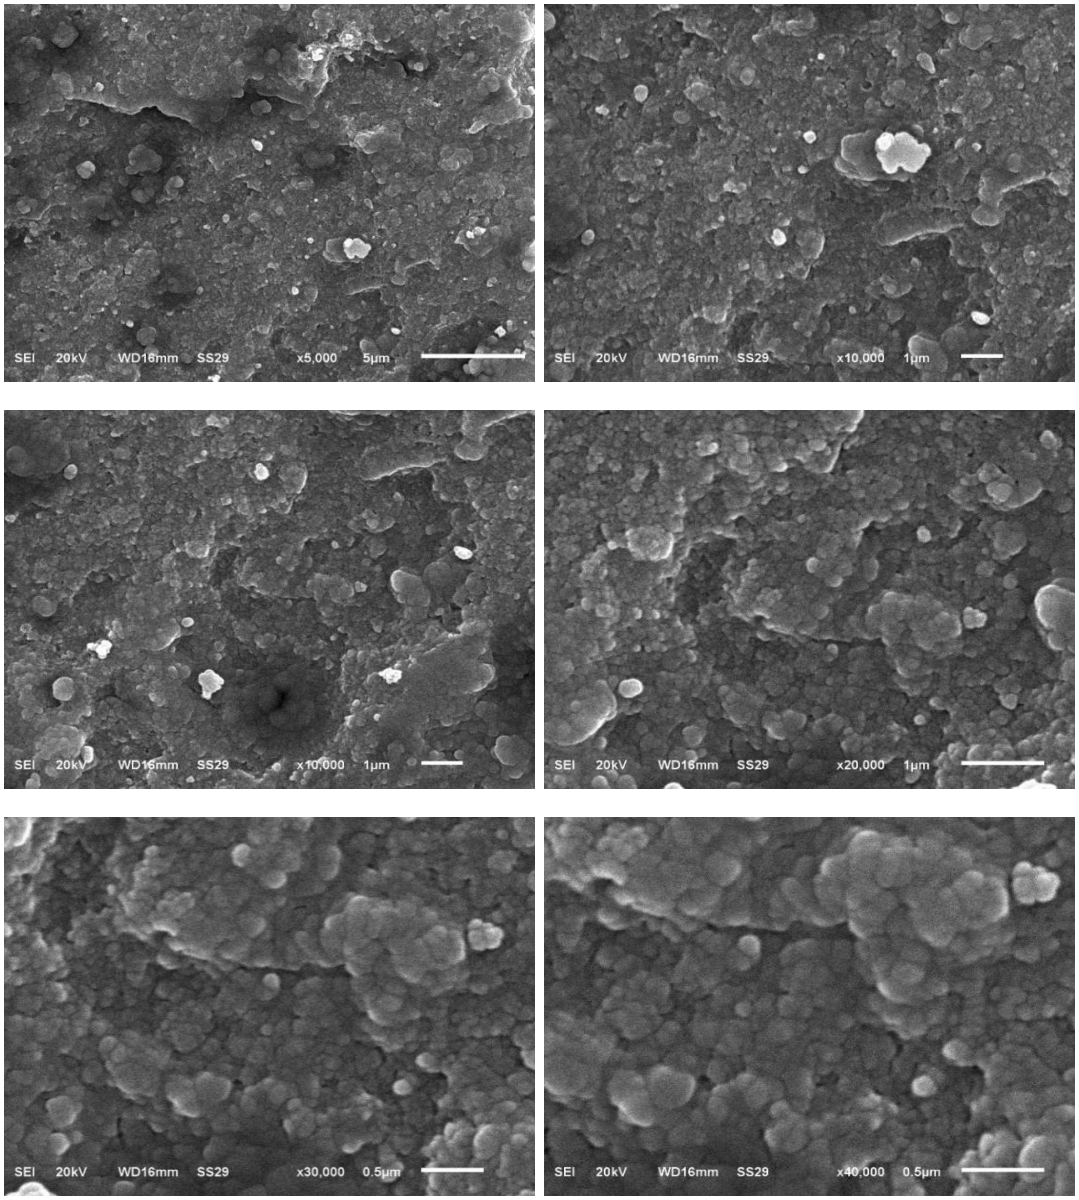
Şekil1: *Cuscuta Europaea* L. Ekstraktının Hazırlanması

T80+ UV/VIS spektrofotometre de 200 ve 800 nm dalga boyları arasında absorbansın tranmasıyla çinko oksit nanopartiküllerin karakteristik zirvesi belirlendi. Elde edilen ürün 5000 rpm 10 dk santrifüj edilerek dibinde oluşan çökelek kısmı ayrıt dilerek 100 °C 4 saat boyunca etüvde inkübe edildi. Üretilen nanopartiküllerin SEM, SEM-EDX ve FTIR analizleri gerçekleştirildi . Üretilen nanopartikülün 100 mg/ml'lik çözeltileri antimikrobiyal analiz için hazırlandı. Testlerde kullanılan bakteri suşları Staphylococcus aureus ATCC 25923, Escherichia coli ATCC 11229 .Antimikrobiyal aktivite testi S. Aureus ve E. Coli üzerinde well difüzyon yöntemi kullanılarak gerçekleştirildi [O. Erdoğan ve ark., 2019)

BULGULAR VE TARTIŞMA

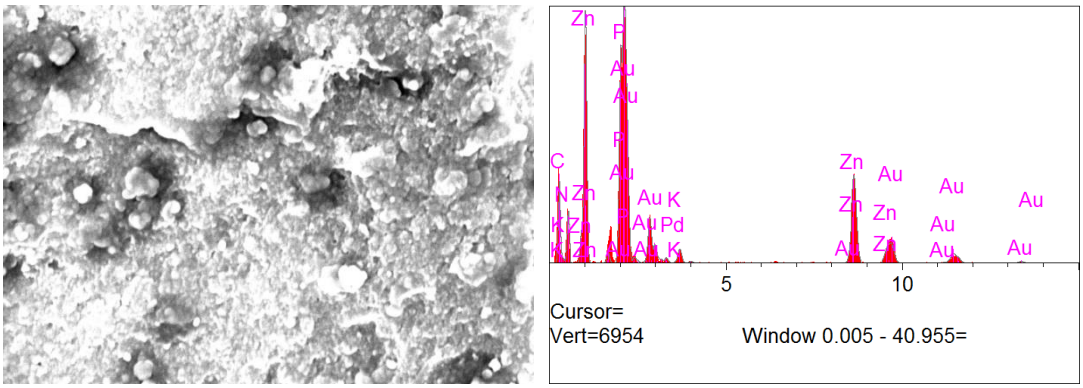
UV/VIS Spektrofotometre

Şekil 2, C.sZnO UV-VIS spektrofotometresinde 200-800 nm arasında absorbans taramalarını göstermektedir.



Şekil2: C.sZnO UV-VIS Grafiği

CsZnO için SPR 350 nm'de kaydedildi (E. Darvishi ve ark., 2019).



SEM ve EDX ANALİZİ:

Cuscuta Europaea L. ekstraktı kullanılarak yeşil sentezlenen ZnO NP'lerin taramalı elektron mikroskobu (SEM) görüntüleri Şekil 3'te görülmektedir. SEM görüntüleri, *Cuscuta Europaea* L. ekstraktının çinkonun farklı tuzları kullanılarak sentezlenen ZnO NP'nin şekil ve boyutlarında farklılıklar meydana getirdiğini göstermektedir.

Şekil 3:SEM Görüntüleri

SEM fotoğraflarında görüldüğü gibi Çinko Oksit nanopartikülleri sentezlenmiştir. Şekil 3'deki görüntüler stafilokoklara benzemektedir. Sentezlenen Çinko Oksit nanopartiküllerinin SEM-EDX sonuçları Şekil 4'te verilmiştir.

Elt.	Line	Intensity (c/s)	Error 2-sig	Conc	Units
C	Ka	324.86	5.144	21.066	wt.%
N	Ka	15.62	1.932	1.824	wt.%

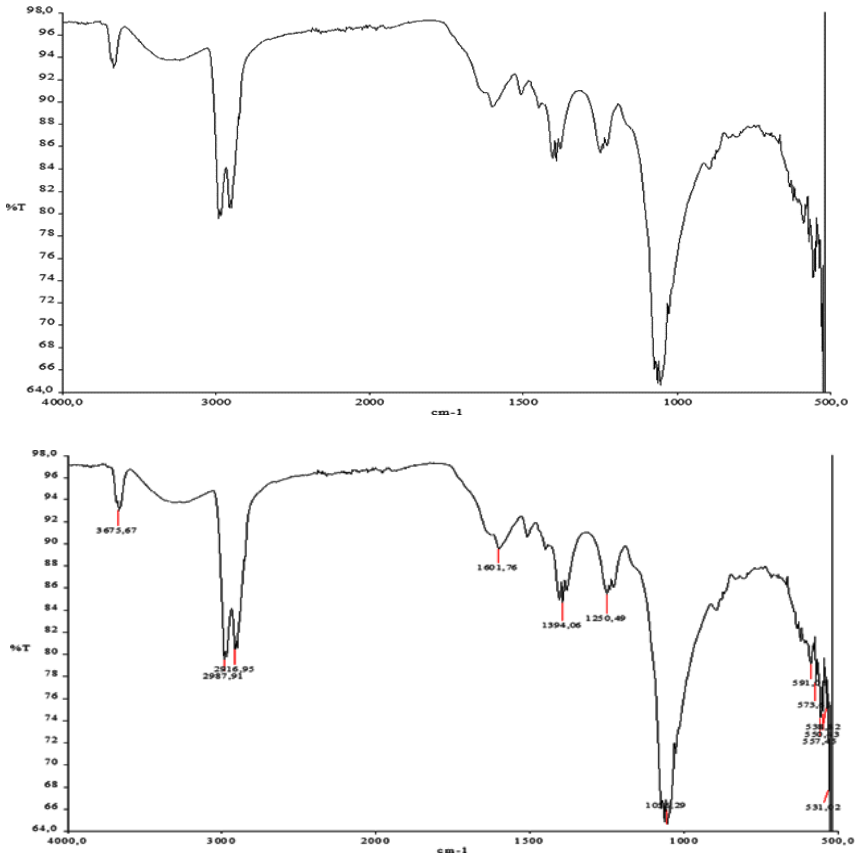
P	Ka	978.03	9.218	8.428	wt.%
K	Ka	20.92	3.872	0.208	wt.%
Ca	Ka	80.19	4.063	0.826	wt.%
Zn	Ka	692.41	7.206	21.876	wt.%
Pd	La	227.85	5.605	7.840	wt.%
Au	La	151.33	3.935	29.602	wt.%
			Total	100.000	wt.%



Şekil 4: SEM-EDX sonuçları

EDX analizi, *Cuscuta europaea L.*'nın elementel bileşimini başarıyla belirlemiştir; bu bileşimde karbon, çinko ve fosfor elementleri en yüksek oranlarda yer almaktadır. Elde edilen veriler, bitkinin tam parazit yaşam tarzının, mineral madde akümülasyonunu önemli ölçüde etkilediğini ortaya koymaktadır.

FTIR ANALİZİ

3400–3200 cm^{-1} (O–H gerilme) bu aralıktaki geniş absorpsiyon bandı, fenolik bileşikler ve polisakkaritler gibi moleküllerin karakteristik O–H gerilmelerinden kaynaklanır ve *Cuscuta europaea L.*'nın önemli bir polifenol ve karbonhidrat kaynağı olduğunu ortaya koyar. 2920–2850 cm^{-1} (C–H alifatik gerilme) gözlenen alifatik C–H gerilme titreşimleri, örneğin bitki lipitlerinin, selüloz/hemiselüloz yapılarını oluşturan metil ve metilen gruplarının varlığını gösterir ve bu da bitkinin temel hücre duvarı yapısıyla uyumludur. 1650–1600 cm^{-1} (C=O ve C=C titreşimleri) Spektrumun bu kısmında görülen güçlü pikler, aromatik $\mathrm{C=C}$ titreşimleri (özellikle flavonoidler ve fenolik bileşikler) ve Amid I ($\mathrm{C=O}$) bandından (proteinler) kaynaklanır. Bu yoğun absorpsiyon, *C. europaea L.*'nın sekonder metabolitler açısından zenginliğini güçlü bir şekilde desteklemektedir. 1400–1250 cm^{-1} (C–H bükülme, C–O gerilme) Bu bölge, fenolik bileşiklerin aromatik halka iskelet titreşimlerini, karboksilat iyonlarının simetrik/asimetrik titreşimlerini ve lignin/polisakkaritlerin çeşitli C–O gerilmelerini içerir. Bu pikler, bitki örneğinin yapısal çeşitliliğini yansıtır. 1150–1000 cm^{-1} (C–O–C polisakkarit titreşimleri) spektrumun bu kısmındaki yoğun pikler, karbonhidrat iskeletinin karakteristik $\mathrm{C–O}$ gerilmelerini ve $\mathrm{C–O–C}$ bağlarını yansıtır; böylece selüloz ve hemiselülozun temel bileşimde bulunduğunu doğrular. 600–500 cm^{-1} (aromatik halka dışı titreşimler) bu düşük dalga sayısı aralığı, molekülün bütünündeki yapısal ayrıntıları yansıtan, aromatik yapıların ve diğer karmaşık organik bileşiklerin özel titreşimlerini barındırır.

FTIR analizindeki pik değerleri Şekil 5'te verilmiştir.

Şekil 5: FTIR analizi

WELL DİFÜZYON YÖNTEMİ

Yapılan testler neticesinde, *Cuscuta europaea* ekstraktının ne *Staphylococcus aureus* ne de *Escherichia coli* üzerinde belirgin bir antibakteriyel etki göstermediği (inhibisyon zonu oluşturmadığı) tespit edilmiştir. Ancak, pozitif kontrol antibiyotikleri, deneyin geçerliliğini doğrulayacak şekilde, beklenen çaplarda inhibisyon zonları oluşturmuştur.

SONUÇ

CsZnO'da 350 nm çevresinde karakteristik absorpsiyon / SPR benzeri tepe bulunur. (AlHamoud ve ark., 2021 ; Saeed ve ark.,2019) Yüzey boyunca gözlenen büyük ve parlak yapılar, yüksek elektron yoğunluğuna sahip ve muhtemelen çinko oksit gibi metal oksit nanopartiküllerine işaret etmektedir. Bu parlak alanların EDX doğrulaması yapıldığında metal oksit olduğunu destekleyen sonuçlar elde edilmesi beklenir. Bu yapı, bitkisel ekstre ile sentezlenen nanopartiküllere özgü bir görünüm olup literatürde fitosentezlenmiş nanopartiküllerin SEM görüntülerinde sıklıkla bildirilen morfoloji özellikleriyle uyumludur. (Ahmed, S ve ark ., 2016) EDX analizi, *Cuscuta europaea L.*'nın elementel bileşimini başarıyla belirlemiştir; bu bileşimde karbon, çinko ve fosfor elementleri en yüksek oranlarda yer almaktadır. Elde edilen veriler, bitkinin tam parazit yaşam tarzının, mineral madde akümülasyonunu önemli ölçüde etkilediğini ortaya koymaktadır. (Koo, B. J., Li, Y., ve Miyasaka, S. C. 2018). *Cuscuta europaea L*'nın FTIR spektral analizi, bitki bileşiminin fenolik bileşikler, karbonhidratlar ve diğer doğal organik moleküller açısından zengin olduğunu ortaya koymuştur. Bu analiz, biyolojik aktivite için temel teşkil eden fonksiyonel grupların varlığını teyit ederek, türün tıbbi değerlendirilmesine önemli bir katkı sağlamaktadır. Mevcut well difüzyon çalışmasının bulguları, *C. Europaea* L. ekstraktının test edilen S. aureus ve E. coli üzerinde antimikrobiyal bir etki oluşturmadığını göstermiştir. Bitkinin taşıdığı biyoaktif potansiyelin

derinlemesine anlaşılması için, çeşitli ekstraksiyon prosedürlerini içeren ileri araştırmaların yapılması önerilmektedir. (Afifi, F. U., ve Al-Khalil, S. 2020). (Kokoska, L., ve ark. 2002 ; Sharma, R. , ve Gupta, R. 2020).

TEŞEKKÜR

Bu çalışma, TÜBİTAK tarafından desteklenen 2209-A [Proje No: 1919B012470578] numaralı proje kapsamında gerçekleştirilmiştir. Araştırmanın yürütülmesi sürecinde sağlanan finansal destek için TÜBİTAK'a teşekkür ederiz. Proje araştırmacılarına, laboratuvar altyapısını sağlayan [Mardin Artuklu Üniversitesine], Kimyager Dr. Leyla ERCAN'a ve Proje Danışmanı Öğretim Görevlisi Cemile GÜNBEGİ ÇALIŞKAN'a teşekkür ederim.

Özet

İğde ağacı hoş kokulu çiçekleri ve tatlı ve küçük partiküllü meyveleri ile dikkat çeken bir bitkidir. Çinko oksit nanopartiküller kararlı oluşları ve antioksidan, antimikrobiyal özellikler sergilemeleri nedeniyle son yıllarda pek çok çalışmada araştırma konusu olmaktadır. Bu çalışmada iğde meyvesinden çinko oksit nanopartiküller sentezlenerek bu nanopartikülün antimikrobiyal, antikanserojen özellikleri araştırılmıştır. Bu amaçla sentezlenen nanopartiküllerin SEM, EDX, SEM MAP, FTIR analizleri yapılmıştır. Ayrıca çinko oksit nanopartikülün disk difüzyon yöntemi ile antimikrobiyal özelliğinin yanısıra WST testi ile A549 ve HT29 hücre hatları üzerine sitotoksik etkileri incelenmiştir. Sonuç olarak EaZnO nanopartikülleri *K. pneumoniae, P. aeruginosa* üzerinde antimikrobiyal özellikler sergilemiştir. Ayrıca bu nanopartiküller HT29 hücre hattı üzerinde A549 hücre hattına nazaran daha etkili sonuçlar vermiştir. Bu sonuçlara göre iğde meyvesinden sentezlenen bu nanopartiküller antimikrobiyal etkinliğinin yanısıra antikanserojen özelliği ile adjuvan, nutrasötik ya da fitofarmasötik olarak kullanıma aday olabilir.

Anahtar Kelimeler: Antimikrobiyal aktivite, Antikanserojen, İğde meyvesi

Antimicrobial activity of zinc oxide nanoparticles synthesised from *Elaeagnus angustifolia* fruit and their cytotoxic effect on lung and colon cancer

Abstract

The *Elaeagnus angustifolia* tree is a plant that attracts attention with its sweet-smelling flowers and sweet, small-grained fruits. Zinc oxide nanoparticles have been the subjects of numerous studies in recent years because of their stable structure and their antioxidant and antimicrobial properties. In this study, zinc oxide nanoparticles were obtained from *Elaeagnus angustifolia* fruits, and the antimicrobial and anticarcinogenic effects of these nanoparticles were evaluated. For this purpose, SEM, EDX, SEM MAP, and FTIR analyses were conducted on the produced nanoparticles. In addition to the antimicrobial properties of zinc oxide nanoparticles by the disc diffusion method, their cytotoxic effects on A549 (lung cancer) and HT29 (colorectal adenocarcinoma) cell lines by the WST method were investigated. As a result, EaZnO displayed antimicrobial activity against *K. pneumoniae* and *P. aeruginosa*. EaZnO nanoparticles have given more efficient results on the HT29 cell line than the A549 cell line. These synthesised nanoparticles, in addition to their antimicrobial activity, may be candidates for application as adjuvants, nutraceuticals, or phytopharmaceuticals thanks to their anticarcinogenic properties.

Keywords: Antimicrobial activity, Anticarcinogenic, *Elaeagnus angustifolia* fruit

GİRİŞ

Son yıllarda nanoteknoloji, kanser tedavisi de dahil olmak üzere tıp alanında çeşitli uygulamalara sahip, umut vadeden bir alan olarak ortaya çıkmıştır. Bitkilerin meyve yaprak kök gibi farklı kısımlarından sentezlenen nanopartiküllerin antioksidan, antimikrobiyal, antikanserojen ve antiinflamatuar etki gibi sağlığa faydalı yönlerinin

yanı sıra gıda koruyucu olarak kullanımı da araştırılmaktadır. Dikkat çeken nanomalzemelerden biri, çok yönlü özellikleri ve biyomedikal uygulamalarda kullanım potansiyeli nedeniyle ilgi gören çinko oksit nanopartikülleridir (Günay vd., 2021; Singh vd., 2017; Koçak ve Meydan, 2023). Yeşil sentez olarak bilinen bitki kaynaklı malzemeler kullanılarak çinko oksit nanopartiküllerinin sentezlenmesi, sürdürülebilir ve çevre dostu bir yaklaşım sunduğu için özellikle ilgi görmüştür (Günay vd., 2021).

Araştırmacılar, elde edilen nanopartiküllerin antimikrobiyal etkinliğini artırdığı gösterilen bitki özleri kullanan yeşil sentez yaklaşımları da dahil olmak üzere çinko oksit nanopartiküllerini sentezlemek için çeşitli yöntemler araştırdılar (Koçak ve Meydan, 2023). Nanopartiküllerin boyutu ve dağılımının antimikrobiyal etkinliklerinde önemli bir rol oynadığı, daha küçük ve iyi dağılmış nanopartiküllerin genellikle daha güçlü antibakteriyel etkiler gösterdiği bildirilmiştir (Zakharova vd., 2019). Çinko oksit nanopartiküllerinin antibakteriyel aktivitesi, Gram pozitif ve Gram negatif bakteriler de dahil olmak üzere çok çeşitli bakteri türlerine karşı gösterilmiştir (Hameed vd., 2023).

Ayrıca bir meta-analiz, çinko oksit nanopartiküllerinin tek başına veya fotokatalitik terapi veya doksorubisin gibi antikanser ilaçlar gibi diğer terapilerle birlikte güçlü antitümör aktiviteleri sergilediğini ortaya koymuştur (Vinardell ve Mitjans, 2015). Bu antikanser etkisinin altında yatan mekanizmaların, reaktif oksijen türlerinin üretilmesi ve kanser hücrelerinde apoptoz ve nekrozun indüklenmesini içerdiğine inanılmaktadır. (Premanathan vd., 2010) Özellikle, çalışmalar çinko oksit nanopartiküllerinin kanser hücrelerinde apoptozu seçici olarak hedef aldığını ve indüklediğini, normal hücreler üzerinde nispeten daha düşük bir sitotoksik etkiye sahip olduğunu ve bu durumun kullanımları için potansiyel bir terapötik pencere olduğunu göstermiştir (Premanathan vd., 2010).

Bu çalışmada çeşitli çevre koşullarında yetişebilen ve Elaeagnaceae familyasına ait bir bitki olan, hoş kokulu sarı çiçekleri, gümüş grisi pullarla kaplı yaprakları, nitrojen fiksasyonu yapan kökleri (Khamzina vd., 2009; Guo ve Wang; 2021) ve tek çekirdekli yenebilen tatlı meyvesi ile bilinen *Elaeagnus angustifolia* L. meyvesinin özütü kullanılmıştır (Shafroth vd., 1995; Pan vd., 2011; Guo ve Wang; 2021).

E. angustifolia L. meyvesi insan sağlığı için önemli olan pek çok flavonoid ve terpenoid bileşikleri, glikoz, fruktoz, saponinler, fenolik asit, tanenler, kafeik asit, amino asitler, karotenoidler ve vitaminleri; potasyum, magnezyum, sodyum, demir, kalsiyum, çinko gibi mineralleri ve linoleik asit, palmitoleik asit, palmitik asit, fosfolipidler, glikolipidler ve beta-sitostrol gibi yağ asitlerini içerir (Ayaz ve Bertoft, 2001; Hassanzadeh ve Hassanpour, 2018; Okmen ve Türkcan, 2013; Hamidpour vd., 2017).

Bu çalışma, yaygın olarak Rus zeytini olarakta bilinen *Elaeagnus angustifolia* L. meyvesinden sentezlenen çinko oksit nanopartiküllerinin antibakteriyal etkisi ile akciğer ve kolon kanserinin tedavisi için potansiyelini incelemektedir.

2. MATERYAL VE METOD

2.1. Nanopartikül Sentezi ve Karekterizasyonu

Marketten alınan iğde meyvelerinin çekirdekleri çıkarıldı ve 50 gram kuru iğde örneğine 1000 mL saf su eklenerek 700 rpmd 85 °C'de 4 saat manyetik karıştırıcıda karıştırıldı. Daha sonra ekstrakt süzgeç kağıdından süzülerek alındı. İğde ekstresinin 500 mL'sine 100 mL 0,1 M $ZnCH_3COOH$ eklendi ve bir gün boyunca oda sıcaklığında inkübasyona bırakıldı. ZnO nanopartikül sentezi hem renk değişiminden hemde UV-VIS spektrofotometre ölçümü ile gözlendi. Ardından 5000 rpm'de 25 °C'de soğutmalı santrifüj ile santrifüjlenerek çökelek alındı ve 100 °C de etüvde 4 saat bekletilerek dekarboksile edildi. Ardından nanopartikülün SEM, EDX, FTIR anaizleri yapıldı.

2.2. Antimikrobiyal Etkinlik Testi

EaZnO nanopartiküllerinin antimikrobiyal etkinliği disk difüzyon yöntemi uygulanarak tespit edildi. Taze kültürden alınarak çoğaltılan mikroorganizmalar ağarlı petrilere yayma ile ekildi. Ardından petrilere yerleştirilen steril disklere numune emdirilerek 24 saat 30°C de inkübasyona bırakıldıktan sonra inhibisyon çapları ölçüldü (Kirby-Bauer, 2009).

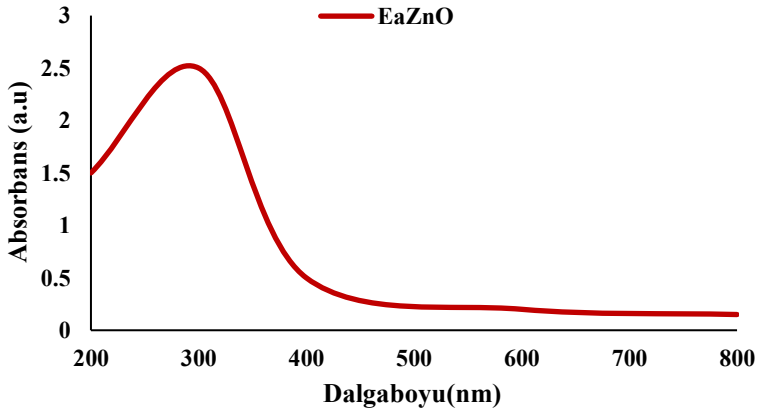
2.3. Sitotoksisite Testleri

2.3.1. A549 ve HT29 Hücre Hattı Çoğaltımı : A549 hücre hattının % 10 FBS (Pan Biotech P30-1301) içeren RPMI1640 içerisinde 25T Flaskta günde 2 defa kontrol edilerek % 70 ve üzerinde konfluensiye gelmesi beklendi. (Doubling Time: 20-24 saat) (A549 Hücre hattı ATCC CCL-185 kökenlidir)

HT29 hücre hattının % 10 FBS (Pan Biotech P30-1301) içeren DMEM-High Glucose içerisinde 25T Flaskta günde 2 defa kontrol edilerek % 70 ve üzerinde konfluensiye gelmesi beklendi. (Doubling Time: 40-60 saat) (HT29 Hücre hattı DSMZ ACC 299 kökenlidir).

2.3.2. Pozitif, Negatif ve Blank Kuyucukların Hazırlanması: Pozitif kontrol test kuyucuğu hücresel ölümün gösterildiği test kuyucuğu olup hücre içeren kuyucuklara materyal uygulanması ile aynı zamanda %2 H_2O_2 eklenerek yapıldı. Negatif Kontrol %100 hücresel büyümenin olduğu kuyucuk olup herhangi bir madde uygulanması yapılmadı.

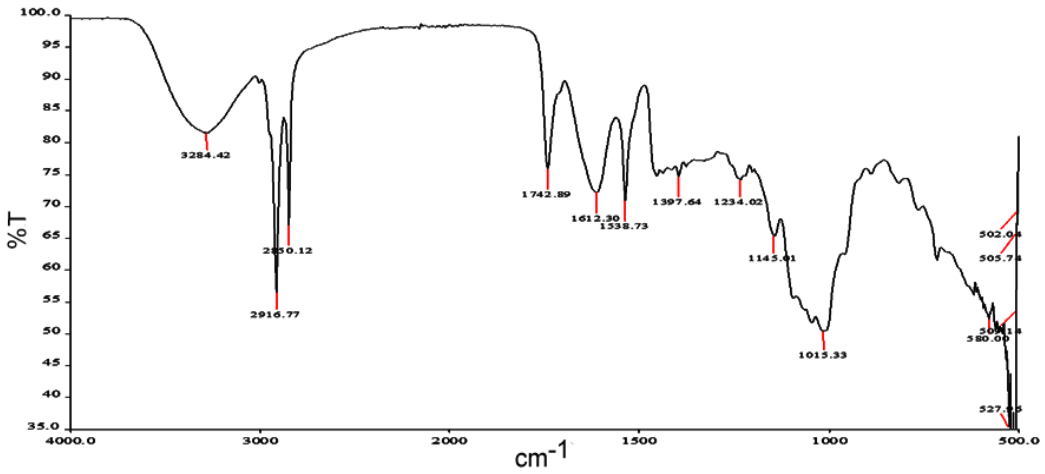
2.3.3. Numunelerin Hazırlanması: Nanopartiküller 1 mg / mL konsantrasyonda hazırlandı. 30 dakika UV ışığına maruz bırakıldıktan sonra, en yüksek güçte ultrasonik banyoda 30 dakika bekletilerek homojenizasyon sağlandı. Bu işlem sonrasında kullanılacak konsantrasyonlar tam besiyeri ile seyreltilerek kullanıldı.



2.3.4. Hücrelerin 96 Kuyucuklu Kaplara Ekilmesi: 25T flask içerisinde %70 ve üzerinde konfluensiye ulaşan hücrelere 500 µL Tripsin-EDTA (Gibco, 15400054) eklendi ve 37°C'de %5 CO2 ortamında 3-5 dakika bekletildi. İnverted mikroskop (Zeiss Primovert, Almanya) altında hücrelerin dissosiye oldukları gözlemlendiği anda %10 FBS içeren besiyeri eklenir. 300xg'de 5 dakika santrifüj edilip besiyeri atıldı ve üzerine 1 mL DMEM-High Glucose besiyeri eklendi. Trypan mavisi (Gibco, 1525061) kullanılarak Logos Luna II cihazında sayım yapıldı. Kuyucuk başına 10^4 hücre gelecek şekilde %10 FBS'li besiyeri eklendi.

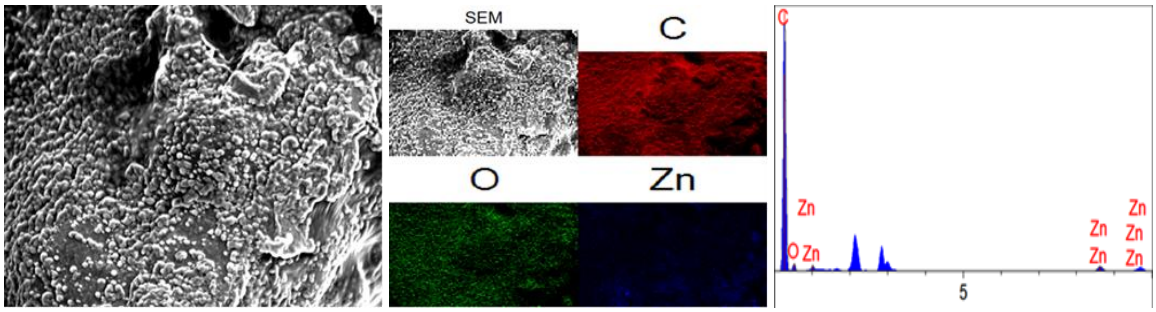
2.3.5. Sitotoksite Testinin Uygulanması: Her kuyucukta % 70 konfluensi yakalandığında kültür kabındaki besiyeri çekildi. Taze besiyeri eklendikten sonra numuneler hücre kabına eklendi. Her grup en az 3 tekrar kuyucuğu şeklinde yapılarak tekrarlı analiz yapıldı. Materyal uygulaması yapıldıktan sonra 22 saat hücreler inkübatörden hiç çıkarılmadan beklendi. 22 saat sonunda kuyucuk hacminin % 10'u kadar WST-1 solusyonu eklendi. Hücre kültür kabı alüminyum folyo ile sarılarak 2 saat daha inkübatörde bekletildi. 2 saat sonunda hücre kültür kabında 450 nm ve 630 nm dalga boylarında okuma yapılarak çıkan sonuçlardan % canlılık hesaplandı.

3. SONUÇLAR VE TARTIŞMA



3.1. Nanopartiküllerin Karekterizasyonu

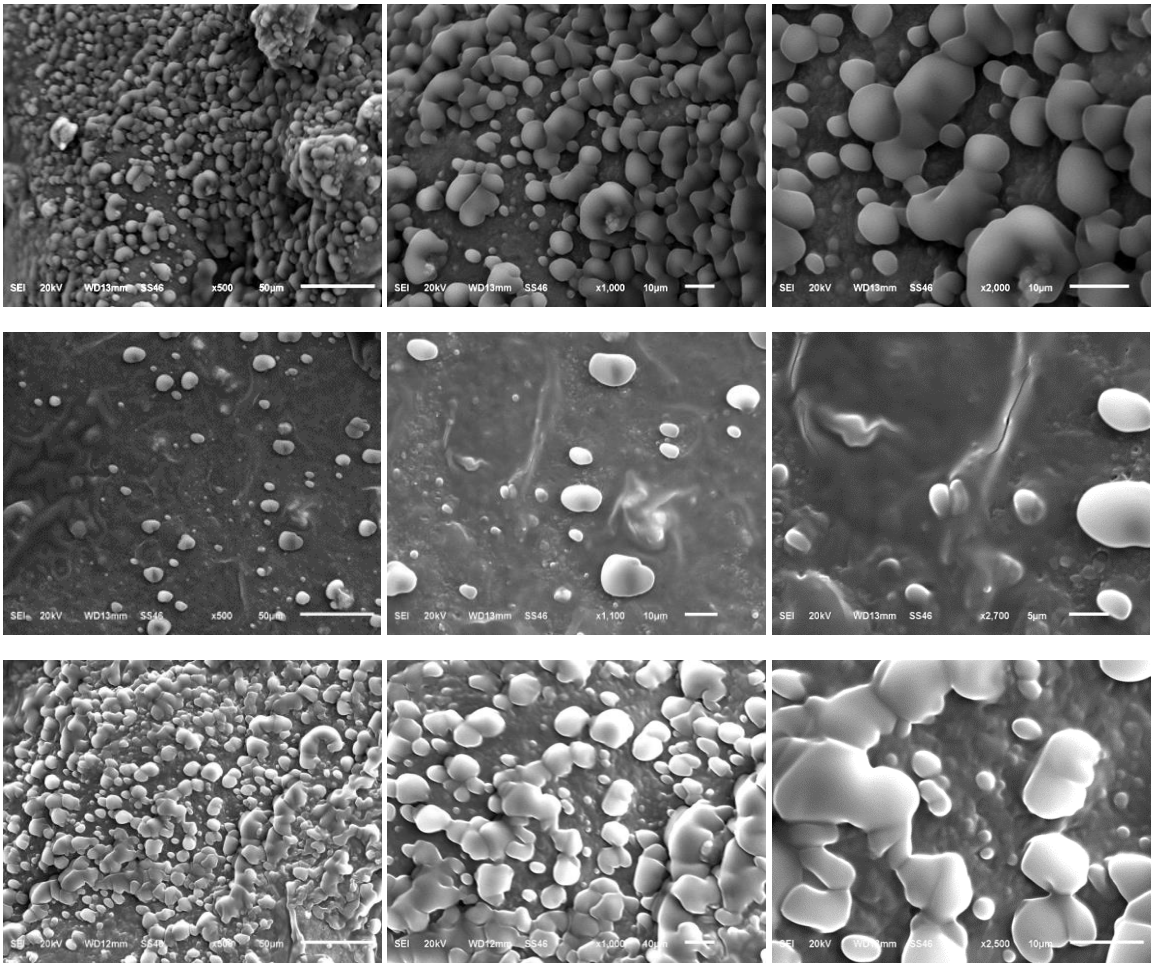
EaZnO nin UV-VIS Spektrofotometrede 200 - 800 nm aralığındaki analiz sonucu Şekil 1'de verilmiştir.



Şekil 1. EaZnO nanopartiküllerinin UV-VIS spektrofotometre analiz sonucu

Şekil 1'de görüldüğü gibi EaZnO literatürle uyumlu olarak 300 nm'de maksimum pik vermiştir. EaZnO'nun FTIR analiz sonuçları Şekil 2'de verilmiştir (Manojkumar, U. vd.,2023).

Şekil 2. EaZnO nanopartiküllerinin FTIR sonuçları



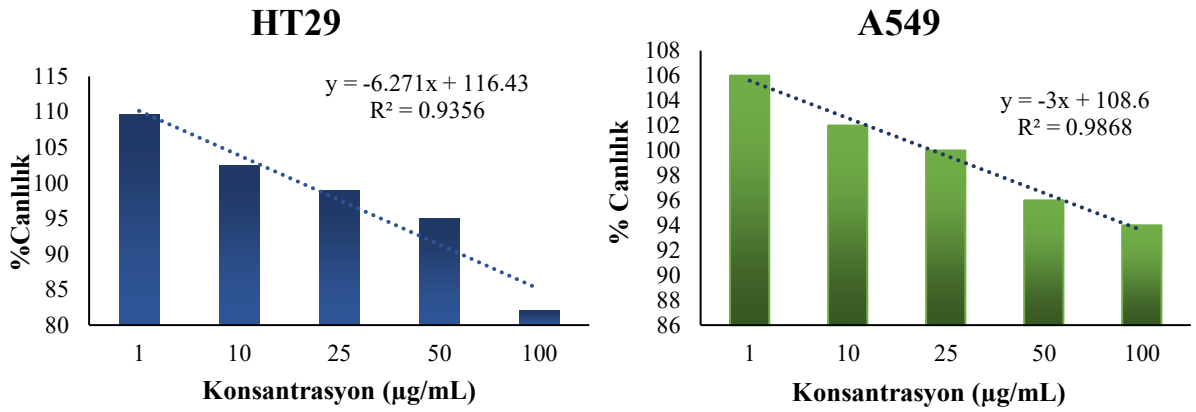
EaZnO nanopartikülleri iğde meyvesinin yapısında bulunan çok sayıda bileşik ile stabilize edilmiştir. EaZnO nanopartiküllerinin EDX sonuçları Şekil 3'te sunulmuştur.

Elt.	Line	Intensity (c/s)	Error 2-sig	Conc	Units
C	Ka	1,621.55	3.699	53.287	wt.%
O	Ka	48.36	0.821	30.910	wt.%
Zn	Ka	68.10	0.998	15.803	wt.%
			Total	100.000	wt.%

Şekil 3. EaZnO nanopartiküllerinin SEM map, EDX sonuçları

EaZnO nanopartiküllerinin sentezinin gerçekleştiği EDX spektrumundan da görülebilmektedir. EaZnO nanopartiküllerinin SEM görüntüleri Şekil 4'te verilmiştir.

Şekil 4. EaZnO nanopartiküllerinin SEM görüntüleri



SEM görüntülerine göre EaZnO nanopartiküllerinin küçük kabarcıklar ve küreler şeklinde oluştuğu belirlenmiştir. EaZnO nanopartiküllerinin antimikrobiyal analiz sonuçları Tablo 1'de sunulmuştur.

Tablo 1. Antimikrobiyal Analiz sonuçları (inhibisyon bölgesi çapları (mm))

Mikroorganizmalar	Eritromisin (15µg/mL)	EaZnO (40mg/mL)
P. aeruginosa	8.0	8.0
K. pneumoniae	10.0	8.0
E. coli	14.0	
S. aureus	19.5	

EaZnO nanopartikülleri sadece *P. aeruginosa* ve *K. pneumoniae* üzerinde etkinlik göstermiştir. Antimikrobiyal analizlerde Eritromisin antibiyotiği pozitif kontrol olarak kullanılmıştır. EaZnO nanopartikülleri *P. aeruginosa* üzerinde eritromisin kadar etkinlik sergilerken *K. pneumoniae* üzerinde eritromisinden daha düşük bir inhibisyon etkinliği göstermiştir.

Hücre kültürü ve sitotoksisite analiz sonuçlarında EaZnO'nun IC_{50} değerleri A549 hücreleri için 484 µg/mL, HT 29 hücreleri için 225 µg/mLolarak tespit edilmiştir. EaZnO nanopartikülleri A549 ve HT29 hücrelerine uygulandıktan sonra hücrelerin göstermiş olduğu doza bağlı canlılık grafiği Şekil 5'te sunulmuştur.

Şekil 5. Doza bağlı % canlılık grafiği

Doza bağlı olarak hücrelerin canlılığı azalmıştır. EaZnO nanopartikülleri HT29 hücre hattı üzerinde A549 hücrelerine nazaran daha fazla sitotoksik etki sergilemiştir.

Sentezlenen nanopartiküller *P. aeruginosa* ve *K. pneumoniae* baklerileri üzerindeki etkinliğinin yanı sıra kanser hücreleri üzerinde gösterdiği sitotoksik etkiyle tamamlayıcı olarak kullanılmaya aday ajanlardır. Bu özellikleri ile özellikle gıda endüstrisi, kozmetik ve tıbbi uygulamalar için önemli potansiyel taşımaktadır.

Abstract

This study aimed to evaluate the antimicrobial effects of postbiotics derived from *Lactobacillus reuteri* ENA31 and *Lactobacillus rhamnosus* GAA6 against common foodborne pathogens. Postbiotics were obtained by culturing the probiotic strains in MRS broth, followed by centrifugation and membrane filtration of the supernatants. Antimicrobial activity was assessed using the disk diffusion method against *Salmonella typhi* ATCC 19430, *Staphylococcus aureus* ATCC 25923, and *Bacillus cereus* ATCC 11778. The results revealed that postbiotics from *L. reuteri* ENA31 exhibited significant inhibitory activity against *S. typhi*, while those from *L. rhamnosus* GAA6 demonstrated strong antimicrobial effects against *S. aureus* and *B. cereus*. These findings suggest that postbiotics may serve as promising bioprotective agents for controlling foodborne pathogens and enhancing food safety.

Keywords: Postbiotics; Probiotics; Antimicrobial activity; *Lactobacillus reuteri*; *Lactobacillus rhamnosus*; Food safety.

INTRODUCTION

Postbiotics are metabolites released by probiotic microorganisms during fermentation and are described in the literature as inactivated microbial cell components (1). These substances may consist of a mixture of bioactive end-products released into the culture medium, including secreted proteins, short-chain fatty acids, organic acids, peptides, vitamins, enzymes, biosurfactants, and amino acids (2). Although the mechanisms of action of postbiotics are not yet fully understood, studies have demonstrated that they can modulate the host's immune response.

Postbiotics have gained attention due to their potential to alter enzyme structure and activity, disrupt the electron transport chain, damage pathogen cell membranes, inhibit macromolecule synthesis, and reduce pH, thereby creating unfavorable conditions for the survival of pathogenic microorganisms (3,4). Owing to these advantages, research on the use of postbiotics against foodborne pathogens has intensified (5). Furthermore, many in vitro and in vivo studies indicate that postbiotics exhibit antimicrobial activity against various pathogenic organisms.

In recent years, the increasing incidence of foodborne illnesses in our country has highlighted the need to explore this topic further. Therefore, the aim of this study was to evaluate the effects of postbiotics on commonly encountered foodborne pathogens.

MATERIALS AND METHODS

Materials

In this study, postbiotics obtained from *Lactobacillus reuteri* ENA31 and *Lactobacillus rhamnosus* GAA6 strains were used. As foodborne pathogens, *Salmonella typhi* ATCC 19430—commonly found in eggs, poultry, and nuts; *Staphylococcus aureus* ATCC 25923—frequently present in meat and sandwiches; and *Bacillus cereus* ATCC 11778—often detected in rice, sauces, and foods stored at room temperature—were selected.

Postbiotic Preparation

L. reuteri ENA31 and *L. rhamnosus* GAA6 strains were activated in Man Rogosa Sharp (MRS) broth at 37°C for 16–18 hours. Following incubation, cultures were centrifuged at 14,000 g for 15 minutes. The resulting supernatants were collected and filtered through 0.45 µm membrane filters to obtain sterile postbiotic preparations.

Pathogen Cultivation

Specific broths were used for the growth of each pathogen:
Tryptic Soy Broth for *S. typhi*
Brain Heart Infusion Broth for *S. aureus*
Nutrient Broth for *B. cereus*

Antimicrobial Activity Assessment

The antimicrobial activity of the postbiotics was evaluated using the disk diffusion method on Mueller-Hinton Agar (MHA). Inhibition zones were measured in millimeters (mm±sd).

RESULTS

Postbiotics derived from *L. reuteri* ENA31 exhibited significant antimicrobial activity against *S. typhi*. In contrast, postbiotics obtained from *L. rhamnosus* GAA6 demonstrated strong inhibitory effects on *S. aureus* and *B. cereus*. The results are presented in Table 1.

Table 1. Inhibition Zones (mm)

	S.typhi ATCC 19430	*S.aureus* ATCC 25923	*B.cereus* ATCC 11778
L.reuteri ENA31 postbiyotiği	18.5±1.5	16.0±1.5	11.0±2.0
L.rhamnosus GAA6 postbiyotiği	12.0±1.0	23.7±1.3	24.0±1.5

DISCUSSION

Postbiotics produced by lactic acid bacteria, particularly probiotics, are known to contain substantial amounts of organic acids (6). These acids—including lactic acid, acetic acid, CO_2, diacetyl, and ethanol—create unfavorable growth conditions for pathogens (6,7). Postbiotic preparations also contain high concentrations of bacteriocins, peptides, and proteins, which contribute to their stability under heat and variable pH conditions. Several studies support that these molecules are responsible for the antimicrobial activities of postbiotics (2,8).

In the present study, postbiotics derived from *L. reuteri* ENA31 exhibited notable inhibitory activity against *S. typhi*, whereas postbiotics from *L. rhamnosus* GAA6 were highly effective against *S. aureus* and *B. cereus*. The number of studies examining the effects of postbiotics on foodborne pathogens is limited. In a previous study, postbiotics obtained from *L. plantarum* strains showed minimal antimicrobial activity against *E. coli* O157:H7, *S. enteritidis*, and *S. aureus* (9).

The findings of this study suggest that postbiotics derived from selective probiotic strains may serve as effective agents in controlling pathogenic microorganisms in foods. Considering their known contribution to extending shelf life, postbiotics hold promise as important bioprotective components in combating foodborne pathogens. Moreover, future studies focusing on the combined use of organic acids with other antimicrobial components present in postbiotics may provide valuable strategies for preventing foodborne intoxication.

Özet

Son zamanlarda yapılan çalışmalarda, özellikle *Salvia* türlerinin potansiyel biyolojik aktivitelerine odaklanıldığı görülmektedir. Antioksidan, antimikrobiyal, antidiabetik, antikanser ve nöroprotektif özelliklerin yanında, bu türlerin fitoterapi, fonksiyonel gıda ve ilaç bitkisi olarak ilgi çekici hâle geldiği belirtilmektedir. *Salvia* türlerinin çok geniş ekolojik aralıklarda, farklı iklim, yükselti, toprak ve substrat koşullarında bulunması, bu taksonlar üzerine daha ayrıntılı çalışmalara ihtiyaç olduğunu göstermektedir. Özellikle endemik türlerin ekolojik nişleri, adaptasyon mekanizmaları ve iklim değişikliği ile habitat bozunumu gibi değişimleri tolere etme durumları üzerine yapılan araştırmaların yetersiz olduğu anlaşılmaktadır. Son yıllarda yeni tür tayinlerinin devam ediyor olması, *Salvia* cinsinin aktif bir taksonomik çalışma alanı olduğunu göstermektedir. Bazı türlerin uçucu yağ kompozisyonu ve biyolojik aktiviteleri incelenmeye başlanmış olsa da, Türkiye'deki çeşitliliğin ancak küçük bir kısmının değerlendirildiği anlaşılmaktadır. Nadir, dar yayılışlı ve endemik türler üzerine daha fazla araştırma yapılması gerekliliği ortaya çıkmaktadır. Sonuç olarak, Türkiye'de *Salvia* türleri tıbbi ve kültürel açıdan önemli olup, yüksek endemizm, geniş ekolojik çeşitlilik, etnobotanik kullanım ve farmakolojik potansiyel ile dikkat çekmektedir.

Anahtar Kelimeler: *Salvia*, endemizm, etnobotanik kullanım, geleneksel tıp

An overview of *Salvia* taxa in Turkey and their use in traditional medicine

Abnstract

Recent studies indicate that research has increasingly focused on the potential biological activities of *Salvia* species. In addition to antioxidant, antimicrobial, antidiabetic, anticancer, and neuroprotective properties, these species have become attractive as phytotherapeutic agents, functional foods, and medicinal plants. The presence of *Salvia* species across a wide ecological range—different climate, altitude, soil, and substrate conditions—demonstrates the need for more detailed studies on these taxa. Research on the ecological niches of endemic species, their adaptation mechanisms, and their ability to tolerate changes such as climate change and habitat degradation remains insufficient. The continued description of new species in recent years shows that the genus *Salvia* represents an active area of taxonomic research. Although the essential oil composition and biological activities of some species have begun to be examined, only a small portion of the diversity present in Türkiye has been evaluated. Consequently, there is a growing need for further studies on rare, narrowly distributed, and endemic species. In conclusion, *Salvia* species in Türkiye are of great medicinal and cultural importance and stand out due to their high endemism, wide ecological diversity, ethnobotanical uses, and pharmacological potential.

Keywords: *Salvia*, *Salvia*, endemism, ethnobotanical use, traditional medicine

GİRİŞ

Angiospermler arasında altıncı en büyük familya olan Lamiaceae (Ballıbabagiller), hem beslenme hem de hastalık tedavisi için kullanılan çok sayıda tıbbi ve aromatik bitki türü kapsayan kutup bölgeleri hariç, deniz seviyesinden yüksek dağlık bölgelere kadar çeşitli rakımlarda ve habitatlarda yetişen, dünya genelinde ekonomik ve tıbbi önemi olan çok sayıda türü kapsayan yaklaşık 230 – 250 cins ve 7000-8000'den fazla türden oluşan büyük bir familyadır (Zhao ve ark., 2021; Kılıç Mungan, 2022; Dirmenci, 2024; Çalış, 2025). Taksonomi üzerine yapılan son çalışmalar, Lamiaceae familyasını on iki alt familyaya ayırmıştır. Bunlar: Ajugoideae, Lamioideae, Nepetoideae, Prostantheroideae, Scutellarioideae, Symphorematoideae, Viticoideae, Cymarioideae, Peronematoideae, Premnoideae, Callicarpoideae ve Tectonoideae'dir (Zhao ve ark., 2021; Cole ve ark., 2021; Çalış, 2025). Özellikle son yıllarda gerçekleştirilen moleküler filogenetik çalışmalar ve morfolojik değerlendirmeler sonucu Türkiye'deki Lamiaceae türlerinin yedi klad tarafından temsil edildiği belirlenmiştir. Bunlar: *Zhumeria*, *Salvia*, *Sclarea*, *Glutinaria*, *Heterosphace*, *Dorystaechas* ve *Rosmarinus*'dur (Celep ve Doğan, 2023).

Bitki familyaları arasında tıbbi kullanım açısından en önemli familyalardan biri olan Lamiaceae familyasının taksonları, güçlü aromatik bitkilerden oluşur. Bu bitkilerin farklı organları (yapraklar, rizomlar, gövdeler) gıda amaçlı, boya ekstraksiyonu, çeşitli hastalıkların tedavisi (sinir, dolaşım, solunum, üreme sistemleri), böcek kovucu, süs amaçlı, gıda katkı maddesi ve koruyucu olarak uçucu yağlar, parfüm ve kozmetik endüstrisinde kullanılmaktadır ve bu nedenle geniş bir uygulama alanına sahiptir. İnsanlık tarihi boyunca bu amaçlarla kullanıldıklarına dair kanıtlar arkeolojik kazılarda ve eski yazıtlarda bulunmuştur (Celep ve Doğan, 2023; Ghoran ve ark., 2023; Dirmenci, 2024).

Son zamanlarda yapılan çalışmalar, Lamiaceae familyasının birçok üyesinin yüksek düzeyde antioksidan, antikolinesteraz, antifungal, antimikrobiyal ve diğer etkilere sahip olduğunu da ortaya koymuştur (Yumrutas ve ark., 2023). Bu çalışmalardan elde edilen sonuçlar da Lamiaceae türlerinin, bitki kimyası, bitki taksonomisi ve doğal kaynaklardan yeni ilaç adayı molekül araştırmaları, etnofarmakolojik ve etnobotanik çalışmalar gibi farklı alanlarda planlanan bilimsel araştırmalar için her açıdan zengin çeşitliliğe sahip kaynaklar olduğunu kanıtlamaktadır.

Küresel olarak Lamiaceae familyasında en fazla tür sayısına sahip cinsler arasında *Salvia* yaklaşık 1.000 türle başı çekmekte, onu *Scutellaria* (480 tür), *Stachys* (370 tür), *Nepeta* (300 tür), *Teucrium* (300 tür), *Thymus* (270 tür) ve *Vitex* (210 tür) izlemektedir. Türkiye'de Lamiaceae, 45 cins ve 614 tür (yaklaşık 800 takson) ile temsil edilmektedir. Türkiye'de en fazla tür sayısına sahip cinsler arasında *Salvia*, *Stachys*, *Sideritis*, *Thymus*, *Nepeta* ve *Teucrium* bulunmaktadır.

MATERYAL METOD

Bu çalışma, Türkiye florasında yer alan *Salvia* türleri ve halk tıbbında kullanımını kapsamlı bir şekilde değerlendirmek amacıyla literatür taraması yöntemiyle hazırlanmıştır. Çalışmada hem ulusal hem de uluslararası akademik kaynaklar taranmıştır. Toplanan veriler, türlerin taksonomik çeşitliliği, ekolojik dağılımı ve etnobotanik kullanım özellikleri açısından sınıflandırılmış ve yorumlanmıştır. Bu yöntem sayesinde, Türkiye'de yetişen *Salvia* türlerinin hem biyolojik çeşitlilik hem de geleneksel kullanım açısından güncel bir değerlendirmesi sunulmuştur.

BULGULAR

Salvia'nın Dünya ve Türkiye'deki Durumu

Genellikle adaçayı olarak bilinen *Salvia* L. cinsi, dünya çapında şu ana kadar kabul edilen 1000'den fazla tür ile çiçekli bitkiler arasında tür açısından en zengin cinslerden biridir. Başlıca çeşitlilik merkezleri Akdeniz bölgesi, Güneybatı Asya, Meksika ve Orta/Güney Amerika ile Doğu Asya'dır. Amerika, Akdeniz, Orta Doğu, Pasifik Adaları ve tropikal Afrika'da yetişen *Salvia*'nın Meksika'da yaklaşık 3000 türü kaydedilmiştir. Bu nedenle Meksika, *Salvia* cinsi açısından en büyük çeşitliliğe sahip ülke olarak kabul edilir. Meksika'dan sonra Türkiye, 1000'den fazla türü ile *Salvia* bitkilerinin çeşitliliğinin yüksek olduğu ikinci sıradaki ülke olarak karşımıza çıkar. Türkiye'yi Çin (yaklaşık 840) ve İran (yaklaşık 620) izlemektedir. *Salvia* türleri çoğunlukla çalımsı ve aromatik çok yıllık bitkilerdir. Farklı boya, farklı çiçek tipi ve renge sahiptirler.

Türkiye florası'nda *Salvia* cinsine ait 97 tür, 4 alttür ve 8 varyete bulunmaktadır. Bu türlerden 51 tanesinin endemik olduğu ve 58 tanesinin İran-Turan, 27 tanesinin Akdeniz, 5 tanesinin Avrupa-Sibirya fitocoğrafik bölgesine, diğer kalan 7 tanesinin de birden fazla fitocoğrafik bölgede yayılış gösterdiği belirtilmiştir (İpek ve Gürbüz, 2010).

Ancak Türkiye Florası 7. Cildin yayınlanmasının ardından geçen özellikle son 20 yıllık sürede bir dizi yeni takson, yeni kayıt ve taksonomik değişiklik yayınlanmıştır. Moleküler filogenetik sonuçlar ve morfolojik incelemelerin

sonucu doğrultusunda Türkiye'de *Salvia* cinsine ait 116 takson bulunduğu tespit edilmiş olup bunların 64'ünün endemik olduğu belirlenmiştir. Bu da %55'lik bir endemiz oranına işaret etmektedir. 116 taksonun, 58 tanesi İran-Turan elementi, 31'inin Akdeniz elementi, 6'sının Avrupa-Sibirya elementi ve 21 tanesinin de çoklu bölgeli element olduğu tespit edilmiştir (Güner ve ark., 2012; Eminagaoglu ve ark., 2022; Celep ve Doğan, 2023; İlçim ve ark., 2023).

Salvia'nın ülkemizde halk tıbbında kullanımı

Salvia'nın iyileştirici özellikleri, eski Mısır'da ve Anglosaksonlar, Yunanlılar ve Romalılar tarafından çok eski zamanlardan beri bilinmektedir (Eksi ve Yılmaz 2021, Yılmaz ve ark., 2023). Son yıllarda, *Salvia* ile ilgili, sayısız yeni taksonomik, mikromorfolojik, moleküler filogenetik, karyolojik, anatomik ve tozlaşma ekolojisi çalışması yayınlanmıştır. Özellikle *Salvia* türlerinin, parfümeri ve kozmetik endüstrisinde, süs bitkileri endüstrisinde, tıpta, bitkisel ilaçlarda ve gıda katkı maddelerinde çok çeşitli kullanım alanlarına sahip, yine antioksidan, antimikrobiyal, Alzheimer önleyici, kanser önleyici ve hatta böcek öldürücü özelliklere sahip ikincil metabolitler, özellikle de uçucu yağlar içerdiği pek çok çalışma ile gösterilmiştir (Pavlidou ve ark., 2004; Bahadırlı ve Ayanoğlu, 2020).

Salvia türleri, bazı kanserler, bronşit, ishal, astım, romatizma, soğuk algınlığı, grip, baş ağrısı, bazı kalp hastalıkları, hafıza güçlendirme, menopoz, kas ağrısı, gece terlemesi, farenjit, cilt enfeksiyonları, mide ağrısı, stomatit, boğaz ağrısı, diş ağrısı, tüberküloz ve yaraların tedavisinde kullanılmaktadır (Paksoy ve ark., 2016; Abak ve ark., 2018; Şenkal ve ark., 2019; Bakir ve ark., 2020; Selvi ve ark., 2022; Yılmaz ve ark., 2023). *Salvia* türleri, steroller, flavonoidler, seskiterpenoidler, sesterpenoidler, diterpenoidler, triterpenoidler, uçucu yağlar ve flavonoidler gibi çeşitli ikincil metabolitler içerir ve bu metabolitler antioksidan, antimikrobiyal, antialzheimer, antikanser, antidiyabetik, antitümör, antiplazmodiyal, antiinflamatuar, antinörodejeneratif, antienzimatik (antikolinesteraz, antiüreaz, antitirozinaz, antielastaz), antipiretik, analjezik, hepatotoksik, sitotoksik, insektisidal aktiviteler gibi

çeşitli biyolojik ve farmakolojik aktivitelere sahiptir (Abak ve ark., 2018; Karik ve ark., 2018; Tulukcu ve ark., 2019; Bakir ve ark., 2020; Eksi ve Yılmaz, 2021; Yılmaz ve ark., 2023).

Zengin geleneksel kültürü nedeniyle, ülkemizde *Salvia*'nın farklı kısımları sıklıkla kullanılmaktadır. Mesela, Türkiye'nin batı Akdeniz bölgesinde, *Salvia viridis*, *Salvia sclarea* ve *Salvia tomentosa* sürgünleri, çiçekleri ve yaprakları gibi toprak üstü kısımlarının infüzyonu, boğaz ağrısı, boğaz iltihabı, bronşit, astım, öksürük kesici, ülser, bağırsak spazmları, jinekolojik rahatsızlıklar ve solunum yolu hastalıklarının tedavisi için halk hekimliğinde yaygın olarak tüketilmektedir. Örneğin, *Salvia wiedemannii* Boiss. peptik ülserlerin tedavisi ve ağrının giderilmesi için; *Salvia cryptantha* Montbert & Aucher ex Benthan ve *Salvia triloba* L. mide semptomlarının tedavisi, yara dezenfektanı, öksürük ve soğuk algınlığı için; *Salvia tomentosa* ve *Salvia chrysophylla* Stapf karın ve romatizmal ağrıları hafifletmek ve dişleri güçlendirmek için; *Salvia aethiopis* ve *Salvia nemorosa* yara iyileşmesi ve kanama için, Karadeniz Bölgesi'nde, *Abies bornmülleriana* Mattf. reçinesinin *Salvia aethiopsis* L. kökü, sabun, balmumu ve tereyağı ile kaynatılarak hazırlanan merhemlerin yara iyileşmesi için kullanımı oldukça dikkat çekicidir (Günbatan ve ark., 2023).

Ege bölgesinde de *Salvia fruticosa* Miller gibi aromatik bir bitkinin ağırlıklı olarak halk ilacı olarak kullanıldığı ve hazırlanan halk ilaçlarının sıklıkla gastrointestinal, solunum sistemi ve dermatolojik hastalıkların tedavisinde kullanıldığı tespit edilmiştir (Honda ve ark, 1996; Kargıoğlu ve ark., 2010; Güler ve ark., 2020; Günbatan ve ark., 2023). *Salvia adenophylla* Hedge et Hub. ve *Salvia tomentosa* Miller türlerinin de karın ağrısı, mide ağrısı ve solunum yolu hastalıklarının tedavisinde kullanıldığı tespit edilmiştir (Bulut ve Tuzlacı, 2015).

Marmara Bölgesinde'de *Salvia* türlerinin karın ağrısı, mide ağrısı ve solunum yolu hastalıklarının tedavisinde sıklıkla kullanıldığı tespit edilmiştir (Uzun ve ark., 2004; Koçyiğit ve Özhatay, 2006; Yeşilyurt ve ark., 2017; Günbatan ve ark., 2023).

Özellikle son zamanlarda diabetes mellitus tedavisi için de pek çok bitkinin kullanıldığı tespiti yapılmıştır. Ülkemizde de diabetes mellitus için kullanılan *Salvia* türleri şu şekilde sıralanmaktadır: *Salvia cyanescens* (Han ve Bulut, 2015), *Salvia fruticosa* (Öztürk ve ark., 2018), *Salvia hydrangea* (Altundag ve Ozturk, 2011), *Salvia multicaulis* (Çakilcioglu ve Türkoğlu, 2010), *Salvia officinalis* (Öztürk ve ark., 2018), *Salvia virgata* (Ahiskalı ve ark., 2012).

Ülkemizde 50'ye yakın *Salvia* türünün etnobotanik kullanımı tespit edilmiş olup (Tablo 2) geri kalan taksonların da kullanımı olduğu tahmin edilmektedir. Bu sebeple arazi çalışmalarının arttırılması etnobotanik kullanımın tespitine imkan sağlaması açısından önemlidir.

Tablo 2 Türkiye'de geleneksel tıpta kullanımı tespit edilmiş *Salvia* taksonları ve kullanıldıkları hastalık çeşitleri

Takson	Kullanılan kısım	Hastalık	Kullanım yöntemi	Kaynak
Salvia absconditiflora (Montbret & Aucher ex Benth.) Greuter & Burdet*	TÜK, çiçek	Astım, bronşit, soğuk algınlığı ve grip, idrar söktürücü, balgam söktürücü, böbrek taşı, mide ağrısı, üretrit, kalp hastalıkları, hemoroid	Lapa, inf. yaprağı çiğtüketme	Özdemir ve Alpınar, 2015; Sargın ve ark., 2015; Doğan ve Bağcı, 2011
Salvia adenophylla Hedge & Hub.- Mor.	TÜK, çiçek	Karın ağrısı	İnf	Bulut ve ark., 2017
Salvia aethiopis L.	TÜK, çiçek, kök	Soğuk algınlığı ve grip, gastrit, yara iyileşmesi, kanama	İnf	Doğan ve Bağcı, 2011; Günbatan ve ark., 2023
Salvia aramiensis Rech.f.	TÜK	Bronşit	İnf	Altayve Karahan 2012
Salvia argentea L.	TÜK	Soğuk algınlığı ve grip	İnf	Koyuncu ve ark., 2010
Salvia bracteata Banks & Sol.	TÜK	Soğuk algınlığı ve grip	İnf	Koyuncu ve ark., 2010
Salvia cadmica Boiss. var. *cadmica*	TÜK	Karın ağrısı, kanama, soğuk algınlığı ve grip	İnf	Bulut ve ark., 2017; Özdemir ve Alpınar, 2015
Salvia candidissima Vahl subsp. *candidissima*	TÜK	Anjina, bronşit, soğuk algınlığı ve grip, böbrek taşı	İnf, grg	Altundag ve Ozturk, 2011; Korkmaz ve Karakurt, 2015

Salvia cryptantha Montbert & Aucher ex Benthan	TÜK	Yara dezenfektanı, öksürük ve soğuk algınlığı	Kyn.	Ghoran ve ark., 2023
Salvia dichroantha Stapf	TÜK	Soğuk algınlığı, Mide ağrısı	İnf	Sezik ve ark., 2001; Üstün ve Sezik, 2011, Ghoran ve ark., 2023
Salvia forskahlei L.	TÜK	Sakinleştirici, mide ağrısı, kabızlık	İnf	Akbulut ve Bayramoğlu., 2014; Karaköse, 2022
Salvia fruticosa Mill.	TÜK,yaprak, çiçek	Karın ağrısı, antiseptik, gaz giderici, soğuk algınlığı ve grip, dispepsi, baş ağrısı, prostat, yatıştırıcı, mide rahatsızlıkları, bademcik iltihabı	İnf	Uysal ve ark., 2012;; Bulut, 2011; Emre ve ark., 2021; Akbaş ve ark., 2024
Salvia glutinosa L.	TÜK	Yanık yaraları	İnf	Saraç ve ark., 2013; Demirci Kayıran ve ark., 2023
Salvia huberi Hedge	TÜK	Sakinleştirici, mide ağrısı, kabızlık	İnf	Toksoy ve ark., 2010
Salvia hydrangea DC. ex Benth.	TÜK	Ateş düşürücü, soğuk algınlığı ve grip, diyabet, adet söktürücü, mide rahatsızlıkları	İnf	Altundag ve Ozturk, 2011
Salvia hypargeia Fisch. & C.A.Mey.	TÜK	Soğuk algınlığı ve grip	İnf	Özdemir ve Alpınar, 2015
Salvia limbata C.A.Mey.	TÜK	Diyabet, diş ağrısı	İnf, grg	Özgen ve ark., 2012; Dalar, 2018
Salvia macrochlamys Boiss. & Kotschy	TÜK	Diyabet	İnf	Dalar, 2018
Salvia multicaulis Vahl	TÜK, çiçek, meyve	İştah açıcı, astım, diyabet, soğuk algınlığı ve grip, sindirim, migren, bademcik iltihabı, solunum ve idrar yolu rahatsızlıkları, karın ve menstrual ağrısı, siğil, yara	İnf, kyn	Güneş ve ark., 2017; Nadiroğlu ve ark., 2019; Cakilcioglu ve Turkoglu, 2010; Yeşil ve İnal, 2021; Demirci ve Kayıran, 2023
Salvia nemorosa L.	TÜK	Nezle, soğuk algınlığı, kanama durdurucu, yara iyileşmesi	İnf, kyn	Altundag ve Ozturk, 2011
Salvia officinalis L.	Yaprak	Soğuk algınlığı ve grip, böbrek rahatsızlıkları	İnf	Gürbüz ve ark., 2019; Cakilcioglu ve ark., 2011
Salvia palaestina Bentham	TÜK	Soğuk algınlığı ve grip, diyabet, balgam söktürücü, karın ve menstrual ağrısı, yara	İnf	Bulut ve ark., 2019; Yeşil ve İnan, 2021; Demirci Kayıran ve ark., 2023
Salvia pinnata L.	TÜK	Soğuk algınlığı ve grip	İnf	Koyuncu ve ark., 2010
Salvia poculata Náb	TÜK	Diyabet	İnf	Dalar, 2018
Salvia rosifolia Sm.	TÜK	Gaz giderici, kabızlık, böbrek taşı, mide ağrısı	İnf	Korkmaz ve Karakurt, 2015
Salvia russellii Benth.	TÜK	Karın ağrısı, soğuk algınlığı	Kyn	Sezik ve ark., 2001; Üstün ve Sezik, 2011, Ghoran ve ark., 2023
Salvia sclarea L.	TÜK,çiçek, taze (çiğ), yaprak	Soğuk algınlığı ve grip, sindirim sistemi, solunum sistemi hastalıkları, ağız ve boğaz ağrısı, yatıştırıcı	İnf, grg	Fakir ve ark., 2016; Akbulut ve Zengin, 2023; Demirci Kayıran ve ark., 2023
Salvia staminea Montbret & Aucher ex Benth.	TÜK	Yara iyileşmesi	Lapa	Güneş ve Özhatay, 2011
Salvia syriaca L.	TÜK, çiçek yaprak	Apse, anti-asit, soğuk algınlığı ve grip	Taze (çiğ), inf	Behçet ve Arık, 2013; Tetik ve ark., 2013; Demirci Kayıran ve ark., 2023

Salvia tomentosa Mill.	Yaprak, TÜK	Karın ağrısı, soğuk algınlığı ve grip, böbrek taşı, farenjit, yara	İnf	Fakir ve ark., 2016; Karaköse, 2022; Akbulut ve Zengin, 2023
Salvia triloba L.	TÜK	Yara dezenfektanı, öksürük ve soğuk algınlığı	Kyn	Ghoran ve ark., 2023
Salvia trichoclada Benth.	TÜK	Diyabet	İnf	Dalar, 2018
Salvia verticillata L. subsp. *amasiaca* (Freyn & Bornm.) Bornm.	TÜK	Karın ağrısı, soğuk algınlığı, müshil, mide bulantısı, diş ağrısı	Kyn	Altundag ve Ozturk,2011; Karakaya ve ark., 2020
Salvia verticillata L. subsp. verticillata	TÜK	Nezle, soğuk algınlığı ve grip, diyabet, mide ağrısı, müshil, yara iyileşmesi	Kyn, inf	Altundag ve Ozturk, 2011; Koyuncu ve ark., 2010; Dalar, 2018;
Salvia virgata Jacq.		Soğuk algınlığı ve grip, kas ağrısı	İnf	Nadiroğlu ve ark., 2019; Koyuncu ve ark.,2010;Akbulut ve Zengin, 2023

Salvia wiedemannii Boiss.	TÜK	Soğuk algınlığı ve grip, ülser, mide ağrısı	İnf	Koyuncu ve ark., 2010; Üstün ve Sezik, 2011
Salvia verbenaca L.	TÜK	Antiseptik, diüretik, mide ağrısı	İnf	Ertuğ ve ark., 2004

Kısaltmalar: TÜK: toprak üstü kısımlar, İnf: infüzyon; grg: gargara; kyn: kaynatma

TARTIŞMA

Son zamanlar da yapılan çalışmalara bakıldığında özellikle *Salvia* türlerinin, potansiyel biyolojik aktivitelerine odaklanıldığı (antioksidan, antimikrobiyal, antidiabetik, antikanser, nöroprotektif (örneğin Alzheimer'a karşı), antidiyabetik), bu yüzden *Salvia* türlerine halkın ilgisinin fitoterapi veya fonksiyonel gıda / ilaç bitkisi olarak cazip hale geldiği görülmektedir (Karadeniz Pekgöz ve ark., 2024).

Salvia türleri çok geniş ekolojik aralıklarda (iklim, yükselti, toprak, substrat) bulunduğundan dolayı bunlar üzerine daha ayrıntılı çalışmalara ihtiyaç vardır. Özellikle endemik türlerin ekolojik nişleri, adaptasyon mekanizmaları, tolere edebilecekleri değişimler (iklim değişikliği, habitat bozunumu vb.) yapılan çalışmalara bakıldığında yetersiz görünmektedir. Özellikle son yıllarda halen yeni tür tayinlerinin yapılıyor olmasıyla, aktif bir taksonomik çalışma alanı olduğu daha net görülmektedir. Bazı türlerin uçucu yağ kompozisyonu ve biyolojik aktiviteleri incelenmeye başlanmış olsa da, ülke genelindeki çeşitliliğin ancak küçük bir kısmı değerlendirilmiş durumdadır ve özellikle nadir, dar yayılışlı, endemik türlerin üzerine daha fazla araştırma yapılabilir.

SONUÇ

Sonuç olarak, Türkiye'de *Salvia* türleri hem tıbbi hem de kültürel anlamda büyük önem taşıyan yüksek endemizm, geniş ekolojik çeşitlilik, zengin etnobotanik kullanım, farmakolojik potansiyel ile öne çıkan bir taksondur. Buna karşın, pek çok türün varlığı habitat baskısı ve yanlış kullanım nedeniyle tehlikededir. Hem bilimsel araştırmalar (etnobotani, kimya, moleküler ekoloji, farmakoloji) hem de toplum temelli koruma programları gereklidir.

Abstract

In this work, a novel mixed-ligand nickel(II) complex based on S-methyl isothiosemicarbazone ligand was synthesized using 3-bromo-5-chlorosalicylaldehyde-S-methylisothiosemicarbazone as the primary ligand in the presence of 2,6-dimethylpyridine as the co-ligand. The structure of the synthesized complex was characterized by elemental analysis, FT-IR, UV–Visible spectroscopy, and ^{1}H-NMR spectroscopic techniques. In addition, detailed crystallographic analysis via single-crystal X-ray diffraction elucidated the molecular structure and confirmed the mixed-ligand coordination environment of the complex. To assess its biological potential, the cytotoxic activity of the complex was evaluated on the MCF-7 breast cancer cell line, K562 human chronic myelogenous leukemia cell line and HUVEC human healty endothelial cell line by using the MTT assay. The results demonstrate that the complex exhibits measurable cytotoxic effects, highlighting its potential as a bioactive nickel-based coordination compound.

Keywords: Thiosemicarbazone, Mixed-ligand complexes, Nickel(II) ion, MTT assay, X-ray diffraction.

INTRODUCTION

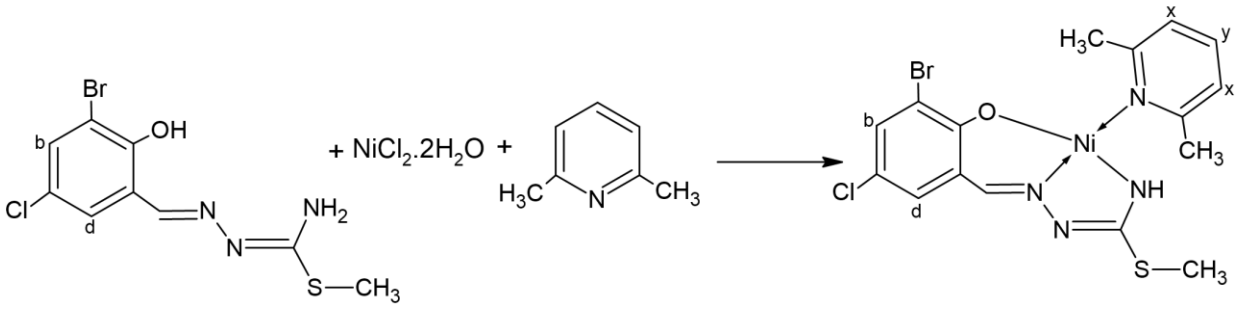
The success of cisplatin as a chemotherapeutic agent has markedly increased the trend toward the use of metal complexes in cancer treatment, as well as the discovery of new metal-based active pharmaceutical ingredients (Jung and Lippard, 2007). In this context, the metal complexes of Schiff bases are particularly among the most frequently investigated classes of compounds (Ali et al., 1997; Arafath, 2023; Kaya, 2023; Morgan et al., 2017).
Thiosemicarbazones are a class of ligands that have attracted significant attention in bioinorganic chemistry owing to their multifunctional metal-chelating properties, broad-spectrum biological activities, and structural flexibility (Khan et al., 2022; Ramanchandran et al., 2012; Pelosi et al., 2010; Atasever et al., 2010; The metal complexes of these ligands have been the subject of numerous biological activity studies, including antidiabetic, antimicrobial, anticancer, antioxidant, antiviral, and antifungal activities, as well as enzyme inhibition and DNA-binding investigations (Palanumithu et al., 2013; Yousef and Abu El-Reash, 2020; Karpagam et al., 2021; Malarz et al., 2018; Avcu Altıparmak et al., 2021; Yanardağ et al., Zhang et al., 2015; Rzycka-Korzec et al., 2021) Studies focusing on the anticancer activities of these compounds have gained substantial popularity, particularly after the approval of Triapine as an anticancer agent (Ma et al., 2008).
In a similar vein, the metal complexes of nickel–thiosemicarbazone ligands have also gained strong visibility in the literature, highlighting their growing importance as bioinorganic therapeutic candidates (Jakupec et al., 2008; Rupam et al., 2013). In this study, a novel mixed-ligand nickel(II) thiosemicarbazone complex incorporating 2,6-dimethylpyridine as a co-ligand has been synthesized. The molecular structure of the synthesized compound has been characterized using elemental analysis, UV–visible spectroscopy, FT-IR, and ^{1}H-NMR techniques, while its solid-state structure has been elucidated through single-crystal X-ray diffraction. The cytotoxic activities of both the free ligand and its nickel(II) complex were evaluated by the MTT assay on cancerous cell models including

K562 (chronic myelogenous leukemia), MCF-7 (breast adenocarcinoma), and healty cell line HUVEC (human umbilical vein endothelial cells).

MATERIALS AND METHODS

Preparation of the Thiosemicarbazone Ligand: The 3-bromo-5-chlorosalicylaldehyde-S-methyl thiosemicarbazone ligand was prepared using a literature-reported method for nickel(II) complex synthesis (Avcu Altıparmak et al., 2021). The formation of the ligand was confirmed using melting point determination and spectroscopic techniques.

Synthesis of the Ni(II) Complex: Equimolar amounts of the thiosemicarbazone ligand (1 mmol, 0.32 g) and $NiCl_2.6H_2O$ (1 mmol, 0.24 g) salt were refluxed in ethanol for 30 min. The resulting green solution was treated with 2,6-dimethylpyridine as a secondary ligand (1 mmol, 0.11 g), and refluxed for an additional 1 h. Upon complex formation, the reaction mixture turned red. The red solution was filtered while hot, and the filtrate was allowed to slowly crystallize at room temperature for 3 days, yielding red single crystals. The isolated crystals were dried for further characterization.



Characterization Details of the Thiosemicarbazone Ligand: Yellow, *Molecular Formula:* $C_9H_9BrClN_3OS$; *Formula Weight:* 322.6 $g.mol^{-1}$. *Elemental Analysis (Calculation% (Found %)):* C (33.51 (33.52)), H (2.81 (2.84)), N (13.03 (13.05)), S (9.94 (9.91)). *FT-IR:* 3480 ν(-OH); 3269, 3231 ν(-NH_2); 1632 σ(-NH); 1600, 1573 ν(C=N); 707 ν(C-S). *UV-Vis (5.10^{-5} M, $CHCl_3$, λ (nm) (ε ($M^{-1}.cm^{-1}$)):* 239.5 (16260); 304.5 (19540); 316.5 (18400); 345.5 (15480). *^{1}H-NMR (DMSO-d_6, (δ, ppm)):* 11.61, 10.64 (*cis*/*trans* ratio: 3/2, s, 1H, OH); 8.42, 8.32 (*syn*/*anti* ratio: 1/2, s, 1H, CH=N[1]), 7.76 (d, 1H, *J* = 2,45, *d*), 7.50 (d, *J* = 2.44, 1H, *b*), 6.99 (s, broad, 2H, NH_2), 2.43, 2.37 (*cis*/*trans* ratio: 1/2, s, 3H, S-CH_3).

Characterization Details of the Complex: Red, *Molecular Formula:* $C_{16}H_{16}BrClN_4NiOS$; *Formula Weight:* 486.44 $g.mol^{-1}$. Melting Point: 288 ºC. *Elemental Analysis (Calculation% (Found %)):* C (39.51 (39.54)), H (3.32 (3.30)), N (11.52 (11.56)), S (6.59 (6.52)). *FT-IR:* 3368 ν(-NH); 3052, 3034, 2971, 2958, 2922 ν(C-H); 1623 σ(-NH); 1603, 1580 ν(C=N); 699 ν(C-S). *UV-Vis (5.10^{-5} M, $CHCl_3$, λ (nm) (ε ($M^{-1}.cm^{-1}$)):* 246.5 (21620); 310 (4840); 386.5 (9100). *^{1}H-NMR (DMSO-d_6, (δ, ppm)):* 7.77 (t, 1H, *y*); 7.53 (m, 2H, *x,x*); 7.40 (s,1H, *CH=N*); 7.33 (d, 1H, *d*); 7.02 (d, 1H, *b*); 4.53 (s, 1H, *-NH*); 2.37 (s, 3H, *S-CH_3*); 2.39 (s, 6H, *-CH_{3Py}*).

X-ray Analysis: Crystal data of Ni(II) complex were collected with a STOE IPDS II diffractometer at room temperature using graphite-monochromated Mo Kα radiation by applying the ω-scan method. Data collection and cell refinement were carried out using X-AREA while data reduction was applied using X-RED32 (Stoe and Cie, 2002). The structure was solved using SHELXT 2018/2 (Sheldrick, 2015) and refined by using SHELXL2019/3 (Sheldrick, 2015). Molecular graphics were generated using OLEX2 (Dolomanov et al., 2009) and PLATON (Spek, 2009).

MTT Assay: The cytotoxic activity of complex and ligand was evaluated using MTT (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl-2H-tetrazoliumbromide) assay (Mosmann, 1983). The MCF-7 human breast cancer cell line, K562 human chronic myelogenous leukemia cell line and HUVEC human umbilical vein endothelial cell line were obtained from the American Type Culture Collection (ATCC) (VA, U.S.A.). Cells were cultured according to the standard procedure and maintained in Dulbecco's modified Eagle's medium (DMEM, Sigma, Chemical Co., St Louis, MO) and RPMI-1640 (Sigma, Chemical Co., St Louis, MO) medium. Medium solutions were supplemented with 10% FBS and 1% penicillin/streptomycin. The cells were cultured in a standard humidified incubator at 5% CO_2 at 37 °C. The number of viable cells was calculated using the trypan blue dye exclusion test. Cells were grown in 96-multiwell flat bottom microtiter plates with 10000 cells/100 µL of complete medium per well. Thiosemicarbazone ligand and complex stock solutions (5 mg mL^{-1}) were prepared in DMSO and diluted with culture medium to obtain final test concentrations of 1–50 µM per well in 96-well plates. The solvent percentage was 0.1% (v/v). 10 µl was added to wells, each one in triplicate. The plates were incubated for 72 hours, and evaluation of cell viability was performed by using the MTT colorimetric assay. Optical density was measured by using a Biotek microplate reader at 560 nm with a reference wavelength of 620 nm. In each experiment, 5 different concentrations were analyzed with 3 replicate microplate wells for each concentration. The IC50 values of all compounds tested in the cell lines were calculated using GraphPad Prism 9 software. Statistical analyses were performed nonparametrically with Student's t-test.

RESULTS and DISCUSSION

The condensation reaction between S-methyl-isothiosemicarbazide and 3-bromo-5-chloro-salicylaldehyde produced the isothiosemicarbazone ligand, comparable to related thiosemicarbazone systems reported in the literature (Avcu Altıparmak et al., 2025). The ligand formation was confirmed through spectroscopic techniques and melting point determination.

The mixed ligand Ni(II) complex was synthesized by the reaction of equimolar amounts (1:1:1) of the ligand, $NiCl_2.6H_2O$ and 2,6-dimethylpyridine. The red crystal product showed good solubility in dichloromethane, diethyl ether, chloroform, DMF and alcohols. It was characterized by elemental analysis, FT-IR, UV-Vis and ^{1}H-NMR spectroscopic methods and the structure of crystal was determined by X-ray diffraction (Scheme 1).

The UV-Vis spectra of the starting material and complex were measured in $CHCl_3$. In the UV-Vis spectrum of the ligand, the bands located at 239.5, 304.5, 316.5 and 345.5 nm can be attributed the π–π* transitions of the aromatic ring, n–π* transition of azomethine and π–π* transition of the thioamide group on thiosemicarbazone. The electronic spectrum of the Ni(II) complex exhibited three bands, with the band at 246.5 nm corresponding to the π–π* transition of the aromatic ring, 310 and 386.5 nm attributed to the π → π* and n → π*, charge transfer transitions, respectively.

The formation of the ligand and Ni(II) were confirmed through characteristic infrared spectral bands. Ligand condensation was demonstrated by the presence of a phenolic O–H band at 3480 cm^{-1}, primary amine (NH_2) stretching bands at 3269 and 3231 cm^{-1}, and azomethine (C=N) vibrations at 1600 and 1573 cm^{-1}, respectively. In the complex FT-IR spectrum, a coordinated N–H stretching band appears at 3368 cm^{-1}. The C=N stretching bands at 1603 and 1580 cm^{-1} indicate the Schiff base unit is preserved upon metal coordination. Aromatic C–H stretches assigned to the coordinated pyridine ring are observed in the 3052–2922 cm^{-1} range. These key features confirm formation of the metal–thiosemicarbazone–pyridine coordination complex.

Ligand formation was supported by ^{1}H-NMR data showing O–H signals at 12.57 and 11.78 ppm arising from cis/trans isomers. The imine (CH=N) protons were recorded at 8.43 and 8.36 ppm, consistent with syn/anti conformers. Aromatic protons appeared at 7.55 and 7.53 ppm, while the NH_2 resonance was observed as a broad peak at 7.19 ppm. S-methyl protons were detected at 2.49 and 2.36 ppm, corresponding to cis/trans isomers, confirming successful condensation into the S-methyl thiosemicarbazone ligand. In the NMR spectrum of the complex, the imine (CH=N) proton was observed at 7.40 ppm. All aromatic protons from the phenolate and coordinated pyridine ring appeared in the 7.77–7.02 ppm range. The NH proton was recorded at 4.53 ppm. The S-methyl group gave a 3H singlet at 2.37 ppm, and the two methyl substituents on coordinated pyridine showed a 6H signal at 2.39 ppm, confirming formation of the Ni(II) mixed-ligand complex.

The structure of the Ni(II) complex was elucidated by single-crystal X-ray diffraction. The complex crystallizes in the triclinic P-1 space group. Structural analysis confirmed that the thiosemicarbazone ligand coordinates to the Ni(II) center through the phenolic oxygen, azomethine nitrogen, and the terminal amine nitrogen, while pyridine acts as a co-ligand via its ring nitrogen, forming an N,O,N,N donor set. The coordination environment generates a slightly distorted square-planar geometry (Figure 1). The key bond lengths are Ni1—O1: 1.8388(19) Å, Ni1—N4: 1.932(2) Å, Ni1—N1: 1.849(2) Å, and Ni1—N3: 1.829(2) Å, supporting strong O/N-based binding with thiolate contribution. Selected bond angles (°) include O1—Ni1—N1: 95.90(9), O1—Ni1—N3: 177.23(10), N1—Ni1—N4: 174.15(9), N1—Ni1—N3: 82.08(10), confirming deviation from ideal planarity. The structural distortion parameter was determined as τ = 0.06, indicating moderate square-planar distortion consistent with analogous heteroaromatic co-ligated Ni(II) thiosemicarbazone complexes reported in the literature (Bal-Demirci et al., 2020; Avcu Altıparmak et al., 2025).

The cytotoxic profile of the Ni(II) complex and its ligand was further benchmarked against the standard chemotherapeutic agent, Cisplatin (Figure 2 and 3). In complexation studies, the Ni(II) complex demonstrated significantly improved potency relative to the ligand and showed competitive activity when compared to Cisplatin, with IC_{50} values of 2.6 µM for MCF-7 breast cancer cells (vs 7.4 µM for Cisplatin), 10.6 µM for K562 leukemia cells (vs 6.7 µM for Cisplatin), and 32.2 µM for HUVEC non-tumorigenic endothelial control cells (vs 5.95 µM for Cisplatin). Although Cisplatin exhibits strong cytotoxicity across all tested lines, the Ni(II) complex achieves markedly lower IC_{50} values in cancer lines—especially in MCF-7—and shows reduced potency in healthy endothelial cells compared to malignant cells, where its IC_{50} (32.2 µM) remains substantially higher than that of Cisplatin. This comparison supports that complexation enhances cytotoxic activity in malignant cell lines and reveals a favorable, measurable shift in selectivity, with the Ni(II) complex exerting a stronger cytotoxic effect on cancer cells than on healthy endothelial cells (Table 2).

CONCLUSION

A novel mixed-ligand Ni(II) complex incorporating the S-methyl-isothiosemicarbazone ligand and 2,6-dimethylpyridine co-ligand has been successfully synthesized and characterized. Spectroscopic (FT-IR, UV-Vis, ^{1}H-NMR) analyses together with melting point and elemental data conclusively verified ligand formation and metal complexation. X-ray diffraction clearly revealed a slightly distorted square-planar coordination environment involving an *N,O,N,N* donor set. The calculated distortion index ($\tau = 0.061$) and key bond metrics align well with analogous structural motifs reported for heteroaromatic co-ligated Ni(II) thiosemicarbazone complexes.

Biological evaluation demonstrated that Ni(II) complexation leads to a clear and measurable increase in cytotoxic activity compared to the free ligand, particularly against malignant cells. The complex exhibited substantially improved IC_{50} values in MCF-7 and K562, indicating that coordination chemistry directly enhances anticancer potency. Importantly, cytotoxicity in the non-tumorigenic HUVEC line remained significantly weaker, reinforcing the notion of a stronger biological effect in cancer-derived models than in healthy controls. These data supporting Ni(II) thiosemicarbazone complexes as promising candidates for further development of selective anticancer agents.

Abstract

Dyes discharged from industrial activities pose a major threat to the environment due to their high solubility, chemical stability, and resistance to biodegradation. Commonly used in textile, paper, leather, food, and cosmetic industries, these pollutants accumulate in aquatic ecosystems, causing toxicity, bioaccumulation, and risks to human health. Conventional treatment methods such as filtration, sedimentation, and biological processes are often ineffective for dye removal because they cannot break down recalcitrant dye structures. Advanced oxidation processes (AOPs) have therefore emerged as effective technologies capable of degrading and mineralizing persistent organic contaminants. These processes rely on the in-situ generation of highly reactive hydroxyl radicals (•OH), typically produced through iron-catalyzed decomposition of hydrogen peroxide (H_2O_2). In the electro-Fenton (EF) process, hydrogen peroxide (H_2O_2) is electrogenerated at the cathode while Fe^{2+} is continuously regenerated, sustaining radical formation. Photoelectro-Fenton (PEF) further improves EF performance by applying UV irradiation, which accelerates $Fe^{3+} \rightarrow Fe^{2+}$ cycling and enhances •OH production. The heterogeneous electro-Fenton (HEF) approach uses solid iron-based catalysts instead of soluble iron, enabling operation over a wider pH range and facilitating catalyst recovery. The heterogeneous photoelectro-Fenton (HPEF) process combines solid catalysts with electrochemical and photonic activation, providing higher stability and increased degradation efficiency. In this study, the effects of current intensity on the degradation and mineralization of Acid Fuchsin dye in aqueous media were examined using EF, PEF, HEF, and HPEF processes with a boron-doped diamond (BDD) anode and carbon felt (CF) cathode at pH 3. Under 100 mA and 0.1 mM Fe^{2+}, EF achieved complete color removal in 18 min and full COD removal in 36 min. PEF achieved complete color removal in 18 min and full COD removal in 60 min under 100 mA and 0.1 mM Fe^{2+}. HEF, using 0.1 $g \cdot L^{-1}$ Fe_3O_4, provided complete color removal in 24 min and total COD removal in 90 min. The HPEF process, performed with 0.1 $g \cdot L^{-1}$ Fe_3O_4 and 100 mA, achieved identical color removal (18 min) and COD removal (60 min). These findings demonstrate the high efficiency of electrochemical and photoelectrochemical AOPs for rapid and complete dye degradation.

Keywords: Electro-Fenton, Photoelectro-Fenton, Heterogeneous catalysts, Advanced oxidation processes, Dye degradation, Magnetic nanoparticles

INTRODUCTION

Dyes are complex organic compounds widely used in textile, paper, leather, food, and cosmetic industries, and their release into wastewater significantly alters the physical and chemical characteristics of aquatic environments (Liu et al., 2023). Industrial wastewater is one of the major contributors to environmental pollution, as it contains diverse toxic compounds originating from washing, extraction, heating, cooling, separation, and various production steps (Khan et al., 2022). Within this context, the textile industry represents one of the largest global consumers of dyes, generating wastewater enriched with recalcitrant and persistent colorants (Mahroudi et al., 2022). Worldwide synthetic dye production is estimated at nearly 70 million tons per year, with approximately 10% discharged directly into the environment (Góralczyk-Bińkowska et al., 2021). Growing concerns over diminishing freshwater resources and increasing pollution have intensified the need for sustainable wastewater treatment and reuse (Özyurt

& Camcıoğlu, 2018). Industrial effluents often contain high levels of harmful chemicals such as dyes, arising from processes including equipment cleaning, mixing, packaging, and floor washing (Camcıoğlu, 2016). Once discharged, these dyes reduce light penetration, inhibit aquatic photosynthesis, increase COD and BOD levels, and exert toxic, mutagenic, and carcinogenic effects on living organisms (Fungaro et al., 2011; Kuczyński et al., 2021). Typical dye concentrations in textile wastewater range between 5–30 mg L^{-1} and may exceed the acute toxicity limits reported for aquatic organisms, typically 0.16–0.43 ppm (Liu et al., 2022). Acid Fuchsin, selected as the model contaminant in this study, is a water-soluble, violet-colored acidic dye used in textile dyeing, corrosion inhibition, and laboratory staining (Xing et al., 2019). Due to its aromatic and sulfonated structure, it is resistant to biodegradation, capable of spreading over wide areas, and poses risks including irritation, respiratory effects, and long-term carcinogenicity (Carmen & Daniela, 2012). Therefore, efficient removal of Acid Fuchsin and similar dyes from wastewater is essential for protecting both environment and human health.

As these micro-pollutants continue to be detected and accumulate in surface and groundwater resources, the implementation of effective treatment technologies has become increasingly important (McBeath et al., 2019). Among the available options, advanced oxidation processes (AOPs) have gained prominence due to their ability to generate highly reactive hydroxyl radicals (•OH) that can non-selectively oxidize a broad range of organic pollutants in water; the overall process efficiency is closely related to the rate and extent of •OH generation (Oturan & Aaron, 2014). Depending on the mode of radical formation, AOPs can be classified as chemical, photochemical, sonochemical, or electrochemical (Rodrigo et al., 2014). Electrochemical advanced oxidation processes (EAOPs) have emerged as efficient, environmentally compatible, and easily automated technologies for the removal of recalcitrant pollutants (Sirés et al., 2014; Nidheesh et al., 2018). Among EAOPs, the electro-Fenton (EF) process is one of the most widely applied. EF relies on the in-situ electrogeneration of hydrogen peroxide (H_2O_2) from the two-electron reduction of dissolved oxygen at the cathode and the continuous regeneration of Fe^{2+}, which catalyzes H_2O_2 decomposition into •OH in acidic medium, typically around pH 3 (Oturan, 2000; Oturan & Pinson, 1995). In parallel, the use of anodes with high oxygen-evolution overpotential, such as boron-doped diamond (BDD), enables additional •OH formation via water oxidation, further enhancing oxidation capacity (Oturan, 2021). The efficiency of EF strongly depends on H_2O_2 production at the cathode, and numerous carbon-based materials—including activated carbon, carbon fiber, graphite, carbon felt (CF), carbon black, carbon nanotubes, and graphene—have been investigated to improve oxygen reduction and H_2O_2 yield (Wang et al., 2018; Trellu et al., 2018; Nidheesh & Gandhimathi, 2014; El-Ghenymy et al., 2014; Sopaj et al., 2020; Liu et al., 2013; Khataee et al., 2014; Yang et al., 2017; Wang et al., 2023). EF has been successfully applied to the degradation of various organic contaminants, including pesticides, pharmaceuticals, and dyes, achieving fast and often complete mineralization (Barhoumi et al., 2017; Camcioglu et al., 2022; Martínez-Huitle et al., 2023; Nidheesh et al., 2022). The homogeneous photoelectro-Fenton (PEF) process couples EF with UV or solar irradiation. In PEF, UVA or UVB radiation accelerates Fe^{3+}/Fe^{2+} cycling via photoreduction of $Fe(OH)^{2+}$ and Fe(III)–carboxylate complexes and promotes additional •OH generation through photolysis of H_2O_2 and organic intermediates, leading to higher mineralization rates than conventional EF (Garcia-Segura & Brillas, 2014; Ye et al., 2020; Brillas, 2020). However, the need to operate at acidic pH and the requirement for post-treatment removal and disposal of soluble iron species limit the large-scale application of homogeneous PEF systems (Brillas, 2020).

To overcome these drawbacks, research has increasingly focused on heterogeneous Fenton and photo-Fenton systems employing insoluble iron-based catalysts such as Fe_3O_4, γ-Fe_2O_3, and Fe-modified semiconductor oxides (Ganiyu et al., 2018; Wang et al., 2020; Thomas et al., 2021). These heterogeneous systems offer important advantages, including operation over a wider pH range, easy separation and reuse of the catalyst, and mitigation of iron sludge production (Poza-Nogueiras et al., 2018). In heterogeneous photo-Fenton processes, irradiation plays a key role in enhancing interfacial $\equiv Fe^{3+}/\equiv Fe^{2+}$ cycling, promoting charge separation, and boosting H_2O_2 activation at the catalyst surface (Banerjee et al., 2018; Khalid et al., 2012; Sun et al., 2018). Magnetite (Fe_3O_4), in particular, is an attractive catalyst owing to its mixed-valence Fe^{2+}/Fe^{3+} structure, good magnetic separability, and ability to efficiently activate H_2O_2 for •OH production (Banerjee et al., 2018; Camcıoğlu et al., 2023).

The integration of heterogeneous catalysts into electro-Fenton and photoelectro-Fenton configurations has led to the development of heterogeneous electro-Fenton (HEF) and heterogeneous photoelectro-Fenton (HPEF) processes, which combine the benefits of EF, photo-Fenton, and heterogeneous Fenton chemistries (Ganiyu et al., 2018; Poza-Nogueiras et al., 2018). In these systems, the electrochemical generation of H_2O_2, the regeneration of surface $\equiv Fe^{2+}$ sites, and the photonic activation under UV or solar irradiation act synergistically, enabling high •OH

fluxes and improved degradation of persistent organic pollutants (Brillas, 2020; Camcıoğlu et al., 2023). Within this framework, the present study comparatively evaluates EF, PEF, HEF, and HPEF processes for the degradation and mineralization of Acid Fuchsin dye using a BDD anode and a CF cathode, with particular emphasis on the influence of current intensity on treatment performance.

MATERIALS AND METHODS

Experiments were conducted in a 250 mL glass reactor with 200 mL of a 0.05 mM Acid Fuchsin solution and 50 mM Na_2SO_4 as the supporting electrolyte. A BDD anode (16 cm^2) and CF cathode (16 cm^2) were used and connected to a DC power supply. Compressed air was introduced five minutes prior to the experiment and maintained throughout the experimental period to promote the in-situ generation of H_2O_2 at the cathode. The experiments were carried out under constant current conditions, with the applied current ranging from 100 to 500 mA. For homogeneous Fenton-based experiments (EF and PEF) 0.1 mM $FeSO_4 \cdot 7H_2O$ was introduced as the catalyst prior to initiating the experiments, whereas for heterogeneous Fenton-based experiments (HEF and HPEF) 0.1 $g \cdot L^{-1}$ Fe_3O_4 was used. Fe_3O_4 was synthesized via the co-precipitation method. For photoelectrochemical degradation studies (PEF and HPEF), UVA (365 nm) and UVC (254nm) light sources were utilized. Initial pH was adjusted using acid (0.2 M H_2SO_4) or base (0.1 M NaOH) solutions. Solution homogeneity was ensured through magnetic stirring. Samples were periodically collected throughout the experiment for color and COD analyses to evaluate treatment efficiency and monitor dye removal and COD reduction. Dye removal was quantified by measuring the solution absorbance at 546 nm using a UV-VIS spectrophotometer, while COD removal was assessed following Standard Methods for COD analysis. In this study, the effects of current intensity on dye and COD removal were investigated for EF, PEF, HEF, and HPEF processes.

RESULTS and DISCUSSION

The results of studies conducted to determine the effect of current intensity for the treatment of Acid Fuchsin solution using the EF method under pH 3 and 0.1 mM Fe^{2+} catalyst concentration conditions are presented in Figure 1. The complete degradation of 0.05 mM Acid Fuchsin was quickly achieved in all cases, verifying that the dye was efficiently oxidized by •OH both in the bulk solution and at the surface of the anode. The decay of Acid Fuchsin concentration was improved by the increase in current value up to 100 mA for which complete degradation was achieved in 18 min. Further increase in current value did not enhance the degradation efficiency. The decrease in the degradation kinetics at higher current intensities may be related to the enhancement of the rate of the side reactions that inhibit the formation or promote the consumption of •OH. The most important of these side reactions are evolution of H_2 at the cathode which competes with the formation of H_2O_2 and the evolution of O_2 on the anode surface.

The mineralization of Acid Fuchsin solution was performed at different current values with regard to COD removal efficiency. COD removal rate increased with the increments of current from 50 to 500 mA, as expected from the enhanced production of •OH. This fact can be explained by the high oxygen evolution overpotential of the BDD anode allowing the formation of high amounts of heterogeneously formed •OH as well as homogeneously formed •OH in the bulk, due to the increased rate of electrogenerated H_2O_2 and fast electro-regeneration of Fe^{2+} promoting Fenton's reaction. The fastest and complete COD removal was achieved within 36 min under 100 mA current intensity, showing acceleration of parasitic non-oxidative reactions of the •OH at higher current values, mainly heterogeneously formed •OH oxidation to O_2 and the recombination of homogeneously formed •OH to H_2O_2.

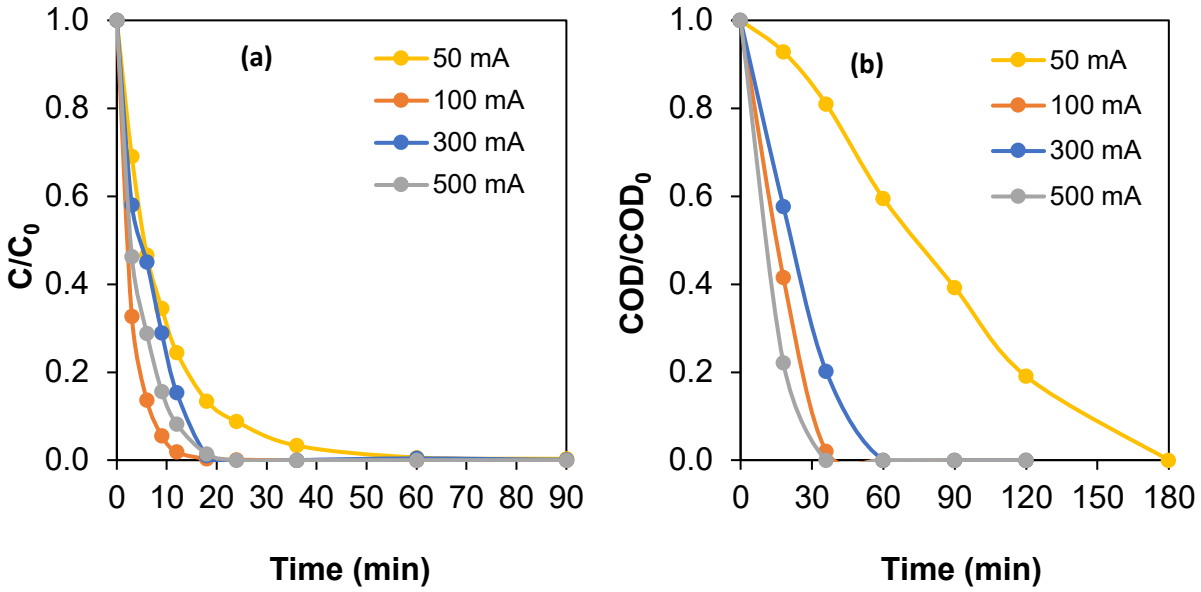

Figure 1. The effect of current intensity on color (a) and COD (b) removal using the EF method

The influence of current intensity on the performance of the PEF process in degrading and mineralizing Acid Fuchsin under pH 3 and 0.1 mM Fe^{2+} catalyst concentration conditions is presented in Figure 2. The process exhibits higher efficiency with complete degradation and mineralization at 18 min and 60 min under applied current of 100 mA compared to 300 mA and 500 mA. Increasing the applied current appears to promote side reactions that either inhibit the formation of •OH or enhance their consumption. The most significant of these side reactions is the evolution of O_2 at the anode and H_2 generation at the cathode. These competing reactions adversely affect the overall process efficiency, explaining the reason that lower currents yield better performance than higher currents. Based on these observations, 100 mA was selected as the optimum current intensity for PEF process.

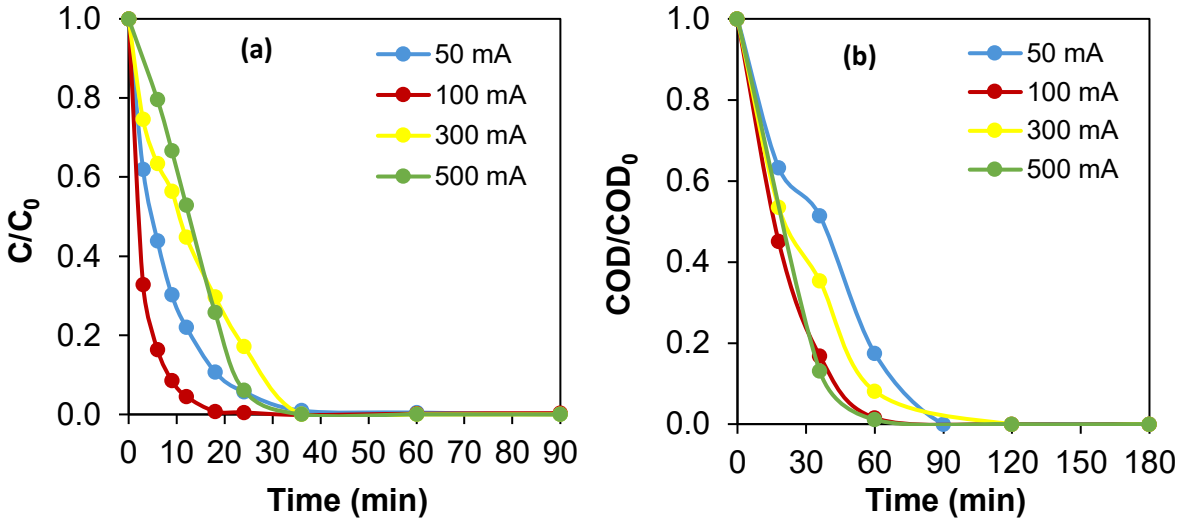

Figure 2. The effect of current intensity on color (a) and COD (b) removal using the PEF method

The results of studies conducted to determine the optimum current intensity for the treatment of Acid Fuchsin dye using the HEF method under pH 3 and 0.1 $g.L^{-1}$ Fe_3O_4 catalyst concentration conditions are presented in Figure 3 demonstrates that complete degradation of Acid Fuchsin was achieved within 24 min at the current intensity of 100 mA. The acceleration of the Acid Fuchsin decay kinetics with increasing applied current intensity up to 100 mA can be attributed to the enhancement of H_2O_2 electro-generation and regeneration of heterogeneous catalyst $\equiv Fe^{II}$, resulting in a higher production rate of •OH. However, further increases in current from 100 to 500 mA did not enhance degradation. This can be associated with an increase in the rate of side reactions that either inhibit the

generation of •OH or accelerate its consumption. The most notable side reactions are cathodic H_2 formation, which competes with the production of H_2O_2, reduction of H_2O_2 to H_2O at the cathode, O_2 evolution reaction in the bulk and at the anode.

Mineralization efficiency increased regularly with increasing applied current density up to 500 mA owing to the promotion of HEF in three ways. First, the electro-regeneration of the $\equiv Fe^{II}$ catalyst increases at high currents due to the cathodic reduction of $\equiv Fe^{III}$, resulting in an increase in the reaction rate. Secondly, anodic oxidation (AO) increases with applied current and creates a synergy with the catalyst regeneration at the cathode enhancing EF mineralization of organics in water. Finally, the in situ electro-generation of H_2O_2 by the cathodic reduction of oxygen is dependent on the applied current.

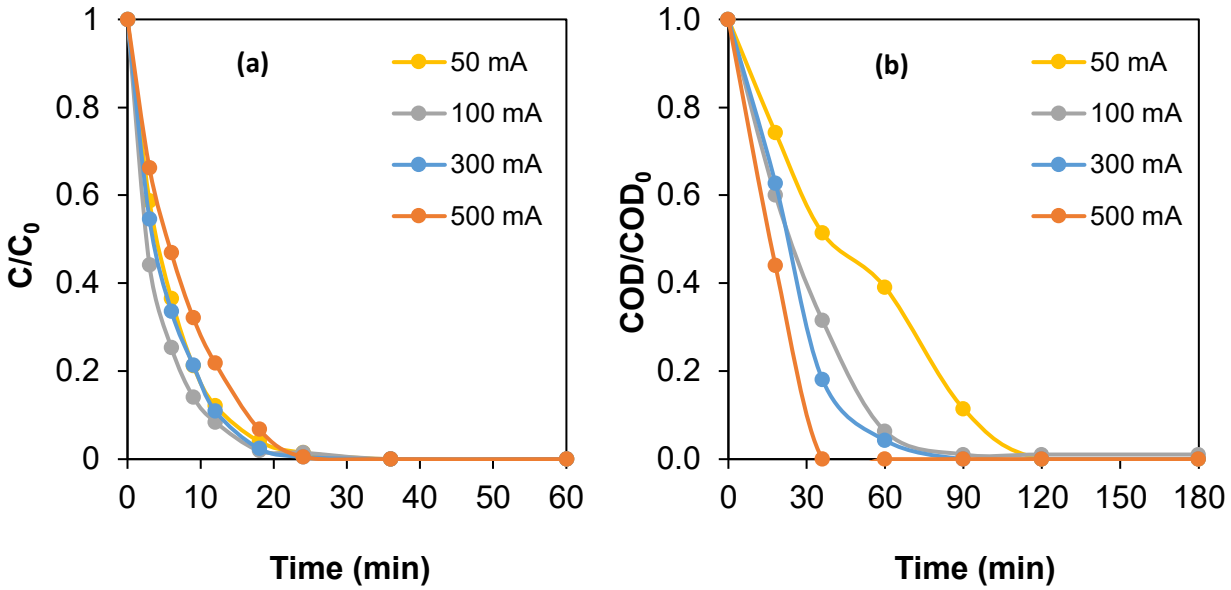

Figure 3. The effect of current intensity on color (a) and COD (b) removal using the HEF method

The effect of applied current intensity on the degradation and mineralization of Acid Fuchsin was investigated utilizing HPEF method under pH 3 and 0.1 $g.L^{-1}$ Fe_3O_4 catalyst concentration conditions by varying the applied current from 50 mA to 500 mA and the results are illustrated in Figure 4. The results indicate that COD removal efficiencies improve progressively with an increase in current intensity up to 500 mA. This enhancement is attributed to the facilitation of AO and HPEF mechanisms. Higher currents favor the electro-regeneration of catalyst via the cathodic reduction of $\equiv Fe^{III}$, leading to increased •OH generation. Furthermore, an increase in applied current enhances anodic oxidation, synergizing with the EF process to boost the mineralization of the target molecule in water. The in-situ electro-generation of H_2O_2 through the cathodic reduction of oxygen is notably affected by the applied current. Nevertheless, elevating the applied current to 500 mA does not yield significant enhancements in degradation, attributable to an escalation in side reactions that either impede •OH formation or augment its consumption. Prominent among these side reactions are the evolution of O_2 at the anode surface and within the bulk solution, which decelerates the rate of AO. Additionally, the production of H_2 at the cathode, resulting from H_2O reduction, competes with the oxygen reduction reaction, thus limiting H_2O_2 production.

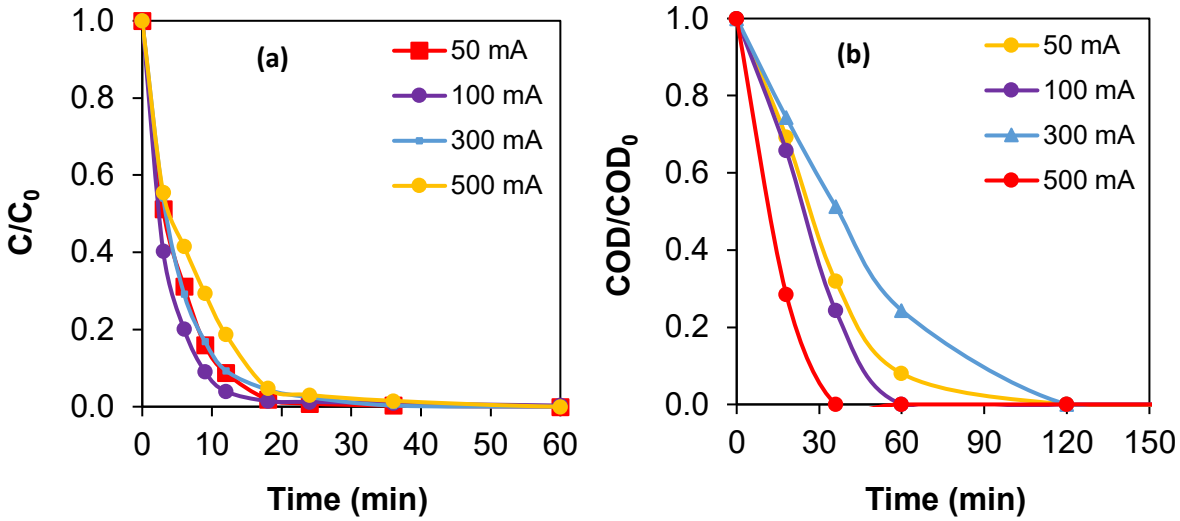

Figure 4. The effect of current intensity on color (a) and COD (b) removal using the HPEF method

CONCLUSION

In this study, the degradation and mineralization of Acid Fuchsin dye were systematically evaluated using four electrochemical advanced oxidation processes—EF, PEF, HEF, and HPEF—employing a BDD anode and CF cathode at pH 3. For all processes, color removal was very fast, confirming that the investigated systems can efficiently oxidize the chromophoric groups of the dye. Under the optimum operating conditions, complete discoloration was achieved within 18–24 min for all methods, demonstrating the strong oxidative capacity of both homogeneous and heterogeneous Fenton-based routes. Current intensity was found to be a key parameter controlling process performance. For EF and PEF, increasing the current up to 100 mA enhanced both decolorization and mineralization, but further increases led to lower efficiency due to competing side reactions, such as O_2 evolution at the anode and H_2 formation or H_2O_2 reduction at the cathode. Under 100 mA and 0.1 mM Fe^{2+}, EF provided the fastest mineralization, achieving complete COD removal in 36 min, whereas PEF required 60 min for full COD removal at the same current and catalyst concentration. In the heterogeneous systems, the use of magnetite (0.1 $g \cdot L^{-1}$ Fe_3O_4) enabled efficient treatment while offering the additional advantages of solid catalyst recovery and the potential for operation over a wider pH range. In HEF, complete color removal was obtained in 24 min and full COD removal in 90 min, with mineralization efficiency increasing with current due to enhanced H_2O_2 electrogeneration and $\equiv Fe^{2+}$ regeneration. The HPEF process further improved performance, reaching complete discoloration in 18 min and full COD removal in 60 min at 100 mA, owing to the synergistic action of electrochemical H_2O_2 production, interfacial Fenton reactions, and UV-driven radical generation.

Overall, the results confirm that electrochemical and photoelectrochemical AOPs are highly effective for the rapid and complete removal of Acid Fuchsin from water. EF offers the highest mineralization rate under optimized current density, whereas HEF and HPEF provide attractive, magnetically recoverable catalytic systems, with HPEF combining high efficiency with the practical advantages of a heterogeneous catalyst. These findings highlight the strong potential of Fenton-based EAOPs, particularly EF and HPEF, as advanced treatment options for dye-laden industrial wastewaters and motivate further studies on energy consumption optimization, catalyst stability, and application to real effluents.

Abstract

This research utilized dried elderberry fruits (*Sambucus nigra* L.). an edible and medicinal plant. in conjunction with ultrasound-assisted extraction (UAE) and deep eutectic solvents (DESs) to produce elderberry extracts by environmentally friendly extraction methods. Six varieties of DESs were made with choline chloride as Hydrogen bond acceptors (HBAs) and 6 distinct Hydrogen bond donors (HBDs) (citric acid. L-ascorbic acid. fructose. sucrose. ethylene glycol. glycerol) and compared with extracts derived from ethanol and methanol solutions of standard organic solvents. Antioxidant activities (DPPH and ABTS). total monomeric anthocyanin content (pH differential technique) and total phenolic content (Folin-Ciocalteu) were examined. The LC-MS/MS method was used to assess the quantities of phenolic compounds. The results indicate that the glycerol-based deep eutectic solvent. ChCl:GLY:Water (1:1:2). exhibits superior efficiency compared to ethanol solvent in assessing antioxidant activity. anthocyanin content. and phenolic content. In the assessment of total phenolic content (Folin-Ciocalteu). the ChCl:GLY:Water (1:1:2) deep eutectic solvent yielded 4.216 mg GAE/g dry matter. whereas the 50% ethanol-water solution produced 3.635 mg GAE/g dry matter. and the methanol solution resulted in 5.014 mg GAE/g dry matter. In the examination of phenolics using LC-MS/MS. it was noted that glycerol-based deep eutectic solvents (14 phenolics) extracted a greater quantity of phenolic compounds and exhibited superior performance compared to methanol (8 phenolics). Elderberry extracts made with DES were rich in anthocyanins (cyanidin-3-rutinoside chloride and cyanidin-3-o-glucoside). flavonoids (hesperidin). and phenolic acids (fumaric acid and chlorogenic acid). Specifically. glycerol-based DES has demonstrated that deep eutectic solvents derived from green solvents can be a good substitute for conventional solvents like ethanol and methanol. which are detrimental to both human health and the environment.

INTRODUCTION

Green technology is actively researching new solvents to replace common organic solvents, which exhibit high volatility and inherent toxicity, leading to the evaporation of volatile organic compounds into the atmosphere (Paiva et al., 2014). Green technologies aim to reduce the production and consumption of hazardous substances, reduce the amount of energy consumed in the production of hazardous chemicals, and increase the use of renewable resources (Kantar et al., 2021).

Extraction of phenolic compounds is generally based on solid-liquid extraction with water/organic solvent mixtures and organic solvents (methanol, ethanol, acetone, chloroform, ethyl acetate, etc.). However, organic solvents have been noted to have some disadvantages, such as toxicity, volatility, non-degradability, flammability, and high cost (Clarke et al., 2018). Extraction solvents are known to be primarily derived from non-renewable resources, particularly petroleum-based volatile organic compounds, which are suspected of being harmful to both human health and the environment (Chemat et al., 2019). Furthermore, increasing awareness of human impact on the environment has brought the concept of green extraction to the forefront of interest within the scientific and industrial communities. Green extraction is generally based on the discovery and design of extraction methods that will provide safe and high-quality extracts/products, allowing the use of renewable natural products and alternative solvents that will reduce energy consumption (Chemat et al., 2012).

In recent years, there has been a growing concern about environmental issues worldwide, and people must be more aware of and responsible about the environmental impact of their activities (Armenta et al., 2019). Therefore, it is important to investigate alternative solvents that are inexpensive, readily available, safe to use, and compatible with the idea of "green chemistry" (Kowalska et al., 2021). Ideal candidates are those with high solubilizing capacity and low toxicity for specific target molecules; They must be readily biodegradable and recyclable without any harmful environmental impacts (Chemat et al., 2019).

Deep eutectic solvents (DESs) are green alternatives to traditional organic solvents with unique physicochemical properties that offer the opportunity to be designed for specific purposes. In many cases, they have achieved higher extraction efficiencies compared to traditional organic solvents (Mišan et al., 2020). DESs are generally defined as mixtures of binary or more compounds that can be solid or liquid and can combine primarily through hydrogen bonds. Combining these compounds in specific proportions results in eutectic mixtures with lower melting points than their individual components (Paiva et al., 2014). Hydrogen bond acceptors (HBAs) in the formation of DESs primarily include quaternary ammonium or phosphonium salts, while amides, alcohols, and carboxylic acids have been used as the most common HBAs. Compounds such as sugars, sugar alcohols, and amino acids are also considered in the preparation of DESs (Dai et al., 2013). The most common DESs, or DESs, are formed using choline chloride (ChCl) as a hydrogen bond acceptor (HBA) and carboxylic acids and other HCAs, such as citric acid, glycerol, and succinic acid, as hydrogen bond donors (HBDs) (Mbous et al., 2017; Paiva et al., 2014).

Recently, a combination of DESs and new green extraction techniques, such as ultrasound-assisted extraction (UAE), has been proposed to increase the extraction efficiency of DESs in the extraction of phenolic compounds (Patil et al., 2021; Wu et al., 2020). UDE; It is considered a green technology due to its advantages of high extraction efficiency, low solvent consumption, low energy consumption and short-term consumption (Kumar et al., 2021; Wu et al., 2020).

Elderberry (Sambucus nigra L.), belonging to the family Adoxaceae, is a highly accessible and abundant plant native to the Northern Hemisphere and is now found in diverse habitats such as the subtropical regions of Asia, North Africa, and North America (Finn et al., 2008; Młynarczyk et al., 2018). The content of primary metabolites (sugars and organic acids) gives elderberry its typical sweet and tart taste, while its characteristic aroma is attributed to the presence of various volatile and phenolic compounds (Ferreira et al., 2020). Elderberry is rich in nutrients such as carbohydrates, proteins, fats, fatty acids, organic acids, minerals, vitamins, and essential oils, but also contains potentially toxic cyanogenic glycosides (Młynarczyk et al., 2018). While the use of elderberries is sometimes restricted due to the presence of cyanogenic glycosides, ripe elderberries are reportedly safe for consumption and processing, as increasing fruit ripeness leads to a decrease in the content of these compounds (Ferreira et al., 2020).

In this study extracts were obtained from the dried fruits of the black elderberry (Sambucus Nigra), an edible and medicinal plant, using ultrasound-assisted extraction (UAE) combined with DESs, which are less toxic, environmentally friendly, and have higher solubility than organic solvents. They were compared with extracts obtained using two conventional organic solvents. The aim was to produce products with less costly and environmentally friendly extraction processes that are harmless to human health and to promote the use of green solvents. Today, it is necessary to increase the use of environmentally friendly products for climate change, environmental pollution and sustainable living, which are considered as important problems internationally.

MATERIALS AND METHODS

In this study. dried black elderberries with organic certification code TR-OT-014-127/05R were used as raw materials. All other chemicals were supplied by Sigma Aldrich.

Preparation of Deep Eutectic Solvents

In the presented study. solvents were prepared by calculating their molar ratios based on information obtained from the literature. First. the prepared DES were heated in a water bath at the specified temperatures for 6 hours until they liquefied. They were then stirred on a magnetic stirrer for 1 hour until they became a clear liquid. The resulting liquefied. clear DES were then incubated in an ultrasonic water bath at 100 Hertz and 60°C for 30 minutes. A literature search (Popovic et al., 2022; Vladimir-Knežević et al., 2022) found that the water content in DES should

be between 0-70%. In this study. it was decided to work at a 50% water ratio (15 mL water - 15 mL DW). 0.5 g of black elderberry powder was placed in 50 mL tubes. For the six DES solutions. it was decided to use 50% ethanol and 100% methanol with 1% HCl as two control groups. The molar ratios of HBD and HBA used in the preparation of DESs are given in Table1.

Table 1. Components and molar ratios used in the preparation of DESs (Mišan et al., 2020)

Solvent	Components	Molar Ratio
1	ChCl: Citric Acid: Water	1:1:2
2	ChCl: L-Ascorbic Acid: Water	1:1:2
3	ChCl: Fructose: Water	5:2:5
4	ChCl: Sucrose: Water	4:1:4
5	ChCl: Ethylene Glycol: Water	1:1:2
6	ChCl: Glycerol: Water	1:1:2
7	50% Ethanol-Purified Water Solution (1% acidified)	
8	100% Methanol (1% acidified)	

Ultrasound-Assisted Deep Eutectic Solvent Extraction from Black Elderberry

Extraction was performed by adding 25 mL of DOS solution to 0.5 g of dry powdered sample. The extract was shaken by hand for approximately 10-15 seconds to mix the extract and solution. then left at room temperature for 30 minutes. Ultrasound-assisted extraction was then applied for 10 minutes at 20 kHz. 500 watts. and 40% amplitude. Finally. the extract was centrifuged at 5000 rpm for 10 minutes. filtered through filter paper. and then passed through a 0.45-micron syringe filter. The resulting extracts were stored in a +4°C refrigerator until bioactive analyses were performed.

Bioactive Analyses

Determination of Total Monomeric Anthocyanin Content (pH Differential Method)

The pH differential method described by Fuleki and Francis (1968) was used to determine total anthocyanin content. This method is based on the color change of anthocyanin pigments depending on the pH of the medium. The difference between measurements at different pH values at the wavelengths where the samples exhibit maximum absorbance is directly proportional to the anthocyanin content of the sample. In this context. pH 1.0 and pH 4.5 buffers prepared with 0.02 M Na_2HPO_4 and 0.02 M NaH_2PO_4 were added simultaneously to 1 ml of each extract and incubated for 30 minutes in the dark at room temperature. In the study. each sample. prepared for pH 1.0 and pH 4.5 and diluted to yield absorbance in the 0.4-0.8 range. was measured at 516 nm (maximum wavelength) and 700 nm to detect turbidity (Agilent-Cary 60. USA). Results are given in mg of cyanidin 3-O-glucoside per gram of sample. Experiments were performed in two replicates and five replicates. The total anthocyanin content was calculated using the formula below.

$$Anthocyanin\,(mg/L) = (\Delta A/\mathcal{E} * L)10\text{^}3 * MW * SF \quad (1)$$

ΔA: Absorbance difference (A= ((A516nm- A700nm) pH 1.0) – ((A516nm- A700nm) pH 4.5))
Ɛ: Molar absorbance
L: Optical path of the absorbance measurement cuvette (=1)
MW: Molecular weight
SF: Dilution factor

Determination of DPPH Radical Scavenging Activity

The antiradical activity of the samples was determined using the method recommended by Faller and Fialho. 2010 with some modifications. For this purpose. 100 µL of the prepared extract solutions were mixed with 3.9 ml of DPPH (Sigma. USA) solution (0.1 mM and prepared in methanol) and then allowed to stand in the dark for 30 minutes. At the end of this period. the absorbance values of the test tubes were determined at 517 nm using a UV-Vis spectrophotometer (Agilent-Cary 60. USA) zeroed with methanol. Experiments were performed in two replicates and five parallels. The DPPH radical scavenging activity of the samples was calculated as % inhibition using the formula below.

$$A\%\ Inhibition = [(Abs\ Control - Abs\ Extract)/Abs\ Control] \quad (2)$$

Determination of Total Phenolic Content

100 µL of black elderberry extracts were diluted at specific ratios. 2.9 ml of 0.2 N Folin-Ciocalteu reagent was added and vortexed for 2 minutes. 2 ml of 7.5% sodium carbonate was added. After 2 hours in the dark. 5 ml of distilled water was added and centrifuged at 5000 rpm for 5 minutes. The absorbance of each sample was measured at 765 nm using a spectrophotometer (Agilent-Cary 60. USA). Total phenolic content was expressed as gallic acid equivalents (GAE) in mg GAE/g dry matter.

ABTS Method

ABTS Scavenging Activity was determined by making some modifications to the method established by Almajano et al., (2007). In this method. 2.45 mM K2S2O8 and 7 mM ABTS (2.2'-azino-bis (3-ethylbenzthioazoline-6-sulfonic acid)) solutions were mixed at a 1:1 ratio and incubated for 16 hours at room temperature in the dark. The absorbance of this prepared ABTS radical solution was measured at 734 nm and diluted with ethyl alcohol until an absorbance of 1.850±0.05 was achieved. This absorbance was used as the control absorbance (Agilent. Carry 60 UV-Vis. USA). 4 mL of this radical solution was then added to test tubes. 100 µL of plant extracts were added to these tubes and incubated for 2 hours at room temperature in the dark. At the end of this period. the absorbance of the samples was recorded at 734 nm against a blank composed of PBS (Phosphate Buffer. pH = 7.4) (Wu et al., 2009). The decreased absorbance indicates the amount of ABTS radicals scavenged from the medium (Keser et al., 2013). The amount of ABTS radicals scavenged by the extracts in the medium was calculated using the following formula:

$$ABTS\ \%\ Inhibition = [\,[(A_0 - A_1)/A_0]\ x\ 100\,] \quad (3)$$

A_0 was taken as the absorbance of the control and A_1 was taken as the absorbance of the samples.

Determination of Phenolic Content by LC-MS/MS

LC-MS/MS (Agilent 6460 Triple Quadrapole) High-Performance Liquid Chromatography/Sequential Mass Chromatography was used in the study. Samples obtained from the phenolic extraction were vortex-mixed and injected onto the LC-MS/MS column. All analyses were run in two parallel runs.
LC-MS/MS operating conditions for the phenolic content determination of black elderberry samples are carried with Zorbax SB18 C18 (1.8 µm x 2.1 x 50 mm), 0.3mL/min flow rate, 40°C oven temperature,1 µL injection volume and gradient flow profile. The mobile phase consisted of A (0.1% of formic acid aqueous solution) and B (acetonitrile) phases at 0.1 mL/min and 35 °C. The LC gradient was operated as follows 0–5 min (%7 B); 5–8 min (%30 B); 8–35 min (%50 B); and 35–50 min (%7 B).

RESULTS and DISCUSSION

Table 3 shows the antioxidant activities (DPPH and ABTS). Total phenolic amounts (Folin-Ciocalteu) and total anthocyanin amounts (pH differential method) of black elderberry extracts obtained with 6 DES (Choline chloride: Citric Acid (1). Choline chloride: L-Ascorbic Acid (2). Choline chloride: Fructose (3). Choline chloride: Sucrose

(4). Choline chloride: Ethylene Glycol (5). Choline chloride: Glycerol (6)). Ethanol: Distilled Water Solution (7) and 100% Methanol Solution (8) solutions.

Table 3. Bioactive Analysis Results of Samples

	DPPH (% Inh.)	Total Anthocyanin (mg C_3G /g)	Total Phenolic (mg GAE /g dry matter)	ABTS (µmol trolox/g)
1	14.67±1.21	1.02±0.08	1.48±0.03	12.16±0.94
2	19.61±2.04	0.81±0.04	1.18±0.02	11.43±1.12
3	34.98±0.97	1.34±0.05	1.95±0.03	13.74±1.78
4	35.07±2.71	1.58±0.06	2.31±0.04	15.17±0.83
5	35.91±1.05	1.97±0.13	2.79±0.03	15.84±1.31
6	49.07±2.65	2.88±0.09	4.22±0.14	19.35±1.25
7	47.94±1.75	2.49±0.07	3.64±0.16	18.58±0.96
8	63.14±2.12	3.13±0.17	5.01±0.41	20.06±1.07

In the antioxidant activity analysis with DPPH. the values ranged between 14.67% inhibition and 49.074% inhibition. Although ChCl:Citric Acid (14.67% inhibition) and ChCl:L-Ascorbic Acid (19.6% inhibition) DESs number 1 showed lower performance than the other DESs (34.982%-49.074% inhibition). similar results were obtained in other analyses. Methanol solution showed the highest performance in antioxidant activities (DPPH and ABTS). total phenolic amount (Folin-Ciocalteu) and total anthocyanin amounts (pH differential method) analyses. However. ChCl:GLY DES number 6 (49.074% inhibition) was observed to be better than 50% ethanol-water solution number 7 (47.942% inhibition).

There are very few studies in the literature on the extraction of black elderberry with DES. In one study. Vladimir-Knežević et al., (2022) compared the extraction efficiencies of DES based on water. 70% ethanol. and a 1:3 molar ratio of choline chloride (ChCl) and ethylene glycol (EG). and the same molar ratio of choline chloride and glycerol (GLY) using dried black elderflower (Sambucus nigra L.) and rosemary (Rosmarinus officinalis L.) plants. They reported that high levels of phenolic acids were found in elderflower leaves (3.64±0.13%). Regarding the extraction of total phenolic acids. it was found that ChCl:EG and ChCl:GLY were almost as effective as 70% ethanol solutions with a 1:3 molar ratio of 50% water by volume. They reported that 50% ChCl:GLY gave slightly better results than the other two. A similar result was obtained in this thesis. In the analysis of total phenolic content. DES formed with ChCl:EG (2.785 mg GAE/g dry matter). 50% ethanol-water solution (3.635 mg GAE/g dry matter). and ChCl:GLY yielded the best results with a dry matter value of 4.216 mg GAE/g.

In another study. DES formed with different molar ratios of L-lactic acid (HBD) and glycine (HBA) and extracts obtained using water. a 60% methanol aqueous solution. and a 60% ethanol aqueous solution were compared after ultrasonication pretreatment of black elderberry flowers. They reported that the DES formed with L-Lactic Acid: Glycine (5:1) was the highest-performing system (Kaltsa et al., 2020).

Another study evaluated the possibility of using water-glycerol systems to obtain anthocyanin extracts from black aronia and black elderberry berries. The highest anthocyanin concentrations were obtained from the 50% water-glycerol system at extraction temperatures of 20°C and 50°C (Kowalska et al., 2021). The study concluded that glycerol could be an alternative solvent to ethanol for the extraction of anthocyanins. A similar result was obtained in this thesis. with the ChCl:Glycerol-based DES-containing extract yielding better results than ethanol.

The composition and amounts of phenolic compounds in black elderberry are given in Table 4. In one of the two studies in the literature on the extraction of elderberry using DES, Vladimir-Knežević et al., (2022) investigated elderberry flowers and rosemary leaves for their polyphenolic content and composition. The presence of flavonoids

and phenolic acids in the plant extracts was proven by thin-layer chromatography. Among the phenolic acids, chlorogenic acid was the most abundant in dried elderberry flowers, followed by rutin and isoquercetin. In another study, Kaltsa et al., (2020) reported that rutin, di-p-coumaroylquerciic acid, and chlorogenic acid were predominant in the richest elderberry flower extract obtained by LC-DAD-MS analysis.

Similar to two studies in the literature on elderberry extracts obtained using DES, this thesis also found abundant chlorogenic acid, a phenolic acid, in the extracts obtained using DES. LC-MS/MS analysis revealed that elderberry extracts contained abundant chlorogenic acid. Domínguez et al., (2020), using ethanol as a solvent, aimed to characterize the potential use and nutritional value of elderberry as a source of antioxidant compounds. Optimization of extraction parameters was designed using a Box-Behnken design combined with response surface methodology and desirability function analysis. Finally, numerical optimization revealed that the optimal extraction parameters were a temperature of 60°C, a 50% ethanol solution, and a pH of 2. LC-MS/MS analysis revealed abundant flavonoids (rutin and quercetin) and phenolic acids (gallic acid and gentisic acid) in elderberries. In this

thesis, because of LC-MS/MS analysis performed with the extracts obtained using DES, hesperidin and quercetin were detected in the highest amounts among the flavonoids.

CONCLUSION

Although other studies in the literature used different raw materials and methods, analysis results generally yielded advantages for green solvents. Furthermore, most studies indicate that deep eutectic solvents can be an alternative to traditional solvents, but further research is needed on this topic. Green solvents, which offer significant advantages such as biodegradability, recyclability, non-toxicity, sustainability, low cost, and ease of preparation, have been shown to be an alternative to traditional organic solvents commonly used in extraction processes, such as ethanol and methanol, which are volatile, non-degradable, flammable, costly, and harmful to human health and the environment.

Abstract

The smart packaging system for real-time visual monitoring of food freshness plays a significant role in food safety. The use of biopolymer as a matrix and natural anthocyanin as a pH indicator has led to increased interest in freshness detection in recent years. However, anthocyanin migration and the relatively weak mechanical strength of the film limit the applicability of biopolymer based smart packaging systems. Techniques such as blending two or more biopolymers, adding reinforcing agents, and crosslinking have been developed to improve mechanical properties. The aim of this study is to determine the pH-dependent color change in cross-linked films prepared with biopolymer blends by adding cranberry extract to monitor food freshness, and thus to develop colorimetric films that can be used for smart packaging. The effect of the extract on the film properties including structural characterization, color parameters, bioactivity, and pH-dependent color changes was investigated.

Keywords: Colorimetric film, Cranberry, Anthocyanin, pH indicator.

INTRODUCTION

With the emergence of impressive healthy nutrition management, smart packaging systems have gained significant attention due to their ability to quickly and easily visually detect food quality during storage and transportation. In practice, volatile alkaline substances are released during the decomposition of protein-rich or fatty products, causing pH changes as well as an alkaline state. Colorimetric films, which operate on the principle of color changes caused by pH, are the preferred films for accurately assessing food freshness. Today, anthocyanins, natural substances that can be obtained from fruits, vegetables, flowers, and even food waste, are widely added to film compositions as pH-sensitive dyes for detecting food freshness (Liu et al., 2017; Shaik et al., 2022). The use of synthetic dyes such as methyl orange and bromocresol green/blue as pH indicators is limited due to their high toxicity and genotoxicity.

The cranberry (CR) used in the study is a small red fruit grown in the cooler climates of the Northeastern United States, Canada, and Chile (Philip and Walsh, 2019). Cranberries are rich in many bioactive compounds with nutritional components and antioxidant properties. Both American (Vaccinium macrocarpon) and European (Vaccinium oxycoccus) cranberry species are rich in polyphenols such as phenolic acids, anthocyanins, and flavonoids (Nemzer et al., 2022). For this reason, cranberries were used as an anthocyanin source in the study.

Polymer-based indicators preserve and even improve the performance of pH-sensitive molecules, and in some cases, the polymer matrix increases their stability by protecting them from oxidation or other environmental factors (Kossyvaki et al., 2022). However, the hydrophilic and water-soluble nature of biopolymer films results in weak mechanical and physical properties, making them unsuitable for application in the food industry. These weak mechanical properties can be improved by adding crosslinkers, bioactive compounds, nanoparticles, etc. (Özgen and Özbaş, 2025).

Starch, carboxymethyl cellulose, sodium alginate, and other biopolymers are widely used in food packaging due to their low toxicity, biocompatibility, and biodegradability. Carboxymethyl cellulose (CMC) is a cellulose derivative obtained by the carboxymethylation process of cellulose. It is non-toxic, safe, renewable, biocompatible, biodegradable, and has excellent film-forming ability. It can also be used to carry pH dye indicators in colorimetric films (Kaewprachu et al., 2024). Sodium alginate (SA) is a natural biopolymer obtained from brown seaweed that is water-soluble, biocompatible, and has film-forming properties (Yang et al., 2022). Starch (ST) is widely used in

food packaging due to its stability against heat, acid, and base conditions, low cost, and good film-forming properties (Liu et al., 2017; Zhai et al., 2017). Polymer blends are often used to improve the water resistance and thermal stability of polymeric films. Additionally, calcium chloride ($CaCl_2$), an excellent crosslinking agent, is preferred to enhance the mechanical properties of biopolymer based packaging films (Yang et al., 2021).

Numerous investigations on visual and intelligent pH indicator films with various biodegradable matrixes made by adding anthocyanins have been conducted in recent years to investigate food spoilage. The following are some studies using biopolymers used in the study to assess food freshness: ST/polyvinyl alcohol incorporated with roselle anthocyanins (Zhai et al., 2017), pectin/SA/xanthan gum incorporated with raspberry pomace extract (Yang et al., 2021), polyvinyl alcohol/CMC incorporated with red cabbage anthocyanins, SA/CMC incorporated with rose anthocyanins (Yang et al., 2022), and gellan gum/ST/xanthan gum with aronia extract (Eker et al., 2025).

In this study, crosslinked colorimetric films were prepared from CMC, SA, and ST polymers containing CR extract, a polyphenolic compound rich in anthocyanins, to monitor the freshness of foods. The potential of these films for use in smart packaging was investigated based on the color change they exhibit in response to pH changes.

MATERIALS AND METHODS

Chemicals

CR extract was obtained from Pharmatoka (Rueil-Malmaison, France) and used as received. The CMC and SA biopolymers used to prepare the films were Sigma-Aldrich products, and ST was ISOLAB product. The crosslinking agent ($CaCl_2$), glycerin, Na_2CO_3, Folin-Ciocalteu phenol reagent, 2,2-Diphenyl-1-picrylhydrazil (DPPH), HCl-KCl buffer (pH 1.0), and CH_3COONa buffer (pH 4.5) were Sigma-Aldrich products. Merck buffer solutions ranging from pH 2.0 to 13.0 were used to monitor the color change of the films.

Film Preparation

The solvent casting method was used to obtain colorimetric films. First, 0.27 g of CMC, 0.27 g of SA, and 0.06 g of ST were dissolved in distilled water at ~80°C with continuous stirring for 3 hours using a magnetic stirrer. Then, glycerol (500 µL) was added to the solution as a plasticizer. After cooling to 50°C, different amounts of powdered CR extract (CR: 0; 0.03 g, 0.06 g, and 0.09 g) were added to the film solution. Finally, 0.15% $CaCl_2$ was added to the solution as the crosslinker. The final volume of the solutions was adjusted to 30 mL, poured into petri dishes, and allowed to dry at 40°C. The prepared films were named CSS-CR0, CSS-CR1, CSS-CR2, and CSS-CR3 according to the amount of extract they contained.

Film Characterization

Film thickness and color: A digital micrometer was used to measure the thickness of each film, and the average values were reported. A portable Konica Minolta CR-400 chroma meter was used to record the color parameters (L, a, and b) of the films. The total color difference (ΔE) was calculated using the Equation (1) (L*: 92.60, a*: -0.92, b*: -2.24):

$$\Delta E = \sqrt{(L^* - L)^2 + (a^* - a)^2 + (b^* - b)^2} \quad (1)$$

Fourier transform infrared (FTIR) analysis: Structural analysis of the biopolymers and the resulting films was recorded with an FTIR spectroscopy (Bruker Tensor II) equipped with attenuated total reflection (ATR) accessory in the range of 4000-500 cm^{-1}.

Bioactivity analysis: Bioactive characterization of the films was evaluated by total antioxidant capacity (TAC) and total monomeric anthocyanin content (TMAC).

100 mg of film was extracted with 15 ml of 80% ethanolic solution (acidified with HCl). This extract was used in all bioactivity analyses. DPPH radical scavenging activity (Kan et al., 2019) and ABTS radical scavenging activity (Almajano et al., 2007) tests were used to evaluate the TAC of the film.

30 µL of each sample was mixed with 2970 µL of 0.1 mM DPPH methanol solution in a test tube and allowed to react for one hour in the dark. The absorbance of the reaction solution at 517 nm was measured with an Agilent Cary 60 UV-Vis spectrophotometer.

The ABTS+ cation radical was obtained by the reaction between 7 mM ABTS and 2.45 mM potassium persulfate (1:1) and was stored in the dark at room temperature for 12-16 hours before use. The absorbance of the ABTS radical solution at 734 nm was adjusted with ethyl alcohol to 1.850±0.05. 25 µL of film extract was mixed with 2975 µL of ABTS solution and stored in the dark at room temperature for 2 hours. The absorbance at 734 nm was then measured using an Agilent Cary 60 UV-Vis spectrophotometer. The TAC of the samples was determined by the Equation (2):

$$TAC\ (\%) = \left({}^{A_0 - A_1}/_{A_0}\right) * 100 \quad (2)$$

where A_0 and A_1 are the absorbance of the control and sample, respectively.

TMAC determination of the samples was carried out according to the pH differential method (Giusti and Wrolstad, 2001). The total amount of anthocyanin present in the sample was determined based on measuring the absorbance difference between pH 4.5 and pH 1.5. The results were presented as cyanidin-3-glucoside (cyd-3-glc) equivalents according to the Equation (3):

$$TMAC = {}^{(A * MW * DF * 1 * d)}/_{\varepsilon M} \quad (3)$$

where A is the absorbance, MW is the molecular weight of cyd-3-glc (449.2 g/mol), d is the path length of the cuvette (1.0 cm), DF is the dilution factor, and ε is the molar extinction coefficient (26 900 L/cm.mol^{-1}).

Determination of pH sensitivity of films: The film samples were immersed in different buffer solutions (pH 2-13) for 5 minutes at ambient temperature. A portable Konica Minolta CR-400 chroma meter was used to record ΔE of the films at different pHs.

All experiments in the study were performed in triplicate, averaged, and standard deviations were calculated.

RESULTS and DISCUSSION

Thickness and Color Parameters of Films

The thickness, color parameters, ΔE values, and appearance of the prepared films were given in Table 1. The film without extract (CSS-CR0) was thinner than the films containing extract, and the thickness increased with increasing extract amount. The CSS-CR0 film was transparent, and the color parameters were L= 91.49, a= -0.37, and b= 1.29. Increasing the CR concentration decreased the L value while increasing the a and b values. Furthermore, increasing the CR amount resulted in increased ΔE values.

Table 1. Thickness, color parameters, ΔE values and appearance of films

Films	Thickness (µm)	L	a	b	ΔE	Appereance
CSS-CR0	93.47±0.68	91.49±0.29	0.37± 0.03	1.29±0.11	4.15±0.06	
CSS-CR1	96.43±0.74	81.10±0.79	3.31± 0.20	8.68±0.62	16.41±1.01	
CSS-CR2	98.40±0.66	72.50±0.42	8.87±0.28	14.01±0.63	27.64±0.74	
CSS-CR3	100.53±1.02	60.90±2.47	17.54±1.79	17.27±1.16	42.47±1.63	

FTIR Analysis

The pure biopolymers, films containing/not containing CR, and CR extract were structurally characterized by FTIR. The FTIR spectra of the biopolymers and the film without CR (CSS-CR0) were given in Figure 1 (A), while the FTIR spectra of the films with CR extract and CR were presented in Figure 1 (B). In the FTIR spectrum of CMC, the peak at 3234 cm^{-1} was attributed to the stretching vibration of the –OH group, the strong peak at 1591 cm^{-1} was attributed to the stretching vibration of the COO– group, the peak around 1414 cm^{-1} was assosiated with the CH_2 shearing vibration, and the peak around 1025 cm^{-1} was attributed to the CHO–CH_2 stretching vibration (Acar et al., 2023). In the FTIR spectrum of SA, the peak at 3241 cm^{-1} was attributed to the stretching vibration of the hydroxyl group (O-H), the strong peaks at 1595 and 1406 cm^{-1} were related to the asymmetric and symmetric stretching vibrations of the carboxylate group (COO−), and the peak at 1026 cm^{-1} was attributed to the stretching vibration of the C-O group (Bekin et al., 2014). In the FTIR spectrum of ST, the peak at 3289 cm^{-1} was attributed to the stretching vibration originating from hydrogen-bonded O-H groups, and the strong band with three peaks seen between 980 and 1200 cm^{-1} was relatedto the C-O stretching vibrations characteristic of polysaccharides (Zarski et al., 2016).

The shifts in the wave numbers of the vibrations were observed in the FTIR spectrum of CSS-CR0 film containing CMC, SA and ST. This situation showed that there were strong interactions in terms of hydrogen bonding, electrostatic forces and van der Waals forces between CMC, SA and ST molecules, and good compatibility was found between the polymers.

The FTIR spectrum of pure CR showed typical absorption peaks indicating the presence of rich polyphenolic contents. The broad peak around 3276 cm^{-1} was attributed to the symmetric and asymmetric stretching of the polymeric O–H group, while the peak at ~2936 cm^{-1} was related with the stretching vibrations of -CH, -CH_2, and -CH_3 derived from carbohydrates and sugars in the CR structure. On the other hand, the peak at ~1708 cm^{-1} was attributed to the carbonyl groups (C=O) of aldehydes and sugar derivatives. In addition, the stretching vibration of C=C–C and C–H of aromatic bonds, the stretching vibration of C=C aromatic rings, and the phenolic C-O stretching peak were observed at 1605 cm^{-1}, 1515 cm^{-1}, and 1274 cm^{-1}, respectively (Zepon et al., 2019; Rizwana et al., 2023).

The characteristic peaks of biopolymers were observed in the FTIR spectra of films containing CR. With the incorporation of CR into the structure, shifts and slight increases in peak intensities were observed in the stretching vibration peaks of O-H and C-O groups. The absence of a new peak indicated that there was no chemical interaction between CR and the polymers.

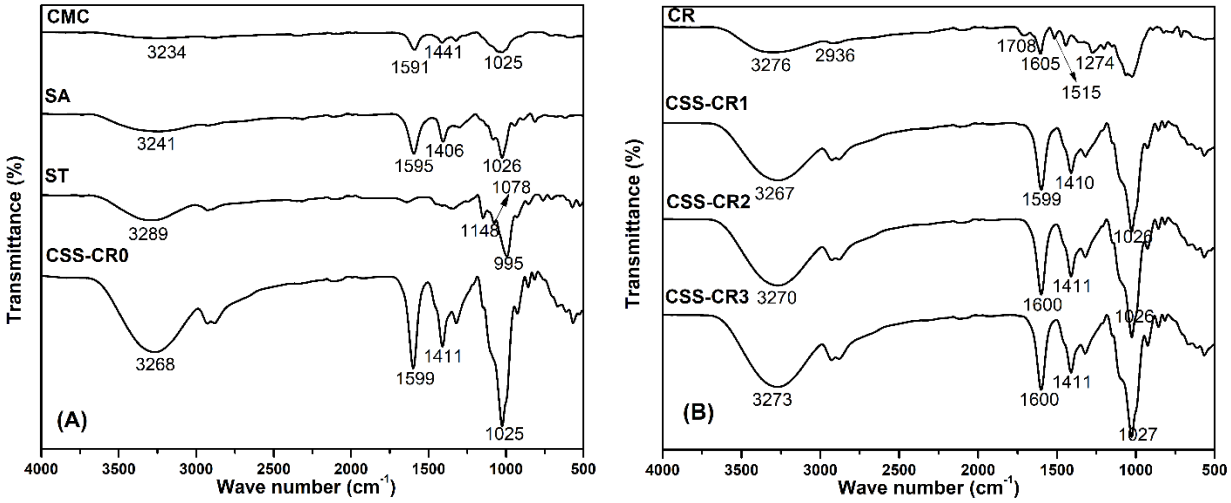

Figure 1. (A) FTIR spectra of biopolymers (CMC, SA, ST) and CR-free film (CSS-CR0), (B) FTIR spectra of CR extract and CR containing films

Bioactivity Analyses

Antioxidant activity results were determined as the percentage of DPPH and ABTS radical scavenging activities, and the total anthocyanin amount was determined as cyd-3-glc equivalents (Table 2). As CR amounts increased, TMAC, DPPH radical scavenging activity, and ABTS radical scavenging activity values increased as expected.

Table 2. TMAC and antioxidant activity (as a percentage of DPPH and ABTS radical scavenging activities) results of the films

Films	TMAC (µg/g)	TAC–DPPH (%)	TAC–ABTS (%)
CSS-CR0	0±0	0.86±0.13	1.53±0.52
CSS-CR1	0.526±0.03	7.48±0.45	8.11±1.34
CSS-CR2	1.034±0.14	25.93±0.21	36.41±1.41
CSS-CR3	1.518±0.23	40.57±1.04	53.02±1.95

pH Sensitivity of Films

Since food spoilage can typically be monitored by pH changes, the pH sensitivity of packaging films can be used to track food freshness. The pH-sensitive color changes of the prepared films were evaluated using buffer solutions with pH values ranging from 2 to 13.

The ΔE values and appearances of films containing/not containing CR after immersion in buffer solutions were listed in Table 3. As shown in the tables, the prepared films exhibited visible color changes after immersion in buffer solutions. The fact that color changes can be observed with the naked eye indicated that the films were suitable for detecting food spoilage.

Table 3. ΔE values and appearances of the films after 5 minutes of exposure to different buffer solutions

	CSS-CR0		CSS-CR1		CSS-CR2		CSS-CR3	
pH	**ΔE**	**Film**	**ΔE**	**Film**	**ΔE**	**Film**	**ΔE**	**Film**
2	4.37±0.05		20.07±0.38		34.81±1.37		49.34±1.06

CONCLUSION

The findings revealed that the crosslinked films prepared from CMC, SA, and ST polymers containing CR extract, a polyphenolic compound rich in anthocyanins, were synthesized to monitor the freshness of foods, and that these films exhibited color changes depending on pH. Thus, the potential of the developed films to be used as colorimetric films for smart packaging is demonstrated.

Abstract

Raphanus sativus L. var. *longipinnatus* (daikon) is a Brassicaceae plant rich in glucosinolates, isothiocyanates, and flavonoids, compounds known for their antioxidant and anticancer activities. Although several studies have documented cytotoxic effects of *R. sativus* extracts in various cancer models, their activity against the human pancreas adenocarcinoma cell line (MiaPaCa-2), human urinary bladder carcinoma cell line (T24, ATCC, HTB-4), and human umbilical cord epithelial cell line (HUVEC, ATCC, HTB-4) remains underexplored. Cytotoxicity was assessed using the MTT assay at concentrations ranging from 62.5–4000 µg/mL for 24, 48, and 72 hours, and IC_{50} values were calculated by nonlinear regression. Total phenolic content was determined using the Folin–Ciocalteu method, while total flavonoid content was determined using the aluminum chloride method. The DPPH antioxidant activity test assessed antioxidant capacity. The extract produced a clear time and dose-dependent reduction in cell viability, with T24 cells exhibiting the most incredible sensitivity, followed by MiaPaCa-2 and HUVEC cells. The moderate antioxidant activity (13.14% inhibition) together with measurable phenolic (1.326 mg GAE/g) and flavonoid levels (0.727 mg CE/g) supports the presence of bioactive phenolic compounds. Collectively, these results indicate that *R. sativus* var. *longipinnatus* exhibits selective cytotoxicity and measurable antioxidant activity, supporting its relevance as a natural candidate for anticancer research.

Keywords: *Raphanus sativus* var. *longipinnatus,* ethanol extract, cytotoxicity, antioxidant activity

INTRODUCTION

Raphanus sativus, is a member of the Brassicaceae family, has been used in traditional medicine for centuries, especially for respiratory and liver-related disorders (Perez-Gutierrez et al., 2004). Several recent studies have shown that aqueous, methanolic, and hydrophobic *R. sativus* extracts exhibit biological activities such as antioxidant, antiproliferative, and antimutagenic effects. These effects are attributed to secondary metabolites such as phenolic acids and anthocyanins contained in *R. sativus*. Modern studies support these traditional uses (Hanlon & Barnes, 2011). Radish juice shows antimicrobial activity against *Bacillus subtilis*, *Pseudomonas aeruginosa* and *Salmonella typhosa*. Ethanol and water extracts inhibit *Streptococcus mutans* and *Candida albicans*, leaf extracts display antiviral properties, and the roots show antimutagenic effects in *Salmonella typhimurium* assays (Perez-Gutierrez et al., 2004).

Raphanus sativus L., commonly known as Japanese radish or daikon, is a widely used vegetable in the Brassicaceae family. The plant grows naturally across Europe and Asia, typically reaching 30–90 cm in height, and its roots vary in size, shape and colour (Perez-Gutierrez et al., 2004). *R. sativus* var. *longipinnatus* contains high levels of phenolic compounds and isothiocyanates, which contribute to its biological activity (Zappia et al., 2023). The breakdown of glucosinolates forms isothiocyanates, molecules known to trigger cell death pathways and exert protective effects against cancer (Barillari et al., 2008; Egner et al., 2011). The plant is also rich in flavonoids, which act as strong antioxidants that neutralise free radicals and help reduce oxidative stress (Wang & Zhang, 2011).

Although extracts of *R. sativus* have shown cytotoxic effects in various cancer cell lines (Umamaheswari et al., 2021), their impact on pancreatic cancer cell line (MiaPaCa-2), bladder cancer cell line (T24), and endothelial cell line (HUVEC) remains poorly understood. This study aims to investigate the cytotoxic activity of *R. sativus* var.

longipinnatus ethanol extract in these three cell lines using the MTT assay, and to measure its total flavonoid content and antioxidant capacity using the DPPH method. These findings will help deepen our understanding of the biological effects of *R. sativus* var. *longipinnatus* and support future efforts to develop plant-derived anticancer agents.

MATERIALS AND METHODS

Extract preparation

Fresh *Raphanus sativus* var. *longipinnatus* was purchased from a local market in Türkiye. The plant was sliced, frozen at –80°C, and then lyophilised. Dried samples were ground to a fine powder and extracted with 70% ethanol (1:10 w/v) in an ultrasonic bath at 40°C for 5 hours. After centrifugation (4000 rpm, 15 min), the supernatant was collected, and ethanol was removed under reduced pressure using a rotary evaporator. Extracts were stored at –20°C until further experiments.

Total phenolic content

The total phenolic content was determined using the Folin–Ciocalteu method. Briefly, 200 µL of 0.2 N Folin–Ciocalteu reagent was added to 100 µL of extract and mixed thoroughly. Subsequently, 2 mL of distilled water and 1 mL of 6% sodium carbonate (Na_2CO_3) solution were added, the mixture was vortexed, and then incubated at room temperature in the dark for 2 hours. After incubation, the absorbance was measured at 765 nm using a spectrophotometer. Total phenolic content was expressed as gallic acid equivalents (mg GAE/g).

Total flavonoid content

Total flavonoid content was measured using a modified aluminum chloride method (Saeed et al., 2012). To perform this test, 25 µL of the extract and 100 µL distilled water were mixed in microplate. Then, seven µL of 5% $NaNO_2$ was added and microplate was kept at room temperature for 5 minutes. After incubation, seven µL of 10% $AlCl_3$ was added to the mixture, and further incubated for 5 minutes. After adding 50 µL of 1M NaOH and 60 µL of distilled water, absorbance was measured at 490 nm in a microplate reader. Total flavonoid content was expressed in terms of catechin equivalent (mg CE/g).

Antioxidant activity assay

Antioxidant activity was analysed using the DPPH radical-scavenging activity method (Mathangi & Prabhakaran, 2013). 50 µL of *R. sativus* var. *longipinnatus* ethanol extract was mixed with 150 µL of methanol, and 3.8 mL of DPPH solution was then added to the mixture, which was incubated in the dark for 30 minutes. Absorbance was measured at 515 nm with the help of a spectrophotometer. The following formula calculated percentage inhibition:

$$\text{Inhibition } \% = \left(\frac{Abs_{control} - Abs_{sample}}{Abs_{control}}\right) \times 100$$

In vitro cytotoxicity assay

MTT [3-(4,5-dimethylthiazol-2-yl)-2,5-dipenyltetrazolium bromide] method was used to determine the cytotoxic activity of *R. sativus* var. *longipinnatus* ethanol extract on human pancreas adenocarcinoma cell line (MiaPaCa-2, ATCC, CRL-1420), human urinary bladder carcinoma cell line (T24, ATCC, HTB-4), and human umbilical cord epithelial cell line (HUVEC, ATCC, HTB-4). The cells were grown in Dulbecco's modified Eagle's medium (DMEM) supplemented with 10% FBS, 1% L-glutamine, and 1% penicillin/streptomycin in a humidified environment with 5% CO_2 at 37°C in a incubator.

Cells were seeded at 1×10^4 cells per well in 96-well plates and incubated overnight. Then, different extract concentrations prepared as 2-fold dilutions from 62.5 to 4000 µg/mL were treated with cells in triplicate. After 24, 48, and 72 hours of exposure, 10 µL of MTT solution (5 mg/mL) was added, and the mixture was incubated for 4 hours. Formazan crystals formed by adding MTT solution were dissolved in 200 µL DMSO, and absorbance was measured at 570 nm. Cell viability was calculated using the following formula, and IC_{50} values were determined from the cell viabilities at different extract concentrations.

$$\text{Viability \%} = \left(\frac{Abs_{test\ well}}{Abs_{control\ well}}\right) \times 100$$

Statistical Analysis

All experiments were performed in triplicate (n=3). Results are expressed as the mean ± standard deviation (SD). Statistical evaluations were performed using one-way analysis of variance (ANOVA) via the GraphPad Prism software. A p value of <0.05 was considered statistically significant.

RESULTS

In this study, the antioxidant activity value of ethanol extracts obtained from *R. sativus* var. *longipinnatus* was calculated according to the DPPH method, and the results are expressed as a percentage inhibition compared to the control group (Table 1).

Table 1. Antioxidant activity results of *Raphanus sativus* var. *longipinnatus* ethanol extract.

Sample	Antioxidant activities (%Inhibition)
Raphanus sativus var. longipinnatus ethanol extract	13.14
Butylated hydroxyanisole (BHA)	97.09

The antioxidant activity test revealed that the inhibition value of *R. sativus* var. *longipinnatus* ethanol extract was 13.14%. The antioxidant activity value of BHA, a standard antioxidant, was found to be 97.09%.

Herein, total phenolic content was calculated as 1.326 mg GAE/g; while total flavonoid content was determined as 0.727 mg CE/g (Table 2).

Table 2. Total phenolic and flavonoid content results of *Raphanus sativus* var. *longipinnatus* ethanol extract.

Assay	Extract
Total phenolic content	1.326 mg GAE/g
Total flavonoid content	0.727 mg CE/g

The cytotoxic effect of *R. sativus* var. *longipinnatus* ethanol extract was determined using the MTT assay after 24, 48, and 72 hours of incubation on MiaPaCa-2 (Figure 1), T24 (Figure 2), and HUVEC (Figure 3) cell lines, and the percentage viability values were calculated. The percentage viability values obtained from the applied concentrations in the MTT assay were statistically analyzed relative to the control group.

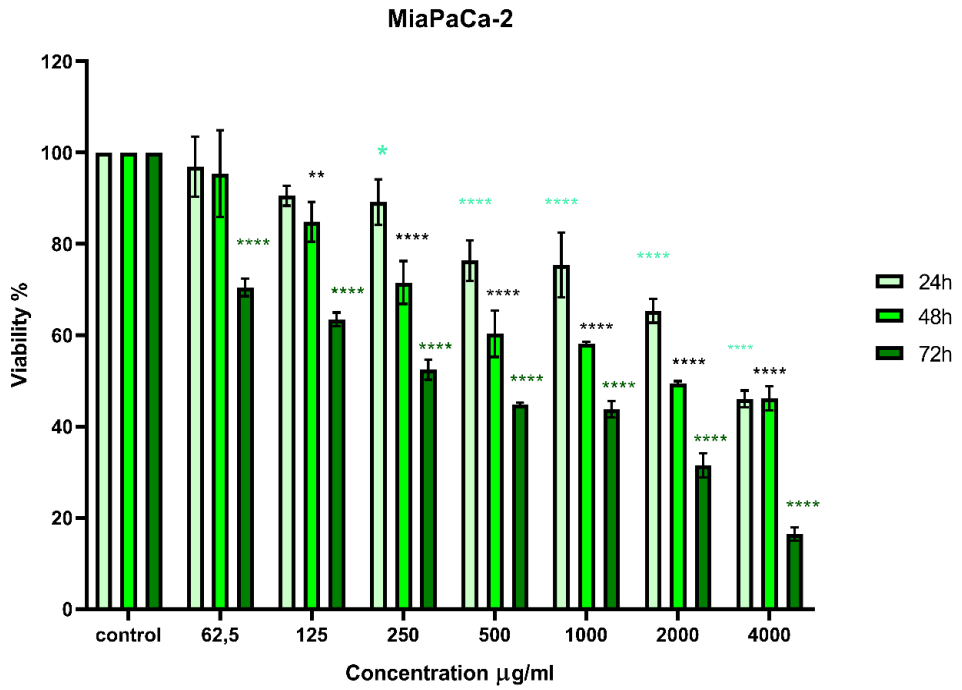

Figure 1. Cell viability values of different concentrations of *Raphanus sativus* var. *longipinnatus* extract on MiaPaCa-2 cell line (*: p<0.05, **: p<0.01, ***: p<0.001, ****: p<0.0001)

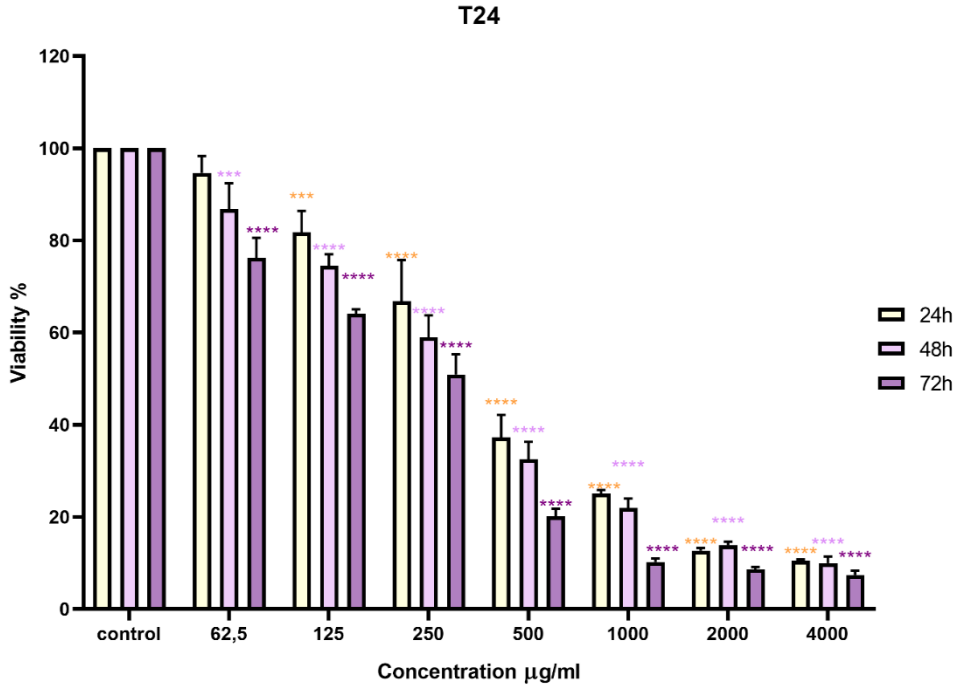

Figure 2. Cell viability values of different concentrations of *Raphanus sativus* var. *longipinnatus* extract on T24 cell line (*: p<0.05, **: p<0.01, ***: p<0.001, ****: p<0.0001)

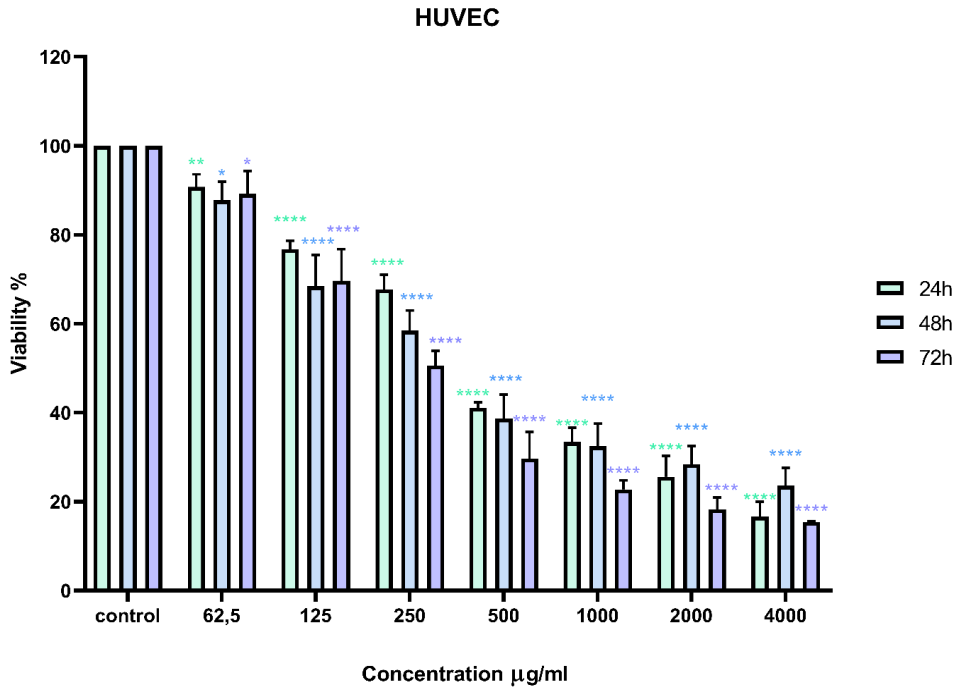

Figure 3. Cell viability values of different concentrations of *Raphanus sativus* var. *longipinnatus* extract on HUVEC cell line (*: p<0.05, **: p<0.01, ***: p<0.001, ****: p<0.0001)

The IC_{50} values were calculated using GraphPad software (GraphPad, Version 8.4.2, San Diego, CA, USA) based on the cell viability values obtained after 24, 48, and 72 hours of treatment (Table 3).

Table 3. IC_{50} values of *Raphanus sativus* var. *longipinnatus* ethanol extract on MiaPaCa-2, T24, and HUVEC cell lines.

Cell lines	IC_{50} (µg/ml)		
	24h	48h	72h
MiaPaCa-2	3110.00±250.46	1490.33± 92.19	389.63±5.22
T24	404.26±33.45	318.06±13.55	197.43±15.64
HUVEC	481.06±13.87	404.36±24.73	287.3±13.07

*: p<0.05, **: p<0.01, ***: p<0.001, ****: p<0.0001

The experimental results demonstrated that the *R. sativus* var. *longipinnatus* ethanol extract exerted a time and dose-dependent cytotoxic effect on all tested cell lines (MiaPaCa-2, T24, and HUVEC). As shown in Table 3, the IC_{50} values summarize the cytotoxic potential of the extract and the relative sensitivity of each cell line.

The extract demonstrated a time-dependent decrease in IC_{50} values across all tested cell lines. In MiaPaCa-2 cells, IC_{50} values reduced from 3110 ± 250 µg/mL (24 h) to 1490 ± 92 µg/mL (48 h) and 389 ± 5 µg/mL (72 h), indicating a progressive increase in sensitivity over time. T24 bladder cancer cell line exhibited the highest level of sensitivity, with IC_{50} values dropping from 404 ± 33 µg/mL (24 h) to 197 ± 15 µg/mL (72 h). This range is consistent with moderate-to-strong cytotoxicity reported in the literature for plant-derived extracts, suggesting active constituents compatible with anti-proliferative mechanisms.In contrast, HUVEC endothelial cells displayed higher IC_{50} values compared with both cancer cell lines (481 ± 13 µg/mL at 24 h; 287 ± 13 µg/mL at 72 h), indicating that the extract was less toxic to normal cells. These values collectively demonstrate that the extract is more potent against cancer

cells, particularly T24 and MiaPaCa-2, than against HUVEC cells. The cytotoxic activity follows a clear time-dependent pattern, implying that more prolonged exposure enhances the biological effect.

In the MiaPaCa-2 cell line, the IC_{50} value at 48 and 72 hours was found to be significantly higher than at 24 hours ($p<0.0001$), while the significance between 48 and 72 hours was lower ($p<0.001$). In the T24 cell line, the IC_{50} value between 24 and 72 hours had a higher statistical significance ($p<0.0001$) compared to the IC_{50} values between 24 and 48 hours and between 48 and 72 hours ($p<0.01$). The HUVEC cell line, similar to the T24 cell line, showed a high statistical significance for the IC_{50} value between 24 and 72 hours ($p<0.0001$); however, the IC_{50} values between 48 and 72 hours ($p<0.001$) and between 24 and 48 hours ($p<0.01$) had lower significance.

DISCUSSION

The findings of this study demonstrate that *Raphanus sativus* var. *longipinnatus* ethanol extract exerts a concentration and time dependent cytotoxic effect on MiaPaCa-2, T24, and HUVEC cells. Among the tested cell lines, T24 bladder cancer cells were the most sensitive, while normal HUVEC endothelial cells showed comparatively higher IC_{50} values, indicating reduced susceptibility. This trend aligns with earlier researchs suggesting that radish-derived glucosinolate metabolites particularly isothiocyanates preferentially target malignant cells by inducing apoptosis, modulating detoxification enzymes, and disrupting mitochondrial signaling pathways (Barillari et al., 2008; Egner et al., 2011; Umamaheswari et al., 2021).

The moderate antioxidant capacity observed in the present study contrasts with higher scavenging activities reported for radish extracts obtained using other solvents or extraction conditions (Zappia et al., 2023). Methodological differences including solvent polarity, extraction duration, plant part used, and harvest maturity strongly influence the yield of phenolic compounds and may account for the lower DPPH inhibition obtained (Perez-Gutiérrez & Pérez, 2004; Zappia et al., 2023).

When compared with previous cytotoxicity studies, the IC_{50} values obtained for MiaPaCa-2 and T24 cells fall within the range reported for radish and related Brassicaceae extracts tested against breast, colon, and liver cancer cell lines (Umamaheswari et al., 2021). However, little is documented regarding the effects of radish extracts on pancreatic and bladder cancer cells, making the present findings a valuable contribution to the broader understanding of the plant's anticancer potential. The observed progressive decline in IC_{50} values over time suggests that the extract's active compounds may accumulate intracellularly or initiate delayed apoptotic signaling, a pattern similarly reported for other isothiocyanate-rich species (Barillari et al., 2008).

A study used the above-ground parts of *R. sativus* and analyzed ethanol-extracted samples in MDA-MB-231 human breast cancer cells. A dose-dependent decrease in cell viability was observed in cells treated with the extract at concentrations of 100-300 µg/mL for 48 hours (Kim et al., 2011). In another study, red radish tubers were extracted using Soxhlet extraction with water, ethanol, and methanol, and were found to exhibit cytotoxic effects at high doses (Kaya, 2023). In a study in which silver-nanoparticles (NPs) were synthesized via the aqueous extraction of *Raphanus sativus* leaves, cytotoxic activity was evaluated in human dermal fibroblasts (HDF) and SK-OV-3, CaCo-2, and U118 cancer cell lines. NPs applied to cells at a concentration of 25 µg/mL reduced viability by 76.97% in the HDF cell line compared to the control group. This value was found to be 68.44%, 87.37%, and 89.10% in the SK-OV-3, CaCo-2, and U118 cancer cell lines, respectively (Hatipoğlu et al., 2023).

Altogether, the current study results are consistent with the existing literature on the biological activities of *R. sativus* var. *longipinnatus* while expanding current knowledge by providing new evidence of its effects on specific cancer models. The combination of cytotoxic activity, total phenolic and flavonoid contents, and antioxidant potential underscores the promise of *R. sativus* var. *longipinnatus* as a natural source of bioactive compounds.

CONCLUSION

This study demonstrates that *Raphanus sativus* var. *longipinnatus* ethanol extract exhibits selective cytotoxic activity against MiaPaCa-2 and T24 cancer cells, with reduced toxicity toward HUVEC endothelial cells. The extract also displayed moderate antioxidant capacity and measurable levels of phenolics and flavonoids, confirming the presence of bioactive phytochemicals associated with anticancer and antioxidant effects. When compared with

literature, the results align with well-established properties of *R. sativus* var. *longipinnatus* while contributing new data regarding its impact on pancreatic and bladder cancer cell lines. These findings suggest that *Raphanus sativus* var. *longipinnatus* ethanol extract may serve as a promising natural candidate for further development in anticancer research. Future studies should focus on identifying the specific active compounds, elucidating their molecular mechanisms, and evaluating their effects in *in vivo* models.

Abstract

This study investigated the potential antigenotoxic effects of methanol extracts obtained from the aerial parts of *Sideritis brevidens* and *Sideritis libanotica* subsp. *violascens*, traditionally used in folk medicine for its antioxidant properties. Plants were collected from the Mersin region of Turkey, and four extract concentrations (1.25, 2.5, 5, and 10 mg/mL) were tested against genotoxicity induced by ethyl methanesulfonate (EMS), an alkylating agent. The Somatic Mutation and Recombination Test (SMART; wing-spot test) was performed using two *Drosophila melanogaster* strains carrying the recessive markers *flare-3* (*flr*^{3}) and *multiple wing hairs* (*mwh*). Transheterozygous larvae (72±4 hours old) obtained from crosses between these strains were chronically fed with plant extracts, EMS, and their combinations. Wings of emerged adults were microscopically examined for spot formation. The extracts showed no genotoxic effects at any concentration. However, co-treatment with EMS significantly reduced the frequency of somatic mutations and recombinations, particularly at 5 and 10 mg/mL ($p<0.05$). These results indicate that the tested *Sideritis* extracts possess notable antigenotoxic activity and may serve as natural agents for reducing DNA damage, warranting further pharmacological evaluation.

Keywords: Antigenotoxicity, *Sideritis brevidens*, *Sideritis libanotica*, SMART assay

INTRODUCTION

Throughout human history, plants have been regarded as one of the most valuable natural resources in traditional medicine (Atanasov et al., 2015; Çarıkçı et al., 2023). Many species have been utilized for their therapeutic potential, particularly due to their rich content of bioactive compounds (Eruygur et al., 2024). Among these, antioxidant-rich plants are notable for their ability to scavenge free radicals and mitigate oxidative stress- a major contributor to cellular damage and various diseases, including cancer (Lobo et al., 2010; Valko et al., 2006). In this context, the exploration of the protective roles of plant-derived compounds against DNA damage has garnered significant scientific attention.

The genus *Sideritis*, part of the Lamiaceae family, is traditionally used as a herbal tea and is common in Mediterranean regions (Selvi et al., 2022). Several species of *Sideritis* have demonstrated antioxidant, anti-inflammatory, antimicrobial, and even anticancer potential in prior phytochemical and pharmacological studies (González-Burgos et al., 2011; Elbouny et al., 2022; Chrysargyris et al., 2023; Walasek-Janusz et al., 2025). Despite these findings, data regarding the antigenotoxic capacity of *Sideritis* species remain scarce, especially in the context of in vivo genotoxic assays.

In this study, methanol extracts obtained from the aerial parts of *Sideritis brevidens* and *Sideritis libanotica* subsp. *violascens,* collected from the Mersin region of Turkey, were evaluated for their potential protective effects against ethyl methanesulfonate (EMS)- induced genetic damage. EMS is a well-known alkylating agent that generates point mutations and chromosomal aberrations by modifying DNA structure, and it is frequently used as a standard genotoxin in experimental systems (Ansari et al., 2025).

To assess the potential antigenotoxic effects of these plant extracts, the *Drosophila melanogaster* wing somatic mutation and recombination test (SMART) was employed. This in vivo assay allows the detection of somatic

mutation and recombination events through phenotypic markers (Frölich and Würgler, 1990; Graf et al., 1998). *Drosophila*, as a model organism, offers various advantages for toxicological and genetic research due to its short life cycle, well-characterized genome, and conserved cellular mechanisms related to DNA repair and oxidative stress response (Rand et al., 2023).

By investigating whether the selected *Sideritis* species can reduce EMS-induced genetic alterations in *Drosophila*, this research aims to provide new insight into the protective potential of plant-derived natural products. The results may contribute to the identification of novel candidates for developing protective agents against genotoxicity and may support the ethnopharmacological use of *Sideritis* in preventive medicine.

MATERIALS AND METHODS

***Drosophila* Strains:** In this study, two distinct *Drosophila melanogaster* strains were utilized: *multiple-wing hair* (*mwh/mwh*) males and *flare-3* (*flr*^{3}/*In*(*3LR*) TM3, *ri p*^{p} *sep I*(*3*)*89Aabx*^{34e}) females. Both strains were obtained from the Laboratories of Basic Sciences Application and Research Center at Erzincan Binali Yıldırım University. The *multiple-wing hair* (*mwh*) gene is located on chromosome 3 and is characterized by a unique phenotype in which homozygous individuals exhibit multiple trichomes per epithelial cell. The *flare-3* (*flr*^{3}) gene, also mapped to chromosome 3, is recessive and results in the development of abnormal point-like trichomes on the wing surface. The genetic markers and associated phenotypes have been previously described in detail in earlier studies (Graf et al., 1984; Lindsley and Zimm, 1987).

Chemical: Ethyl methanesulfonate (EMS, 62-50-0) was obtained from Sigma Aldrich.

Plant Material Collection and Extract Preparation: The plant samples used in this study were collected at their maturation stage from the Anamur district of Mersin province by Dr. Emre SEVİNDİK, who also carried out the botanical identification. The aerial parts of the air-dried plants were treated with liquid nitrogen and homogenized to obtain material suitable for extraction. From the powdered plant material, 50 g was accurately weighed for each extract using an analytical balance, and the volume was brought to 250 mL with methanol. Extraction was carried out accordingly. The methanolic extracts were then concentrated by removing most of the solvent under reduced pressure at 40°C using a rotary evaporator (Kotan et al., 2010). Stock solutions were prepared from the obtained *Sideritis brevidens* (SB) and *Sideritis libanotica* subsp. *violascens* (SL) extracts and applied to the experimental groups at final concentrations of 1.25, 2.5, 5, and 10 mg/mL. The stock solutions were stored at +4°C until further use.

Survival Rate (Larval Mortality) Assay: To evaluate the potential toxic effects of SB and SL plant extracts, survival rate assays were conducted using transheterozygous (*mwh/flr*^{3}) *Drosophila melanogaster* larvae. A total of 100 larvae aged 72±4 hours were transferred into food media supplemented with different concentrations (1.25, 2.5, 5, and 10 mg/mL) of SB and SL extracts. Each treatment group was tested in triplicate, and the number of larvae that successfully developed into adult flies was recorded for each replicate. Survival rates were then calculated to evaluate the potential toxicity of the extracts. EMS was used as the positive control, while the negative control group consisted of larvae reared on standard medium without any extract. The survival percentages were calculated based on the number of emerged adults, and the data were comparatively evaluated to determine the potential toxic or protective effects of the plant extracts.

Somatic Mutation and Recombination Test (SMART) Assay: The wing SMART assay was employed to evaluate the genotoxic effects of test compounds in *D. melanogaster* by assessing loss of heterozygosity (LOH) at two recessive loci: *multiple-wing hair* (*mwh*, 3-0.3) and *flare-3* (*flr*^{3}, 3-38.8) (Graf et al., 1984). This assay allows for the detection of various genetic alterations, including point mutations, deletions, chromosomal loss, nondisjunction, and mitotic recombination (Würgler and Vogel, 1986). The trans-heterozygous larvae were obtained by crossing virgin *flr*^{3} females with *mwh* males. Eggs were collected over 8 hours, and third instar larvae (72±4 hours old) were harvested and rinsed with tap water. Subsequently, 100 larvae were transferred into plastic vials containing 1.5 g of dry *Drosophila* Instant Medium (Carolina Biological Supply Company, Burlington, NC) rehydrated with 9 mL of the respective treatment solutions. Test groups consisted of various concentrations (1.25, 2.5, 5, and 10 mg/mL) of plant extracts (SB and SL). The positive control group was exposed to EMS (1mM),

while the negative control group received only distilled water. All treatments were administered via larval feeding until pupation. Experiments were conducted at 25±1°C and ~65% relative humidity.

Following adult emergence, trans-heterozygous flies were collected and preserved in 70% ethanol at 14°C. Wings were dissected and mounted in Faure's solution (50 g chloral hydrate, 30 mL glycerol, 30 g of gum arabic, and 50 mL distilled water). Slides were examined under a light microscope at 400x magnification. Wings were analyzed for mutant spots categorized as:

(1) small single spots (1-2 mutant cells) and

(2) large single spots (>2 mutant cells), both showing either the *mwh* or *flr*^{3} phenotype, and

(3) twin spots, characterized by adjacent clones both *mwh* or *flr*^{3} phenotype (Graf et al., 1984).

While single spots may arise from point mutations, deletions, or chromosomal events (e.g., nondisjunction or recombination), twin spots are specifically indicative of reciprocal mitotic recombination events. Genotoxicity modulation was evaluated by comparing total spot frequencies. The inhibitory effect of plant extracts was calculated using the following formula (Abraham, 1994):

$$Inhibition = (a - b/a)x100$$

Where a represents the mean total spot frequency induced by EMS alone, and b represents the frequency observed in the presence of both EMS and the test extract.

Statistical Analysis: Statistical analyses for survival rate were performed using SPSS version 22.0 (IBM Corp., Armonk, NY, USA). For normally distributed data, comparisons between groups were made using one-way analysis of variance (One-Way ANOVA). Results were expressed as mean ± standard error of mean (SEM), and a p-value of <0.05 was considered statistically significant. The genotoxic potential in the Somatic Mutation and Recombination test was performed using a two-tailed χ^2 test for proportions ($\alpha = \beta = 0.05$) following the method described by Frei and Würgler (Frei and Würgler, 1995).

RESULTS

In this study, the effects of *Sideritis brevidens* (SB) and *Sideritis libanotica* subsp. *violascens* (SL) extracts on larval mortality and genotoxicity in *Drosophila melanogaster* were evaluated, and the results were compared in terms of both parameters.

Survival rate determination: Survival rate findings (Figure 1) demonstrated that EMS, used as a positive control, exerted significant toxicity by reducing larval viability in *D. melanogaster* larvae (n = 100, 72 ± 4 h trans-heterozygous larvae). In contrast, SB and SL extracts at concentrations of 5 and 10 mg/mL significantly increased survival rates compared to the negative control group ($p<0.05$).

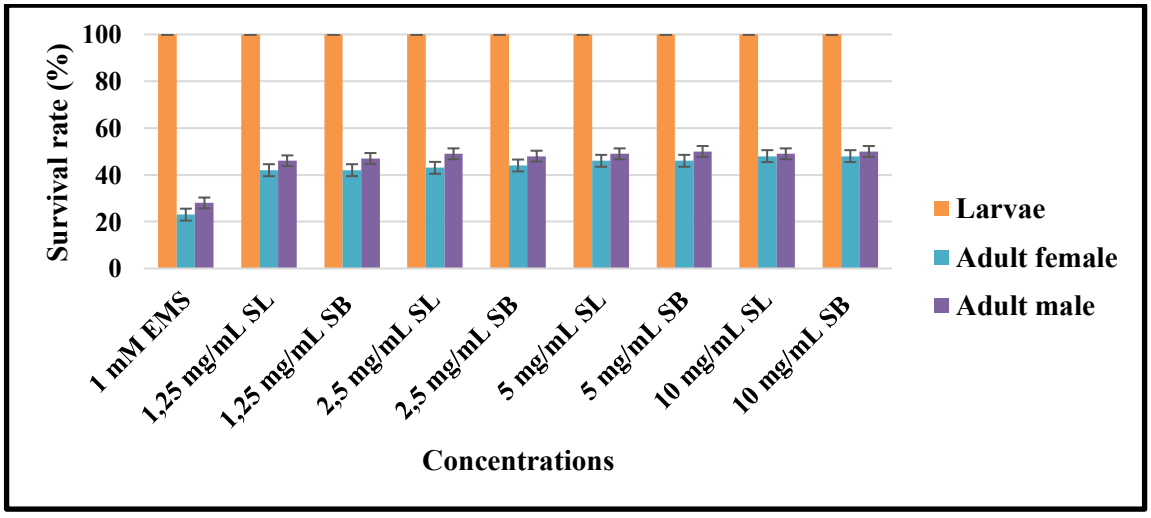

Figure1. Larval survival of *D. melanogaster* exposed to SB and SL extracts

Genotoxicity assay: After treating trans-heterozygous larvae with EMS and changing concentrations of plant extracts, administered both alone and together, the emerging adult flies were classified based on their phenotypes as either normal (*mwh/flr³*) or serrated (*mwh/TM3)*.

According to data in Table 1, EMS (1 mM) treatment in the *mwh/flr³* and *mwh/TM3* genotypes induced significant increases in small, large, and twin spots compared to the distilled water control, indicating a pronounced mutagenic effect. Individually applied *Sideritis brevidens* (SB) and *Sideritis libanotica* subsp. *violascens* (SL) extracts at low and medium concentrations did not elicit mutagenicity, while high concentrations generated limited positive responses. Co-treatment with EMS and plant extracts, particularly at concentrations of 5 mg/mL and above, markedly reduced the total spot frequency. Inhibition rates reached up to 54.81% for SB and 50.62% for SL, demonstrating that both extracts possess antimutagenic properties. The efficacy of these extracts varied depending on concentration and genotype. Overall, SL exhibited slightly lower or comparable protective effects concerning SB at certain concentrations.

Table 1. Wing spot test analysis of *Sideritis brevidens* and *Sideritis libanotica* subsp. *violascens* extracts in *Drosophila melanogaster*: results for *mwh/flr³* and *mwh/TM³* genotypes

DISCUSSION

In vivo toxicity assay using *Drosophila* larvae indicated that *Sideritis* extracts are non-toxic. Moreover, these extracts improved survival, pupation, and eclosion rates in flies exposed to oxidative stress, suggesting a protective effect (Diken and Yilmaz, 2022). *Sideritis* essential oils are rich in monoterpenes, such as carvacrol and thymol, which are associated with their biological activities (Sevindik et al., 2021; Chrysargyris et al., 2023). *S. scardina* hot water extract treatment significantly prolonged both average and maximum lifespan of wild-type *C. elegans* in a dose-dependent manner, indicating its potential to promote longevity (Nishioka et al., 2020). *S. scardina* extracts demonstrated notable antiaging effects in yeast models by enhancing survival rates and improving stress responses in premature aging mutants, underscoring their potential role in modulating cellular longevity mechanisms (Vasileva et al., 2022).

Plant extracts have been shown to modulate EMS-induced genotoxicity in *Drosophila,* although their effects vary considerably depending on factors such as plant species, extraction method, and dosage. Certain extracts, such as those derived from *Rosa canina* and *Echium amoenum*, have demonstrated significant antigenotoxic activity by reducing DNA damage, whereas others may exert minimal effects or even enhance genotoxicity. Therefore, careful selection of plant species, standardized extraction procedures, and rigorous evaluation are essential to establish plant extracts as effective antigenotoxic agents (Jacociunas et al., 2013; Kızılet et al., 2013; Uysal et al., 2015; Çetinkaya and Yurtsever, 2021; Okorie et al., 2021).

The genotoxic and antigenotoxic potentials of *Sideritis* species have attracted growing attention due to their well-documented antioxidant and anti-inflammatory properties (Oalđe et al., 2021). However, no studies to date have directly evaluated *Sideritis* extracts using the *Drosophila* wing spot test (SMART), a widely accepted in vivo model for assessing genotoxicity and antigenotoxicity of various substances, including plant-derived compounds. The SMART assay has been effectively applied to different herbal extracts, revealing their ability to inhibit mutagen-induced wing spot formation and indicating protective effects against DNA damage (Pitchakarn et al., 2021; Çarıkçı et al., 2023). Despite the promising bioactivities of *Sideritis,* its potential to modulate EMS-induced genotoxicity in *Drosophila melanogaster* remains unexplored. This study addresses this gap by providing the first evidence of the antigenotoxic effects of two *Sideritis* species against EMS-induced DNA damage in *Drosophila*, thereby contributing valuable insights into the safety and therapeutic potential of these medicinal plants. Future research should focus on elucidating the molecular mechanisms underlying these protective effects and further evaluating the potential of *Sideritis* in reducing genotoxicity.

CONCLUSION

The findings of this research demonstrate that *Sideritis brevidens* and *Sideritis libanotica* subsp. *violascens* can effectively counteract EMS-induced genetic damage in *Drosophila melanogaster*, as evidenced by reductions in wing spot formation. The observed protective effects, particularly at higher extract concentrations, suggest that these species may serve as valuable natural candidates for developing agents that aim to minimize DNA damage. Beyond expanding the biological profile of *Sideritis* species, the present results provide a foundation for future work exploring their bioactive components, underlying mechanisms, and broader applications in genotoxicity prevention.

ACKNOWLEDGEMENTS

We thank Dr. Emre SEVİNDİK for providing support in the field collection and taxonomic identification of the studied *Sideritis* species.

Abstract

Seedlessness is a preferred trait for many plant species, including grapevines. Consumer demand for seedless table grape cultivars, both fresh and dried, has increased globally. Furthermore, almost all dried grape consumed in global markets are seedless. For this reason, breeding studies have focused on the development of seedless varieties for many years. The aim of this study is to share some information about the seedlessness-associated genes and the mechanism of seedlessness in grapevines. For this purpose, firstly, the flower structure and flower types of grapevines have been introduced and the concepts of flowering and pollination have been explained. Then, some molecular mechanisms related to seedlessness have been explained, including information on seedlessness-associated genes in grapevines. Additionally, some research examples on the effective use of both classical and modern breeding methods for seedlessness have been included. There are numerous studies on seedlessness in *Vitis vinifera* L. species, including the identification of quantitative loci, gene identification, gene expression studies, molecular marker development, and characterization using markers in hybridization and selection breeding studies. Studies on these topics have been identified as being both illustrative and complementary. As a result of these studies, it appears that the single-gene effect approach is now being replaced by a multi-gene effect approach. Within the scope of the information given in this study, it is anticipated that future studies on alternative seedless grape breeding will be more effective.

Keywords: *Vitis vinifera* L., Seedlessness-associated genes, Molecular identification

INTRODUCTION

The grapevine known as *Vitis vinifera* L. belongs to the genus *Vitis*. The genus *Vitis* is divided into two sections, *Muscadinia* (2n=2x=40) and *Euvitis* (2n=2x=38), due to differences in some morphological features and chromosome numbers. There are approximately sixty known *Vitis* species worldwide. The most commonly grown grapevine species is known as *Vitis vinifera* L. (native to Europe, North Africa and the Near East) (Owens, 2008). The total world grape production amount has been reported as approximately 72.5 million tons (FAOSTAT, 2023). Türkiye's grapevine production amount has been recorded as 3.4 million tons (approximately 5% of world production) (TUIK, 2023; OIV, 2023). Emphasizing the importance of seedlessness, this study aims to share the functions of genes associated with seedlessness in grapes. Some molecular mechanisms involved in seedlessness in grapes have been explained. Examples of classical and modern seedlessness breeding studies have been also included.

FLOWER TYPES AND FLOWER STRUCTURE IN GRAPEVINES

Three flower types have been identified in grapevines: (i) Functional hermaphrodite flower (both male and female organs are functional), (ii) Functional female flower (non-functional male organs are present) and (iii) Functional male flower (female organ is not fully developed and is not functional) (Oberle et al., 1938). *Vitis vinifera* L. grapevine varieties of European origin have hermaphrodite flowers, while American grapevine varieties have male and female flowers. (Snyder et al., 1937; Olmo et al., 1943). UPOV (The International Union for the Protection of New Varieties of Plants) criteria mention four flower types for the *Vitis vinifera* grapevines. These are: (i) fully developed stamens and absence of gynoecium, (ii) fully developed stamens and presence of reduced gynoecium,

(iii) fully developed stamens and fully developed gynoecium, and (iv) reflexed stamens and fully developed gynoecium (Figure 1a).

The pistil of hermaphrodite flowers is surrounded by five stamens. However, individual flowers of the same inflorescence may have more than five stamens. Fused petals (corolla) surround the flower parts mentioned above. During flower development, these petals loosen from the base, forming a cap-like structure (calyptra) (Snyder et al., 1937) (Figure 1b, Alfrey et al., 2019).

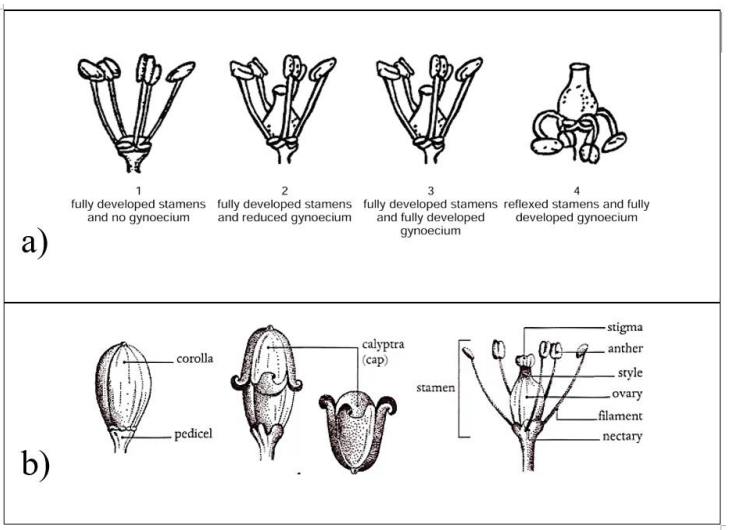

Figure 1. a) Grapevine flower types (UPOV, 2023), **b)** Flower appearances with and without calyptra in grapevine and parts of the hermaphrodite flower (Alfrey et al., 2019).

FLOWERING AND POLLINATION IN GRAPEVINES

The period during which the flowers are open is called anthesis. Flowering can last from one to three weeks, depending on weather conditions. Not all flowers on a cluster open at the same time. Cleistogamy is observed in some varieties. That is, self-pollination occurs before the flowers open. The number of flowers in which cleistogamy, a genetic trait, occurs varies greatly among varieties (Barbagallo et al., 1988; Staudt, 1999). In their study on the onset time of pollination of grapevine flowers under calyptras, Wang et al. (2023a) have been able to determine the flowering process before the flower opened in the cultivar 'Shine muscat'. The separated floral buds stage has been identified as the initial stage of cleistogamy. According to these researchers, this situation will reduce labor and time and provide a theoretical basis for hybridization breeding.

Pollination of grapevine flowers generally occurs with their own pollen. Wind, honeybees, and other insects assist in pollination as active pollinators (Olmo, 1943; Bronner and Wagner, 1997; Kimura et al., 1998). Pollination is affected by temperature, relative humidity, and the pollen acceptance status of the stigma (Bronner and Wagner, 1997). On the other hand, it is reported that pollen is alive in flowers before the cap falls and that the pollen can survive for several days after the cap falls (Heazlewood and Wilson, 2004).

SEEDLESSNESS AND SEEDLESSNESS-RELATED GENES IN GRAPEVINES

Seedlessness is one of the most valuable quality characteristics of grapevines, whether for consumption as fresh fruit or dried fruit (Ledbetter and Ramming, 1989). In seeded grape varieties, the ovary develops after fertilization. However, in most seedless grape varieties, the seed does not develop fully (Burger and Goussard, 1996). "Seedlessness" occurs by two mechanisms: parthenocarpy and stenospermocarpy (Değirmenci and Marasalı, 2007). Parthenocarpic seedless fruits occur without pollination and fertilization (Perl et al., 2000). For the formation of stenospermocarpic seedless fruit, pollination and fertilization initially occur normally. However, after pollination, integument development in the ovaries is prevented by genetic mechanisms. Degeneration of the embryo and endosperm occurs. As a result, seed development is impossible. Only partially formed seeds are seen

with development in the form of seed scars (Costantini et al., 2008). When parthenocarpic grapevine cultivars were used as pollinators for seeded grapevine cultivars, new seedless generations could not be obtained (Stout, 1937). However, when stenospermocarpic grapevine cultivars were used to pollinate seeded grapevine cultivars, it was possible to obtain seedless individuals (Stout, 1937; Weinberger and Harmon, 1964). For this reason, plant breeders have focused on stenospermocarpic cultivars (Burger and Goussard, 1996). Although seeds do not form in parthenocarpic grapevine cultivars such as Black Corinth, rudimentary seeds containing living embryos can develop (Kunter and Sehit, 2019). On the other hand, it has been determined that there is no development or maturation of the embryo and/or endosperm in stenospermocarpic grapevine cultivars such as seedless 'Sultani' (also known as 'Thompson Seedless') (Ledbetter and Burgos, 1994; Mejia et al., 2011).

There are two methods used to obtain seedless grapes: (i) applications of cytokinin (CK) and gibberellic acid (GA) before full flowering stage, (ii) genetic breeding of seedless grapevine cultivars. In an example study for the first of these methods, it was stated that plant hormones can effectively trigger seed degeneration in seeded grapevines (Reynolds et al., 1992). However, although this method has become a common practice in seedless grapevine production, it has been emphasized that it may raise concerns about labor costs and food safety (Park et al., 2022). Correa et al. (2015) investigated the response of fruit size and seed mass to gibberellic acid (GA) applications and quantitative trait loci in table grapes. As a result of gibberellic acid applications tested for 'Ruby seedless' × 'Sultanina' hybrid individuals, an increase in fruit size and a decrease in seed dry mass during ripening were observed. The response to GA3 has been found to have a significant genetic basis associated with QTLs localized in linkage group 2 and linkage group 18. According to the 19 gene clusters covered by these QTLs, fruit size was associated with the response to GA3. Despite the masking effect, the VvAGL11 gene (AGL, AGAMOUS-LIKE) was associated with the response to GA3. According to the second main method used to obtain seedless grapes, plant breeders have been utilized triploid and diploid breeding approaches and embryo rescue techniques to obtain new seedless cultivars (Park et al., 1999; di Rienzo et al., 2021). For example, Roytchev (2007) has been used agronomic characters to determine the genetic variation among F1 individuals obtained by crossing seeded and seedless grapevine varieties ('Super early bolgar' × 'Ruby seedless'), to explain the reasons for clustering and to select elite hybrid individuals. The fact that seeded and seedless individuals were collected into two different groups has been revealed that clustering and principal component analysis could be used effectively. In Roychev (2011) path analysis was carried out on the variability of yield and quantitative traits in hybridization between seeded and seedless grapevine cultivars ('Armira' × 'Russalka-1') based on some agronomic characters. Parent cultivars have been found to specifically affect the phenotype of hybrid plants. In a study conducted by Roychev and Keranova (2023), cluster analysis has been performed to determine phenotypic similarity/dissimilarity based on ampelographic characteristics of seedless grapevine varieties. Based on the groupings obtained for all individuals, the level of stenospermocarpy in the cultivars could also be determined.

Seedlessness is an important quality trait in table grape (*Vitis vinifera* L.) breeding. However, seed development involves a complex mechanism (Wang et al., 2024). During fruit formation in grapevines, some genes associated with the development of different tissues such as integument (seed coat), endosperm, embryo and ovule (Ehlers et al., 2016) have been summarized in Table 1.

Seedlessness in grapevines is associated with mutation (missense mutation) in the VviAGL11 gene (Royo et al., 2018). Mejia et al. (2011) have stated the VvAGL11 gene as a gene belonging to the D lineage of MADS-box genes that control ovule identity. It has stated that this gene could be effectively used for the early detection of stenospermocarpic seedlessness. According to Bolander (2004), MADS is an abbreviation derived from the first letter of four transcription factors defined by the motif MCM1, AG, DEFA and SRF. In Moniruzzaman et al. (2023), who created a schematic model of the hormonal regulation of seedless fruit set in grapevine, the formation of stenospermocarpy due to embryo abortion during the seed coat development stage heve mentioned. Here, there is an explanation that embryo abortion occurs as a result of the effect of CKX7 (cytokinin oxidase-7), one of the CK-degrading enzymes. According to information provided by Mejía et al. (2007 and 2011), Bergamini et al. (2013), and Amato et al. (2022), VviAGL11 likely directly affects seed development by regulating, auxin, MeJA and isoflavonoid synthesis. The VviAGL11 expression level has been found and confirmed to depend on the promoter coding sequence allelic combination. This gene has been identified as activating key triggers of seed coat development. The effect of mutated VviAGL11 was confirmed at the molecular level. A novel mechanism linking

VviAGL11 haplotype diversity and seedlessness class has been described. The p3-VvAGL11 marker has been identified in the promoter region of the VviAGL11 gene. A tight link between this gene the and seedlessness trait has been demonstrated (Table 1).

An interesting example of seedless fruit production has been described in the spontaneous mutant 'Thai seedless' of the species sugar apple (*Annona squamosa*) (Lora et al., 2011). This mutant produces normal-sized fruits that are completely seedless following pollination. The authors have been suggested that the failure to set seeds was due to a deficiency in the outer of the two normal seed coats. They have beeen suggested that this was due to a defect in the ovule, similar to the *Arabidopsis* "inner no outer" (INO-1) mutant (Villanueva et al., 1999). This gene encodes a transcription factor belonging to the YABBY family, which plays a role in determining abaxial identity in various organs. This gene has been expressed in *Arabidopsis thaliana*, where it is required for the formation of the outer shell and asymmetric growth of the egg cell. This mutation has been reported to cause a phenotypic defect in ovules, negatively affecting seed formation (Lora et al., 2011; di Rienzo et al., 2021). According to di Rienzo et al. (2021), the VviINO gene in grapevine has an activity similar to the gene in *Arabidopsis* (Table 1).

According to Zhang et al. (2021), NAC TFs have numerous irreplaceable biological functions in plants, such as ovule development, seed coat formation, fruit ripening, leaf fall, and response to various environmental stresses. In addition to these functions, they have been associated with the early development of flowers and fruits (Tello et al., 2015). The absence of VviAGL11 expression has been found to activate the overexpression of WRKY, Homeobox and NAC, transcription factors. Seed coat differentiation is inhibited, endosperm degeneration occurs, and embryonic development is inhibited (Malabarba et al., 2017; Royo et al., 2018) (Table 1).

In Tang et al. (2016), caspase-1 like activities of VPEs (vacuolar processing enzymes) and their importance in the development of stenospermocarpic seedless grapevine ovules were mentioned. To characterize the relationship between the VPE gene family and stenospermocarpic grapevines, these researchers have been identified three *Vitis vinifera* VPE genes (VvβVPE, VvγVPE, and VvδVPE from the PN40024 grapevine genome). According to phylogenetic analysis of four *Arabidopsis thaliana* and six *Vitis vinifera* VPEs, ten VPEs form three main branches. While six grapevine VPEs have been identified in a similar gene structure containing eight introns and nine exons, six grapevine VPEs have been found on three different chromosomes. According to tissue-specific expression analysis, VvδVPE has expressed in ovules, flowers and buds. While VvγVPE has expressed in various tissues, VvβVPE has expressed in roots, flowers, buds and ovules. However, a study by Gong et al. (2019) determined that the *Vitis vinifera* (Vv) βVPE gene processes seed proteins during seed development and exhibits seed-specific expression. However, it has been stated that this was not yet fully understood. The researchers have been characterized the pVvβVPE (VvβVPE promoter) in seeded and seedless grape genotypes. According to the GUS staining results performed on different tissues and organs, VvβVPE was expressed in the embryo, hypocotyl, cotyledon and suspensor (Table 1).

As a result of transcriptomic and genomic analyses, HB-KNOX members, which are among the Homeobox (HB) transcription factors, play a role in the development of grape fruit and seed. The VvHB63 gene in grapes has been functionally characterized. Although no differences heve been observed in the sequences of seeded and seedless grapevines, higher expression levels of the VvHB63 gene have been observed in integument and chalaza of ovules in seedless grapevines compared to seeded grapevines. In situ hybridization analysis showed that the VvHB63 gene was expressed in ovules and episperm cells of "Thompson Seedless" cultivar (Li et al., 2017; Yao et al., 2023) (Table 1).

Different stages of the flowering plant life cycle are primarily controlled by different classes of MADS-box genes (type-I or SRF-like and type-II or MEF2-like: M group for plants in type-I/MIKCC group and MIKC* group for plants in type-II). It is stated that the development of the female gametophyte (embryo sac), embryo and seed is controlled by type I genes. Most stages of diploid sporophyte development involve the activity of the MIKCC group of type II genes, while male gametophyte (pollen) development is controlled by the activity of the MIKC* group of genes (Gramzow and Theissen, 2010). According to this study; AG (AGAMOUS) and SEP (SEPALLATA) promoters included in the MIKCC group whave been found to be determinants of carpel development. In addition, AG and SEP dimer and AP3 (AP, APETALA) and PI (PISTILLATA) dimer together have been expressed as

determinants of stamen development. While AP1 and SEP dimer and AP3 and PI dimer together have been expressed as determinants of petal development, AP1 and SEP double dimer have been expressed as determinants of sepal development.

According to a study conducted using the SRAP-cDNA analysis system, the VviABCG20 gene was identified as a gene differentially expressed during ovule development between the stenospermocarpic the seeded cultivar 'Pinot noir' and seedless cultivar 'Youngle' (*A. thaliana*, ATP-binding cassette G transporter 20, also known as the ABC-2 type transporter gene family protein) (Wang et al., 2016). According to the expression analysis of VviABCG20 during seed development or fertilization in seeded and seedless cultivars, the VviABCG20 gene has been found to have a role in seed development. According to the results of a study conducted by Wang et al. (2023a), the VviABCG20 gene has been strongly expressed in the seeds of seeded grapes and silencing of the homolog of the same gene in tomato has been resulted in a decrease in the number of seeds. VviABCG20 gene expression was shown to be higher in the seeds of seeded grapes than in seedless grapes. Furthermore, VviABCG20 gene expression was significantly higher in the seed coat than in the ovules and endosperm. According to the intracellular localization analysis performed as a result of induction of grape leaves by exogenous hormones, especially MeJA; the protein product of the VviABCG20 gene is a membrane protein. According to the study results, the VviABCG20 gene may function in seed development in grapevine, partly by participating in suberin biosynthesis in the seed coat. (Tang et al., 2020; Wang et al., 2022a) (Table 1). According to Tang et al. (2020), the ABCG20 model provides a new insight and the expression of single and combined transcription factors in grapevines is effective in flower identity development.

In a study by Palumbo et al. (2019), have been based on 18 representative grapevine "ABCDE genes" encoding MADS-box transcription factors. Transcript levels and biological consistencies obtained in a developmental process, from pre-flowering to post-fertilization stage and in different floral organs (embryos, ovary, filaments, anthers, calyx and calyptra), have been compared with the model proposed for *Arabidopsis*. With a few exceptions, the results have been confirmed the expected expression pattern based on the *Arabidopsis* data. According to this ABCDE model, based on their expression for organ identity determination for *Vitis vinifera* L., there are five classes of flower homeotic genes (Class A, Class B, Class C, Class D, and Class E). A+E genes (VviFUL1, VviFUL2, VviAP1 + VviSEP1, VviSEP2, VviSEP3, VviSEP4) in sepals (FUL, FRUITFULL), A+B+E genes (VviFUL1, VviFUL2, VviAP1 + VviAP3a, VviAP3b, VviPI + VviSEP1, VviSEP2, VviSEP3) in petals, B+C+E genes (VviAP3a, VviAP3b, VviPI + VviAG1, VviAG2, VviAGL6a, VviAGL6b + VviSEP1, VviSEP2, VviSEP3, VviSEP4) in stamens, C+E genes (VviAG1, VviAG2 + VviSEP1, VviSEP3, VviSEP4 + ABS1, ABS2) in carpels (ABS, *Arabidopsis* B sister) and C+D+E genes (VviAG1, VviAG2 + VviAG3 + VviSEP1, VviSEP2, VviSEP3) in ovules have been expressed determinantly according to the ABCDE model (Table 1). The above mentioned VvPI gene has been studied for the *Malus domestica* species (Md-PISTILLATA) by Yao et al. (2001) and has been expressed as a MADS-box TF. According to Pelaz et al. (2000), all the floral whorls of the SEP1, SEP2, and SEP3 triple mutant develop into sepals and flowers that become indeterminate. On the other hand, according to Ditta et al. (2004), vegetative leaves are formed instead of sepals in the SEP1, SEP2, SEP3, and SEP4 quadruple mutant. According to Grimplet et al. (2016), SEP1, SEP2, and SEP3 were stated to be associated with the E class group.

MADS-box genes encode a large family of transcription factors in higher plants and have diverse developmental roles, including flower, fruit and seed development (Sun et al., 2020). These researchers have been stated that there was very little information about the function of these genes in grapevine, especially regarding seed development. In tomato, heterologous expression of VvMADS45 (VvMADS45-OE) has been resulted in larger flowers, fruits, and seeds. However, disruption of a tomato homolog of VvMADS45 (SlAGL104-KO) has been resulted in smaller seeds, fruits and flowers. Both SlAGL104-KO and VvMADS45-OE lines have been produced fewer seeds than the control. It has been emphasized that VvMADS45 plays a role particularly in seed development (Table 1). However, in the study on seedlessness in *Vitis vinifera* L. by Zhang et al. (2022), VvMADS39, which is orthologous to *Arabidopsis* SEP2 and has an E MADS-box gene, was characterized. It has been hypothesized that active VvMADS39 expression in the cultivar ‘Thompson seedless’ may restrict cellular expansion, resulting in the development of smaller fruits and seeds. It has been stated that this gene may play a role in the regulation of ovule development in ‘Thompson seedless’ and contribute to the formation of seedless fruit. In contrast, suppression of the VvMADS39 gene in the ‘Red Globe’ cultivar has been associated with increased histone H3 lysine 27 trimethylation in the promoter region of VvMADS39, resulting in normal ovule formation (Table 1). On the other hand, Zhang et al. (2023) conducted a study on the regulatory mechanisms of ovule and seed development has been

associated with VvMADS28. VvMADS28 has been expressed as a seed development regulatory gene that is positively regulated by the VvERF98 gene. The relatively low expression level of the VvMADS28 gene in the 'Thompson seedless' seedless grapevine cultivar has been associated with increased H3K27me3 repressive marks in the promoter region. It has been stated that the VvMADS28 protein interacts with the VvMADS5 (TypeI/Mβ MADS-domain protein) gene to repress this gene by specifically binding to the VvWUS (WUSCHEL) promoter. Seed development is affected by maintaining VvMADS28 and VvWUS expression homeostasis (Table 1).

In a study conducted by Wang et al. (2022b), according to the results of real-time PCR analysis, VviASN1, VviASN2, VviGS1.1, VviGS1.2 and VviGS2b transcript levels were higher in seedless cultivars than in seeded cultivars during ovule development. It has been stated that asparagine content is higher in the seeds of seedless grapes than in seeded varieties, while glutamine content is higher in seeded varieties. Levels of both amino acids has increased during early seed development and then has decreased as development progressed. VviASN1 is expressed in flowers, while VviASN2 is expressed in leaves. VviGS2a, VviGS2b, and VviGS1.1 are expressed in leaves. VviGS1.2 is expressed in roots (Table 1).

The FUS3 gene has been implicated as a regulator of seed development. It has been well studied in *Arabidopsi*s due to its role in embryo and seed development. In a study conducted by Ahmad et al. (2022), information was shared that the VvFUS3 gene significantly reduces seed number and weight by affecting multiple hormonal signaling pathways (Table 1).

MOLECULAR STUDIES ON SEEDLESSNESS IN GRAPEVINES

Over the last three decades, numerous molecular studies on seedlessness have been conducted for *Vitis vinifera* L.. These studies generally have been covered topics such as identifying quantitative loci, developing molecular markers, performing characterization with the help of markers in hybridization and selection breeding studies, identifying genes, and performing genomic and transcriptomic studies.

Striem et al. (1994 and 1996) has been reported RAPD markers associated with seedlessness. The SDI (seed development inhibitor) gene, a seed development inhibitor associated with seedlessness, has been mentioned in sources such as Bouquet and Danglot (1996), Lahogue et al. (1998), Adam-Blondon et al. (2001) ve Doligez et al. (2002). Lahogue et al. (1998) have been analyzed with RAPD markers and have been developed a SCAR marker (sequence characterized amplified region) linked to the SDI gene. The marker SCC8 was found to explain a large portion of the phenotypic variation in seedless component traits. Similarly, Meija and Hinrichsen (2003) have been developed the SCAR marker to determine seedlessness in grapevines. Among the individuals obtained from the 'Ruby' × 'Sultanina' cross, RAPD primers associated with seedlessness have been used in individuals selected for different stenospermocarpy subtraits. The RAPD fragment, named WF27-2000, was cloned, sequenced, and converted into a SCAR marker named SCF27, which produced a specific amplicon of 2.0 kb. The utility of SCAR markers for marker-assisted selection of seedless grapevine cultivars have been investigated. Specific SCAR markers SCP18 and SCC8, developed from the RAPD marker, heve been used for 43 seedless and 38 seeded grape genotypes. Unlike SCP18, SSC8 has been reported to be a useful marker, at least in seedless × seedless offspring (Adam-Blondon et al., 2001). In a study conducted in the Czech Republic (Korpas et al., 2009), twenty-four seedless grape genotypes, one endosperm-free genotype with a hard seed scar, nine seeded grape genotypes and

three hybrid lines showing segregation according to seedlessness have been examined. For the characterization of seedlessness, SCAR markers named SCC8 and SCF27 linked to the SDI locus have been used. However, it has been stated that this locus is necessary but does not provide sufficient information for the seedless phenotype. The possibility of other loci coexisting with this locus has been considered. However, in a study by Li et al. (2010), the sequence accuracy of the SCAR marker associated with seedlessness was determined by comparative sequence analysis. Based on PCR and DNA sequencing results, both the seeded and seedless phenotypes of *Vitis* species have been found to have highly homologous sequences within an EcoRI-restricted region of up to 5 kbp surrounding the SCAR marker. No linkage haas been found between the marker and the seedless trait. On the other hand, Amca (2011) has preferred SCF27 and SCC8 markers to detect seedlessness in hybrid combinations ('Cınarlı karası' × 'Tekirdag cekirdeksizi', 'Italia' × 'Barıs', 'Italia × Perlette', 'Gri kara' × 'Tekirdag cekirdeksizi') where seeded grape varieties were used as female parents and seedless grape varieties were used as male parents. The SCC8 marker has been reported as a successful DNA marker for detecting seedlessness. However, the SCF27 marker, despite giving distinct bands, has not been found to be useful in distinguishing homozygous and heterozygous genotypes.

There are also molecular characterization studies in which different markers for the determination of seedlessness in grapes have been preferred in the same study. For example, Akkurt et al. (2012), have been used SCAR markers (SCC8, SCF27) and SSR marker (VMC7f2) for the detection of seedlessness in hybrid products (372 F1 individuals) of seeded variety 'Alphonse Lavallée' and seedless variety 'Sultanina'. Homozygous alleles have been detected at the seed development inhibitor locus in 40 F1 individuals. Bands with SCF27 marker have been obtained in 80 F1 individuals. The 198 bp allele of the VMC7f2 marker associated with seedlessness has been identified in 174 F1 individuals. In the second year, 183 F1 individuals heve been positive for at least one marker and seedless grape candidate individuals could have been identified. As a result, a total of twenty individuals providing information on seedlessness for three markers have been identified, and the VMC7f2 SSR marker has been stated to be the marker most associated with seedlessness. On the other hand, Bennici et al. (2019) has been evaluated the effectiveness of four seedlessness-related markers (SCF27, p3-VvAGL11, VMC7f2 and VVIn16) in 97 F1 genotypes obtained from sixteen hybrid combinations. p3-VvAGL11 and VMC7f2 have been determined to be the most effective markers.

In a study conducted by Royo et al. (2018) for *Vitis vinifera*, molecular characterization has been performed based on the TF gene named AGAMOUS-Like 11 (MADS-box gene) and it has been confirmed that the markers of this gene can be used to detect seedlessness. Boztepe et al. (2023) has used the VvAGL11 marker (Forward: CTCCCTTTCCCTCTCCCTCT and Reverse: AAACGCGTATCCCAATGAAG) for F1 genotypes obtained from 'Yalova Seedless' × 'Glenora' and 'Yalova seedless' × 'Philipp' hybrid combinations. Seedless individuals have been successfully detected.

In a study conducted by Xi et al. (2023) to develop a KASP (competitive allele-specific PCR) marker for stenospermocarpic seedlessness in grapevine, a total of 83 grape cultivars with various genetic backgrounds (32 seeded and 51 seedless), 113 F1 hybrid individuals (53 seeded and 60 seedless) and two populations have been used. The KASP marker developed in association with the validated SNP locus for the VviAGL11 gene hes been found to successfully distinguish between seedless and seeded genotypes with high sensitivity and efficiency.

To date, in addition to studies on the development of molecular markers related to seedlessness in grapes, studies on the preparation of quantitative trait loci maps and the identification of linkage groups have also been carried out (Doligez et al., 2002; Fanizza et al., 2005; Cabezas et al., 2006; Costantini et al., 2007 and 2008; Mejía et al., 2007). The aim of a study conducted by Dalbo et al. (2000) has to create a linkage map of genes controlling sex in grapevine, with emphasis on linkage group-2. Cabezas et al. (2006) have developed a QTL map from the hybrid F1 products obtained from a crossbreeding program using the seeded variety 'Dominga' and the seedless variety 'Autumn seedless'. An SSR marker named VMC7F2, closely related to the seedless trait in linkage group-18, has been reported and it has been stated that this marker could be used for early detection in breeding of seedless individuals. Costantini et al. (2008) have been confirmed this finding after analyzing QTL associated with berry size and ripening time in grapes and have been identified the VMC7F2 marker as the marker most closely associated with the SDI locus. Linkage group-18 and linkage group-4 have been defined in Dai et al. (2011). Akkurt

et al. (2013) have detected seedlessness in 314 F1 individuals obtained from the cross of 'Hamburg Muscat' (seeded) × 'Sultani' (seedless) using VMC7f2, SCF27 and SCC8 markers. They have reported that the 198 bp allele identified with the VMC7F2 marker was closely associated with seedlessness in the F1 generation and could have been used in early selection. Karaagac et al. (2012) also have reported that the VMC7F2 SSR marker can be used successfully in the selection of seedless individuals.

p3-VvAGL11 (a sequence-tagged region marker) has been developed to detect the dominant allele controlling seedlessness (stenospermocarpic) in grapevine. This marker has been designed to perform genetic analysis of INDELs in the regulatory region of VviAGL11. Bergamini et al. (2013) have conducted a study to validate the p3-VvAGL11 marker. Only eight of 475 individuals have been found to be seedless. Conner et al. (2018) has performed a characterization of stenospermocarpic seedlessness in *Euvitis* × *Muscadinia* grapevine hybrid progenies using the p3-VvAGL11 marker. They have used the VvAGL11 marker in F1 lines (seeded and seedless hybrid individuals). They have found that this marker (214 bp) gave successful results in all seedless phenotypes. The p3-VvAGL11 marker has useful in identifying seedless offspring at the seedling stage. Early detection of stenospermocarpic seedlessness has possible.

Costenaro-da-Silva et al. (2011) carried out a study on the identification of genes associated with early fruit development in a seedless cultivar (Sultanina). The RDA (Representative Difference Analysis) strategy was developed in the study. A total of 2.400 transcript derivative fragments (TDFs) have been identified and have been cloned via RDA according to three specific developmental fruiting stages. Nine candidate genes have been selected from cDNAs and quantitative PCR analysis has been performed with two reference genes. Seven of the nine genes have been demonstrated consistent stage-specific expression, allowing their isolation by RDA.

The genetics of seedlessness in grapevines were investigated using specific locus amplified fragment sequencing and genome-wide association mapping, which are considered to be strongly complementary approaches. Genome sequences were compared with the reference genome. Single nucleotide polymorphisms were identified (a total of 414.223 SNPs). 294 SNPs have been identified that showed significant correlation with seedlessness. In adddition, candidate genes related to seed development were identified at loci close to significant SNPs. (Zhang et al., 2017).

In recent years, studies on genomic prediction using various programs using artificial intelligence-assisted machine learning (AI-ML) have attracted attention. For example, Wang et al. (2024) utilized the "machine learning-based genomic selection" method to create predictive models for seedlessness in grapes. Using the seedless grapevine varieties 'Black Monukka' and 'Thompson Seedless' they achieved a prediction accuracy of approximately 97%. The study was based on genome-wide association analyses in mapping populations obtained using whole-genome sequencing data. In grapevines, two loci affecting seedlessness were identified from a total of 110 loci, including additional loci identified for the mapping populations.

CONCLUSION

Seedlessness in grapes is a trait highly preferred by consumers due to its ease of eating and improved flavor. Therefore, numerous examples of classical and modern breeding efforts exist to achieve seedlessness in both table and dried grape varieties. In terms of commercial production and consumption, stenospermocarpic seedless grape varieties are in greater demand due to their quality as both table and dried grapes.

This study covers the functions of genes associated with seedlessness and the functioning of some molecular mechanisms related to seedlessness in grapevines. Studies on these topics have been identified as being both illustrative and complementary. As a result of these studies, it appears that the single-gene effect approach is now being replaced by a multi-gene effect approach. Within the scope of the information given in this study, it is anticipated that future studies on alternative seedless grape breeding will be more effective.

Abstract

With the recent proliferation of nuclear technology, the importance of radiation protection has increased. For this purpose, experiments were conducted on samples obtained by mixing certain proportions of calcined and dewatered tincal ore obtained from the Balıkesir/Bigadiç region with cement to investigate the neutron absorption capacity of these mixtures. Neutron absorption experiments and XRD analyses were conducted under various parameters within the scope of the research. Evaluating the data from the samples, it was concluded that tincal has potential in nuclear safety, radiation protection, and building materials. It could contribute to economic sustainability and strategies for reducing external dependency by enabling the conversion of domestic mineral resources in the Bigadiç region, one of Türkiye's significant boron reserves, into value-added products. Furthermore, it is envisioned that radiation-attenuating composites developed with natural minerals could contribute to the dissemination of environmentally friendly material technologies aimed at minimizing toxic waste production.

Keywords: Cement, Tincal, Boron, Radiation, Neutron Absorption

1. INTRODUCTION

In daily life, we are constantly exposed to radiation due to both natural resources and technological advances. The construction materials chosen, especially in living spaces, are crucial for protection against this condition. The type, thickness, and density of the material are among the determining factors in radiation absorption (Yılmaz 2011).

Radiation can be defined as the process resulting from the energy dissipation of atoms and the transport of this energy through space via electromagnetic waves, or particles. This type of energy can occur in both particle and electromagnetic waves, and its spectrum spans a wide range, from long radio waves to cosmic rays. Initially used extensively in medical and industrial applications, radiation has now expanded its scope and is being utilized extensively in various environments and sectors (Sehhatigdiri 2014).

Just as no cell in nature is resistant to radiation, it's also difficult to claim that a place or region in nature is completely free of radiation. This is because everyone living on Earth is exposed to radiation as a part of life, from cosmic rays, from ground-based sources derived from radioactivity, and from artificial sources. While it varies from place to place, 78% of the total public dose comes from natural sources, 20.7% from medical exposure, and the remainder from occupational exposure and artificial sources (Berk, 2003).

Radiation protection has three fundamental elements: necessity, optimization, and personal dose limitations. The goal of radiation protection is to prevent deterministic effects by keeping doses below threshold values and to ensure that the probability of harmful effects remains at acceptable levels. Practically, important measures can be taken to protect against radiation. These are duration, distance, and shielding (Berk, 2003).

The dose of radiation received is inversely proportional to the square of the distance between the radiation source and the worker. Furthermore, the most important and effective way to prevent external radiation hazards is shielding. Shielding involves placing a barrier between the radiation source and the worker, absorbing all or a large portion of the radiation, thus reducing its intensity. This process utilizes the radiation attenuation properties of materials, thus extending the time spent working close to the source. Shielding can be of various shapes and thicknesses, depending on the type and energy of the radiation. α rays can be stopped by a sheet of paper or body skin, β rays by a 2.5 cm thick layer, and ϒ rays are only stopped by large amounts of lead or concrete (Berk, 2003).

To protect the outside world from the harmful effects of radiation, shielding is particularly crucial in units operating under radiation, and the radioactive area is surrounded by lead bricks or concrete. These shielding methods are both costly and cumbersome.

In recent years, a great deal of research has been conducted in the field of building materials, particularly cement-based materials. Nanostructured materials, with their diverse properties such as self-cleaning, dirt-repellent, flame-retardant, sound-insulating, and light-control films, offer a different perspective on conventional building materials (Parhizgar and Ghasemi, 2009).

Concrete, used as a building material, is a multicomponent material obtained by mixing cement, water, sand, and various mineral additives such as silica fume, fly ash, and blast furnace slag in specific proportions. Cement is one of the highest-cost components in concrete production, and Portland cement is widely preferred. Today, mineral additives are often included in concrete mixtures, and these additives are used to improve the performance of concrete in both its fresh and hardened states (Yılmaz 2011).

Boron is not found free in nature. It is generally found in crystalline or amorphous compounds. Boron is present in the Earth's crust at an average level of 10 ppm in environments such as soil, rocks, and water. Natural boron exists as a mixture of two stable isotopes, with mass numbers of 10 (19.8%) and 11 (80.2%), respectively. Boron occurs in varying proportions in the structure of more than 150 minerals in nature, generally as boron oxide (B_2O_3). Economically important boron minerals occur as hydrate compounds with elements such as calcium, sodium, and magnesium and are classified according to these elements. Among the primary boron minerals with industrial value are tincal, colemanite, ulexite, probertite, boracite, pandemite, szaybelite, hydroboracite, and kernite. After mining, these minerals are generally washed and ground to make them suitable for use (TMMOB Chamber of Metallurgical Engineers 2003).

Tincal, also known as borax, a boron mineral, appears colorless and transparent in its pure form. However, in areas where it is layered with clay and in fine-grained form, it can turn pale pink, yellowish-orange, and gray under the influence of external substances (Dırak 2011). A review of scientific literature suggests that boron oxide may have radiation shielding properties. Studies have shown that:

Experiments were conducted on concrete samples containing boron oxide, colemanite, and boron, and the radiation shielding capacity of the concrete's chemical components was analyzed. The study demonstrated that boron-added heavyweight concretes offered advantages not only in terms of effective shielding performance but also in terms of cost (Henrie 1962a).

In a study conducted by Sychev, the shielding performance of concrete samples prepared using hematite minerals against neutrons emitted from a beryllium source was investigated. In this context, evaluations were made considering five different neutron energy levels ranging from 170 MeV to 660 MeV (Sychev 1967).

In their study, Erdoğan et al. (2000) produced different types of cement by adding ground boron minerals to cement and examined their physical and mechanical properties. They also evaluated the shielding capacity of boron minerals against neutron rays in concrete using theoretical approaches. Based on their findings, they concluded that boron mineral addition positively affected shielding performance (Erdoğan et al. 2000).

Erdoğmuş and colleagues (2011) investigated the effects of adding different mixtures of colemanite concentrator waste and Karabük slag to Portland cement on the mechanical properties of the cement. Additionally, the effect of adding different ratios of Na_2CO_3 to Portland cement on the mechanical properties of the cement was investigated. The colemanite concentrator waste, slag, gypsum, and clinker used in the experiments were chemically analyzed using XRF. The mechanical properties examined in the study included compressive strength, setting time, volumetric expansion, and normal consistency water. The findings were compared with Turkish Standards (TS), and the research concluded that colemanite concentrator waste and Karabük slag can be utilized appropriately in cement production (Erdoğmuş et al. 2011).

Uğurlu and colleagues (2004) investigated the usability of solid waste, called "clay paste," generated during the concentration of borax mineral during tincal production, in cement. For the cement study, ground clay paste waste was added to Portland cement mortar at different ratios, and fresh and hardened concrete tests were conducted on the resulting mortar samples. These tests investigated the behavior of clay paste in cement and its effect on cement mortar samples. The results were compared with reference samples and Turkish Standards (TS). The results

indicate that borax-containing clay paste waste can be used as a retarder in mortar or concrete, and that low percentages of clay paste waste can increase the impermeability of concrete (Uğurlu et al. 2004).

In 2010, Akkurt and his colleagues conducted a study using heavy concretes produced using barite and lead. They measured linear absorption coefficients using radioactive sources with energies of 0.662 MeV, 1.173 MeV, and 1.332 MeV using a NaI(Tl) detector. The results were compared with XCOM data. The results revealed that barite and barite-added heavy concretes are good gamma-ray absorbers, but their shielding properties are lower than those of lead (Akkurt et al. 2010).

In another study conducted by Korkut and colleagues in 2011, the shielding properties of amethyst ore were investigated using the FLUKA Monte Carlo code and linear attenuation coefficients were calculated. These calculations concluded that amethyst ore has potential as a material for shielding against radiation (Korkut et al. 2011).

2. MATERIALS and METHODS

2.1. Materials

2.1.1. Materials used in experiments

In this study, tincal, a primary boron mineral, was used to investigate its neutron beam absorption properties. The cement used in the experiments was Portland cement (CEM I 42.5 R) supplied by the Aşkale Cement Factory.

Tincal, a natural borate mineral with a high boron content, was obtained from the Balıkesir-Bigadiç/Türkiye region. Before being used in experimental studies, it underwent preliminary preparation processes such as grinding, drying, and sieve analysis. Following these processes, the samples were reduced to micron size and finally heat-treated at 650°C to remove the crystal water, resulting in anhydrous boron.

2.2. Method

2.2.1. Production of Concrete

The concretes examined in this study were produced at the Civil Engineering Department Laboratory of Erzurum Technical University. Three types of concrete were produced in this study: standard concrete and tincal-added concrete. First, cement-only samples were prepared for comparison. Then, 1%, 5%, and 10% tincal were added to each cement sample, sequentially and separately. The water/binder ratio was set at 0.20 in the experiments. The temperature of the sample was measured with a digital thermometer, and the mixing water temperature was determined to be between 25-30°C. The prepared samples were placed in 5x5x5cm cube sample molds. The samples were kept in their molds for 24 hours and then removed from the molds. During the curing process, the samples were maintained in a constant temperature environment (24°C), and the ambient temperature and relative humidity were regularly monitored with a digital thermometer.

2.2.2. Neutron Absorption

The experimental measurements undertaken in relation to the attenuation coefficient of the concrete produced as part of the study were conducted at the High Energy Spectroscopy Laboratory, which is housed within the Department of Atomic and Molecular Physics at Atatürk University's Faculty of Science.

The measurement of the neutron absorbed dose rate was conducted using a ^{241}Am/Be fast neutron source, which emits 2–11 MeV neutron particles. The Canberra NP100B-BF_3 gaseous neutron detector and the Canberra ADM606 series of digital rate meters were utilized in this process. The experimental neutron dose rate measurement system is illustrated in Figure 1.

The intensity of a photon flux with intensity I_0 decreases when it passes through an absorbing material of thickness t. If the transmitted intensity is I, this decrease in intensity is described by the Lambert-Beer law (Yılmaz 2011) as the linear attenuation coefficient (MM),

$$\mu = -\frac{1}{t}\, ln\, ln\left(\frac{I}{I_0}\right) \text{ (cm}^{-1}\text{)}$$

However, the mass attenuation coefficient (μ/ρ), defined as the ratio of the linear attenuation coefficient (μ) to the sample density (ρ) and does not change depending on the phase of the material, is more commonly used.

The values in the Table 1. were calculated using the equation below.

$$\frac{\mu}{\rho} = -\frac{1}{\rho t} ln \ln\left(\frac{I}{I_0}\right)$$

where ρt is called the mass thickness. The unit of the mass attenuation coefficients is cm^2/g.

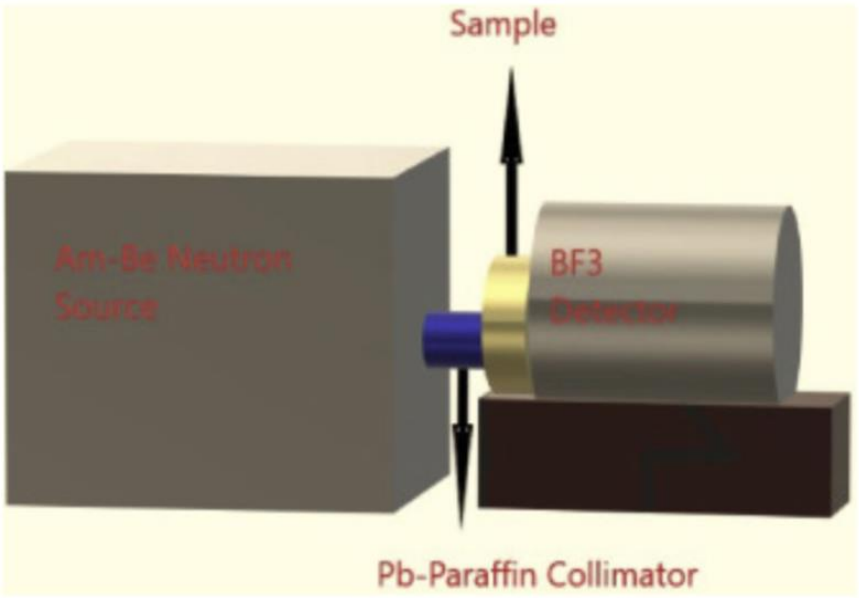

Figure 1. Experimental setup for neutron absorption experiments.

2.2.3. X-ray diffraction (XRD)

XRD analysis of the concretes produced within the scope of this study was measured at Erzurum Technical University's High Technology Application and Research Center (YUTAM).

Calculating compound or phase compositions from oxide components can be accomplished using both theoretical and experimental methods. X-ray diffraction (XRD) has been successfully used for many years to determine mineral concentrations. Since 1958, various studies have been conducted on the use of XRD analysis in determining cement compositions (Winter 2012).

Concrete, a composite material, exhibits complex behavior due to its high cement content. Microstructural differences from the cement paste have been observed, particularly at the cement-aggregate interface. The formation of new compounds as a result of exposure to various aggressive environmental conditions and the formation of characteristic structures during the natural deterioration processes of concrete have made X-ray diffraction (XRD) analysis an important and essential method for investigating service life, durability, and related product performance (Ramachandran et al. 2000).

2.2.4. Heat treatment

The use of boron in the cement sector has become widespread, but boron ores are suitable for use up to a maximum water content of 2% (Kocadağistan and Arslan, 2024). Tincal was dewatered in a muffle furnace at 650°C for 6 hours. Following the heat treatment, the chemically bound water removal rate was calculated by taking the weight differences of tincal and ulexite ores. According to the calculations, 98% water removal was achieved in the ore (Ataç 2024).

According to XPS and chemical analysis results, tincal was determined to contain 47.2% H_2O. Based on the weight difference calculations, the H_2O content was reduced to 1% after heat treatment and used in the experiments.

3. RESEARCH FINDINGS AND DISCUSSION

Cement, mixtures of cement and dewatered tincal at 1%, 5%, and 10% were examined, and their neutron absorption values are given below. These values revealed that 5% tincal was the best. XRD analyses were conducted based on these values. Furthermore, the samples with the best absorption values were subjected to unconfined compression tests, and their suitability as a building material was evaluated.

3.1. XRD Analysis Evaluation (5% Tincal Added Sample)

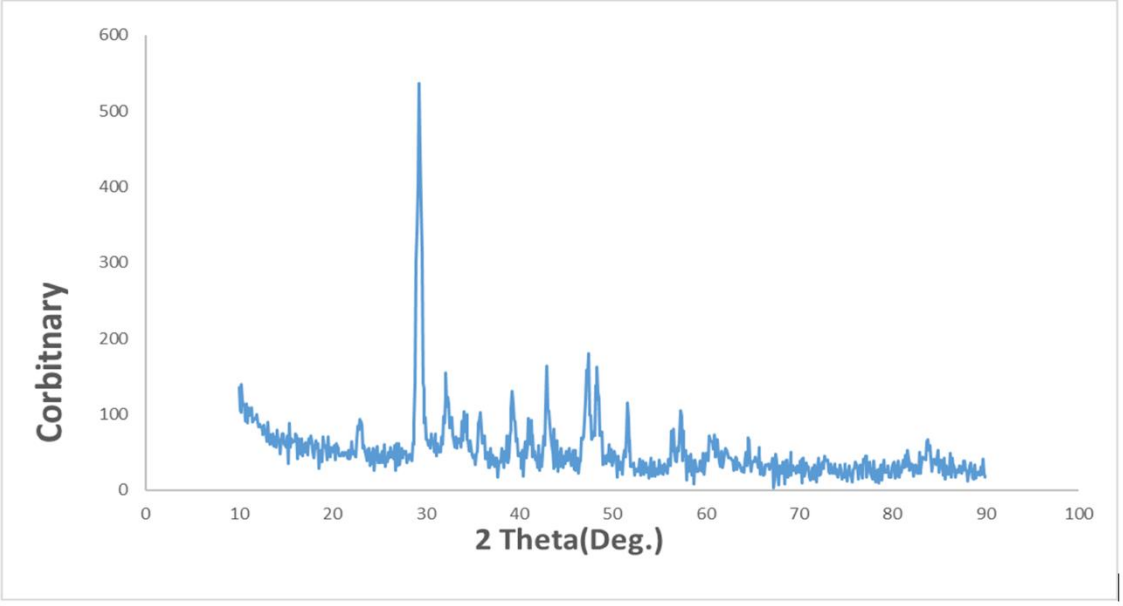

Figure 2. XRD analysis of the 5% Tincal added sample (Tincal:)) %5

The X-ray diffraction (XRD) pattern of a tincal-added cement sample allows the determination of its crystal structure and mineralogical composition. The graph presents intensity values corresponding to the 2θ angle, and these data are used to identify the crystalline phases within the sample.

Tincal, dolomite, smectite, and calcite are observed in the planes corresponding to the prominent peaks in the XRD spectrum of tincal ore. The high-intensity peak observed at approximately 29° 2θ in the obtained diffractogram reveals the dominant presence of tincal ($Na_2B_4O_7.10H_2O$) and calcite ($CaCO_3$) phases in the sample. Calcite is a common component in the cement matrix, and its presence may be due to either the clinker structure or the carbonation process of the cement matrix. In addition, other intense pixels observed in the 32–34° 2θ range indicate the presence of calcium silicate hydrate (C-S-H) and ettringite phases, which are cement hydration products.

Some pixels detected in the graph with low intensity but distinct levels can be associated with X-ray reflections of the crystal structure of the mineral tincal ($Na_2B_4O_7 \cdot 10H_2O$), which is used as an additive. This suggests that the additive is preserved in physical or chemical form within the cement matrix and integrated into the structure. However, diffraction pixels appearing between 40° and 50° 2θ suggest that tincal may have interacted with cement hydration products, triggering the formation of new mineral phases.

These data indicate that a 5% tincal addition can lead to the formation of specific crystalline phases in the cement matrix, thereby inducing structural changes in the cement microstructure. Such structural changes have the potential to directly affect the mechanical and physical properties (e.g., compressive strength, durability, and impermeability) of cement-based composites.

3.2. Neutron Absorption Experiments of Tincal Added Cement

The values of the Neutron absorption test results of the samples of the mixtures are given in Table 1. and Figure 3.

Table 1. Tincal neutron absorption experiment values

Sample	Transmitted Ray Intensity (I)	Relative Beam Intensity (I/I₀)	Thickness (t, cm)	Mass (M, g)	Intensity (ρ, g/cm³)	Linear Attenuation Coefficient Sigma (cm⁻¹)	Mass Attenuation Coefficient (Sigma/Rho) cm²/g
Control	0,886	0,875	0,540	9,9676	1,8245	0,248	0,136
Control + Tincal 1%	0,856	0,845	0,540	9,8815	1,8087	0,313	0,173
Control + Tincal 5%	0,846	0,839	0,540	9,9705	2,1424	0,381	0,178
Control + Tincal %10	0,839	0,830	0,540	9,3464	1,8476	0,373	0,202

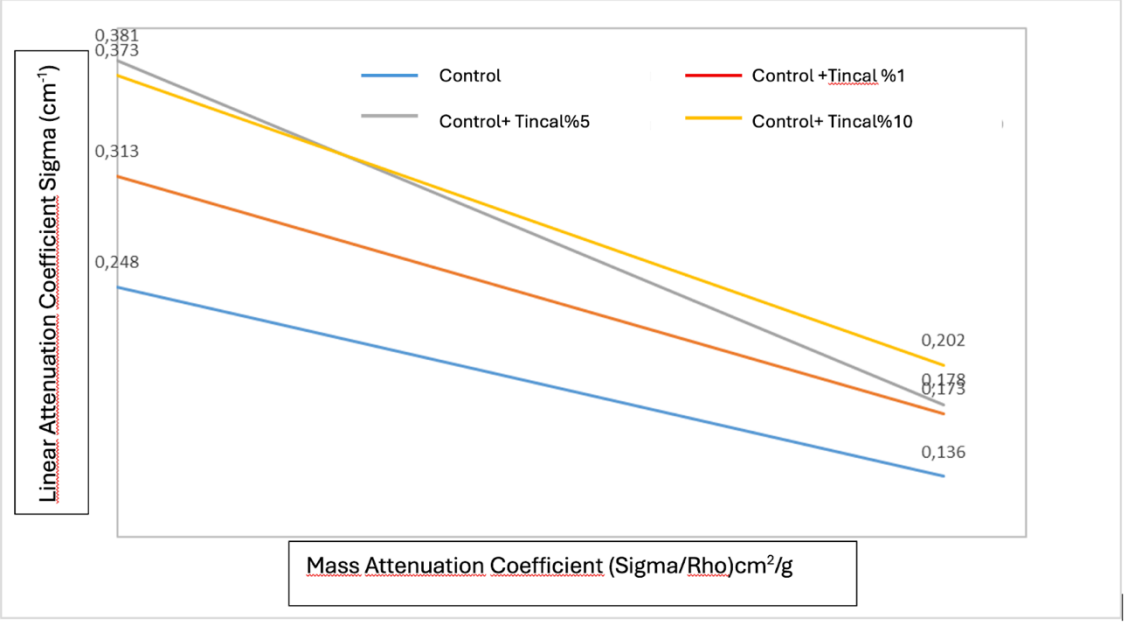

Figure 3. Tincal neutron absorption experiment values

The data in Table 1. demonstrate the effects of tincal addition on the neutron attenuation behavior of cement-based samples. As tincal addition increases, a decrease in transmitted light intensity is observed, indicating that the material becomes more effective attenuator against neutrons. Particularly with 5% and 10% tincal additions, the relative radiation intensity reaches lower values, and the linear attenuation coefficient increases significantly. This indicates that neutron interactions within the material increase, increasing the attenuation capacity. The change in density values fluctuates depending on the doping ratio, with the highest density value recorded at 5% tincal. This increase may contribute to attenuation performance in terms of neutron scattering and absorption. The increase in the mass attenuation coefficient also supports this finding. Consequently, tincal addition has the potential to improve the attenuation performance of cement-based composites against neutron radiation.

4. CONCLUSION AND RECOMMENDATIONS

In this study, various experimental methods were applied to tincal ores obtained from the Balıkesir-Bigadiç region to investigate their neutron absorption capacity. These experimental studies included neutron absorption experiments under various parameters, and X-ray diffraction (XRD) analyses. Following these analyses, the neutron absorption properties of tincal ores were evaluated in detail, and the findings are presented below.

The neutron absorption capacities of composite samples formed by adding tincal ore at different rates were experimentally investigated. It was observed that as the tincal addition rate increased, the transmitted radiation intensity decreased, while at the same time, the attenuation properties became more effective against neutrons. Particularly at 5% and 10% tincal additions, the relative radiation intensity reached lower values, and the linear attenuation coefficient increased significantly. This indicated that the interactions between neutrons within the material increased, increasing the attenuation capacity. Consequently, tincal addition has the potential to improve the attenuation performance of cement-based composites against neutron radiation.

Demonstrating the attenuation performance of tincal ore against neutron radiation with varying amounts of additives suggests that these natural minerals can be considered alternative shielding materials in radiation protection applications. This finding contributes to the development of environmentally friendly solutions that can reduce reliance on toxic and environmentally hazardous materials, particularly lead.

The utilization of tincal ore from the Bigadiç region, one of Turkey's significant boron reserves, allows for the transformation of domestic mineral resources into value-added products. This supports both economic sustainability and offers a strategic contribution to reducing external dependency.

The attenuation coefficients obtained over a wide energy range constitute a valuable database that can be used in the design and development of next-generation radiation shielding materials. These data serve as a reference for the scientific literature, providing the basis for further research.

Slimming composites developed using natural minerals minimize toxic waste production, contributing to the dissemination of environmentally friendly material technologies. In this respect, the study can be considered within the scope of sustainable engineering practices.

Özet

Beyin hasarı; travmatik beyin hasarı, iskemi-reperfizyon, intrakraniyal hemoraji veya nörotoksik maddelere bağlı olarak ortaya çıkar ve yüksek morbidite ile mortaliteye sahiptir. Bu süreçte oksidatif stres, inflamasyon, mitokondriyal disfonksiyon ve apoptoz gibi karmaşık biyokimyasal ve moleküler mekanizmalar etkin rol oynar. Kuersetin, doğal bir flavonoid olup güçlü antioksidan, antiinflamatuar, antiapoptotik ve mitokondri stabilizan özelliklere sahiptir. Deneysel modellerde kuersetin; oksidatif stres göstergelerini azaltma, inflamatuar sitokinleri düşürme, kan-beyin bariyerini koruma, mitokondriyal fonksiyonu iyileştirme ve nöronal apoptozu sınırlama gibi çok yönlü nöroprotektif etki gösterdiği ifade edilmiştir. Ancak kuersetinin zayıf suda çözünürlüğü ve düşük biyoyararlanımı, klinik uygulamadaki potansiyelini sınırlamaktadır. Bu derleme mevcut deneysel kanıtları ve geleceğe dönük araştırma ihtiyaçlarına dikkat çekerek kuersetinin beyin hasarındaki rolünü ele almaktadır.

Anahtar Kelimeler: kuersetin, antioksidan ajan, beyin hasarı, nöroinflamasyon

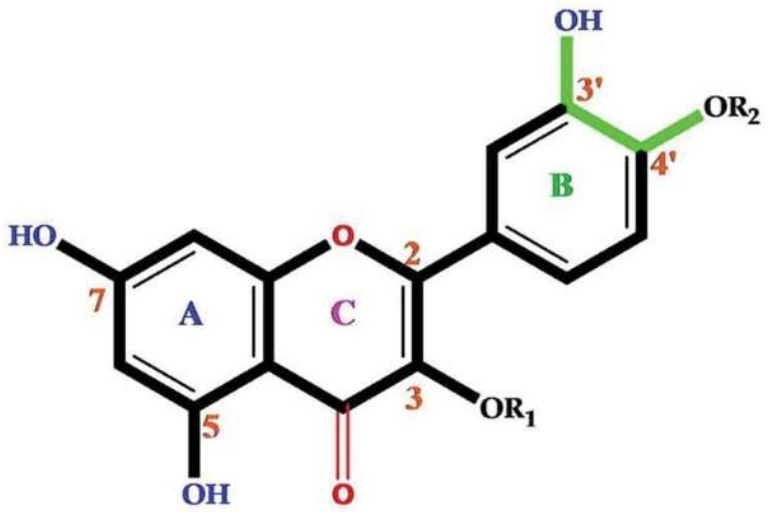
Quercetin and brain ınjury: Experimental findings and clinical potential

Abstract

Brain injury may result from traumatic brain injury, ischemia–reperfusion, intracranial hemorrhage, or exposure to neurotoxic agents, and is associated with high morbidity and mortality. In this process, complex biochemical and molecular mechanisms including oxidative stress, inflammation, mitochondrial dysfunction, and apoptosis play critical roles. Quercetin, a natural flavonoid, possesses potent antioxidant, anti-inflammatory, anti-apoptotic, and mitochondrial-stabilizing properties. Experimental models have demonstrated that quercetin exerts multifaceted neuroprotective effects by reducing oxidative stress markers, suppressing inflammatory cytokines, preserving the blood–brain barrier, improving mitochondrial function, and limiting neuronal apoptosis. However, the poor water solubility and low bioavailability of quercetin restrict its potential clinical application. This review addresses the role of quercetin in brain injury by highlighting current experimental evidence and future research needs.

Keywords: quercetin, antioxidant agent, brain injury, neuroinflammation

GİRİŞ



Beyin hasarı, hem insanlarda hem de hayvan modellerinde önemli mortalite ve morbidite nedenlerinden biri olmakla birlikte travma kökenli ya da sekonder kaynaklı olarak ortaya çıkabilmektedir. Travmatik beyin hasarı, serebral iskemi-reperfüzyon, intrakraniyal hemoraji veya toksik etkenlere bağlı nöronal yıkım, kompleks biyokimyasal ve moleküler mekanizmaların etkileşimiyle gelişir (Yan ve ark., 2024). Sekonder beyin hasarı, oksidatif stres, inflamasyon ve apoptoz gibi moleküler olaylar aracılığıyla nöronal dejenerasyonu derinleştirir (Aronowski ve Zhao, 2011; Shao ve ark., 2022). Bu süreçte reaktif oksijen türleri (ROS) ve proinflamatuar sitokinlerin artışı, lipid peroksidasyonu ve mitokondriyal disfonksiyon ile birleşerek beyin dokusunun yapısal ve fonksiyonel bütünlüğünü bozar. Bu nedenle, sekonder hasarı hedefleyen terapötik ajanlar, hem nöronal korunma hem de klinik iyileşme açısından kritik öneme sahiptir (Davis ve Vemuganti, 2022).

Beyin hastalıklarında oksidatif stres, nöronal ölümle sonuçlanan tanımlanmış patolojik mekanizmaların birçoğunda rol oynar. Reaktif oksijen ve azot türlerinin (ROS ve NOS) aşırı üretimi, nörodejeneratif hastalıkların başlangıcında, devamında ve ilerlemesinde kritik olarak kabul edilmiştir (Uttara ve ark., 2009; Gandhi ve Abramov, 2012; Dajas ve ark., 2015). Ortaya çıkan oksidatif hasarın önlenebilmesi adına birçok çalışmada çeşitli antioksidan ajanlardan yararlanılmıştır. Önemli flavonoid türevlerinden biri olan kuersetin'de bunlardan biridir.

Kuersetin (3,3′,4′,5,7-pentahidroksiflavon), ilk olarak meşe ağacından izole edilen bitkisel kökenli güçlü bir antioksidan olarak dikkat çekmektedir. Soğan, elma, üzüm, karadut, yaban mersini, kırmızı kiraz ve yeşil çay gibi birçok gıdada doğal olarak bulunur (Rasouli ve ark., 2017). Kuersetin, insanlar için önemli bir diyet besin maddesi, antioksidan ve potansiyel terapötik ajan olmakla birlikte (Lawson, 2023) metabolik ve inflamatuvar bozuklukların tedavisi için en yaygın kullanılan biyoflavonoidlerden biridir (Anand ve ark., 2016). Fizyopatolojik süreçlerde gösterdiği antioksidan etki, kuersetinin en önemli özelliğidir. Kuersetinin, vücuttaki bir antioksidan olan glutatyon seviyesini artırarak oksidatif stresin neden olduğu birçok hastalığı ve vücuttaki proinflamatuvar maddelerin salınmasını önlemek/tedavi etmek için önemli bir terapötik ajan olduğu (Imran ve ark., 2022), oksidatif stres ile ilişkili hücre hasarı durumlarında koruyucu etkisinin olabileceği düşünülmektedir (Becerra-Torres ve ark., 2009; Özçiflikçi, 2023). Bu bilgiler ışığında çalışmanın yapılmasındaki temel amaç; çeşitli biyoaktif özellikleri ile öne çıkan kuersetin kullanımına ve beyin hasarına karşı olası protektif etkilerine dikkat çekmektir.

KUERSETİN

Kuersetin, sarımsı kristal yapıda bulunan ve yüksek erime noktasına sahip (316.5 °C) hidrofobik bir bileşikdir (Lawson, 2023). Uluslararası Saf ve Uygulamalı Kimya Birliği (IUPAC) terminolojisinde 3, 3', 4', 5, 7 pentahidroksiflvanon olarak tanımlanan bu molekülün kimyasal formülü C15H10O7'dir (Li ve ark., 2016; Nguyen ve Bhattacharya, 2022). Kuersetin, diğer flavonoidlerle kıyasla en az lipofilik olan flavonoiddir (Lawson, 2023). Kuersetinin biyolojik aktivitesi, içerisinde yer alan aktif fenolik hidroksil gruplarına ve çift bağlara atfedilmektedir (Wang G ve ark., 2022). Bu yapısal özellikler, kuersetine antioksidan, antiinflamatuvar, antimikrobiyal, antiviral, antikanser, antiobezite kardiyovasküler ve nöroproteksiyon gibi birçok farmakolojik etkiler kazandırmaktadır (Nguyen ve Bhattacharya, 2022). Kuersetin'in kimyasal yapısı Şekil 1'de, içerisinde yoğun olarak bulunan gıdalar ise Şekil 2'de verilmiştir.

Şekil 1. Kuersetin kimyasal yapısı (Rasouli ve ark., 2017).

Şekil 2. Kuersetin içeren besin kaynakları (Rasouli ve ark., 2017).

Diyetle alınan kuersetin hızlı bir metabolik dönüşüme uğrar ve gastrointestinal sistemin farklı bölgelerinde değişen oranlarda emilir: midede %24–53, ince bağırsakta %5–10 ve kolonda %90–95 (Li ve ark., 2016; Deepika ve Maurya, 2022). Duodenumda emilen kuersetin glikozitleri, daha sonra ince bağırsakta ve karaciğerde enzimler aracılığı ile metillenerek metabolitlere ayrılmaya başlar (Li ve ark., 2016). Özellikle karaciğerde oluşturulan kuersetin metabolitleri emilir, daha sonra sistemik dolaşıma katılır, dokulara dağılır, dönüştürülür veya atılır. Kuersetin, lipofilik olması nedeniyle plazma zarından kolayca geçer (Deepika ve Maurya, 2022) ve plazmada albümine güçlü bir şekilde bağlanır. Kuersetinin eliminasyonu, yağlı beslenme sonrası gecikmesiyle beraber eliminasyon yarı ömrü yaklaşık olarak 25 saattir (Lakhanpal, 2007).

Kuersetin, serbest radikallerle reaksiyona girerek hidrojen atomu bağışlayabilme ve ROS'u söndürebilme kapasitesi nedeniyle güçlü bir antioksidan olarak tanımlanır (Deepika ve Maurya, 2022). Aktif oksijen radikallerinin parçalanması; hidrojen atomu nakli (HAT), basit elektron nakli ve ardından proton aktarımı (SET-PT), proton kaybıyla sıralı elektron aktarımı (SPLET) ve geçiş metallerinin şelasyonu (TMC) mekanizmaları ile sağlanabilir (Michala ve Pritsa, 2022). Ayrıca kuersetinin metal iyonlarına bağlanmada etkin bir iyonofor olduğu da vurgulanmaktadır (Imran ve ark., 2022). Bunun yanında, glutatyon (GSH) düzeylerini artırarak endojen antioksidan kapasitenin güçlenmesine katkı sağlar (Imran ve ark., 2022). Kuersetin, hücresel düzeyde oksidatif hasarı azaltma, inflamatuar sinyal yollarını baskılama, mitokondri fonksiyonlarını koruma ve apoptozu önleme gibi çok yönlü etkiler gösterir. Bu nedenle kuersetin, beyin hasarının biyokimyasal ve moleküler sonuçlarını hafifletmede potansiyel bir nöroprotektif ajan olarak değerlendirilmektedir.

Literatürde, kuersetinin AMPK aktivasyonunu uyararak hücresel enerji metabolizmasını iyileştirdiği, oksidatif stresi azalttığı ve proinflamatuvar sitokin üretimini baskıladığı gösterilmiştir. Bu etkiler hem antiinflamatuvar hem de nöroprotektif özelliklerinin temel mekanizmalarından biri olarak değerlendirilmektedir. Deneysel çalışmalarda kuersetin; orta serebral arter oklüzyonu ve travmatik beyin hasarı modellerinde davranışsal ve biyokimyasal parametrelerde belirgin iyileşmeler sağlamıştır. Bu modellerde SOD, CAT ve GSH gibi antioksidan enzim aktivitelerinin artması; MDA düzeylerinin azalması ve nörolojik skorların iyileşmesi, kuersetinin çok yönlü koruyucu etkilerini açıkça ortaya koymakta ve desteklemektedir (Li ve ark., 2021). Kuersetinin nöroprotektif etkilerinin önemli bir boyutu, kan–beyin bariyeri (KBB) bütünlüğü üzerindeki koruyucu rolüdür. Beyin hasarı sonrası KBB'nin yapısal bütünlüğünün bozulması periferal inflamatuvar hücrelerin beyin dokusuna geçişini

kolaylaştırarak ödem ve ikincil hasara yol açar. Kuersetin, bariyer bütünlüğünün korunmasına katkı sağlayarak inflamasyonun ve doku yıkımının ilerlemesini sınırlayabilmektedir (Dong ve ark., 2014; Chiang ve ark., 2023).

Moleküler düzeyde ise kuersetinin Nrf2'nin nükleusa translokasyonunu artırdığı, NF-κB'nin fosforilasyonunu engellediği ve bu sayede oksidatif stres–inflamasyon eksenindeki etkileşimi dengelediği bildirilmektedir. Mitokondriyal membran potansiyelinin korunması ve ATP düzeylerinin artışı da kuersetinin enerji metabolizması üzerindeki olumlu etkilerini desteklemektedir (Li X ve ark., 2016). Sonuç olarak, kuersetinin AMPK aktivasyonu, oksidatif stres modülasyonu, inflamasyonun baskılanması ve KBB bütünlüğünün korunması gibi çok yönlü mekanizmalar aracılığıyla nöroprotektif potansiyel taşıdığı açıkça ortaya konulmaktadır. Bununla birlikte, kuersetinin optimal doz aralığı, uygulama şekli ve uzun dönem etkilerini netleştirmek amacıyla daha kapsamlı çalışmalara ihtiyaç duyulmaktadır.

DENEYSEL BULGULAR VE KLİNİK POTANSİYEL

Oksidatif stres, hücrelerde ve dokularda reaktif oksijen türleri (ROS) ve reaktif azot türlerinin (RNS) üretimi ve birikimi ile endojen savunma sistemlerinin bu yan ürünleri ortadan kaldırma yeteneği arasındaki dengesizlikten kaynaklanan bir durumdur. Temelde antioksidan dengede yer alan homeostatik mekanizmalardaki bozulmalardan kaynaklanmakta olup, yüksek lipid içeriği, yoğun oksijen tüketimi ve sınırlı antioksidan savunma kapasitesi nedeniyle beyin dokusunun oksidatif strese karşı son derece hassas olduğu bilinmektedir (Olufunmilayo ve ark., 2023). Beyin hasarına eşlik eden oksidatif stresin, enerji üretiminde eksiklik, lipid peroksidasyonu, nöroinflamasyon, metal homeostazında değişiklik ve nöronal apoptoz gibi patofizyolojik mekanizmalar ile birçok nörodejeneratif bozukluğun tipik özelliği olan toksik protein agregatlarının birikmesine yol açan mitokondriyal işlev bozukluklarında kritik rol oynamaktadır (Olufunmilayo ve ark., 2023). Bu nedenle, antioksidan bileşiklerin beyin hasarına karşı etkili bir tedavi seçeneği olabileceği düşünülmekte ve çok yönlü biyolojik aktiviteye sahip doğal moleküllerin nöroprotektif stratejiler açısından giderek daha fazla dikkat çektiği görülmektedir. Flavonoid yapısındaki güçlü antioksidanlardan biri olan kuersetin, serbest radikalleri temizleme kapasitesi/antioksidayon (Costa ve ark., 2016), inflamatuvar yolakları baskılama etkisi/antiinflamatuar (Li ve ark., 2016), nöroprotektif aktivite (Barreca ve ark., 2016) ve mitokondriyal stabiliteyi artırıcı fonksiyonları nedeniyle beyin hasarı modellerinde umut vadeden bir ajan olarak öne çıkmaktadır (Dajas ve ark., 2015; Chiang ve ark., 2023).

Lin ve ark., (2021) tarafından yapılan bir çalışmada 250–300 g ağırlığındaki 40 adet erkek Sprague–Dawley sıçan, çevresel koşullara adapte edildikten sonra rastgele dört gruba ayrılmıştır: sham, ligasyon, kuersetin ve önleyici grup. Kuersetin gruplarına, fizyolojik salin içinde çözülmüş 20 mg/kg dozunda kuersetin intraperitoneal olarak günde bir kez 10 gün süreyle uygulanmıştır. İskemik model oluşturmak için sağ orta serebral arter (MCA) ve sağ ortak karotid arter (CCA) 60 dakika süreyle bağlanmıştır. Operasyon sonunda hayvanlar anestezi altında dekapite edilerek ipsilateral beyin korteksi alınmış, homojenize edilip süpernatantları biyokimyasal analizler için kullanılmıştır. Doku örneklerinde malondialdehit (MDA) düzeyi tiobarbitürik asit reaktif madde (TBARS) yöntemiyle, Mg, Zn, Se, Fe ve Cu konsantrasyonları atomik absorpsiyon spektrofotometresiyle, SOD ve CAT aktiviteleri ticari kitlerle spektrofotometrik olarak belirlenmiştir Kuersetin uygulamasının serebral iskemiye karşı belirgin nöroprotektif etki gösterdiği belirlenmiştir. Kuersetin ön tedavisi, ligasyon grubuna kıyasla beyin korteksinde MDA, Fe, Cu düzeyleri ve Cu/Zn oranını anlamlı biçimde azaltırken; Mg, Zn, Se elementleri ile SOD ve CAT aktivitelerini artırmıştır. Bu bulgular, kuersetinin antioksidan savunma sistemini güçlendirerek ve esansiyel element dengesini düzenleyerek oksidatif stres kaynaklı lipid peroksidasyonunu azalttığını göstermektedir.

Wang ve ark., (2020), kuersetinin oksidatif stresi ve inflamasyonu azaltarak sıçan hipokampal nöronlarında serebral iskemi/reperfüzyon hasarına ve oksijen-glikoz yoksunluğu/reoksijenasyon nörotoksisitesine karşı koruduğunu bulmuştur. Li ve ark., (2021), kuersetinin hipoksi ve reoksijenasyon nedeniyle hasar gören endotel hücreleri üzerindeki koruyucu etkisini araştırmıştır. Araştırmacılar, kuersetinin insan göbek kordonu endotel hücrelerinde hücre apoptozunu ve oksidatif stresi azalttığını buldular. Bu çalışmalar, kuersetinin inflamasyonu ve oksidatif stresi azaltarak farklı serebral iskemi ve hipoksik-iskemik beyin hasarı modellerinde nöroprotektif etkilere sahip olduğunu ileri sürmektedir.

Kuersetinin subaraknoid kanama (SAK) sonrası beyin hasarı üzerindeki etkilerinin araştırıldığı bir çalışmada (Dong ve ark., 2014) deneysel olarak indüklenen SAK modelinde 10 mg/kg ve 50 mg/kg dozunda kuersetin etkinliği inclenmiş ve özellikle 50mg dozunda kuersetin alan grupta SOD ve GPx aktivitelerini belirgin şekilde artırdığı, MDA düzeylerini ise azalttığı belirlenmiştir. Ayrıca beyin ödeminin ve nörodavranışsal eksikliklerin düzeldiğini belirten çalışma ekibi, optimal dozda kuersetin uygulamasının endojen antioksidan enzimlerin aktivitesini artırarak ve serbest radikal oluşumunu engelleyerek SAK modelinde beyin hasarını iyileştirebileceğini ve nöroproteksiyon sağlayabileceğini vurgulamışlardır.

Robinson ve ark., (2025) tarafından yapılan bir çalışmada in vitro ve in vivo modellemeler ile travmatik beyin hasarı üzerinde durulmuş ve kuersetin kullanımının; serebral endotel hücrelerinde ROS'u azaltmada etkili olduğu, beyin endotel hücrelerinde sıkı bağlantıları, yapışık bağlantı proteinlerini ve aktin sitoskeletal düzeneğini koruyarak KBB sıkı bağlantı bütünlüğünün kaybına karşı koruma sağladığı; oksidatif strese maruz kaldığında endotel hücrelerinin kritik bariyer fonksiyonunu koruduğu ve intravenöz uygulamasının, orta şiddette travmatik beyin hasarlı bir fare modelinde KBB bozulmasına ve hiperpermeabiliteye karşı terapötik potansiyeline sahip olduğunu vurgulamışlardır.

Kuersetinin Alzheimer hastalığı (AD) patofizyolojisine yönelik çok yönlü koruyucu etkileri çeşitli moleküler mekanizmalarla ilişkilendirilmektedir. Kuersetinin amiloid-beta (Aβ) agregasyonunu inhibe ettiği ve Aβ plak oluşumunu azalttığı gösterilmiş olup, bu etkiler hastalığın ilerlemesini yavaşlatmada önemli bir rol oynayabileceği ifade edilmiştir (Alghamdi ve ark., 2022). Ayrıca kuersetinin, proinflamatuvar sitokinlerin ve diğer inflamatuvar mediyatörlerin üretimini baskılayarak belirgin antiinflamatuvar özellikler sergilediği de bildirilmiştir (Wang L ve ark., 2022). Kuersetinin nöroprotektif etkilerinin bir diğer önemli boyutu, gen ekspresyonunun düzenlenmesine yönelik etkileridir. Özellikle nöronal sağkalım ve sinaptik plastisite ile ilişkili genlerin ekspresyonunu modüle ettiği; böylece nöronal hasara karşı koruma sağladığı ve bilişsel fonksiyonların sürdürülmesine katkıda bulunduğu belirtilmektedir (Thiruvengadam ve ark., 2021). Bunun yanı sıra kuersetinin, beyinde kritik sinyal yolakları arasında yer alan PI3K/Akt ve MAPK/ERK sinyol yollarını modüle ettiği bildirilmiştir (Ghafouri-Fard ve ark., 2021). Bu yolaklar, nöronal hayatta kalma, sinaptik plastisite ve hafıza oluşumunun düzenlenmesinde temel öneme sahiptir. Genel olarak kuersetinin AD'de gösterdiği moleküler etkiler kompleks ve çok faktörlü olup, mevcut kanıtlar bu flavonoidin hastalığın önlenmesi ve tedavisi açısından umut vadettiğini göstermektedir. Bu kapsamda Cheng ve ark., (2024) tarafından yürütülen deneysel AD modelinde kuersetinin; öğrenme ve hafıza bozukluklarını iyileştirdiği, amiloidojenik süreci baskıladığı, oksidatif stresi azalttığı ve Keap1/Nrf2/HO-1 yolu üzerinden asetilkolinesteraz (AChE) aktivitesini düzenlediği rapor edilmiştir. Ayrıca, APP/PS1 transgenik farelerde hücre apoptozunu önlediği gösterilmiştir. Bu bulgular, kuersetinin AD tedavisinde klinik değerlendirmeler için güçlü bir moleküler temel sağlayabileceğini ortaya koymaktadır.

Kuersetinin, proinflamatuar sitokinlerin ve diğer inflamatuar mediyatörlerin üretimini inhibe ederek anlamlı düzeyde anti-inflamatuar etki gösterdiği bildirilmektedir. Beyinde ortaya çıkan kronik inflamasyonun Parkinson hastalığının (PD) gelişimi ve ilerlemesinde merkezi bir rol oynadığı bilindiğinden, inflamatuar yanıtın baskılanmasının hastalığın seyrini yavaşlatabileceği düşünülmektedir (Chiang ve ark., 2023). Kuersetinin PD ile ilişkili önemli moleküler süreçlerden biri olan alfa-sinüklein agregasyonunu inhibe ettiği ve bu protein birikimlerinin oluşumunu azalttığı gösterilmiştir (Zhu ve ark., 2013). Alfa-sinüklein agregasyonunun azalması, nöronal hasarın sınırlanmasına ve hastalığın progresyonunun yavaşlatılmasına katkı sağlayabilir. Ek olarak kuersetin, nöronal hücre ölümünü azaltarak dopaminerjik nöronların korunmasına yardımcı olmakta ve böylelikle PD'ye özgü motor fonksiyon bozukluklarının hafifletilmesine katkıda bulunmaktadır. Parkinson hastalığına yönelik deneysel modellerde kuersetinin nöroprotektif etkilerini değerlendiren çeşitli çalışmalar bulunmaktadır. Yapılan çalışmalarda kuersetinin, rotenon kaynaklı nöroinflamasyon, oksidatif stres ve davranış değişiklikleri üzerindeki düzenleyici etkileri (Sharma ve ark., 2020; Jain ve ark., 2022), dopamin metabolizması ve gen ekspresyonu üzerindeki etkileri (Josiah ve ark., 2022), hücre kültürü ve MitoPark transgenik fare modellerinde kuersetinin mitokondriyal disfonksiyon ve dopaminerjik nörodejenerasyona karşı koruyucu mekanizmaları (Ay ve ark., 2017) incelenmiştir. Bu çalışmalar, kuersetinin oksidatif stres, inflamasyon, mitokondriyal bozulma ve toksik ajanlara maruziyet gibi PD patogeneziyle ilişkili süreçler üzerinde belirgin düzenleyici etkilere sahip olduğunu ortaya koymaktadır. Ayrıca dopamin metabolizmasının modülasyonu ve inflamasyonun baskılanması gibi etkiler, kuersetinin nöroprotektif potansiyelinin temel mekanizmaları arasında yer almaktadır. Genel olarak mevcut

bulgular, kuersetinin Parkinson hastalığında tedavi edici potansiyele sahip doğal bir aday bileşik olabileceğini düşündürmekte; ancak klinik kullanımın netleştirilmesi için daha kapsamlı çalışmalara ihtiyaç duyulduğunu göstermektedir (Chiang ve ark., 2023).

SONUÇ

Kuersetin, antioksidan, antiinflamatuar, antiapoptotik ve mitokondri koruyucu özellikleri sayesinde beyin hasarının sekonder biyokimyasal süreçlerine karşı potansiyel bir nöroprotektif ajan olarak öne çıkmaktadır. Hücresel düzeyde AMPK aktivasyonu ile enerji metabolizmasını dengeleyebilmesi, NF-κB ve NLRP3 inflamazom yollarını inhibe ederek pro-inflamatuar sitokin üretimini azaltması, kuersetinin nöroinflamatuar hasara karşı etkili olmasını sağlamaktadır. Bununla birlikte, kuersetinin düşük suda çözünürlüğü, sınırlı oral biyoyararlanımı ve kısa plazma yarı ömrü, klinik uygulamalarını kısıtlamaktadır. Gelecekteki araştırmaların, kuersetinin biyoyararlanımını artırmaya yönelik stratejileri, optimal doz-zaman ilişkilerini ve kombinasyon tedavilerini incelemesi, ayrıca biyokimyasal ve moleküler biyobelirteçlerle korelasyonlarını değerlendirmesi, kuersetinin translasyonel değerini yükseltecek ve beyin hasarı tedavisinde tamamlayıcı bir yaklaşım olarak kullanımını destekleyecektir.

Abstract

Due to their anatomical relationships and shared microbial environments, pulpal and periodontal tissues interact bidirectionally during inflammatory processes. Endo-perio lesions can occur when pulpal and periodontal inflammatory conditions occur sequentially in the same tooth, but they can also occur simultaneously. Disease progression results from a disruption of the microbial balance in both tissues, leading to an excessive host response. Disease progression exceeds the physiological limits of the host defense system, leading to the emergence of a chronic inflammatory response. Although the results of regenerative periodontal treatment were reported as unpredictable in the past, advances in technology and a better understanding of periodontal tissue biology have improved its success. Today, the success of periodontal regenerative treatments is evaluated based on objective clinical and radiographic parameters, such as increases in radiographic bone density and volume, decreases in probing depth, and clinical attachment gain. Regenerative surgical procedures are classified into three main categories: graft-based, graft-free, and biologically based. In the treatment of endo-perio lesions, accurate diagnosis is crucial for treatment planning. Vitality testing is one of the key clinical data used for accurate diagnosis. In periodontal lesions, as long as the pulp is not secondarily affected, the tooth is vital, and periodontal treatment is sufficient. For lesions resulting from pulpal inflammation, endodontic treatment is essential. For complete healing of endo-perio lesions, both periodontal and endodontic treatments, whether independent or combined, are indicated. Periodontal defects are treated after successful endodontic treatment. In combined endo-perio lesions, both pulp and periodontal tissues are affected. Due to the presence of endotoxins and biofilm on the root surface, adhesion of periodontal ligament cells is limited. Additionally, periodontal regeneration treatments can also be applied to endo-perio lesions.

Keywords: Periodontal regeneration, Regenerative endodontic treatment, Endo-perio lesions, Guided periodontal tissue regeneration

INTRODUCTION

The periodontal disease process begins with the formation of a subgingival biofilm. Over time, as bacteria proliferate, plaque matures. As bacteria proliferate, they produce specific chemical compounds that damage the periodontium, such as hydrogen sulfide, proteases, and ammonia, and stimulate the immune system (Socransky et al., 1998). Periodontal microbial agents trigger periodontitis. The severity of periodontitis is primarily determined by interactions between bacterial factors and the host response (Song et al., 2017). Both the innate and adaptive immune systems are involved in defense against microbial agents. The role of these systems is to eliminate the causative agents of periodontal disease and maintain periodontal health (Genco & Slots, 1984). The balance between neutrophils, the complement system, and antibodies constitutes the first line of defense for periodontal tissues. Microorganism-derived toxins, lipopolysaccharides, and enzymes activate the immune system by stimulating tissue destruction (Darveau, 2009). After neutrophil chemotaxis, various products are released from neutrophils that reach tissues, causing local tissue destruction (Kantarci, Oyaizu, and Van Dyke, 2003).

Periodontal inflammation progresses from an initial neutrophil-dominant lesion to an early lesion containing a high number of macrophages and T lymphocytes. The established lesion and advanced lesion progress in complexity, with B lymphocyte and plasma cell dominance (Hajishengallis, Chavakis, & Lambris, 2020). Treatment of chronic periodontal disease involves a combination of different therapeutic steps (Rojas et al., 2019). Conventional

periodontal therapy does not promote tissue regeneration, but instead aims to halt the existing disease (Sculean, Chapple, & Giannobile, 2015).

Due to their anatomical relationships and shared microbial environments, pulpal and periodontal tissues interact bidirectionally during inflammatory processes. Endo-periolesions are lesions that occur when pulpal and periodontal inflammatory conditions occur sequentially or simultaneously in the same tooth. Endo-perioles are considered to result from polymicrobial dysbiosis. The disease progresses due to the disruption of the microbial balance in both tissues and the resulting excessive host response. Disease progression exceeds the physiological limits of the host defense system, leading to the emergence of a chronic inflammatory response (Kinane, Stathopoulou, and Papapanou, 2017; Adam, 2021).

Various pro-inflammatory mediators such as cytokines, chemokines, prostaglandins, and matrix metalloproteinases accelerate extracellular matrix degradation and cause progressive tissue destruction in periodontal tissues (Graves, 2008). As in periodontal inflammation, increased vascular pressure, immune cell infiltration, and rapid extracellular matrix degradation disrupt tissue integrity in pulp inflammation (Cooper & Smith, 2013). Therefore, the tissue damage seen in endo-perio lesions is often the result of a shared biological integrity rather than two separate systems (Rotstein & Simon, 2006a).

Wound healing is essentially a natural mechanism involving various cell types and biological mediators. In periodontal wound healing, various cell populations migrate, differentiate, and proliferate. Epithelial and connective tissue interact with each other. Cytokines and extracellular matrix molecules are organized in intertwined phases (Cho et al., 2021).

The epithelium and surrounding connective tissue transform into non-functional scar tissue during the healing process following traditional periodontal treatment. These effects of traditional periodontal treatment can be prevented by applying regenerative procedures to correct periodontal tissue loss (Nyman et al., 1982). In recent years, many periodontal regeneration treatments, regenerative endodontic treatments, and multifaceted biological treatments that reorganize root development, promote new connective tissue formation, and stimulate cementum and bone formation have been offered (Duarte et al., 2025). Regenerative treatment has been developed to restore lost portions of tooth support structures. The literature shows that regenerative periodontal treatments yield more favorable outcomes compared to traditional periodontal treatments (Eickholz et al., 2007).

Achieving regeneration in endo-periodontal lesions, where two different tissue types heal simultaneously, is a biologically challenging clinical application (Rotstein & Simon, 2006a). This review aims to summarize the biology of periodontal tissue destruction and current regenerative approaches. Furthermore, considering the biological limitations and specific challenges of periodontal regeneration in endo-perio lesions, the potential for regenerative treatment in these complex lesions will be discussed.

PERIODONTAL TISSUE DESTRUCTION

Periodontal inflammation and the subsequent tissue loss are complex processes initiated by the interaction between gram-negative anaerobic bacteria and the host response, and developed through various cytokines and mediators (Lindhe, Lang, and Karring, 2009). Some of the molecules that cause inflammation and tissue destruction are of bacterial origin, while others are endogenous (Kinane et al., 2011).

The natural and acquired immune responses play an important role in the periodontal disease process. The natural immune response represents the first line of defense against infectious agents (Kinane et al., 2001). Periodontal tissues attempt to counteract bacteria and bacterial products found in the biofilm through various mechanisms. Epithelial cell turnover; antimicrobial peptides and cytokines secreted by epithelial cells; the barrier function of the junctional epithelium; the washing effect of saliva and DOS; and various antibodies and proteases found in DOS and saliva are among the many mechanisms that contribute to the defense of periodontal tissues. However, the insufficiency of these mechanisms and the disruption of physiological balance can lead to gingivitis and subsequently periodontitis (Lindhe, Lang, and Karring, 2009).

The pathogenesis of periodontitis was first defined histopathologically by Page & Schroeder (1976) as the Initial lesion, Early lesion, established lesion (Gingivitis), and Advanced lesion (Periodontitis). In 1997, Kornman, Page,

and Tonetti explained the pathogenesis of periodontal disease at the genetic and molecular levels, proposing new definitions: 1. Acute bacterial attack phase, 2. Acute inflammatory response phase 3. Immune response phase 4. Regulation and resolution phase. The pathways activated by bacteria that cause tissue destruction in host cells through various antigens and virulence factors have been clarified. The effects of genetic, environmental, and acquired risk factors on the periodontal disease chain have been emphasized (Page & Kornman, 1997).

During the acute bacterial attack phase, the epithelium is exposed to various bacteria. Following bacterial plaque formation, fatty acids, peptides, and bacterial metabolites are secreted and can diffuse from the plaque into the junctional epithelium. Various cytokines and MMPs produced by the junctional epithelium cross the epithelial tissue and reach the connective tissue. Neutrophils are recruited in response to bacterial stimulation. Interleukin-8 is expressed in the junctional epithelial cells. Neutrophils migrate from the junctional epithelium to the gingival crevice. During the acute inflammatory response phase, as is the case with all epithelial surfaces, the epithelial turnover rate increases with the increasing bacterial load in the gingival crevice. The amount of interstitial fluid increases due to mild inflammation. The expansion of the intercellular space facilitates the migration of neutrophils from the connective tissue to the gingival crevice.

Among the migrating cells are macrophages, antigen-presenting cells, and lymphocytes. Collagen destruction and tissue damage begin due to migrating cells and the cytokines they release. Macrophages determine the immune response. They secrete cytokines that stimulate the recruitment of new macrophages and lymphocytes. Macrophages, under the influence of lipopolysaccharides, produce interleukin, MMP, and prostaglandin E2. MMPs lead to increased collagen degradation. Activation of B lymphocytes leads to the transformation into plasma cells. In the gingival sulcus, accessory elements begin to come into play. Plasma cells still predominate during the assembly and resolution phase. Mediators that cause tissue destruction increase. If the local immune response cannot limit the bacterial attack, the environment is ripe for the development of periodontitis and bone resorption (Kornman, Page, and Tonetti, 1997).

WOUND HEALING AND PERIODONTAL REGENERATION

Periodontal regeneration is defined as the reconstruction or rebuilding of lost or damaged periodontal tissue. Periodontal regeneration requires the regeneration of the cementum that forms the root surface, the alveolar bone, the periodontal ligament that connects them, and the gingiva. However, regeneration of the periodontium is a complex process. Although the complete chain of events during regeneration and healing is not fully understood, first, cells must migrate and attach to the affected root surface. This process is controlled by extracellular matrix elements and other cells (Lindhe, Lang, and Karring, 2009). Wound healing, similar to that in other parts of the body, proceeds through a series of distinct processes, beginning with the formation of a blood clot. Clot formation, followed by the absorption and adhesion of plasma proteins to the root surface, is the first stage of healing (Wikesjö, Nilvéus, and Selvig, 1992). An early inflammatory phase, involving neutrophils and monocytes, occurs within a few hours. Within three days, macrophages migrate to the area and form granulation tissue. By the seventh day, connective tissue attachment, along with collagen fibers, may form. By the fourteenth day, new collagen fibers may form an arrangement that allows for physical binding to dentin (Selvig, Bogle, and Claffey, 1988). It may take 3–5 weeks for these fibers to become functional and mature. As the healing process progresses, increasing mechanical stimulation promotes the formation of an organized extracellular matrix. Alveolar bone and cementum maturation are also promoted (Lindhe, Lang, and Karring, 2009). New bone formation begins from days 10–21 (Wilderman, 1964). In the apical region, a thin layer of cementum is observed along the connective tissue attachment, whereas in the coronal region, it is absent (King et al., 1997). After the formation of mineralized tissues, the microenvironment between cementum and alveolar bone is regulated by the placement and orientation of periodontal ligament fibers (Mine et al., 2005).

Although the outcomes of regenerative periodontal treatment were previously reported to be unpredictable, studies have shown that advances in technology and a better understanding of periodontal tissue biology have improved its success. Today, the success of periodontal regenerative treatments is evaluated using various criteria. Examples of these criteria include a reduction in probing depth, radiographic monitoring of bone density, and clinical attachment gain (Aichelmann-Reidy et al., 2015; Lee & Kim, 2025).

Regenerative surgical procedures are primarily classified into three main categories: graft-based, graft-free, and biologically based procedures. The bone graft materials used in these applications are classified according to their osteogenic, osteoinductive, and osteoconductive potentials based on bone regeneration mechanisms, while they are classified as autografts, allografts, xenografts, and synthetic grafts according to the source of the material (Newman et al., 2023).

Directed tissue regeneration is based on the concept of preventing epithelial migration into the defect, thereby allowing space and time for the healing of other tissues, such as the periodontal ligament and bone. This concept can stimulate the formation of new cementum, connective tissue, and bone in conjunction with growth and differentiation factors secreted by stem cells. The three fundamental structures necessary for guided tissue regeneration are scaffold material for tissue regeneration, cell signaling for stem cell migration and differentiation, and stem cells (Lang et al., 1995; Prabhakaran, Venugopal, and Ramakrishna, 2009). While graft materials are not used in traditional directed tissue regeneration, directed tissue regeneration is combined with bone grafts in the United States.

With increased research in tissue engineering, biologically derived products for regenerative therapies have been developed. Examples of biological products used in regeneration include platelet-derived growth factor, platelet-rich plasma, platelet-rich fibrin, dentin matrix derivatives, recombinant fibroblast growth factor, and recombinant bone morphogenetic protein (Newman et al., 2023). With advances in tissue engineering, studies on the use of autologous blood products in medicine and dentistry have increased, offering hope for future treatments. By varying the centrifugation times and speeds of platelet-rich fibrin, PRF derivatives with more advanced properties, such as advanced platelet-rich fibrin and advanced platelet-rich fibrin plus, have been developed. There are also studies on the use of PRF derivatives in regenerative applications such as periodontal regeneration and regenerative endodontic treatment (Simões-Pedro et al., 2022; Ashour et al., 2023; Bains et al., 2023).

REGENERATIVE ENDODONTIC TREATMENT

Regenerative endodontic treatment is a biologically based treatment method applied to support continued root development, achieve apical closure, and promote thickening of the dentin walls in teeth with immature necrotic pulp (Murray, 2023). This procedure involves disinfecting the root canal system, then inducing apical bleeding with a file and forming a blood clot in the root canal (Kahler, Lu, and Taha, 2024). Regenerative endodontic treatment began to be applied in the 2000s and was first referred to as revascularization in 2001, then as revitalization in 2010 (Iwaya, Ikawa, and Kubota, 2001; Huang et al., 2010). In 2007, the American Association of Endodontists began using the term “regenerative endodontic treatment,” stating that the treatment extends beyond simply restoring blood circulation and encompasses tissue-engineering principles (Murray, Garcia-Godoy, and Hargreaves, 2007). While regenerative endodontic treatment was initially applied only to immature teeth, it is now also used for mature teeth with closed apices and for teeth that have previously undergone root canal treatment (He et al., 2017; Barbosa-Ribeiro et al., 2021).

ENDODONTIC-PERIODONTAL LESIONS

Pulp and periodontal tissues are connected through physiological and iatrogenic pathways. Dentin tubules, furcation canals, apical foramina, and exposed dentin tubules are physiological communication pathways between the pulp and periodontium. Conditions such as dentin cracks, root damage, palatogingival grooves, perforations, and vertical root fractures can also cause transmission between the pulp and periodontium. Endo-perio lesions occur in conjunction with bidirectional communication between the pulp and periodontium via various pathways, including anatomical and pathological ones (Lisican, 2024).

Endodontic-periodontal lesions have been classified in various ways. According to the classification made by Simon et al. in 1972, they are divided into five groups: 1. Primary Endodontic Lesions, 2. Primary Endodontic Lesions with Secondary Periodontal Involvement, 3. Primary Periodontal Lesions, 4. Primary Periodontal Lesions with Secondary Endodontic Involvement, 5. True Combined Lesions (Simon, Glick, and Frank, 1972). According to another classification made in 2022, endodontic-periodontal lesions are divided into three classes. Class 1 – Crown-down Plaque-induced Periodontal Lesions start at the crown and progress apically toward deep periodontal tissues. Although clinically mimicking pulp pathologies, there is no initial pulp involvement. Periodontal treatment alone is sufficient. As the condition worsens, the pulp may be affected via lateral canals and other transmission pathways. At this stage, root canal treatment and periodontal treatment are necessary. Class 2 – Down-crown

Periodontal Lesions of Endodontic Origin start in the apico-coronal direction; the periodontium is healthy as long as the periodontal ligament is not affected by lateral canals and other transmission pathways. Class 3 – Combined Endodontic-periodontal lesions. An endodontic lesion formed at the tooth apex is connected to a periodontal pocket formed due to plaque (Cerutti, 2024).

Accurate diagnosis is crucial for treatment planning in endo-periodontal lesions. The vitality test is an important clinical test that can aid accurate diagnosis. In periodontal lesions, the tooth is vital as long as the pulp is not secondarily affected, and periodontal treatment is sufficient. However, endodontic treatment is essential for lesions caused by pulp inflammation. Both periodontal and endodontic treatments are indicated for the complete healing of endo-periodontal lesions, whether independent or combined. Periodontal defects are treated after successful endodontic treatment (Rotstein & Simon, 2006b; Newman et al., 2023). In combined endo-perio lesions, both the pulp and periodontal tissues are affected. Due to the presence of endotoxins and biofilm on the root surface, the adhesion of periodontal ligament cells is limited (Farag et al., 2025). In addition, periodontal regeneration treatments can also be applied in endo-perio lesions. Alquthami et al. achieved successful results by applying routine root canal treatment and regenerative periodontal treatment in the treatment of a tooth with endo-perio lesions (Alquthami et al., 2018).

Guided tissue regeneration has been used in several studies to treat teeth with endo-perio lesions (AlJasser et al., 2021). Numerous in vitro and clinical studies demonstrate that guided tissue regeneration, enamel matrix derivative, and cell-based approaches promote healing in periodontal tissue. Similar principles apply to endo-perio lesions (Rosen et al., 2023; Tietmann et al., 2024). A review of the current literature reveals insufficient data on cases where both regenerative endodontic treatment and periodontal regeneration were combined in teeth with endo-perio lesions.

CONCLUSION AND FUTURE DIRECTIONS

The pathophysiology of periodontal and combined endo-periodontal lesions is characterized by complex interactions between inflammatory responses and extracellular matrix degradation, leading to tissue loss. Although periodontal tissue reconstruction is possible with treatments using various biomaterials, such as guided tissue regeneration and enamel matrix derivatives, the simultaneous regeneration of pulp and periodontal tissues in endo-perio lesions remains a significant clinical challenge. Due to limited strong clinical evidence in these complex cases, the success of regenerative strategies largely depends on meticulous multidisciplinary case management, including accurate case selection, effective disinfection of the root canal system, and root surface debridement. In the future, the integration of innovative tissue engineering applications such as extracellular matrix-based scaffolds, controlled growth factor release systems, exosomes, and three-dimensional bioprinting aims to increase the clinical predictability of both periodontal and endodontic regeneration.

Özet

Gıda endüstrisi ve biyoteknoloji alanlarında önemli bir organik asit olan sitrik asit, yüksek talep gören bir metabolittir. Günümüzde sitrik asit üretimi genellikle karbonhidrat kaynaklı substratlarla gerçekleştirilmektedir. Ancak endüstriyel üretimde maliyetlerin düşürülmesi ve çevresel sürdürülebilirliğin sağlanması amacıyla tarımsal atıkların değerlendirilmesi önem kazanışmıştır. Bu çalışmada, nar üretiminde ortaya çıkan atık kabukların, *Aspergillus niger* kullanılarak yarı katı kültür fermantasyonu yöntemiyle sitrik asit üretiminde substrat olarak kullanılabilirliği araştırılmıştır. Deneylerde farklı nar atığı miktarları (3–25 g), sıvı besi yeri hacimleri (25–35 mL) ve metanol konsantrasyonları (%0–3 v/v) kullanılmıştır. Optimum koşulların belirlenmesi amacıyla pH, sıcaklık ve iz element etkileri incelenmiştir. Elde edilen sonuçlara göre, 10 g nar atığı, 25 mL sıvı besi yeri ve %3 metanol içeren ortamda en yüksek sitrik asit üretimi (15,43 g/kg) elde edilmiştir. Ayrıca, $CuSO_4$ ilavesi fermantasyon verimini anlamlı ölçüede artırmıştır. Bu sonuçlar, nar atıklarının sitrik asit üretiminde sürdürülebilir, ekonomik ve çevre dostu bir alternatif substrat olabileceğini göstermektedir.

Anahtar Kelimeler: Sitrik asit, nar atığı, *Aspergillus niger*, yarı katı kültür, fermantasyon

Investigation of citric acid production from pomegranate waste by semi solid-state fermentation

Abstract

Citric acid, a tricarboxylic organic acid, is widely used in the food, pharmaceutical, and detergent industries. To reduce production costs and promote sustainability, this study investigated the potential use of pomegranate waste as a substrate for citric acid production via semi solid-state fermentation using *Aspergillus niger*. Various parameters such as substrate mass (3–25 g), liquid medium volume (25–35 mL), and methanol concentration (0–3% v/v) were optimized. The effect of trace elements and pH were also evaluated. The optimum citric acid yield (15.43 g/kg) was achieved at 10 g pomegranate peel, 25 mL medium, and 3% methanol. The addition of 0.0078 g/L $CuSO_4$ significantly enhanced production efficiency. Results demonstrate that pomegranate waste can serve as a low-cost and eco-friendly substrate for citric acid fermentation.

Keywords: Citric acid, pomegranate waste, *Aspergillus niger*, semi solid-state, fermentation

GİRİŞ

Nar üretimi Türkiye'de önemli bir tarımsal faaliyettir. İzmir Ticaret Borsası'nın 2024 verilerine göre 2023 yılında yaklaşık 638 kiloton nar üretilmiş olup, bunun %54'ü atık olarak değerlendirilemeden çevreye atılmaktadır (Cano-Lamadrid ve diğ., 2022). Nar kabuğu, yüksek şeker (%31,38) ve protein (%8,7) içeriği nedeniyle biyoteknolojik üretimlerde potansiyel karbon kaynağıdır (Naseem Ullah ve diğ., 2012). Sitrik asit ($C_6H_8O_7$), gıda, ilaç ve kimya sektörlerinde çok yönlü kullanım alanına sahip bir organik asittir (Sinko ve diğ., 2006). Endüstriyel ölçekte sitrik asit üretimi genellikle *Aspergillus niger* kullanılarak fermantasyon yoluyla yapılmaktadır (Behera, 2020). Bu çalışmanın amacı, nar atıklarının yarı katı kültür fermantasyonu yöntemiyle değerlendirilmesi ve sitrik asit üretimi için uygun koşulların belirlenmesidir.

MATERYAL VE METOT

Kullanılan Mikroorganizma:
Aspergillus niger, patates dekstroz agar (PDA, 42 g/L) üzerinde 30 °C'de 7 gün inkübe edilmiştir.

Katı Besi Yeri:
Nar kabukları 40 °C'de kurutulmuş, öğütülerek toz haline getirilmiştir.

Sıvı Besi Yeri Kompozisyonu:
(NH_4Cl 0.25 % w/v, K_2HPO_4 0.1 %, $MgSO_4 \cdot 7H_2O$ 0.02 %, $MnSO_4 \cdot 4H_2O$ 0.001 %, $CuSO_4 \cdot 5H_2O$ 0.078 %) (Vandenberghe & R. Soccol, 1999).

Yarı Katı Fermantasyon:
Nar kabuğu tozu belirlenen miktarlarda (3–25 g) erlenlere eklenmiş, sıvı besi yeri hacimleri (25–35 mL) ve pH = 5 olacak şekilde ayarlanmıştır. 121 °C'de 15 dk otoklavlanarak sterilizasyon sağlanmıştır. Metanol konsantrasyonları %0–3 (v/v) olarak değişmiştir.

Sitrik Asit Tayini:
Numuneler 4100 rpm'de 10 dk santrifüyj edilerek süpematant alınmış, 0.1 N NaOH ile titre edilmiştir (Kareem ve diğ., 2010). Ayrıca spektrofotometrik analizde Cu–Amonyak kompleksi yöntemi kullanılmış, absorbans 750 nm'de ölçülmüştür (Farajzadeh & Nagizadeh, 2002). Kareem et al., 2010'da verilem formüle göre titrasyon hesapları yapılmıştır.

Parametreler:

Tablo 1: Deneyin Parametreleri

Parametreler	Değişkenler
Nar Atığı Miktarı	3, 5, 10, 15, 20, 25 (g)
Sıvı Besi Yeri Miktarı	25, 30, 35 (mL)
Metanol Miktarı	%0, %1, %2, %3 (v/v)
Sıvı Besi Yeri Türü	Sıvı Besi Yeri, 0,0078 (%w/v) $CuSO_4$.5H2O, Distile Su
Fermantasyon Süresi	7 gün

BULGULAR ("BULGULAR ve TARTIŞMA" şeklinde tek başlıkta da verilebilir.)

Nar atığı miktarı 10 g olduğunda en yüksek sitrik asit verimi (12.78 g/kg) elde edilmiştir. Daha düşük miktarlarda yüzey alanı yetersiz kalmış, yüksek miktarlarda ise miselyum yayılımı sınırlanmıştır. Sıvı besi yeri hacmi arttıkça sitrik asit üretimi azalmış; optimum değer 25 mL olarak belirlenmiştir. Metanol miktarı arttıkça üretim verimi %3'e kadar artmış ve 15.43 g/kg sitrik asit üretimi elde edilmiştir. Metanolün hücre zar geçirgenliğini artırması, sitrik asidin dışarı difüyonunu kolaylaştırmıştır. Ayrıca, $CuSO_4$ ilavesi fermantasyon verimini artırmış; optimum Cu^{2+} konsantrasyonu 0.0078 g/L olarak tespit edilmiştir. Fermantasyon süreci 7 gün boyunca izlenmiş, 4. günde maksimum üretim, 6. günde pH 2.35'e düşmesiyle üretim azalmıştır. *Aspergillus niger*'in optimum pH aralığı pH = 5 civarında olup, aşırı asidik koşullar üretimi sınırlandırmıştır (Andersen ve diğ., 2009).

Tablo 2. Değişkenin Nar Atığı Miktarı ile Yapılan Deneylerin Sonuçları

Nar Kabuğu Miktarı (g)	Sıvı Besi Yeri Miktarı (mL)	Metanol Miktarı (mL)	Ortalama g/Kg Sitrik Asit	Sıvı Besi Yeri Tipi
3	25	0,5	9,606 ± 0,896	Sıvı Besi Yeri
5	25	0,5	11,669 ± 0,499	Sıvı Besi Yeri

Şekil 1. Sitrik asit üretim miktarı ve üretimin artış miktarının zamana bağlı değişim grafiği

SONUÇ

Elde edilen bulgular, nar atıklarının yarı katı kültür fermantasyonu ile sitrik asit üretiminde etkili bir substrat olduğunu göstermiştir. 10 g nar kabuğu, 25 mL sıvı besi yeri, %3 metanol ve 0.0078 g/L $CuSO_4$ koşulları optimum olarak belirlenmiştir. Bu yöntem, hem tarımsal atıkların yeniden değerlendirilmesini sağlamakta hem de ekonomik ve çevreci bir üretim yaklaşımı sunmaktadır.

TEŞEKKÜR

Bu çalışma, İstanbul Medeniyet Üniversitesi Biyomühendislik Bölümü bünyesinde gerçekleştirilmiştir. Araştırma süresince desteklerinden dolayı Biyomühendislik Bölümü Lisans Öğrencisi Ayceren KIYAK'a teşekkür ederiz.

Abstract

This study was designed to investigate the role of postbiotics—non-viable microbial cells, their components, and metabolites produced during fermentation—in food bio preservation. The aim was to evaluate current findings on the antimicrobial and antioxidant effects of postbiotics and their practical application in extending the shelf life of perishable foods. Researchers typically make postbiotics by cultivating probiotic strains such as Lactobacillus plantarum, L. acidophilus, and Bifidobacterium bifidum in a special broth, followed by treatments such as centrifugation, filtration, and heat to remove viable cells. Cell-free supernatants containing organic acids, bacteriocins, peptides, and enzymes have been applied to a variety of food models, including milk, meat, and plant-based products. In reviewing numerous studies, postbiotics have consistently been shown to reduce microbial spoilage and inhibit common pathogens such as Listeria monocytogenes, Escherichia coli, and Salmonella spp. They also contributed to lipid stability and maintained sensory quality during storage. While the results suggest that postbiotics offer promising natural preservation benefits, their effectiveness depends on the microbial strain, extraction conditions, and food matrix. Overall, postbiotics represent a viable alternative to traditional preservatives, but further research is needed to address their regulatory status and scalability for industrial use

Keywords: postbiotics, lactic acid bacteria, antimicrobial activity, fermentation metabolites, natural preservatives

INTRODUCTION

Microbial biopreservation strategies represent one of the most rapidly evolving fields within modern food safety science. Although traditional food-processing techniques—such as thermal treatment, dehydration, salting, and the use of chemical preservatives—are effective in ensuring microbial stability, they involve considerable limitations regarding sensory quality, nutrient retention, consumer perception, and sustainability. In contrast, the controlled application of microbial cellular components or metabolic products to food matrices, without the presence of viable cells, has gained considerable attention due to its potential to enhance food safety through a “natural, clean-label, thermally stable, and toxicologically safe” approach. This next-generation biopreservation strategy has recently been associated with postbiotics, defined as microbially derived, non-viable molecules that nevertheless exhibit physiological and functional activity (Collins & Stanton, 2021).

Postbiotics comprise a wide range of bioactive compounds, including organic acids, short-chain fatty acids (SCFAs), antimicrobial peptides and bacteriocins, hydrogen peroxide, reactive oxygen species, surface proteins, cell wall fragments, exoenzymes, and exopolysaccharides (EPS). These molecules exert multifaceted functions, ranging from pathogen inhibition and suppression of quorum sensing mechanisms to biofilm disruption and enhancement of oxidative stability. Compared with probiotics, postbiotics possess superior environmental stability, thermal tolerance, longer shelf-life, functional durability during food processing, and lower regulatory risk due to the absence of viable microorganisms (Aguilar-Toalá et al., 2018). Collectively, these attributes position postbiotics as a strategic tool for mitigating food safety risks, controlling spoilage microorganisms, and extending shelf life.

The use of postbiotics in biopreservation is primarily rooted in metabolites produced by lactic acid bacteria (LAB). LAB species are particularly well-suited for postbiotic production due to their natural presence in food ecosystems, GRAS/QPS status, tolerance to low pH, homo- and heterofermentative metabolic flexibility, and high capacity to

produce antimicrobial compounds. Species belonging to the genera Lactobacillus, Leuconostoc, Pediococcus, Lactococcus, and Streptococcus are widely utilized at industrial scale. Bacteriocins synthesized by these microorganisms—such as nisin, pediocin, and plantaricin—display inhibitory activity against both Gram-positive and Gram-negative bacteria, offering effective protection against foodborne and opportunistic pathogens (Silva et al., 2022).

The significance of postbiotic-based biopreservation strategies extends beyond their contribution to microbial safety; they also exert minimal impact on the sensory and technological properties of foods, align with the "chemical preservative-free" product development trend, and meet consumer demand for clean-label ingredients. Consequently, postbiotics are increasingly recognized as effective biopreservatives across a wide range of food categories, including meat products, dairy products, fermented fruits and vegetables, cereal-based foods, and plant-based alternatives. Moreover, integrating postbiotic components into edible films and coatings, active packaging systems, and controlled-release technologies further strengthens their industrial applicability. This multi-layered approach enables the sustained antimicrobial activity of postbiotics over time, supporting shelf-life extension and minimizing food safety hazards.

In summary, the use of postbiotics in biopurification offers a potent biological functionality independent of microbial viability, providing an innovative solution to critical challenges faced by the food industry, such as pathogen control, spoilage management, consumer expectations, and sustainability concerns. This review aims to comprehensively examine the role of postbiotics in enhancing food safety and extending shelf life, their mechanisms of action, application areas, technological integration strategies, regulatory considerations, and future research perspectives.

DEFINITION, CLASSIFICATION AND CHARACTERISTICS OF POSTBIOTICS

The concept of postbiotics is defined as a new generation of terminology that refers to bioactive components of microbial origin that exhibit health or technological functions without the involvement of living microorganisms. The International Scientific Association of Probiotics and Prebiotics (ISAPP) defines postbiotics as "prepared microbially derived biological products that do not contain living cells but are produced by microorganisms or their metabolites and that confer a health benefit on the host" (Salminen et al., 2021). This definition significantly broadens the functional scope of postbiotics, encompassing both physical and morphological cellular components and the end products of microbial metabolism.

Postbiotics are classified into various categories based on structural properties, mode of production, molecular nature, and biological activity. The general classification is as follows: (i) metabolic products, (ii) cellular components, (iii) secreted macromolecules, and (iv) inactive microbial cell preparations (paraprobiotics).

Metabolic Products (Organic and Metabolic Fractions)

The largest group of postbiotics consists of the end products of microbial metabolism. These components are:

- *Organic Acids (lactic acid, acetic acid, propionic acid, etc.):* Lactic acid, synthesized by lactic acid bacteria (LAB), is a powerful bioprotective agent with its ability to lower pH, disrupt membrane potential, and inhibit pathogen growth. Acetic acid, on the other hand, has a strong effect on Gram-negative bacteria by disrupting membrane permeability (Prajapati et al., 2023).

- *Short-Chain Fatty Acids (SCFAs):* SCFAs such as acetate, propionate, and butyrate are important postbiotic molecules that possess both antimicrobial potential and influence redox balance. SCFA production in functional food products is also associated with supporting intestinal health (Mousavi Ghahfarrokhi et al., 2024).

- *Bacteriocins and Antimicrobial Peptides:* Ribosomal protein/peptide-based antibacterial molecules such as nisin, pediocin, plantaricin, and enterocin exhibit high inhibitory capacity, particularly against Gram-positive pathogens such as *Listeria monocytogenes*. Their heat resistance and narrow/targeted spectrum of activity constitute an important subclass of postbiotics. Nisin (*Lactococcus lactis*) is a heat-stable lantibiotic approved by the FDA and EFSA as a food preservative. Pediocin PA-1 (Pediococcus acidilactici) exhibits superior inhibition against *Listeria* spp (Zhao et al., 2025).

- *Hydrogen Peroxide and Reactive Oxygen Species (ROS):* H_2O_2, synthesized by LAB during oxidative metabolism, is a broad-spectrum antimicrobial agent. It is particularly effective in inhibiting yeast and mold (Guerrero-Encinas et al., 2021).

Cellular Components

The second largest group of postbiotics consists of the structural components of the non-viable cells of microorganisms:

- *Peptidoglycan and Cell Wall Fragments:* Peptidoglycan fragments derived from LAB play a role in immune modulation, anti-inflammatory activity, and antimicrobial mechanisms of action Tao et al., (2024).

- *Lipopeptides and Lipoteichoic Acids:* These components are cell membrane components, particularly of Gram-positive species, and support antimicrobial activity in foods. They also contribute to the regulation of the immune response (Balaguer et al., 2022).

- *Surface Proteins and S-Layer Proteins:* S-layers are protein layers that form a crystalline structure on the cell surface. They are effective in adhesion, biofilm interaction, and pathogen exclusion mechanisms.

Exo-Secreted Molecules and Macromolecules

- *Exopolysaccharides (EPS; especially dextran, levan, etc.):* EPSs both improve food technological properties (viscosity, water-holding capacity, gel structure) and provide bioprotection by forming a protective barrier against pathogens.

- *Enzymes and Proteases:* Microbial proteases, lipases, and glycosidases support bioprotection mechanisms and can also affect the textural properties of the food matrix.

- *Heat-Inactivated Microorganism Preparations (Paraprobiotics):* This group consists of microbial fractions that are not alive but exhibit cellular activity. They are increasingly used in industry due to their stability advantage (Danladi et al., 2022).

Key Properties of Postbiotics

The functional properties of postbiotics differ significantly from those of classical probiotics (Thirumdas et al., 2025):

- *Heat and Processing Stability:* Unlike live microorganisms, postbiotics do not lose activity during processes such as pasteurization, UHT, drying, or freezing. Therefore, they are more flexible in industrial applications.

- *Functional Stability Throughout Shelf Life:* Molecules can remain active for extended periods and are resistant to oxidative and mechanical stresses.

- *Safety Profile (GRAS, QPS):* The absence of living cells eliminates risks such as the transmission of antibiotic resistance genes.

- *Mechanism-Specific Activity:* Postbiotics possess versatile mechanisms such as cell membrane damage, inhibition of metabolic pathways, disruption of signaling, and suppression of biofilm formation.

- *Clean-Label Compliance:* This directly aligns with positive consumer perceptions such as "natural preservative" and "microbial-derived."

FOOD SAFETY PRACTICES

The primary advantage of postbiotic ingredients in food safety is their stable and predictable antimicrobial activity, independent of the variable factors of living microorganisms such as survival, proliferation, or susceptibility to environmental stresses. This property is particularly critical for thermally processed, cold-chain-stored, packaged, or minimally processed products. Postbiotics offer a multifaceted contribution to food safety by inactivating foodborne pathogens, suppressing spoilage microorganisms, and preventing toxin formation. In this context, the protection provided by postbiotics occurs through both direct antimicrobial effects and modulation of microbial behavior (Moradi et al., 2020).

Patojen İnhibisyonu

The effectiveness of postbiotics in pathogen control relies on the synergistic effects of different molecular mechanisms. One of the most studied and widely used compounds in industry is nisin, a lantibiotic produced by *Lactococcus lactis*. Nisin inhibits cell wall synthesis by binding to the lipid II molecule in the cell membrane and causes pore formation in the membrane, leading to leakage of cell contents. Thanks to this bidirectional mechanism, nisin exhibits high inhibitory activity against *Listeria monocytogenes*, *Bacillus cereus, Clostridium botulinum* spores, and some Gram-negative bacteria (under conditions with weakened outer membranes). Nisin's stability between 50 and 120°C makes it an ideal postbiotic for pasteurized, UHT, or sterilized products. Therefore, nisin is widely used in liquid eggs, cheese, pasteurized meat products, shelf-stable dairy products, and canned goods.

Control of Spoilage Microorganisms

Postbiotics effectively suppress not only pathogens but also spoilage microorganisms that shorten shelf life. This effect is mediated primarily by organic acids, hydrogen peroxide, SCFAs, and exopolysaccharides (Nikravan et al., 2024). Firstly, the role of organic acids; lactic acid, acetic acid, and other organic acids produced by lactic acid bacteria: (I) limit the reproductive capacity of microorganisms by lowering pH; (II) diffuse into cells in protonated form, disrupting internal pH and leading to metabolic collapse; and (III) suppress yeast and mold growth. Through these mechanisms, postbiotics delay spoilage and increase shelf life in products such as fermented dairy products (ayran, kefir, and plant-fermented beverages), bread, and bakery products (fruit juice and fruit-based beverages). Secondly, the contribution of propionic acid bacteria; propionic acid, produced by Propionibacterium freudenreichii, is one of the most effective natural compounds, particularly in mold inhibition. Therefore, it is frequently used to extend the shelf life of products such as bread and cheese (especially Swiss cheese). Finally, the hydrogen peroxide and ROS effect; LAB-derived H_2O_2 destroys the cell walls of yeast and molds through oxidative damage. This mechanism is particularly effective in products stored at low temperatures.

Suppression of Toxin Production

One of the most critical effects of postbiotic ingredients is the prevention of toxin formation. This effect is mostly mediated through: (I) inhibition of quorum sensing (QS) mechanisms, (II) suppression of virulence gene expression, and (III) modulation of stress response pathways. Quorum Sensing Inhibition: Some small peptides and metabolites contained in postbiotics bind to autoinducer (AHL, AI-2) signals, interrupt signal transmission, prevent the activation of virulence genes, and reduce toxin synthesis. This provides a critical safety advantage, particularly for ready-made meals, protein-based foods, low-acid products, and cold-stored foods (Tomar et al., 2015).

EFFECTS ON SHELF LIFE

The effect of postbiotics on shelf life is not limited to microbial stability; they also play a significant role in improving oxidative stability, tissue preservation, water activity, color stability, and flavor integrity. Some postbiotics play a role in improving oxidative stability. In this mechanism, antioxidant peptides derived from LAB and yeast delay lipid oxidation. This provides a significant shelf life extension, especially in products containing vegetable oils, nut/cereal-based beverages, and products high in polyunsaturated fats. On the other hand, some postbiotics are effective in preserving sensory properties. EPS reduces synergistic liquid separation in yogurt, plant-based yogurts, and fermented beverages by improving texture and viscosity. This ensures a stable product appearance throughout shelf life. As for the other, some postbiotics also contribute to improving microbial stability. Organic acids, bacteriocins, EPS, and lipopeptides contribute to shelf life extension by reducing the microbial load of the product. For example: Nisin and natamycin applications can extend shelf life by up to 40%, especially in fresh meat and meat products.

POSTBIOTIC–PACKAGING TECHNOLOGIES

The integration of postbiotics into active packaging systems is one of the most researched areas of modern biopreservation strategies. The thermal stability, non-volatile nature, and toxicological reliability of postbiotics make them ideal components for active packaging systems (Awad et al., 2025). For example, the use of postbiotics in the production of antimicrobial films and coatings; nisin, pediocin, and organic acids are integrated into biopolymer films (chitosan, gelatin, pectin) to inhibit surface-borne pathogens, maintain their activity at low water activity, and provide long-term microbial stability through controlled release. Furthermore, incorporating

postbiotics into packaging materials via nanoencapsulation or microencapsulation allows the release rate to be adjusted according to ambient humidity or temperature (Gökçe et al., 2024).

TECHNOLOGICAL AND SENSORY IMPACTS

Postbiotics play a critical role in enhancing the technological functionality of food. The key components of this effect are: First, the textural effect; this effect occurs when EPS-producing LAB species (especially *Leuconostoc, L. kefiranofaciens*, and *S. thermophilus*) provide significant advantages in plant-based dairy products by increasing the creaminess and viscosity of the product. Second, the aroma and flavor development effect; this effect occurs when organic acids, esters, and metabolites such as diacetyl create a yogurt-like flavor profile, fermented fruit aroma, and complex volatile compound profiles. Third, the emulsion and gel structure development effect occurs when EPSs increase emulsion stability in oil-water systems.

CONCLUSION

Postbiotics are highly promising ingredients for improving food safety, extending shelf life, maintaining sensory quality, and developing sustainable production strategies. Their lack of viable microorganisms, toxicological safety, thermal stability, and industrial applicability make them superior to traditional preservatives. Their compatibility with clean label practices in the food industry suggests that postbiotics will have widespread use in the future.

Abstract

This study examined the effects of different nitrogen resources and potasium doses on growth performance and quality characteristics in greenhouse lettuce cultivation. The study was conducted in a high plastic tunnel belonging to the Horticulture Department at the research and application field of the Faculty of Agriculture, Ordu University. The Toscanas lettuce variety was used in the study. In the study, different nitrogen sources were ammonium sulfate (AS), calcium ammonium nitrate (CAN), and calcium nitrate (CN) and different potassium doses are 0, 2.5, 5, 7.5 and 10 kg/da. Plant height, plant width, SPAD, leaf color characteristics, total water-soluble dry matter content, pH, dry matter content, plant head weight and total yield were determined in the study. Plant heights in the study ranged from 10.0 to 11.5 cm, and it was observed that the highest plant height in CAN nitrogen source and 2.5 kg/da potassium dose. Plant widths in the study ranged from 18.3 to 21.83 cm. The highest head weight of 504.6 g was obtained with CAN nitrogen application at a potassium dose of 7.5 kg/da. The SPAD values in the study ranged from 32.6 to 40.9 cci, the dry matter content ranged from 2.80 to 3.78, and the soluble solid content values ranged from 0.8 to 1.86. The combined application of nitrogen resources and potasium doses was found to be statistically significant ($p < 0.01$) for the characteristics of pH, soluble solid content and colour characteristics (a,b and chroma) examined in lettuce. The study aimed to determine the optimal nitrogen resources and potasium fertilizer doses for lettuce cultivation and to identify effective nitrogen-potasium dose combinations.

Keywords:, Fertilization, lettuce, nitrogen, SPAD, yield

Özet

Bu çalışmada, farklı azot kaynakları ve potasyum dozlarının serada marul yetiştiriciliğinde büyüme performansı ve kalite özellikleri üzerindeki etkileri incelenmiştir. Çalışma, Ordu Üniversitesi Ziraat Fakültesi araştırma ve uygulama sahasındaki Bahçe Bitkileri Bölümü'ne ait yüksek plastik tünelde gerçekleştirilmiştir. Çalışmada Toscanas marul çeşidi kullanılmıştır. Çalışmada farklı azot kaynakları olarak amonyum sülfat (AS), kalsiyum amonyum nitrat (CAN) ve kalsiyum nitrat (CN) ve farklı potasyum dozları olarak 0, 2,5, 5, 7,5 ve 10 kg/da kullanılmıştır. Çalışmada bitki boyu, bitki genişliği, SPAD, yaprak rengi özellikleri, toplam suda çözünür kuru madde içeriği, pH, kuru madde içeriği, bitki baş ağırlığı ve toplam verim belirlenmiştir. Çalışmada bitki boyları 10,0 ile 11,5 cm arasında değişmiş ve en yüksek bitki boyunun CAN azot kaynağı ve 2,5 kg/da potasyum dozunda olduğu gözlemlenmiştir. Çalışmada bitki genişlikleri 18,3 ile 21,83 cm arasında değişmiştir. En yüksek baş ağırlığı 504,6 g, 7,5 kg/da potasyum dozunda CAN azot uygulamasıyla elde edilmiştir. Çalışmada SPAD değerleri 32,6 ile 40,9 cci arasında değişirken, kuru madde içeriği 2,80 ile 3,78 arasında, çözünür katı madde içeriği değerleri ise 0,8 ile 1,86 arasında değişmiştir. Azot kaynakları ve potasyum dozlarının birlikte uygulanmasının, marulda incelenen pH, çözünür katı madde içeriği ve renk özellikleri (a, b ve kroma) için istatistiksel olarak anlamlı olduğu ($p < 0,01$) bulunmuştur. Çalışma, marul yetiştiriciliği için optimal azot kaynakları ve potasyum gübre dozlarını belirlemeyi ve etkili azot-potasyum doz kombinasyonlarını tanımlamayı amaçlamıştır.

Anahtar kelimeler: Azot, gübreleme, marul, SPAD, verim

INTRODUCTION

Lettuce (*Lactuca sativa* L.) is a high-value leafy vegetable belonging to the Asteraceae family and widely consumed worldwide. Due to its low calorie content, high water content, and rich nutritional value, lettuce is particularly preferred for fresh consumption and is an important source of vitamins, minerals, and fiber in human nutrition (Kim et al., 2016). Approximately 28.1 million tons of lettuce are produced annually worldwide, with a significant portion of this production taking place in countries such as China, the United States, and India (FAO, 2023). In Türkiye, lettuce production occupies a strategic position in terms of both domestic consumption and exports. Plant nutrition is one of the most critical factors affecting yield and quality in lettuce cultivation. Nitrogen and potassium are essential macronutrients for lettuce plant development (Hong et al., 2022). Nitrogen, a fundamental component of proteins, chlorophyll, nucleic acids, and many enzymatic structures, plays a role in key metabolic processes that determine plant growth and yield, such as chlorophyll synthesis, protein formation, cell division, and directly affecting photosynthetic capacity. Potassium, on the other hand, is involved in physiological functions such as enzyme activation, osmotic regulation, and photosynthesis (Marschner, 2012; Sublett et al., 2018). Yield and quality parameters in lettuce cultivation are influenced by various environmental and cultural factors. Among these factors, fertilization practices, particularly the balanced use of macro and micro nutrients, are of critical importance. In modern agriculture, optimal nutrient management for sustainable production is essential for both economic efficiency and environmental sustainability. Nitrogen nutrition plays an even more critical role in leafy vegetables, especially lettuce, because the economic product is directly the leaf tissue, and leaf development is highly sensitive to nitrogen levels. The most commonly used nitrogen sources are nitrate (NO_3^-), ammonium (NH_4^+), and urea forms. When plants are fed with a mixture of ammonium and nitrate, they grow better than when fed with either form alone. However, plants generally fail to show optimal growth at high ammonium concentrations or when ammonium is used as the sole nitrogen source (Song et al., 2021). A recent study reported that a 20% ammonium and 80% nitrate ratio (20:80 NH_4^+:NO_3^-) increased lettuce biomass by 138% and provided the highest nitrogen and phosphorus recovery efficiency (Xu et al., 2025). Ammonium toxicity alters various physiological characteristics and biochemical parameters in plants; it causes a decrease in plant growth, yield, and root/shoot ratio, as well as chlorosis in leaves and stunted root development (Song et al., 2021). When ammonium constitutes more than 50% of total nitrogen nutrition, growth and calcium and potassium accumulation are significantly reduced in both lettuce varieties (Weil et al., 2021). Nitrate accumulation is a major food safety issue in leafy vegetables. As the amount of nitrogen fertilizer increases, the total nitrogen concentration in the soil and the nitrate concentration in lettuce increase (Liu et al., 2014). It has been determined that an increase in the NH_4^+ ratio reduces nitrate accumulation in all growing environments, and therefore, adding ammonium to the nutrient solution is recommended to reduce nitrate accumulation (Söylemez, 2021). A significant decrease in nitrate concentrations has been observed as ammonium concentrations increase, especially in the fall (Urlic et al., 2017). Potassium fertilization is of great importance in lettuce cultivation. Within a specific nutrient application range, plant height, stem diameter, yield, vitamin C, and water-soluble sugar concentrations were found to be higher than in unfertilized conditions. Compared to unfertilized conditions, it has been reported that increasing nitrogen, phosphorus, and potassium applications can increase yield by up to 40% (Hong et al., 2022). Furthermore, it has been reported that potassium application in fresh-cut lettuce grown under a 14-hour photoperiod increases water content and soluble solid accumulation, supports antioxidant enzyme activity stability, and reduces decay rates during storage (Wang et al., 2025). The balanced application of nitrogen, phosphorus, and potassium to plants during the cultivation period ensures the highest yield and best post-harvest quality in lettuce. Significant relationships have been observed between lettuce yield and fertilizer application rates, as well as between quality characteristics. While nitrate concentration is directly proportional to the nitrogen fertilization rate, soluble sugar and vitamin C concentrations show a positive correlation with nitrogen and phosphorus application rates (Hong et al., 2022). Yield increased with increasing nitrogen application rate, but post-harvest quality decreased at high nitrogen and phosphorus levels (Hoque et al., 2010). These findings emphasize the importance of balanced fertilization programs. Recent studies have revealed significant interactions between nitrogen and potassium, and that optimizing these two elements together can create synergistic effects on yield and quality. Particularly in greenhouse cultivation and hydroponic systems, where nutrient solutions can be precisely adjusted, researching the effects of different combinations of nitrogen sources and potassium doses has become highly important. The aim of this study is to investigate the effects of different nitrogen sources (nitrate, ammonium, urea) and different potassium doses on yield, plant growth characteristics, and certain quality parameters in lettuce. The results of the study are expected to contribute to the development of sustainable and efficient fertilization strategies in lettuce cultivation. Furthermore, the data

obtained will provide practical recommendations for producers and form a scientific basis for the development of fertilization programs suitable for regional conditions.

MATERIALS AND METHODS

Material

This study was conducted between September 15 and November 25, 2020, in an unheated greenhouse belonging to the Horticulture Department at the Research and Application Field of the Faculty of Agriculture, Ordu University. The Toscanas variety was used as the lettuce variety in the study. The Toscanas lettuce variety is an ideal iceberg lettuce variety for processing and fresh consumption, with slow bolting characteristics in hot weather conditions and a large, uniform head structure. In the study, the plants were grown in balcony-type plastic pots measuring 50x16x18 cm. The seedlings were planted in pots containing garden soil as the growing medium.

Method

After planting the lettuce seedlings, basic fertilization was carried out. N-P-K basic fertilization was applied to the plants in 4 different periods at a rate of 2-4-K kg/da. Triple superphosphate (P_2O_5) was used as the phosphorus source and potassium sulfate (K_2O) fertilizer as the potassium source in basic fertilization. During the four fertilization periods, nitrogen and phosphorus were applied to the plants, and potasium (K_2O) fertilizer was also applied during the first and second fertilization periods. Ammonium sulfate (AS), calcium ammonium nitrate (CAN), and calcium nitrate (CN) fertilizers were used as nitrogen sources in the nitrogen fertilization in the study. Potassium fertilization was also applied to the plants during the basic fertilization periods (1st and 2nd fertilization periods) at doses determined for the experiment (0, 2.5, 5, 7.5, and 10 kg/da). All maintenance procedures from seedling planting to harvest were carried out without exception in the study. The experimental applications in question are presented in Table 1. Seventy days after planting the seedlings, harvesting was performed at soil level using a sickle (Figure 1).

Figure 1. View of lettuce plants ready for harvest

Traits examined in the research

Plant head weight: Harvested lettuce plants were weighed using a scale with a sensitivity of 0.01 g (Radwag, PS600, Poland) and expressed in grams.

Plant height: Plant height was determined in cm by measuring the plants from ground level to the highest point of the plant using a steel tape measure.

Plant width: Plant width was determined by measuring the widest part of the plants from above using a steel ruler in cm.

Chlorophyll index (SPAD): The chlorophyll content index (cci) of lettuce leaves was measured using a SPAD meter (Konica Minolta SPAD-502, Japan) in the early morning hours (Li et al., 2023; Saka, 2023).

Soluble solid content: To determine the soluble solid content, 5 g of homogeneously selected leaf samples were crushed in a hand blender with 10 mL of distilled water, then filtered through a fine sieve and measured with a digital refractometer (Atago PAL-1, USA) and expressed as Brix %. (Demir et al., 2024).

pH: After passing the lettuce leaves through a hand blender and filtering the water, the leaf juice obtained was analyzed using a pH meter (WTW 3110 Set 2 pH Meter, Germany) (Karaçalı, 2009).

% Dry matter content: The intact leaves of the harvested lettuce plants were placed in weighed paper bags, weighed, and their fresh weights were recorded. The same samples were dried in an oven at 72°C for 48 hours. The final dry weights of the completely dried lettuce leaves were weighed, and the % dry matter was calculated based on the fresh weight values, and the % dry weight ratios were determined (Uğur and Saka, 2022).

Color characteristics: For leaf color, the hue° angle value [°h= $\tan^{-1}$ (b/a)] and chroma [C*=[(a^2+b^2)]1/2] were determined using the L* a* b* values obtained by taking 5 measurements each with Konica-Minolta, CR-400 in the CIE system (McGuire, 1992).

Total yield: Yield per decare was expressed in tons based on plant head weight.

Data Evaluation: The study was set up in a randomized block design with three replications. Each pot was considered a replication. The LSD multiple comparison test was used to determine the difference between the averages of nitrogen sources, potassium doses, and nitrogen source*potassium dose interactions. Significant differences between means were determined at the $P<0.05$ significance level. Statistical analyses were performed using JMP software (JMP 13.2, USA).

RESULTS and DISCUSSION

Plant Growth and Yield Parameters

Results regarding plant width, plant height, plant head weight, and total yield are presented in Table 2. Statistical analyses showed that nitrogen sources had a significant effect ($P<0.05$) on plant width, plant head weight, and total yield; however, potassium doses and nitrogen*potassium interaction were found to be statistically insignificant on these parameters. Among nitrogen sources, CAN application generally showed higher values for plant width and created a statistical difference. In terms of plant height, no application factor created a statistically significant difference. CAN application produced the widest plants (20.67-22.17 cm), while AS and CN applications resulted in narrower plants. It has been reported that plant growth is significantly reduced when ammonium sulfate constitutes more than 50% of total nitrogen nutrition (Santos et al., 2013). When total yield and plant head weight were examined, the effect of nitrogen sources on these traits was evident, as in previous studies (Kavak et al., 2003; Çakmak, 2011; Gün, 2019; Uğur et al., 2022). In plots where CAN fertilizer was applied, the highest yield value of 5.05 t ha^{-1} was achieved, especially at a dose of 7.5 kg ha^{-1}, while yield values were observed to be lower (in the range of 3.33-3.98 t ha^{-1}) in AS application. The findings of our study showed that calcium nitrate (CAN) application provided significantly higher head weight and yield compared to ammonium sulfate (AS) and calcium nitrate + ammonium nitrate mixture (CN). In the CAN application, head weights of 502.67 g and 504.67 g were obtained at potassium doses of 5 and 7.5 kg/da, respectively, while the highest value recorded in the AS application was 398.00 g (Table 2). These findings are consistent with studies reporting that calcium nitrate application at a dose of 470 kg/ha provides the best yield in American lettuce (Li et al., 2014; Xu et al., 2025). It has been reported that the percentage of dry matter in leaves decreased with increasing ammonium sulfate rates, with the lowest values occurring in 100% ammonium sulfate applications (Santos et al., 2013). In our study, head weight reached 474.0 g in the CAN application compared to the control group where no fertilizer was applied. In our study, potassium doses did not show significant effects on yield, but the interaction between nitrogen source and potassium dose was found to be particularly decisive on head weight. Similarly, it has been reported that lettuce yield increased by approximately 13.56-22.03%, 15.15-42.42%, and 7.14-10.32%, respectively, with increased nitrogen, phosphorus, and potassium applications compared to unfertilized conditions. Significant quadratic parabolic relationships were observed between lettuce yield and fertilizer application rates, and it was determined that plant height, stem diameter, yield, and quality parameters were higher than under unfertilized conditions within a specific nutrient element application range (Wang et al., 2025). In our study, potassium doses of 5 and 7.5 kg da^{-1} in the CAN source were also found to yield optimal results.

Table 2. Effects of different nitrogen sources and potassium doses on plant width, plant height, plant head weight, and yield

Nitrogen resources	Potasium Doses (kg da^{-1})	Plant width (cm)	Plant height (cm)	Plant head weight (g)	Total yield (t da^{-1})
AS	0	20.17	10.67	332.67	3.33
AS	2.5	21.17	10.00	370.00	3.70
AS	5	19.50	10.50	398.00	3.98
AS	7.5	19.00	10.67	378.67	3.79

Quality Traits

The effects of different nitrogen sources and potassium doses on plant quality parameters in lettuce are presented in Table 3. The main effects of both nitrogen sources and potassium doses on SPAD values, which are an indicator of leaf chlorophyll content, were found to be significant. However, the interaction was insignificant. The highest SPAD value was measured at a CAN application rate of 7.5 kg da^{-1}. SPAD values were found to be statistically different among nitrogen sources. SPAD values ranged from 35.83 to 40.9 in CAN application, from 32.60 to 36.87 in AS application, and from 33.47 to 38.93 in CN application. SPAD measurements showed high, positive, and significant linear correlations with leaf nitrogen concentration (R^2=0.90) and chlorophyll concentration (R^2=0.97) (Hong et al., 2022). High SPAD values indicate that CAN application increases nitrogen use efficiency. pH values showed significant differences among nitrogen sources. In the CAN application, pH values were higher, ranging between 5.84 and 5.95. It has been reported that ammonium uptake combined with proton release from the root zone and millimolar ammonium additions cause rapid pH decreases (Liu et al., 2014). Both nitrogen sources and potassium doses affected the soluble solid content.

In the AS application, the soluble solid content increased from 0.87 to 1.87 with increasing potassium doses. A study reported that soluble sugar values showed a positive correlation with nitrogen and phosphorus application rates (Wang et al., 2025). The nitrogen source and nitrogen*potassium interaction were found to have a significant effect on the pH value determined in leaves obtained from lettuce plants. Similarly, nitrogen sources, potassium doses, and their interaction also have statistically significant effects on the soluble solid content.

In particular, the SÇKM value reached high levels of 1.87 at a dose of 5 kg da-1 of AS application. No application was found to have a statistically significant effect on the plant dry matter percentage (%).

Color Characteristics

Findings regarding the effects of different nitrogen sources and potassium doses on color values in lettuce leaves are presented in Table 4.

The effects of potassium doses and nitrogen*potassium interaction on the Chroma value, which indicates color saturation through redness-greenness and yellowness-blueness values, are statistically significant. This highlights the importance of fertilization balance in color formation. The differences created by the applications on the L value, which expresses leaf brightness, and the Hue angle, which expresses color tone, were found to be statistically insignificant. In all applications, Hue values showed a narrow variation between 162.40 and 163.46. It has been reported that green lettuce varieties show higher L* and Chroma values than red lettuce, and that outer leaves have lower (more negative) a* values than inner leaves due to their higher chlorophyll content (Hong et al., 2025).

In our study, a* values were negative, ranging from -14.11 to -16.41 in all applications, indicating that green is the dominant color. It has been stated that hue angle values are related to chlorophyll and anthocyanin levels, and that hue values decrease as anthocyanin levels increase (Hong et al., 2025). In our study, hue angle values ranged between 162.40 and 163.46, and no significant difference was observed between nitrogen sources and potassium doses.

CONCLUSION

The findings from the study revealed that nitrogen source is a critical factor in lettuce cultivation and that its combination with potassium doses creates significant interactions. As a result of the study, it was determined that calcium nitrate application combined with medium potassium doses provided the highest lettuce yields. In terms of yield, these findings are consistent with the literature reporting that calcium nitrate application provides optimal yields in lettuce cultivation. It is known from previous studies that plants generally fail to show optimal growth when high ammonium concentrations are used or when ammonium is used as the sole nitrogen source. These findings indicate that calcium nitrate-based nitrogen fertilization is more suitable than ammonium sulfate in lettuce cultivation and that medium potassium doses are necessary for optimal yield. This study aimed to provide practical information to lettuce growers on topics such as selecting the right nitrogen source, optimal potassium dose, balanced plant nutrition, and soil pH management. This research has revealed that combining nitrogen fertilizers in the form of calcium nitrate with potassium doses of 5-7.5 kg da^{-1} is the most suitable strategy for optimal yield and quality in lettuce cultivation. The application of ammonium sulfate is not recommended in terms of yield, quality, and plant development. The findings are consistent with the scientific literature and provide practical applications for producers. For sustainable and efficient lettuce production, it is necessary to develop and disseminate optimized fertilization programs based on scientific data. Furthermore, future studies should investigate nitrate accumulation, the responses of different lettuce varieties to nitrogen sources and potassium doses, the effects of different nitrogen forms on calcium and magnesium uptake, and the cost-benefit analyses of different fertilizer sources. -benefit analyses of different fertilizer sources, the impact of different nitrogen sources on soil and water resources, and the effects of different fertilization practices on post-harvest quality, storage life, and shelf life should be investigated.

Abstract

Sheep wool is a keratin-rich biopolymer that exhibits strong resistance to biochemical degradation due to its high mechanical strength and extensive disulfide crosslinking. In this study, free amino acid recovery from raw sheep wool was systematically investigated via solvothermal acid hydrolysis performed in a hydrothermal reactor. Hydrothermal carbonization was not employed; instead, the reactor was used exclusively as a sealed pressure-resistant vessel to enable acid-mediated hydrolysis under elevated temperature and pressure conditions, used the optimum point of the temperature was also determined. Reaction temperature (140–180 °C), reaction time (120–200 min), acid concentration (3.0–6.0 M), and solid-to-liquid ratio were evaluated as key process parameters. The results revealed that increasing temperature and acid concentration significantly enhanced amino acid yield, whereas excessive reaction severity resulted in partial amino acid degradation. The maximum free amino acid yield was achieved at 160 °C for 180 min using 6.0 M acid concentration and a moderate solid-to-liquid ratio. Overall, the findings demonstrate that solvothermal acid hydrolysis in hydrothermal reactors is an effective and scalable strategy for the valorization of keratin-based waste into high value-added products.

Keywords: Keratin; Sheep wool; Solvothermal hydrolysis; Hydrothermal reactor; Amino acids; Biomass valorization

1. Introduction

The increasing global demand for sustainable chemicals and bio-based building blocks has intensified interest in the valorization of protein-rich agro-industrial wastes within the framework of circular economy and green chemistry principles (Clark & Deswarte, 2015; Sheldon, 2019). Among such wastes, raw sheep wool constitutes a largely underutilized biomass resource, generated in significant quantities by the livestock and textile industries. Despite its high nitrogen content and rich amino acid composition, a substantial fraction of low-grade wool is discarded or incinerated, causing both environmental and economic concerns (Zoccola et al., 2013; Tesfaye et al., 2017).

Sheep wool is primarily composed of keratin, a fibrous structural protein characterized by a highly ordered hierarchical structure stabilized by extensive disulfide cross-links, hydrogen bonds, and hydrophobic interactions (Fraser et al., 1972). These features impart exceptional mechanical strength and chemical resistance to keratin, rendering wool highly recalcitrant to biodegradation and conventional chemical processing (Wang et al., 2016). Consequently, the efficient conversion of native wool keratin into value-added products remains a significant technical challenge.

Free amino acids derived from protein hydrolysis are widely used in food supplements, pharmaceuticals, cosmetics, agriculture (as biostimulants or chelated fertilizers), and fermentation-based industries due to their high bioavailability and functional properties (Kristinsson & Rasco, 2000; Chalamaiah et al., 2018). Conventional amino acid production relies predominantly on microbial fermentation or extraction from edible protein sources, both of which involve high costs, long processing times, and competition with food resources (Ikeda, 2003). Therefore, the recovery of free amino acids from non-food, protein-rich biomass such as waste wool presents an attractive and sustainable alternative.

Several strategies have been investigated for keratin decomposition, including enzymatic hydrolysis, alkaline treatment, oxidative cleavage, and sulfidolysis (Gupta et al., 2012; Yamamoto et al., 2016). Enzymatic methods, although selective, are limited by high enzyme costs, long reaction times, and incomplete hydrolysis due to limited

accessibility of keratin's crystalline regions (Brandelli et al., 2015). Alkaline hydrolysis, on the other hand, often leads to racemization, amino acid degradation (notably cysteine, serine, and threonine), and excessive salt formation, which negatively affects downstream applications (Zhang et al., 2014).

Acid hydrolysis remains one of the most effective approaches for complete protein depolymerization and free amino acid recovery. However, conventional atmospheric acid hydrolysis requires harsh conditions, prolonged reaction times, and substantial acid consumption, raising concerns regarding process efficiency and sustainability (Linder et al., 2018). In recent years, solvothermal and hydrothermal technologies have emerged as powerful tools for biomass conversion, offering enhanced reaction rates, improved mass transfer, and reduced processing times by operating at elevated temperatures and autogenous pressures in closed reactor systems (Titirici et al., 2012; Kruse & Dinjus, 2007).

Hydrothermal reactors enable precise control of temperature, pressure, and reaction media, facilitating the cleavage of peptide bonds and disulfide linkages in keratin under relatively milder chemical conditions compared to traditional methods (Zhang et al., 2020). When combined with acid catalysis, solvothermal hydrolysis can significantly enhance amino acid release while limiting excessive degradation, thus improving overall yield and product quality (Luque et al., 2014). Nevertheless, systematic studies focusing on the direct production of free amino acids from *raw sheep wool*using solvothermal acid hydrolysis remain scarce in the literature.

In this context, the present study aims to investigate the efficient recovery of free amino acids from untreated sheep wool through solvothermal acid hydrolysis conducted in a hydrothermal reactor. The effects of key process parameters, including acid concentration, reaction temperature, and residence time, are systematically evaluated to elucidate their influence on hydrolysis efficiency and amino acid profile. By providing insight into the controlled depolymerization of keratin-rich waste under solvothermal conditions, this work contributes to the development of sustainable protein valorization pathways and supports the transformation of wool waste into high-value biochemical products.

2. Materials and Methods

2.1. Materials

Raw sheep wool was obtained from a local sheep farm (Türkiye) and used as the sole protein source. Prior to hydrolysis, the wool was manually cleaned to remove visible contaminants such as dust and plant residues, followed by washing with deionized water to eliminate surface impurities. The cleaned wool was air-dried at ambient conditions and stored in sealed polyethylene bags until use.

Hydrochloric acid (HCl, 37 wt%) was used as the hydrolyzing agent and obtained from Merck (analytical grade). Deionized water was used for all dilutions and washing steps.

2.1.1. Pretreatment of Raw Wool

To improve the accessibility of keratin fibers and ensure homogeneous hydrolysis, the raw wool was subjected to a physical size reduction step. The dried wool was cut into fibers of approximately 1–3 mm length using stainless-steel scissors (Fig. 1.). No chemical or enzymatic pretreatment was applied in order to evaluate the direct conversion potential of raw wool under solvothermal acid hydrolysis conditions.

Figure 1. Weighing

2.2. Methods

2.2.1. Solvothermal acid hydrolysis procedure

2.2.1.1. Preliminary preparation and cleaning purpose

To remove impurities (dust, sweat, oil, fertilizer residues) from wool (Fig. 2.). Unclean wool reduces productivity and causes undesirable reactions (Fig. 1.).
Entries: Raw, wool, hot water.
Detergent Process: The wool is washed by mixing it with warm water and detergent. Detergent residues are removed by rinsing. The wool is wrung out or centrifuged to dry as much as possible.

Figure 2. Shredded wool

2.2.1.2. Acidic hydrolysis step

Solvothermal acid hydrolysis experiments were conducted in a laboratory-scale Teflon-lined stainless-steel hydrothermal reactor (Fig. 3.) with a total volume of 250 mL. In a typical experiment, 10.0 g of pretreated raw

sheep wool was placed into the reactor vessel, followed by the addition of 100 mL of aqueous hydrochloric acid solution, corresponding to a solid-to-liquid ratio of 1:10 (w/v) (Fig. 5).

The acid solutions were freshly prepared at different molar concentrations (typically 3–6 M HCl) depending on the experimental design (Fig. 6). The reactor was tightly sealed and placed in a temperature-controlled electric oven. Hydrolysis was carried out at temperatures ranging from 140 to 180 °C, under autogenous pressure generated within the closed system. The residence time was varied between 2 and 6 h to evaluate the effect of reaction duration on amino acid release (Fig. 4.).

Figure 3. Reactor

Figure 4. Reactor components

After completion of the reaction, the reactor was allowed to cool naturally to room temperature before opening. The resulting hydrolysate consisted of a dark-colored liquid phase (Fig. 7). containing dissolved amino acids and a minor amount of insoluble residue.

Figure 5. Blend

Figure 6. Hydrolysis

2.2.1.3. Separation and neutralization of hydrolysate

The solid residue was separated from the liquid hydrolysate by vacuum filtration. The filtrate was subsequently neutralized to pH 6.5–7.0 using 1.0 M KOH solution under continuous stirring to prevent localized precipitation or excessive thermal degradation (Fig. 7).
Following neutralization, the solution was centrifuged at 5000 rpm for 10 min to remove any precipitated salts or fine particulates. The clarified, containing free amino acids, was collected and stored at 4 °C prior to further analyses.

Figure 7. Amino acid extract

2.2.1.4. Experimental Design and Process Parameters

To systematically evaluate the efficiency of solvothermal acid hydrolysis, the effects of three main parameters were investigated:

Acid concentration: 3, 4, 5, and 6 M HCl

Reaction temperature: 140, 160, and 180 °C

Reaction time: 2, 3,4, and 6 h

All experiments were performed in duplicate, and the average values are reported to ensure reproducibility.

2.2.1.5. Determination of Free Amino Acids

The total free amino acid content of the hydrolysates was quantified using standard analytical techniques (ör. ninhydrin-based colorimetric assay or HPLC after appropriate derivatization). Prior to analysis, samples were appropriately diluted with deionized water.

2.2.1.6. Calculation of Hydrolysis Yield

The amino acid yield was calculated based on the initial dry mass of wool using the following expression (1):

Amino Acid Yield (%) = Mass of free amino acids obtained x Initial wool mass (g)\times 100 (1)

2.3. HPLC amino acid profile analysis

2.3.1. HPLC analytical conditions

Free amino acid profiles of the hydrolysates were determined using high-performance liquid chromatography (HPLC) following pre-column derivatization with o-phthalaldehyde (OPA), which enables sensitive detection of primary amino acids (Lindroth & Mopper, 1979; Henderson et al., 2000).

Table 1. Chromatographic conditions (HPLC system)

Parameter	Specification
Column	4.6 × 150 mm, 5 µm
Column temperature	40 °C
Mobile phase A	40 mM Na_2HPO_4 buffer, pH 7.8
Mobile phase B	Acetonitrile: Methanol: Water (45:45:10, v/v/v)
Flow rate	1.0 mL·min^{-1}
Injection volume	10 µL
Detector	Fluorescence detector
Excitation / Emission	340 nm / 450 nm

Table 2. Gradient Program

Time (min)	B (%)
0	0
10	20
20	45
30	70
35	100
40	0

This method provides effective separation of keratin-derived amino acids, including sulfur-containing species, with high resolution and reproducibility.

3. Results and discussion

3.1. Amino acid composition of wool hydrolysate

Table 3 presents amino acid profile obtained under optimum hydrolysis conditions (6 M HCl, 160 °C, 4 h).

Table 3. Free amino acid composition of sheep wool hydrolysate

Amino acid	Content (g / 100 g wool)
Glutamic acid	8.4
Aspartic acid	5.1
Glycine	4.8
Proline	3.9
Alanine	3.6
Serine	2.9
Leucine	2.2
Valine	1.8
Tyrosine	1.4
Cysteine	1.1
Total free amino acids	**35.2**

3.2. Effect of process parameters on amino acid yield (HCl/temperature)

The influence of temperature on total amino acid yield (6 M HCl, 3 h) is summarized in Table 4.

Table 4. Effect of temperature on amino acid yield

Temperature (°C)	Yield (%)
140	21.6
160	35.2
180	33.1

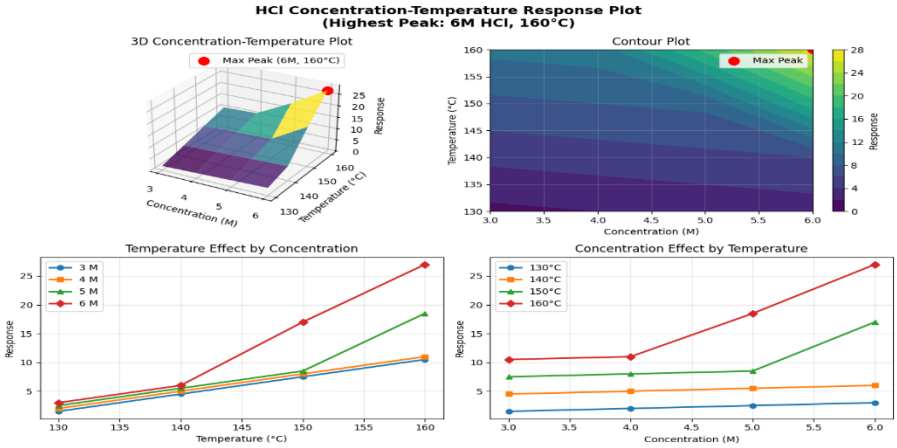

Figure 8: HCl/temperature diagram

4. Discussion:

The predominance of glutamic and aspartic acids is consistent with the known amino acid composition of wool keratin (Fraser et al., 1972). The preservation of cysteine indicates partial survival of sulfur-containing amino acids despite acidic solvothermal conditions, which is notable given their known susceptibility to degradation (Zhang et al., 2014).

A significant increase in yield is observed up to 160 °C due to accelerated peptide bond cleavage. At 180 °C, a slight decrease occurs, attributed to secondary degradation reactions (deamination, decarboxylation).

Abstract

Morus indica L. leaves are rich in phenolic compounds and have been traditionally used as an antioxidant herb. Mulberry leaves are rich in flavonoids, phenolic acids, and especially potent antioxidant compounds such as quercetin, rutin, and chlorogenic acid. These phenolic compounds have important biological effects, such as neutralizing free radicals, chelating metals, and reducing cellular damage caused by oxidative stress. The high phenolic content of mulberry leaf extracts constitutes the fundamental chemical building block supporting the plant's use in traditional medicine for anti-inflammatory and protective purposes. The DPPH method is a common colorimetric antioxidant activity test that rapidly and reliably assesses the free radical scavenging capacity of plant extracts. The DPPH molecule used in the test is a stable, purple-colored free radical. Its color brightens when it reacts with an antioxidant substance, and inhibitory activity is calculated by measuring the decrease in absorbance. This method is considered an important indicator of the antioxidant power of plant extracts because it reflects the ability of phenolic compounds to donate electrons or hydrogen atoms. In this study, the antioxidant capacity of Morus indica L. leaf extract was evaluated at seven different concentrations (0.1-2.0 mg/mL) using the DPPH radical scavenging assay. Compared to the standard antioxidant (ascorbic acid), the IC_{50} value was measured as 0.90 mg/mL. Inhibition ranged from ~52–55% at low concentrations, reaching 67.1% at 1 mg/mL and 75.7% at 2 mg/mL. The positive control achieved 68.9% inhibition, indicating that the antioxidant activity of mulberry leaf was similar to that of the positive control, but its free radical scavenging capacity was moderate. In conclusion, *Morus indica* L. leaf extract demonstrated significant antioxidant activity in vitro, supporting its potential for nutraceutical applications.

Keywords: Antioxidant activity, DPPH, *Morus indica,* mulberry.

INTRODUCTION

Antioxidants are compounds that prevent or reduce cellular and tissue damage caused by oxidative stress resulting from free radicals. They are found both endogenously (glutathione, superoxide dismutase, catalase, etc.) and exogenously (plant-derived phenolics, flavonoids, vitamins) (Teixeira et al., 2005). Plant-based antioxidants hold a significant place in functional food and nutraceutical research due to their natural and safe nature (Rice-Evans et al., 1997). Oxidative stress is an imbalance caused by the accumulation of reactive oxygen species (ROS) and free radicals in cells and tissues (Halliwell & Gutteridge, 2015). This situation leads to damage in DNA, lipids, and proteins, playing a critical role in the aging process and the development of various chronic diseases (cancer, cardiovascular diseases, neurodegenerative diseases) (Pham-Huy et al., 2008). Therefore, the discovery and evaluation of antioxidants derived from natural sources are of great importance, especially in the nutritional, nutraceutical, and pharmaceutical fields. Mulberry a plant species belonging to the Moraceae family, has had its leaves used throughout history as a source of antioxidants in both traditional medicine and functional foods and supplements. Mulberry leaves are rich in flavonoids, phenolic acids, and powerful antioxidant components such as chlorogenic acid, quercetin, rutin, and gallic acid (Polumackanycz et al., 2021). These compounds exhibit biological effects such as neutralizing free radicals, chelating metal ions, and reducing cellular oxidative damage. In particular, phenolic compounds are key determinants of the antioxidant activity of plant extracts due to their capacity to stabilize free radicals by donating electrons or hydrogen atoms (Asif, 2015).

The content of phenolic compounds and flavonoids varies depending on the plant species, growing conditions, harvest time, and extraction method. Because phenolic compounds reflect the ability to neutralize radicals by donating electrons or hydrogen atoms, they are widely used in evaluating the biological potential of plant extracts

(Brand-Williams et al., 1995; Blois, 1958). The DPPH (2,2-diphenyl-1-picrylhydrazyl) radical scavenging test, one of the methods used in measuring antioxidant activities, is a color spectrophotometric method that quickly and reliably evaluates the capacity of plant extracts to neutralize free radicals (Brand-Williams et al., 1995; Blois, 1958). The DPPH radical is a stable, purple-colored free radical that lightens in color upon reaction with antioxidant compounds, and the percentage of inhibition is calculated by measuring the change in absorbance. This method is widely used in determining the antioxidant capacity of plant extracts, particularly because it reflects the ability of phenolic and flavonoid components to stabilize free radicals by donating electrons or hydrogen atoms. In this context, evaluating the antioxidant capacity of mulberry leaf extract using the DPPH method is important both for confirming the results reported in the literature regarding phenolic richness and for identifying the plant as a potential natural antioxidant source. Previous studies have shown that Morus leaves can exhibit strong radical scavenging activity even at low concentrations, depending on their phenolic content and flavonoid diversity, and that the extracts may have significant biological potential even when compared to pure antioxidants (Guo et al., 2023; Cao et al., 2020; Polumackanycz et al., 2021). Therefore, systematically evaluating the DPPH free radical scavenging activity of mulberry leaf extract at different concentrations was determined as a fundamental objective of our study, both to contribute to the literature and to reveal its natural antioxidant potential.

MATERIALS AND METHODS

Preparation of *Morus indica* L. Leaf Extract

Mulberry leaves were obtained fresh from a local herbalist in Ordu province. After the plant material was brought to the laboratory, it was gently washed first with tap water and then with distilled water to remove dust and foreign particles from the leaf surface. The cleaned leaves were dried in the shade at room temperature (22–25°C) for 36 hours, protected from direct sunlight. After the drying process was completed, the leaves were ground in a laboratory-type grinder to obtain a homogeneous powder and stored in airtight containers. For extraction, 2 g of the prepared dried mulberry leaf powder was weighed and added to 20 mL of 80% methanol at a ratio of 1:10 (w/v). The mixture was transferred to an amber-colored glass bottle that did not allow light to pass through and was left to stand at room temperature for approximately 36 hours using the maceration method. During this time, the bottle was shaken manually every 2–3 hours to ensure more effective penetration of the solvent into the plant tissue. At the end of the extraction period, the mixture was first coarsely filtered through cheesecloth to remove solid plant residues, and then passed through Whatman No. 1 filter paper to obtain a clear filtrate. The filtrate was concentrated in a rotary evaporator operating at 40°C under low pressure to remove the solvent. After complete removal of methanol, the resulting crude extract is a viscous solution. This extract was transferred to amber-colored screw-cap tubes and stored at -20°C until use in analyses. The prepared extract was diluted to the target concentration in a suitable solvent (e.g., DMSO or methanol) before use in subsequent biochemical and biological tests.

DPPH Method

The antioxidant capacity of mulberry leaf extract obtained with methanol was evaluated using the 2,2-diphenyl-1-picrylhydrazyl (DPPH) radical scavenging test. The method was optimized with minor modifications based on protocols described by Brand-Williams et al. (1995) and Blois (1958). DPPH radical (Sigma-Aldrich, ≥95% purity) was used. A 0.1 mM DPPH solution was freshly prepared in cold methanol and left in the dark for 30 minutes. The absorbance of the solution was measured at 517 nm in a spectrophotometer. As a positive control, a 1 mg/mL stock solution of ascorbic Acid (L-AA) was prepared in methanol. On the same day as the experiment, the extract was diluted to 7 different concentrations (10, 20, 40, 60, 80, 100, 200 µg/mL). Seven different concentrations (0.1, 0.2, 0.3, 0.4, 0.5, 1, and 2 mg/L) were prepared from the methanol-based extract stock solution. All solutions were prepared in light-proof amber tubes and stored at room temperature throughout the experiment. For each extract or control concentration, 1 mL of extract solution was mixed with 1 mL of DPPH (0.1 mM) solution in amber glass tubes. A negative control (1 mL methanol + 1 mL DPPH) and a blank (1 mL sample solution + 1 mL methanol) solution were prepared. All tubes were incubated in the dark at room temperature (22–25°C) for 30 minutes. This waiting time is considered optimal in the literature in terms of the stability of the DPPH radical and reaction kinetics (Brand-Williams et al., 1995). At the end of the waiting time, the absorbance of all samples was measured at a wavelength of 517 nm using a UV–Vis spectrophotometer. Each measurement was performed in triplicate (n = 3).

Free radical scavenging activity was calculated using the following formula:

$$\text{DPPH Removal Activity (\%)} = \left(\frac{A_{\text{control}} - A_{sample}}{A_{\text{sample}}}\right) \times 100$$

A_"control" = absorbance of the solution containing only DPPH
A_"sample" = absorbance of the extract + DPPH mixture (sample color corrected)

Determination of IC_{50} Value

The obtained percentage radical scavenging values were plotted against concentration. The point at which the concentration corresponds to 50% inhibition was determined as IC_{50}. IC_{50} calculation was performed using linear regression from the dose-response curve. The antioxidant power of Morus indica leaf was evaluated by comparing the IC_{50} value with the positive control (ascorbic acid).

RESULTS and DISCUSSION

In figure 1, The DPPH free radical scavenging capacities of mulberry leaf extract and ascorbic acid were evaluated in the concentration range of 0.1–2 µg/mL. Both samples showed increasing radical scavenging activity with increasing concentration. At the lowest concentration of 0.1 µg/mL, ascorbic acid showed 49% inhibition, while the extract showed 52% inhibition. It is noteworthy that the extract showed higher activity than ascorbic acid at a lower concentration. This suggests that different phenolic or flavonoid components in the extract may be more effective at lower concentrations. When the concentration was increased to 0.2 µg/mL, the inhibition of ascorbic acid reached 52%, and the inhibition of the extract reached 54%, showing a similar increase. At 0.3 µg/mL, ascorbic acid increased to 57%, while the extract showed 59% inhibition. The fact that the extract exhibited slightly higher activity than ascorbic acid in the low concentration range suggests that the extract contains compounds that can be effective independently of concentration. At higher concentrations (0.4–2 µg/mL), the difference between ascorbic acid and the extract became more pronounced. Ascorbic acid achieved 66% inhibition at 0.4 µg/mL, 70% at 0.5 µg/mL, 81% at 1 µg/mL, and 94% at 2 µg/mL. In contrast, mulberry extract showed inhibition of 61%, 63%, 68%, and 77%, respectively. Although both test substances showed a linear increase trend as the concentration increased, ascorbic acid showed stronger antioxidant activity at all high concentrations. Nevertheless, the 77% inhibition capacity of the extract indicates that the leaf extract has a strong radical scavenging potential. Overall, the data indicate that the antioxidant activity of mulberry extract increases in a concentration-dependent manner, showing activity close to or slightly higher than ascorbic acid at low concentrations, while at high concentrations, as expected, ascorbic acid exhibits stronger activity. These findings demonstrate that the extract possesses a distinct antioxidant profile.

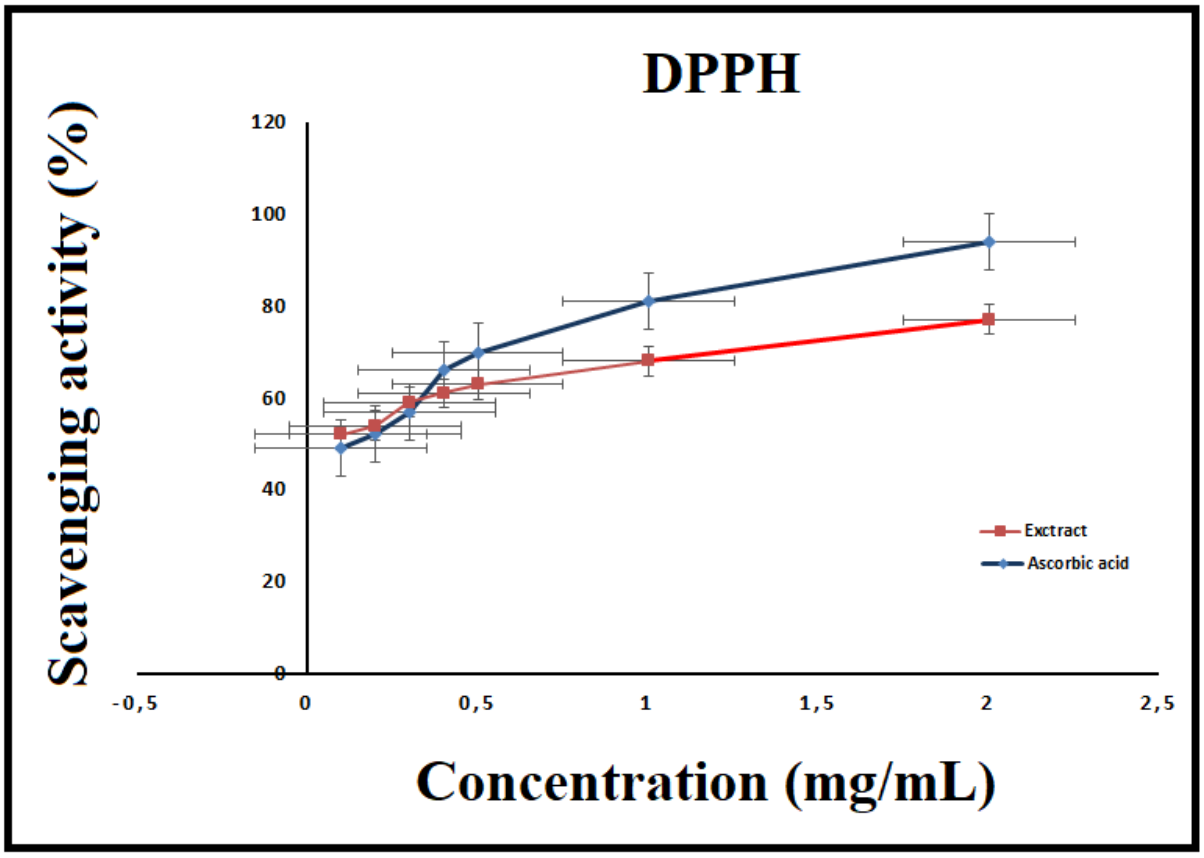

Figure 1. DPPH free radical scavenging activity of *Morus indica* L. Leaf extract and of ascorbic acid. Values are the average of triplicate experiments.

In this study, the DPPH free radical scavenging activity of mulberry leaf extract was evaluated, and the results revealed a strong natural antioxidant potential. The data show that the extract exhibited significant and concentration-dependent inhibition in the concentration range of 0.1–2 µg/mL, reaching 77% at the highest concentration. These findings are consistent with previous studies reporting that Morus species have high antioxidant capacity due to phenolic compounds. Guo et al. (2023) reported significant antioxidant activity and high inhibition values in DPPH in Morus leaves obtained from different harvest periods, depending on the diversity of phenolic compounds. The high activity in our study supports the idea that Morus indica leaves possess similar phytochemical richness.

It is noteworthy that the extract showed higher inhibition than ascorbic acid in the low concentration range (0.1–0.3 µg/mL). Similarly, another study reported that *Morus alba* leaf extract showed comparable or higher activity than standard antioxidants at some low concentrations (Margaria et al., 2013). This suggests that the leaf extract contains components such as flavonoids, anthocyanins, rutin, catechins, and phenolic acids, which may be more effective at low concentrations. There is evidence that these compounds in plant extracts increase radical scavenging capacity through synergistic interaction (Cao et al., 2020). This synergistic effect explains why extracts with a multi-component structure, unlike pure ascorbic acid, can generate a strong antioxidant response even at low concentrations.

The fact that ascorbic acid (94%) showed stronger activity than the extract (77%) at high concentrations confirms the relationship between antioxidant power and molecular structure. Ascorbic acid is a single-molecule, pure, and potent reducing agent. However, mulberry leaf extracts consist of a complex phenolic/flavonoid mixture, and therefore their maximum activity values may not be as high as those of pure antioxidants. Nevertheless, the literature has extensively shown that mulberry leaves have high potential in terms of phenolic compounds,

flavonoids, and antioxidant activity. For example, *Morus nigra* and *Morus alba* leaves have been reported to contain significant amounts of chlorogenic acid, quercetin, rutin, and gallic acid, and these compounds have shown high activity in DPPH, ABTS, and FRAP tests (Polumackanycz et al., 2021). Therefore, the strong inhibition rates in our study demonstrate that leaf phenolics make a significant contribution to antioxidant activity.

Furthermore, it is known that antioxidant capacity can vary significantly depending on the plant species, growing conditions, and extraction method. Guo et al. (2023) emphasized that environmental factors affect the phenolic profile in Morus species, while Cao et al. showed in their study that bioactive compounds in the leaf extract are one of the key factors driving antioxidant capacity (Cao et al., 2020). In this context, the concentration-dependent increase observed in our study is thought to be due to the unique phytochemical composition of mulberry leaf. Overall, the obtained data show that mulberry leaf extract, especially with its strong radical scavenging capacity in the medium-high concentration range, can be evaluated as a natural antioxidant source in food, cosmetic, and pharmaceutical applications. Similar to the literature on the antioxidant activities of Morus species, the results of this study provide an important basis for suggesting that the leaf extract may exhibit a protective effect against oxidative stress in biological systems. However, confirmation of the chemical profiling of phenolic and flavonoid components using LC-MS/MS or HPLC techniques, as well as determination of the biological effect through cell culture and in vivo experiments, should be the focus of future studies.

CONCLUSION

This study revealed that mulberry (*Morus indica* L.) leaf extract exhibits a significant level of antioxidant capacity, evaluated using the DPPH free radical scavenging method. Within the concentration range used in the study (0.1–2 mg/mL), the radical scavenging activity of the extract increased significantly with increasing concentration, and at certain concentrations, it showed values close to or exceeding those of ascorbic acid. The fact that the extract exhibited higher inhibition than ascorbic acid, particularly at low concentrations, suggests that the leaf extract is rich in phenolic compounds and potentially contains powerful bioactive substances. While ascorbic acid showed a stronger radical scavenging effect at high concentrations, as expected, the inhibition capacity of Morus indica L. extract, reaching 77%, indicates that it could be a significant natural antioxidant source. This performance is consistent with findings presented in the literature regarding the breadth of phenolic profiles of mulberry leaves and fruits. Therefore, mulberry leaf extract stands out as both a potential alternative to synthetic antioxidants and a complementary antioxidant candidate of natural origin. These results provide important preliminary data on the usability of mulberry leaves as a natural antioxidant component in the food, cosmetic, nutraceutical, and pharmaceutical sectors. However, further advanced chemical characterization studies, such as total phenolic content, flavonoid profile, and HPLC or LC-MS/MS analyses, are needed to gain a more detailed understanding of the extract's antioxidant mechanism. Furthermore, investigating the effects of the extract on oxidative stress in *in vitro* cellular models and in vivo biological systems will be an important step in confirming its biological activity. Overall, this study has shown that mulberry leaf extract is a potent and viable natural antioxidant candidate, and it is believed that this potential will be further revealed through comprehensive phytochemical and biological evaluations in the future.

ACKNOWLEDGEMENTS

I wish to express my deepest and sincere gratitude to my late father, Murat ÖZKAN, for his unwavering dedication, guidance, and support to his children. His encouragement has profoundly influenced my personal and professional journey and continues to serve as a lasting inspiration. May he rest in peace.

Abstract

Artichoke (*Cynara scolymus* L.) leaves are rich in flavonoids, phenolic acids, lignans, and other polyphenolic compounds, and numerous *in vitro* studies have demonstrated potent antioxidant and free radical scavenging properties. This study was conducted to evaluate the effects of *Cynara scolymus* leaf extract on population growth and life performance in *Caenorhabditis elegans* (*C. elegans*). Extract groups exposed at different concentrations (0.5, 1, and 2 mg/mL) were compared with the control group. A population increase of 1900% was calculated in the control group. A population increase of 1500% was determined in the low-dose extract group (0.5 mg/mL); this result indicated that the low dose partially reduced reproduction but did not significantly affect life performance. At the medium dose (1 mg/mL), population growth decreased by 900%. The highest dose (2 mg/mL) showed a significant toxic effect, with population growth decreasing by 100%. These findings suggest that artichoke leaf extract is relatively well tolerated at low doses, but higher concentrations produce strong growth suppressive and toxic effects on *C. elegans*. The results indicated that the biological activity of phenolic compounds in artichoke leaves varies dose-dependently and at high levels may negatively affect reproductive capacity and population dynamics.

Keywords: Artichoke, *Caenorhabditis elegans*, *Cynara scolymus*.

INTRODUCTION

Cynara scolymus L. (artichoke) is a perennial plant belonging to the Asteraceae family and has long been widely used in traditional medicine, especially in the Mediterranean basin, for its liver-protective, digestive-regulating, and bile-flow-enhancing properties. The increasing interest in the biological activity of artichoke leaf extracts in recent years stems from the plant's rich phytochemical secondary metabolite content. Artichoke leaves are particularly rich in phenolic acids, flavonoids, secoiterpene lactones, inulin, and various volatile compounds. Among these compounds, chlorogenic acid, cynarin (1,5-dicapheoylquinic acid), luteolin, and apigenin derivatives are considered key determinants of the pharmacological effects of artichoke leaves (Lattanzio et al., 2009; Gonçalves, 2018).

Phenolic compounds and flavonoids stand out with their strong antioxidant and free radical scavenging properties; thus, they exhibit a potential protective effect against oxidative stress-based diseases. Artichoke leaf extracts have been shown in various *in vitro* and *in vivo* studies to suppress lipid peroxidation, increase glutathione levels, and protect liver cells against toxic agents (El Morsy & Kamel, 2015; Zapolska-Downar et al., 2002). In addition, the choleretic and hepatoprotective properties of cynarin and its derivatives are consistent with the traditional use of the plant and are among the main reasons why artichoke leaf is preferred in herbal medicine as a regulator of liver function (Wagner et al., 1982).

Artichoke leaves are also increasingly being studied in scientific research due to their significant anti-inflammatory, hypolipidemic, antimicrobial, and anticancer effects. Flavonoids such as luteolin and apigenin reduce pro-inflammatory cytokine production by suppressing inflammation-related cellular signaling pathways like NF-κB, thus contributing to the anti-inflammatory effect of artichoke (Park & Song, 2013). In addition, artichoke leaf extracts have been reported to reduce LDL oxidation and exhibit an inhibitory effect on the HMG-CoA reductase

enzyme involved in cholesterol biosynthesis (Gonçalves, 2018). These findings make artichoke leaves an important natural agent in terms of metabolic diseases and cardiovascular risk factors. In recent years, the effects of artichoke leaf components on aging biology, oxidative stress resistance, mitochondrial function, and cellular protection mechanisms have also begun to be investigated in model organisms (e.g., *Caenorhabditis elegans*). Polyphenolic fractions have been shown to enhance stress tolerance, particularly by regulating antioxidant defense genes (sod-3, gst-4, etc.) (Kittimongkolsuk, 2020).

In this context, artichoke leaf has gained a significant place in modern pharmacology, natural product research, and functional food development studies due to its rich phytochemical content and multifaceted biological activities. Increasing evidence in the literature shows that artichoke leaf extracts have broad therapeutic potential through antioxidant and cell-protective mechanisms.

C. elegans is considered an ideal model organism for the rapid and reliable study of *in vivo* biological effects due to its short life cycle (approximately 2-3 weeks), genetically well-characterized structure, transparent body, and high reproductive capacity (Brenner, 1974; Kim et al., 2017). Evaluating the effect of herbal extracts or natural products on population growth allows for holistic observation of the organism's potential effects on overall health, reproductive capacity, and lifespan. Population growth experiments are critical in determining the effects of sublethal or low-dose herbal extracts on toxicity, fertility, and embryonic development (Ha et al., 2016). Reproductive and population dynamics in *C. elegans* are closely related to nutrient intake, metabolic status, and cellular stress responses. Therefore, the antioxidant, adaptogenic, or cellular protective properties of an extract can indirectly demonstrate biological benefit by positively influencing population growth (Lithgow & Walker, 2002). Furthermore, since the cellular and molecular response mechanisms of *C. elegans* are largely conserved with human homologs, observations on population growth are also valuable in predicting the potential effects of herbal extracts on human health (Kaletta & Hengartner, 2006). This approach allows for the systematic and rapid assessment of biological effects, particularly antioxidant capacities, potential to slow aging processes, and increased stress tolerance (Jeon & Cha, 2016). In conclusion, *C. elegans* population growth assays offer a robust, low-cost, and ethically sound method for comprehensively evaluating both the biosafety and pharmacological efficacy of plant extracts.

MATERIALS AND METHODS

Preparation of *Cynara scolymus* L. Leaf Extract

Artichoke leaves (*Cynara scolymus* L.) were obtained fresh from a local herbalist in Ordu province. After the plant material was brought to the laboratory, it was gently washed first with tap water and then with distilled water to remove dust and foreign particles from the leaf surface. The cleaned leaves were dried in the shade at room temperature (22–25°C) for 36 h, protected from direct sunlight. After the drying process was completed, the leaves were ground in a laboratory-type grinder to obtain a homogeneous powder and stored in airtight containers. For extraction, 2.5 g of the prepared artichoke leaf powder was weighed and added to 25 mL of 80% methanol at a ratio of 1:10 (w/v). The mixture was transferred to an amber-colored glass bottle that did not allow light to pass through and left to macerate at room temperature for approximately 36 hours. During this period, the bottle was manually shaken every 2–3 hours to ensure more effective penetration of the solvent into the plant tissue. At the end of the extraction period, the mixture was first coarsely filtered through cheesecloth to remove solid plant residues, and then passed through Whatman No. 1 filter paper to obtain a clear filtrate. The filtrate was concentrated in a rotary evaporator operating at 40°C under low pressure to remove the solvent. After complete removal of methanol, the resulting crude extract is a viscous solution. This extract was transferred to amber-colored screw-cap tubes and stored at -20°C until use in analyses. The prepared extract was diluted to the target concentration in a suitable solvent (e.g., DMSO or methanol) before being used in subsequent biochemical and biological tests.

C. elegans culture

In this study, the N2 wild-type strain of *C. elegans* was used. Nematodes were maintained on Nematode Growth Medium (NGM) and fed with *Escherichia coli* OP50 under standard culture conditions at a constant temperature of 20 °C. Synchronized populations were generated by washing NGM plates containing predominantly gravid adults. To obtain synchronized nematodes, adult worms were treated with a bleaching solution (1 N NaOH and 5% sodium hypochlorite) and gently vortexed every 2 minutes over a total period of 10 minutes. The solution was then centrifuged, and the supernatant containing lysed worm debris was removed, leaving behind an egg pellet. The egg

pellet was washed three times and resuspended in M9 buffer. Eggs were incubated with gentle agitation for approximately 12 hours to hatch and establish a synchronized population. Larvae at the L3–L4 stage were subsequently used for all experimental assays.

Acute Toxicity / LC_{50} Determination

The acute toxicity test was performed to determine sublethal concentrations. For the population growth experiment, the acute toxicity of artichoke leaf extract was first determined by exposure for 24, 48, and 72 hours. Synchronized L4 larvae were incubated at different concentrations for 24–72 hours. Three replicates were performed for each concentration. 80% methanol was used as the solvent control, and only M9 buffer + OP50 was used as the negative control. Live/dead nematode counts were performed at the end of the exposure time. LC_{50} was calculated by probit analysis. For sublethal concentrations, concentrations of LC_{10}–LC_{20} (0–10%) that cause mortality without significant non-mortality side effects on reproduction and growth were preferred.

Population growth assay

To evaluate the effect of artichoke leaf extract after exposure at sublethal concentration, the growth of *C. elegans* population was assessed (Dhawan et al., 1999). Age-synchronized L4 stage nematodes were transferred to 24-well NGM (Nematode Growth Medium) plates at a density of 20 nematodes per well (Corsi et al., 2015). *E. coli* OP50 was used as the food source. All plates containing the experimental and control groups were incubated at 20 ± 1°C for 5 days. On day 5, the total number of live individuals in each well, including parent nematodes, larvae, and offspring, was counted under a stereomicroscope. Nematodes from each well were collected into 2 mL of M9 buffer, homogenized carefully, and 5 µL aliquots were taken for counting under a stereomicroscope. Counts were performed separately for each group, and the average across three replicates was calculated. All measurements were conducted on the same day by the same investigator to minimize variability. Population growth was expressed relative to the initial number of nematodes using the following formula (Zhang et al., 2018):

$$\text{Population Increase (\%)} = \frac{\text{Observed live nematodes} - \text{Initial nematodes}}{\text{Initial nematodes}} \times 100$$

RESULTS AND DISCUSSION

Caenorhabditis elegans, with its short life cycle and high reproductive capacity, is an ideal model organism for evaluating the biological effects of plant extracts (Brenner, 1974; Kim et al., 2017). The effects of plant extracts on the growth rate of nematode populations are important in revealing both the overall health status of the organism and the potential biological activities of the extracts (Hu et al., 2016). *Cynara scolymus* L. leaves exhibit antioxidant, hepatoprotective, and metabolic regulatory effects thanks to their rich phenolic and flavonoid content (Lattanzio et al., 2009; Olas 2024). It has been reported in the literature that artichoke leaf extracts can positively affect the growth and reproductive capacity of organisms by combating oxidative stress at the cellular level (El-Boshy et al., 2017; Zapolska-Downar et al., 2002). In this context, our study investigated the effects of artichoke leaf extract on *C. elegans* population growth (Fig.1).

In our study, the effect of different sublethal concentrations of artichoke leaf extracts on the population growth of C. elegans was evaluated. While population growth was observed to be 1900% in the control group, a significant decrease in population growth was recorded with increasing concentration in the extract-treated groups. Growth was measured as 1500% in the group treated with 0.5 mg/ml, 900% in the 1 mg/ml group, and 100% in the 2 mg/ml group. The data obtained show that artichoke leaf extract can inhibit *C. elegans* reproduction and population growth depending on the concentration.

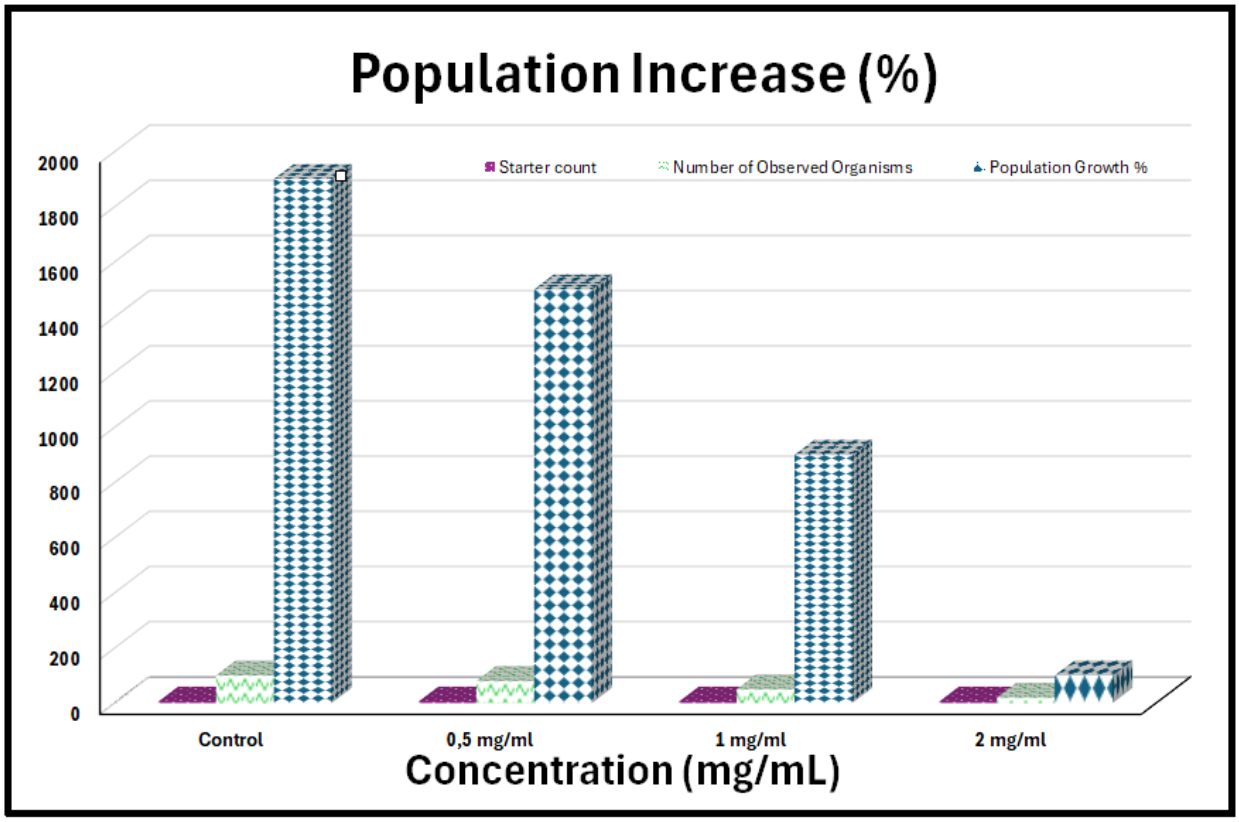

Figure 1. Effects of sublethal concentrations of *Cynara scolymus* leaf extract on the growth of *C. elegans* populations.

This findings suggests that the biological activity of artichoke leaf extract is related to its phenolic and flavonoid compounds. Literature reports that artichoke leaf extracts contain components such as chlorogenic acid, cynarin, and luteolin, and that these components can exhibit antioxidant, antiproliferative, and metabolic regulatory effects. These compounds can affect the growth and reproductive capacity of organisms by modulating the oxidative stress response at the cellular level (Gebhardt & Fausel, 1997.; Lattanzio et al., 2009). The population growth inhibition observed, particularly at high concentrations (100% growth, 2 mg/ml), is likely related to sublethal stress and cellular metabolic repression mechanisms. Similarly, the inhibitory effects of plant extracts on *C. elegans* reproduction have been supported by previous studies. For example, Ha et al. (2022) reported that sublethal concentrations of different plant extracts showed a significant suppressive effect on the *C. elegans* life cycle; This effect was particularly observed in larval development and reproductive capacity. Similarly, Jeon and Cha (2016) showed that certain pharmacological compounds can negatively affect the reproduction and generation time of *C. elegans*. These findings reveal that various natural and synthetic compounds have the potential to inhibit population growth in nematodes, and the observed mechanism of action may occur through both developmental and reproductive processes. The partial population increase observed in the 0.5 mg/ml and 1 mg/ml groups suggests that low-dose artichoke extract may reflect adaptogen-like effects that increase the organism's stress tolerance. In the literatures, it has been reported that low-dose phenolic compounds support reproduction and growth in *C. elegans* by increasing antioxidant gene expression (Vasconcellos et al., 2024). However, as the concentration increases, a significant decrease in population growth is observed as a result of the suppression of cellular metabolism by the extract components. This situation reveals the dose-dependent biphasic effect of artichoke leaf extract. Studies in the literature on the effects of phenolic compounds on *C. elegans* demonstrate the existence of dose-dependent responses. Many plant polyphenols, at low doses, promote stress resistance, reproduction, and growth by increasing antioxidant gene expression, while at high doses they can have negative effects by suppressing cell metabolism. This type of biphasic behavior is described as similar to hormesis interactions, where stimulatory effects are observed at low doses and inhibitory effects at high doses. For example, a recent study reported that plant polyphenols showed dose-dependent effects on *C. elegans* at different concentrations, and that nematode

survival decreased at high doses. In this study, increasing plant extract concentrations were shown to decrease the survival rate and the adult rate, which is consistent with dose-dependent toxicity (Hu et al., 2025). Similarly, studies with a potent polyphenol like epigallocatechin 3-gallate (EGCG) have reported that low to moderate doses prolong the lifespan of *C. elegans* and activate antioxidant mechanisms, but high doses reverse the positive effects and lead to harmful consequences. These findings suggest that phenolic compounds may exhibit a hormetic effect (Peng et al., 2021). Furthermore, numerous studies have shown that polyphenols can exhibit antioxidant, anti-aging, or stress response gene expression-enhancing effects in the C. elegans model, but these effects vary significantly depending on concentration and composition (Ha et al., 2022). In light of this general view, the bidirectional effect of phenolic-containing plant extracts such as artichoke leaf in *C. elegans* (benefit at low doses, suppression at high doses) has been similarly reported in other herbal polyphenol studies in the literature. In this context: Substances with a rich phenolic profile, such as artichoke extract, can support energy and reproductive processes by activating antioxidant defense systems at low concentrations, which is associated with increased antioxidant gene expression and oxidative stress tolerance. However, high doses of phenolics can trigger reactive species that can suppress metabolic pathways, thus reducing population growth, survival, and reproductive output. The unique phenolic composition of artichoke leaf extract (chlorogenic acid, flavonoids, etc.) has been confirmed in the literature to enhance its antioxidant capacity, which is consistent with other herbal examples where these compounds both regulate stress response genes and exhibit dose-related inhibitory effects depending on different doses. Overall, the findings suggest that artichoke leaf extract modulates *C. elegans* population growth in a concentration-dependent manner, and particularly at high doses.

CONCLUSION

In this study, the effects of artichoke leaf (*Cynara scolymus* L.) extract on the population growth of *Caenorhabditis elegans* were evaluated. The findings reveal that artichoke leaf extract exhibits a dose-dependent biphasic effect. At low concentrations, the extract was observed to positively influence reproductive and developmental processes by promoting *C. elegans* population growth; this is consistent with the low-dose phenolic compounds reported in the literature to enhance stress resistance by increasing antioxidant gene expression. On the other hand, at high concentrations, the extract significantly reduced population growth, an effect likely related to the suppression of cellular metabolism and the inhibitory effects of high-dose phenolic compounds. In conclusion, it was determined that artichoke leaf extract can exhibit both stimulatory and inhibitory effects on *C. elegans*, and this effect varies in a dose-dependent manner. These findings provide an important basis for evaluating the potential biological activities of artichoke leaf phenolic compounds and the balance between toxicity and biological benefit through a nematode model; Furthermore, it has been shown that dose optimization of natural phenolic compounds is critical to maximizing their biological effects.

Abstract

Artichoke leaves are a rich plant source of flavonoids, phenolic compounds, caffeol derivatives, and other polyphenols. These compounds have the capacity to neutralize free radicals and reduce oxidative stress. Antioxidant capacity plays a critical role in protecting cells and tissues from oxidative damage and is important for assessing the biological value of natural products. The antioxidant potential of artichoke leaf extract is being investigated to determine its potential use as both a food additive and a functional food. The DPPH (2,2-diphenyl-1-picrylhydrazyl) test is a widely used, rapid, and reliable spectrophotometric method for measuring free radicals. In this test, the DPPH radical is purple and loses its color when neutralized by antioxidants by donating electrons or hydrogen. The radical scavenging capacity (% inhibition) of the extract is calculated by measuring the absorbance change with a spectrophotometer. The DPPH test allows quantitative determination of the antioxidant potency of extracts at different concentrations, and comparative assessments can be made using the IC_{50} value. Therefore, the DPPH test is the standard and preferred method for determining the antioxidant potential of natural products such as artichoke leaves. The IC_{50} value represents the concentration at which the extract reaches 50% radical scavenging capacity and is a widely used parameter for determining the comparable antioxidant potential of natural products. In this study, the antioxidant capacity of artichoke leaf extract was evaluated by the DPPH radical screening method. Spectrophotometric measurements were taken at different concentrations (0.1–2.0 mg/mL), and the radical scavenging activity IC_{50} value was estimated to be approximately 0.81 mg/mL. The results indicate that artichoke leaf extract has a strong antioxidant potential and can be used in functional food or nutraceutical applications. The DPPH test reveals the antioxidant potential of the extract based on its ability to neutralize free radicals. The study results showed that artichoke leaf extract increased its radical scavenging capacity in a concentration-dependent manner. The radical scavenging rate increased at higher concentrations and reached a level comparable to the positive control. The results support the potential of artichoke leaf as a natural antioxidant source and constitute an important reference in the fields of functional food and nutraceuticals.

Keywords: Antioxidant, artichoke, *Cynara scolymus,* DPPH.

INTRODUCTION

Oxidative stress is an imbalance resulting from the overwhelm of antioxidant defense systems by intracellular reactive oxygen species (ROS) and free radicals. This damages essential biomolecules such as DNA, proteins, and lipids, leading to cellular dysfunction and playing a critical role in the pathogenesis of chronic diseases. Elevated ROS levels cause DNA strand breaks, protein oxidation, and lipid peroxidation, contributing to genomic instability, enzyme dysfunction, and membrane integrity disruption. These mechanisms have significant implications in many chronic pathologies, including cancer, cardiovascular diseases, neurodegenerative disorders (such as Alzheimer's and Parkinson's), and metabolic diseases (Jomova et al., 2023). Antioxidants are compounds that neutralize these molecules, limiting oxidative damage, maintaining cellular homeostasis, and helping to reduce disease risk. Endogenous enzymatic antioxidants (e.g., superoxide dismutase, catalase, glutathione peroxidase) and exogenously derived antioxidants (such as vitamin C, vitamin E, flavonoids) prevent biomolecular damage by scavenging reactive species. Antioxidant activity refers to the capacity of a compound or extract to neutralize free radicals or oxidative agents. This activity is a key parameter in evaluating the health benefits of herbal extracts because it is

associated with the presence of phenolic compounds, flavonoids, and similar phytochemicals (Kähkönen et al., 1999; Subedi et al., 2014; Muflihah et al., 2021).

The DPPH (1,1-diphenyl-2-picrylhydrazyl) radical scavenging assay is a commonly used spectrophotometric method to measure antioxidant capacity. DPPH exists as a stable free radical in solution and exhibits a characteristic absorbance in a purplish-red solution. When an antioxidant substance reacts with DPPH, the DPPH radical accepts hydrogen or electrons, causing the color to fade and absorbance values to decrease. This change reflects an increase in antioxidant activity and is measured by quantitative parameters such as IC_{50}: a lower IC_{50} value indicates a stronger radical scavenging capacity (Gulcin & Alwasel, 2023). The main reasons for preferring the DPPH test are: Simplicity, sensitivity, and reproducibility: The method is a fast, easy-to-apply, and cost-effective test. Suitability for plant extracts: It reliably measures the effectiveness of hydrogen-donating antioxidant components such as phenolics and flavonoids (Gulcin & Alwasel, 2023). High literature support: It is used as a standardized test in numerous plant antioxidant studies worldwide (Kedare & Singh, 2011). Therefore, the DPPH test has gained widespread acceptance as a first-stage bioactivity assessment method, especially in plant extracts, for in vitro antioxidant screening (Kedare & Singh, 2011).

Plants are rich sources of powerful antioxidants such as phenolic acids, flavonoids, tannins, and other phytoactive compounds. These biomolecules can react with free radicals, reducing oxidative damage and consequently maintaining cellular homeostasis. When evaluating the antioxidant efficacy of plant extracts, radical scavenging tests such as DPPH provide valuable preliminary information about the bioactive compound profile and pharmacological potential of the extracts (Mustafa et al., 2010; Chew et al., 2011; Formagio et al., 2014; Yu et al., 2021). *Cynara scolymus* L. (artichoke), a plant native to the Mediterranean region, is widely used both as food and in traditional medicine. Its leaves are particularly rich in phenolic compounds and flavonoids, and have many biological effects associated with antioxidant activity (Salekzamani et al., 2019). Systematic reviews and in vitro studies have revealed that artichoke exhibits antioxidant effects as well as anti-tumor, hepatoprotective, and lipid metabolism regulating effects (Salekzamani et al., 2019). Artichoke leaves stand out with their phenolic profile (e.g., luteolin, apigenin, chlorogenic acid derivatives), and these compounds play an active role in combating oxidative stress. Therefore, artichoke leaf extracts are considered natural antioxidant sources and were investigated in this study due to their potential value in herbal medicine development, functional food production, and nutritional supplements.

MATERIALS AND METHODS

Preparation of *Cynara scolymus* L. Leaf Extract

Artichoke leaves (*Cynara scolymus* L.) were obtained fresh from a local herbalist in Ordu province. After the plant material was brought to the laboratory, it was gently washed first with tap water and then with distilled water to remove dust and foreign particles from the leaf surface. The cleaned leaves were dried in the shade at room temperature (22–25°C) for 36 hours, protected from direct sunlight. After the drying process was completed, the leaves were ground in a laboratory-type grinder to obtain a homogeneous powder and stored in airtight containers. For extraction, 50 g of the prepared artichoke leaf powder was weighed and added to 500 mL of 80% methanol at a ratio of 1:10 (w/v). The mixture was transferred to an amber-colored glass bottle that did not allow light to pass through and was left to macerate at room temperature for approximately 36 hours. During this time, the bottle was shaken manually every 2–3 hours to ensure more effective penetration of the solvent into the plant tissue. At the end of the extraction period, the mixture was first coarsely filtered through cheesecloth to remove solid plant residues, and then passed through Whatman No. 1 filter paper to obtain a clear filtrate. The filtrate was concentrated in a rotary evaporator operating at 40°C under low pressure to remove the solvent. After complete removal of methanol, the resulting crude extract is a viscous solution. This extract was transferred to amber-colored screw-cap tubes and stored at -20°C until use in analyses. The prepared extract was diluted to the target concentration in a suitable solvent (e.g., DMSO or methanol) before use in subsequent biochemical and biological tests.

DPPH Method

The antioxidant capacity of artichoke leaf extract obtained with methanol was evaluated using the 2,2-diphenyl-1-picrylhydrazyl (DPPH) radical scavenging test. The method was optimized with minor modifications based on protocols described by Brand-Williams et al. (1995) and Blois (1958). DPPH radical (Sigma-Aldrich, ≥95% purity) was used. A 0.1 mM DPPH solution was freshly prepared in cold methanol and left in the dark for 30 minutes. The

absorbance of the solution was measured at 517 nm in a spectrophotometer. As a positive control, a 1 mg/mL stock solution of Ascorbic Acid (L-AA) was prepared in methanol. On the same day as the experiment, the extract was diluted to 7 different concentrations (e.g., 10, 20, 40, 60, 80, 100, 200 µg/mL). Seven different concentrations (0.1, 0.2, 0.3, 0.4, 0.5, 1, and 2 mg/L) were prepared from the methanol-based extract stock solution. All solutions were prepared in light-proof amber tubes and stored at room temperature throughout the experiment. For each extract or control concentration, 1 mL of extract solution was mixed with 1 mL of DPPH (0.1 mM) solution in amber glass tubes. A negative control (1 mL methanol + 1 mL DPPH) and a blank (1 mL sample solution + 1 mL methanol) solution were prepared. All tubes were incubated in the dark at room temperature (22–25°C) for 30 minutes. This waiting time is considered optimal in the literature in terms of the stability of the DPPH radical and reaction kinetics (Brand-Williams, 1995). At the end of the waiting time, the absorbance of all samples was measured at a wavelength of 517 nm using a UV–Vis spectrophotometer. Each measurement was performed in triplicate (n = 3).

Free radical scavenging activity was calculated using the following formula:

$$\text{DPPH Removal Activity (\%)} = \left(\frac{A_{\text{control}} - A_{sample}}{A_{\text{sample}}}\right) \times 100$$

A_"control" = absorbance of the solution containing only DPPH
A_"sample" = absorbance of the extract + DPPH mixture (sample color corrected)

Determination of IC_{50} Value

The obtained percentage radical scavenging values were plotted against concentration. The point where the concentration corresponds to 50% inhibition was determined as IC_{50}. IC_{50} calculation was performed using linear regression from the dose-response curve. The antioxidant power of artichoke leaf was evaluated by comparing the IC_{50} value with the positive control (ascorbic acid).

RESULTS and DISCUSSION

The DPPH radical scavenging capacity of artichoke leaf extract was evaluated at concentrations ranging from 0.1–2 mg/mL, and the results were compared with ascorbic acid (Figure 1). The data clearly show that the antioxidant capacity of the extract exhibits a dose-dependent increase. At the lowest concentration (0.1 mg/mL), the DPPH inhibition percentage of artichoke leaf extract was determined to be 51%, and this value reached 66% when the concentration was increased to 2 mg/mL. This linear trend can be attributed to the increasing radical neutralization capacity of phenolic acids, flavonoids, and especially chlorogenic acid derivatives present in the extract as their concentration increases. Ascorbic acid, as a positive control, showed higher radical scavenging activity at all concentrations (49%–94%). However, artichoke extract yielded results quite close to ascorbic acid, especially in the low and medium concentration ranges. For example, at a concentration of 0.3 mg/mL, the inhibition of ascorbic acid was measured at 57%, while the inhibitory activity of the extract was 56%; this indicates that artichoke has a biologically significant antioxidant capacity. Similarly, at 0.5 mg/mL, ascorbic acid offered 70% inhibition, while the extract reached 59%; this shows that the difference between the artichoke extract and ascorbic acid becomes more pronounced as the concentration increases, but its activity remains at a strong level. These findings show that the radical scavenging activity of artichoke leaf extract increases with concentration, but even at high doses, the activity is not as strong as ascorbic acid. However, the performance close to that of ascorbic acid exhibited at low concentrations supports the high biological activity of the polyphenolic components in the artichoke extract. When the known chemical profile of artichoke leaves is examined, it is reported that chlorogenic acid, luteolin derivatives, and caffeoylquinic acid, in particular, play an active role in free radical neutralization. Therefore, the obtained antioxidant capacity is consistent with the phenolic richness of the plant. In addition, the fact that the inhibition curve of the extract shows a regular increase throughout the concentration range suggests that the capacity of the extract to chemically interact with DPPH radicals can be explained by a linear kinetic model. This indicates that the antioxidant components of the extract may have a synergistic effect on each other, and that the radical

scavenging efficiency becomes more pronounced as the concentration increases. Thus, artichoke leaf extract is considered a strong antioxidant candidate consistent with its phenolic profile, and the results are also consistent with the DPPH inhibition trends in other artichoke studies reported in the literature.

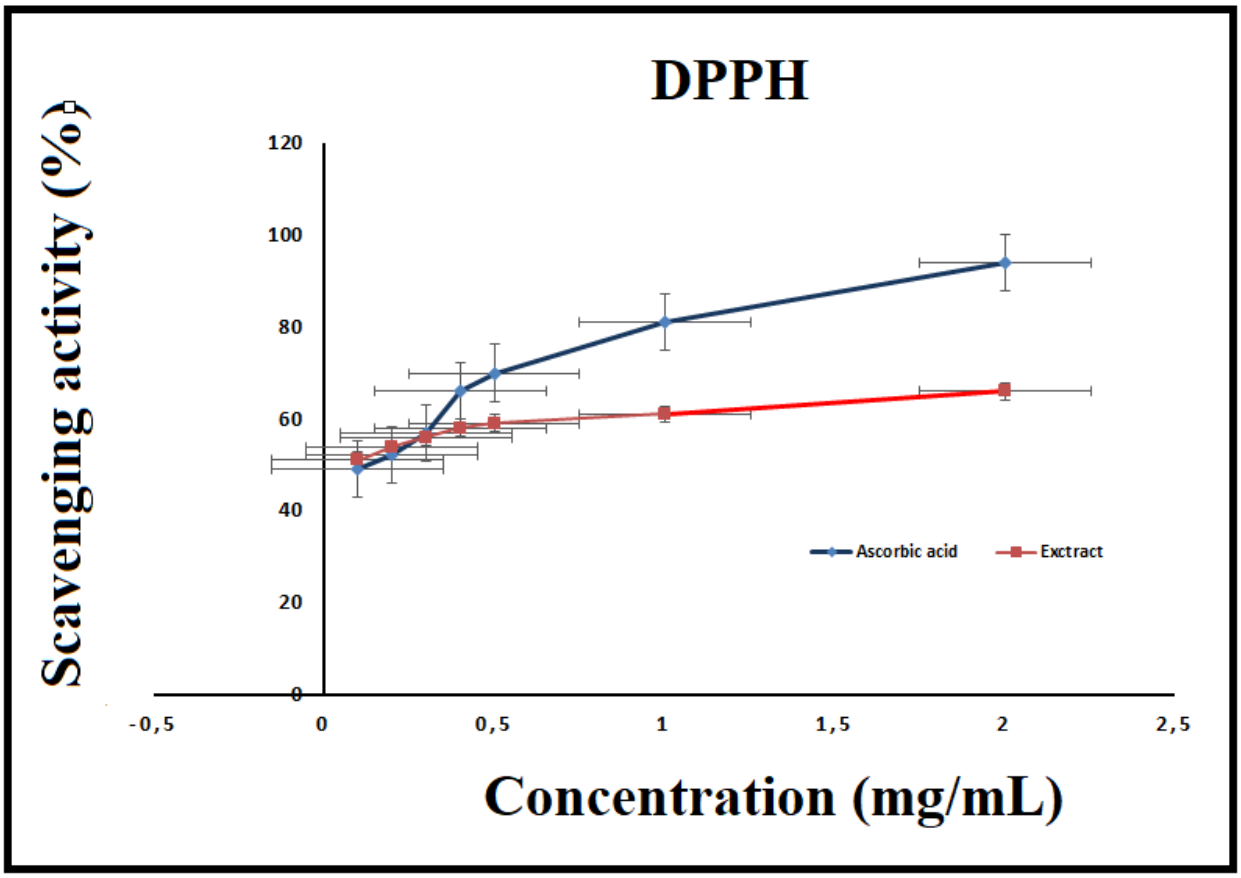

Figure 1. DPPH free radical scavenging activity of *Cynara scolymus* L. Leaf extract and of ascorbic acid. Values are the average of triplicate experiments.

According to DPPH data, a remarkable difference in profile was observed between artichoke leaf extract and ascorbic acid. Linear interpolation for quantitative assessment of dose-response behavior showed that the IC_{50} value of the extract was approximately 0.098, while the IC_{50} value of ascorbic acid was approximately 0.133. This theoretically suggests that the extract has a higher radical scavenging potential than ascorbic acid at lower doses. However, the reliability of this result is limited because the 50% inhibition point for the extract is just below the lowest measured concentration (~0–0.1 range); therefore, additional low-dose measurements for the extract IC_{50} are recommended. Nevertheless, the two substances clearly differ in terms of maximum effect. Ascorbic acid showed a very high radical scavenging capacity of 94% at a concentration of 2 mg/mL; the maximum observed inhibition for the extract was 66%. This indicates that ascorbic acid offers a higher efficacy against DPPH over a wider concentration range, while the extract has a relative advantage in the initial/intermediate ranges. In other words, the extract is potent (effective at low concentrations), while ascorbic acid has a more effective maximum scavenging capacity.

In our study, artichoke leaf extract showed a dose-dependent increase in the DPPH radical scavenging test, exhibiting inhibition values ranging from 51% to 66% in the 0.1-2 concentration range; ascorbic acid, used as a positive control, yielded results between 49% and 94% in the same range, demonstrating both a higher maximum efficacy and a wider dynamic range of efficacy. When the dose-response relationship and the calculated IC_{50} values (extract ≈ 0.098; ascorbic acid ≈ 0.133 by linear interpolation) are evaluated together, the available data highlight two important points: (1) artichoke extract shows a relatively high potency (low IC_{50}) at low concentrations; (2) ascorbic acid can reach a much higher maximum radical scavenging capacity (Emax) at high concentrations. These

two properties reflect the classic potency-efficacy distinction between potent single-molecule antioxidants and complex phytochemical mixtures (Ucar Turker et al., 224). When we compare the obtained results with the literature, it is seen that the antioxidant capacity of artichoke extract is comparable to that of similar medicinal plant extracts. For example, Saeed et al., who examined the relationship between the phenolic richness of medicinal plants and their antioxidant activity, (2012) reported that high phenolic content leads to a significant increase in DPPH inhibition (Saeed et al., 2012). The dose-dependent increase in our study is consistent with this mechanism. Furthermore, the medicinal importance of artichoke is not limited solely to antioxidant activity. The literature reports that artichoke leaf extract has hepatoprotective, anti-inflammatory, and lipid-lowering effects, and most of these functional activities are associated with its high polyphenol content (Liao et al., 2021). In this context, our study confirms that artichoke leaf extract has strong potential as a natural antioxidant source and provides a scientific basis for its use, especially in the fields of food supplementation, functional foods, and phytotherapy.

CONCLUSION

his study revealed the biological potential of artichoke (*Cynara scolymus* L.) leaf extract by evaluating its antioxidant capacity at different concentration ranges using the DPPH radical scavenging method. The findings showed that the extract exhibited a linearly increasing radical inhibition activity with increasing concentration, reaching 66% inhibition at the maximum dose of 2 mg/mL. Although ascorbic acid showed higher activity at each dose, the fact that artichoke extract produced values close to ascorbic acid, especially at low and medium concentrations, confirms the strong natural antioxidant capacity of the plant. These results support the literature reporting that the rich composition of artichoke leaves in phenolic compounds, especially flavonoids such as caffeoylquinic acid derivatives, luteolin, and apigenin, significantly contributes to antioxidant activity. Therefore, artichoke leaf extract is an important natural antioxidant source that can be evaluated in pharmacological and nutraceutical applications in reducing oxidative stress caused by free radicals. Overall, the study findings reveal that artichoke leaf extract is a reliable herbal agent with high antioxidant activity, and its dose-dependent effect supports its usability in functional foods, phytotherapy, and pharmaceutical formulations. Future studies are recommended to focus on verifying the IC_{50} value of the extract, detailing the phenolic compound profile by HPLC or LC-MS, and investigating its in vivo antioxidant effect in biological systems.

Abstract

Mulberry (*Morus indica* L.) leaves are a natural source of biologically active compounds used in traditional medicine and modern research. Mulberry also holds potential as a biological agent, particularly in pest and nematode control studies using natural products. *C. elegans* is a widely used model organism in biological and toxicological research. The effect of mulberry leaf extract on *C. elegans* populations is important both for understanding potential biological effects on reproduction and survival and for assessing the potential use of natural products as biological control agents. Population growth measurements directly indicate the inhibitory or stimulatory effects of the extract on reproduction and survival, depending on its concentration. In this study, the effect of mulberry leaf extract on *C. elegans* population growth was investigated. Mulberry leaf extract was applied at different concentrations (0.5-2 mg/ml) and the results were observed over a 5–7 day period. A visibly decreased population growth was observed in the group treated with mulberry leaf extract at a low concentration of 0.5 mg/ml. This indicates that the low concentration affected the growth and reproduction of *C. elegans* to a limited extent, but did not suppress them completely. Mulberry leaf extract significantly reduced the *C. elegans* des population in the group treated with the medium concentration of 1 mg/ml, and its inhibitory effect on reproduction increased. A negative increase of 50% was observed in the group treated with the highest concentration of 2 mg/ml. This result indicates that high concentrations negatively affect the survival of nematodes and increase mortality. The obtained data reveal that mulberry leaf extract has a significant inhibitory effect on nematodes population growth, depending on the concentration. Low concentrations exert mild suppression and have limited effects on nematode reproduction, while medium and high concentrations significantly inhibit reproduction and, at high doses, increase mortality.

Keywords: *Caenorhabditis elegans*, *Morus indica,* mulberry, population growth

INTRODUCTION

investigation of the effects of plant-derived bioactive compounds on biological systems has become a subject of increasing interest in pharmacology and nutritional sciences in recent years. These compounds include various chemical groups such as phenols, flavonoids, alkaloids, terpenoids, and glycosides, and can exhibit a wide range of biological effects in the organism, including antioxidant, anti-inflammatory, antimicrobial, hepatoprotective, and cardioprotective properties (Mickymaray, 2019; Ding et al., 2017). The role of herbal extracts, particularly in the prevention and treatment of chronic diseases, is increasingly being evaluated by modern medicine. Medicinal plants, used for many years in traditional medicine, have become the focus of modern pharmacological studies due to their low toxicity profile and versatile biological activities stemming from their natural content.

Morus species, especially *Morus alba* and *Morus nigra*, have a long history in folk medicine in different regions of Asia and Europe. These species are used in the management of diabetes, hypertension, hyperlipidemia, inflammatory conditions, and age-related diseases (Hussain et al., 2017). The phenolic compounds and flavonoids contained in Morus leaves, with their strong antioxidant activity, scavenge free radicals and reduce cellular damage caused by oxidative stress. In addition, leaf extracts can contribute to blood sugar control by regulating glucose metabolism and help balance serum cholesterol and triglyceride levels by improving lipid metabolism (Wang et al., 2023). Furthermore, according to some studies, Morus leaf extracts also exhibit hepatoprotective effects; this protects liver cells against toxic effects, reducing oxidative damage and inflammation (Hussain et al., 2017). Moreover, their antimicrobial properties increase the potential use of Morus leaf extracts in the food and

pharmaceutical industries (Wang et al., 2023). All these biological effects indicate that Morus leaf should be investigated not only in traditional medicine but also in modern pharmacological and nutritional studies.

Mulberry leaf (*Morus indica* L.) extracts have a rich content of phenolic compounds, flavonoids, and other phytochemicals. Numerous studies exist in the literature investigating the antioxidant activities of mulberry leaf extracts, as well as their effects on diabetes management, cholesterol regulation, and anti-aging (Song et al., 2009; He et al., 2022). In particular, its antioxidant capacity is important in modeling aging and neurodegenerative diseases due to its ability to reduce cellular oxidative stress by scavenging free radicals (Sies, 2015). However, reliable and rapid model systems are needed to determine the systematic biological effects of plant extracts. At this point, *Caenorhabditis elegans* (*C. elegans*) stands out as an ideal model organism for studying the biological activities of plant extracts. *C. elegans* is a transparent, approximately 1 mm long model organism known as a soil nematode. Its short life cycle (~3 days), simple anatomy, and ease of manipulation with complete genetic mapping and molecular tools make it widely used in toxicity, senescence, and pharmacological efficacy studies (Brenner, 1974; Kaletta & Hengartner, 2006). Furthermore, the transparent structure of *C. elegans* allows for direct observation of cellular changes in living individuals, providing a significant advantage, particularly in antioxidant and gene expression studies (Aranaz et al., 2020; Liu et al., 2021). Another reason for preferring *C. elegans* in toxicity testing is its ability to quickly and efficiently examine a large number of individuals. This feature provides a reliable system for determining the sublethal and lethal effects of plant extracts. Furthermore, the conserved nature of certain metabolic and genetic pathways in humans and other mammals increases the translational value of the findings (Long et al., 2023). In recent years, the evaluation of plant extracts with antioxidant and anti-aging potential in *C. elegans* models has allowed for the mechanistic investigation of biological activities (Aranaz et al., 2020; Liu et al., 2021).

Investigating the effects of mulberry leaf extract on the *C. elegans* population is important both for understanding the biological potential of the plant and for determining the safe dosage. This study aims to determine the effects of mulberry leaf extract on *C. elegans* population growth and to provide a scientific basis for the applications of mulberry leaf in traditional and modern medicine.

MATERIALS AND METHODS

Preparation of Artichoke. Leaf Extract

Artichoke leaves (*Morus indica*) were obtained fresh from a local herbalist in Ordu province. After the plant material was brought to the laboratory, it was gently washed first with tap water and then with distilled water to remove dust and foreign particles from the leaf surface. The cleaned leaves were dried in the shade at room temperature (22–25°C) for 36 hours, protected from direct sunlight. After the drying process was completed, the leaves were ground in a laboratory-type grinder to obtain a homogeneous powder and stored in airtight containers.

For extraction, 3.5 g of the prepared artichoke leaf powder was weighed and added to 65 mL of 80% methanol at a ratio of 1:10 (w/v). The mixture was transferred to an amber-colored glass bottle that did not allow light to pass through and left to stand at room temperature for approximately 36 hours using the maceration method. During this time, the bottle was shaken manually every 2–3 hours to ensure more effective penetration of the solvent into the plant tissue. At the end of the extraction period, the mixture was first coarsely filtered through cheesecloth to remove solid plant residues, and then passed through Whatman No. 1 filter paper to obtain a clear filtrate. The filtrate was concentrated in a rotary evaporator operating at 40°C under low pressure to remove the solvent. After complete removal of methanol, the resulting crude extract is a viscous solution. This extract was transferred to amber-colored screw-cap tubes and stored at -20°C until use in analyses. The prepared extract was diluted to the target concentration in a suitable solvent before use in subsequent biochemical and biological tests.

C. elegans culture

In this study, the N2 wild-type strain of *C. elegans* was used. Nematodes were maintained on Nematode Growth Medium (NGM) and fed with *Escherichia coli* OP50 under standard culture conditions at a constant temperature of 20 °C. Synchronized populations were generated by washing NGM plates containing predominantly gravid adults. To obtain synchronized nematodes, adult worms were treated with a bleaching solution (1 N NaOH and 5% sodium hypochlorite) and gently vortexed every 2 minutes over a total period of 10 minutes. The solution was then

centrifuged, and the supernatant containing lysed worm debris was removed, leaving behind an egg pellet. The egg pellet was washed three times and resuspended in M9 buffer. Eggs were incubated with gentle agitation for approximately 12 hours to hatch and establish a synchronized population. Larvae at the L3–L4 stage were subsequently used for all experimental assays.

Acute Toxicity / LC_{50} Determination

The acute toxicity test was performed to determine sublethal concentrations. For the population growth experiment, the acute toxicity of *Cynara scolymus* L. leaf extract was first determined by exposure for 24, 48, and 72 hours. Synchronized L4 larvae were incubated at different concentrations for 24–72 hours. Three replicates were performed for each concentration. 80% methanol was used as the solvent control, and M9 buffer + OP50 alone was used as the negative control. Live/dead counts were performed at the end of the exposure time. LC_{50} was calculated by probit analysis. For sublethal concentrations, concentrations of LC_{10}–LC_{20} (0–10%) that did not have significant non-mortality side effects on reproduction and growth were preferred.

Population growth assay

To evaluate the effect of *Morus indica* leaf extract after exposure at sublethal concentration, the growth of *C. elegans* population was assessed (Dhawan et al., 1999). Age-synchronized L4 stage nematodes were transferred to 24-well NGM (Nematode Growth Medium) plates at a density of 20 nematodes per well (Corsi et al., 2015). *Escherichia coli* OP50 was used as the food source. All plates containing the experimental and control groups were incubated at 20 ± 1°C for 5 days. On day 5, the total number of live individuals in each well, including parent nematodes, larvae, and offspring, was counted under a stereomicroscope. Nematodes from each well were collected into 2 mL of M9 buffer, homogenized carefully, and 5 µL aliquots were taken for counting under a stereomicroscope. Counts were performed separately for each group, and the average across three replicates was calculated. All measurements were conducted on the same day by the same investigator to minimize variability. Population growth was expressed relative to the initial number of nematodes using the following formula (Zhang et al., 2018):

$$\text{Population Increase (\%)} = \frac{\text{Observed live nematodes} - \text{Initial nematodes}}{\text{Initial nematodes}} \times 100$$

RESULTS

Figure 1 below evaluates the effect of different concentrations (0.5; 1; 2 mg/mL) of Mulberry (*Morus indica* L.) leaf extract on *C.elegans* population growth. Initially, 20 individuals were placed in each group, and the population growth rate was calculated based on the number of viable individuals observed at the end of the experiment. In the control group, the initial 20 individuals reached 400 viable individuals at the end of the experiment. This represents a 1900% population increase. This high growth rate indicates that the experimental conditions used (*C. elegans* culture medium, nutrient amount, temperature, and plate quality) were optimal for reproduction and development. Since the control group was used as a reference in the experiment, decreases or increases in other groups were interpreted based on this value. In the concentration group where 0.5 mg/mL extract was applied, the number of viable individuals was measured as 320. This corresponds to a 1500% population increase. Although the growth rate was lower compared to the control group, the population still multiplied at a high level. This result suggests that the 0.5 mg/mL concentration caused mild inhibition; However, it shows that it does not completely suppress *C. elegans* reproduction. In the group treated with 1 mg/mL extract, the number of live individuals decreased significantly, and 50 individuals were observed. This value represents a 150% population increase. This result shows that mulberry leaf extract at the 1 mg/mL level causes significant reproductive inhibition. The dramatic decrease in population growth may be related to developmental delay, larval losses, or suppression of reproductive capacity. In the group treated with the highest concentration of 2 mg/mL, the number of live individuals was measured as 10, falling below the initial number. This was calculated as a -50% population increase. In other words, the population decreased. This finding shows that the 2 mg/mL concentration has a toxic effect on nematodes, causing loss of adults or complete cessation of larval development. When evaluated in terms of dose-response relationship, the data obtained clearly show that mulberry leaf extract has a concentration-dependent suppressive effect on *C. elegans* population growth: Low concentration (0.5 mg/mL) slightly reduced the population. Medium

concentration (1 mg/mL) severely reduced population growth. High concentration (2 mg/mL) caused population decline and possible toxicity (Figure 1).

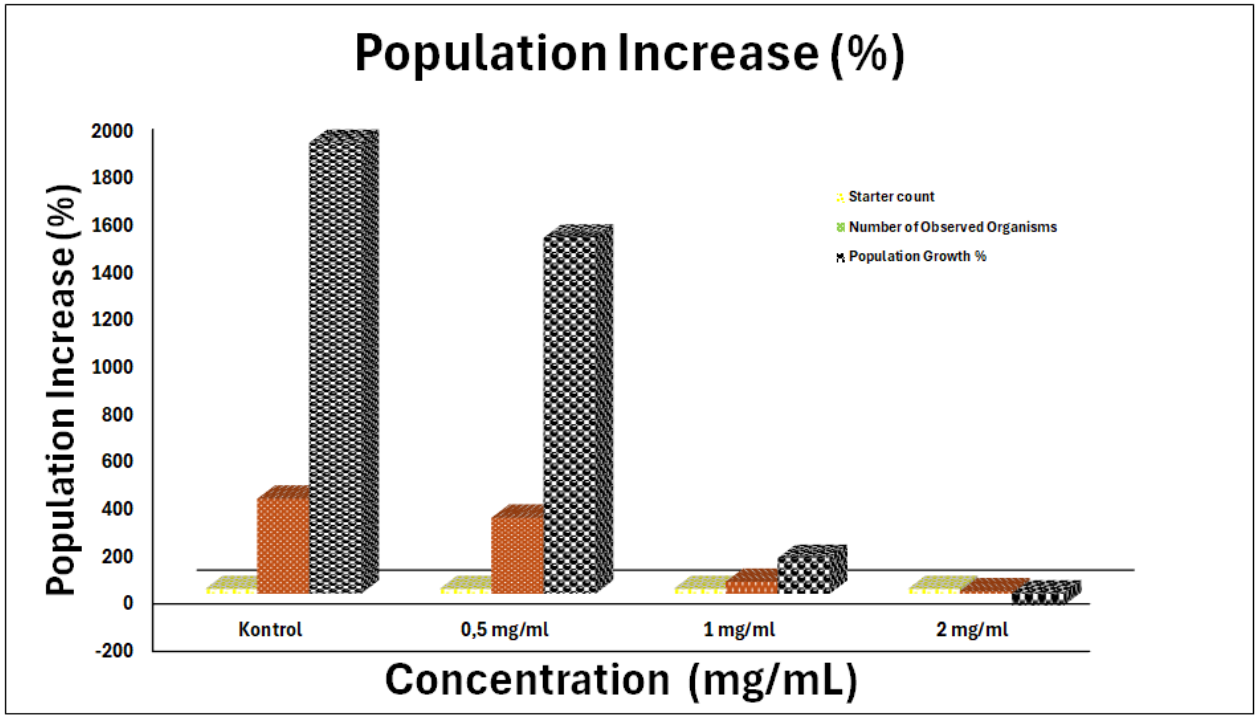

Figure 1. Effects of sublethal concentrations of *Cynara scolymus* leaf extract on the growth of *C. elegans* populations.

This trend suggests that the phenolic compounds and flavonoids in the extract may damage nematode physiology at high concentrations; and may show milder effects at low concentrations. In particular, the negative growth at 2 mg/mL indicates that mortality may occur as a result of developmental arrest, cellular stress, or oxidative damage.

DISCUSSION

Morus indica possesses high antioxidant capacity due to its numerous bioactive molecules, including phenolic compounds, flavonoids, alkaloids, anthocyanins, stilbene derivatives, and ascorbic acid (Mahesh et al., 2017; Memete et al., 2022). Polyphenols, particularly quercetin, rutin, morin, and chlorogenic acid, enhance the plant's pharmaceutical importance. Various studies have shown that *Morus indica* leaf and fruit extracts exhibit high antioxidant activity using methods such as DPPH, ABTS, and FRAP (Yang et al., 2016; Wang et al., 2021; Li et al., 2023; Kumari, 2025).

This study demonstrates that mulberry leaf extract has a concentration-dependent effect on *C. elegans* population growth. At low concentrations, a slight decrease in population growth was observed, at moderate concentrations a significant suppression, and at high concentrations a net population reduction (mortality/sterility). These results are consistent with the literature reporting that plant polyphenols and flavonoids can have both protective and toxic effects on *C. elegans*. For example, in a study by Grünz et al., the lifespan of *C. elegans* was analyzed using flavonols (e.g., quercetin, myricetin, naringenin); the results showed that all of these flavonols extended the lifespan of wild-type worms, but that "structural characteristics" (e.g., number of hydroxyl groups) were important along with the antioxidant effect (Grünz et al., 2012). In another study, the effects of six different flavonoids (baicalein, chrysin, etc.) on lifespan, stress resistance, fat accumulation, and gene expression in *C. elegans* were investigated. Some flavonoids (e.g., baicalein, chrysin) have been shown to prolong lifespan in worms, providing higher stress tolerance under oxidative stress and less fat accumulation; these effects have been reported to occur via signaling pathways (Guerrero-Rubio et al., 2021). In another study, the effects of four different plant polyphenols (tannic acid, gallic acid, ellagic acid, catechin) on *C. elegans* were compared. While all extended lifespan, different and complex effects were found on other parameters such as stress protection, growth, and reproduction. The

researchers observed a combination of "life-extending" and "toxic/negative" effects even with a single polyphenol. They noted that the mechanisms of these polyphenols are not solely dependent on antioxidant capacity; they can also be shaped through different pathways such as hormetic effects, calorie restriction-like effects, or antimicrobial activity (Saul et al., 2011). Previous studies have shown that polyphenols obtained from mulberry (Morus alba) leaves prolong the lifespan and increase oxidative stress resistance in *C. elegans*; however, these positive effects mostly occur in low-to-medium concentration ranges and vary depending on the dose. For example, mulberry leaf polyphenols have been reported to delay aging in *C. elegans*, a short-lived nematode model. These studies suggest that the antioxidant activity of leaf extracts and their effect on pathways regulating cellular stress response may have a positive impact on aging/functional resistance (Zheng et al., 2014).

In our findings, the observation of a still high reproduction rate (1500%) at 0.5 mg/mL suggests that the extract is not entirely harmful at low doses; in fact, some phenolic compounds may stimulate cellular defense mechanisms through a hormetic effect. Numerous studies in the literature on polyphenols report that in *C. elegans*, low/optimal concentrations enhance antioxidant defense and stress response (e.g., gst-4, sod-3 expression), leading to longevity and increased resistance; while higher concentrations conversely lead to oxidative stress, mitochondrial dysfunction, and mortality. This "hormesis" phenotype has been replicated for many plant compounds and is biologically consistent with the sharp decreases in the 1–2 mg/mL range in our findings (Ayuda-Durán et al., 2022). The dramatic population decrease at 1 mg/mL (regression to 150% increase) and the net population decrease at 2 mg/mL (−50%) in our study are likely the result of one or more mechanisms: (i) suppression of reproductive capacity (low egg yield or reproductive organ damage), (ii) larval developmental blockade (arrest at L1–L4 stages), (iii) adult mortality and/or (iv) nutritional deficiency due to inhibition of nutrient intake/interaction with green food (E. coli OP50). Separation of these mechanisms is common in the literature; for example, different polyphenols have been reported to have disparate effects on both growth and aging parameters in C. elegans. Therefore, relying solely on lifespan measurements can be misleading, and most reliable studies report multiple endpoints together, such as lifespan and reproduction/brood size, developmental time, and stress response (Saul et al., 2011). In terms of molecular mechanisms, flavonoids and other polyphenols are frequently associated with insulin/insulin-related processes.

CONCLUSION

This study demonstrates that mulberry leaf extract affects *C. elegans* population growth in a concentration-dependent manner. Low concentrations showed a mild suppressive effect on reproduction, while moderate and high concentrations resulted in significant reproductive inhibition and mortality. The findings reveal the potential biological activities and dose-dependent toxic effects of mulberry leaf extract, and provide a basis for future mechanistic and molecular-level studies.

ACKNOWLEDGEMENTS

I wish to express my deepest and sincere gratitude to my late father, Murat ÖZKAN, for his unwavering dedication, guidance, and support to his children. His encouragement has profoundly influenced my personal and professional journey and continues to serve as a lasting inspiration. May he rest in peace.

Özet

Alüminyum fosfit (ALP) zehirlenmesi, özellikle gelişmekte olan ülkelerde yüksek mortalite oranları ile seyreden kritik bir halk sağlığı sorunudur. Kolay erişilebilirliği ve spesifik bir antidotunun bulunmaması, bu zehirlenmeyi küresel bir toksikolojik acil durum haline getirmektedir. ALP'nin toksisitesi, mide asidi veya nem ile temas ettiğinde açığa çıkan fosfin (PH_3) gazından kaynaklanır. Fosfin gazının temel toksik mekanizması, mitokondriyal elektron taşıma zincirini, özellikle sitokrom c oksidazı (Kompleks IV) non-kompetitif olarak inhibe ederek hücresel solunumu bloke etmesidir. Bu durum, ATP üretiminin azalmasına, belirgin bir enerji krizine ve yoğun oksidatif strese yol açar. Klinik tabloya, en sık ölüm nedeni olan tedaviye dirençli (refrakter) kardiyojenik şok, derin metabolik asidoz ve çoklu organ yetmezliği hakimdir. Spesifik bir antidotun yokluğunda, tedavi yoğun bakım koşullarında yürütülen agresif destekleyici bakıma dayanmaktadır. Bu yaklaşım, hemodinamik ve solunumsal fonksiyonların sürdürülmesini hedefler ancak mortaliteyi düşürmede genellikle yetersiz kalır. Son yıllarda, zehirlenmenin temel patofizyolojisini hedef alan adjuvan tedaviler üzerine yapılan araştırmalar umut verici sonuçlar sunmaktadır. Özellikle, güçlü bir antioksidan olan N-asetilsistein (NAC) ve miyokardiyal enerji metabolizmasını destekleyen Glikoz-İnsülin-Potasyum (GIK) veya yüksek doz insülin tedavilerinin, yapılan meta-analizler ve klinik çalışmalarda mortaliteyi istatistiksel olarak anlamlı düzeyde azalttığı gösterilmiştir. Hindistancevizi yağı ile yapılan gastrik lavaj ve Koenzim Q10 gibi diğer antioksidanlar da klinik sonuçları iyileştirme potansiyeli taşımaktadır. Ayrıca, metabolomik yaklaşımlar ile alüminyum fosfit maruziyeti sonrası hücresel düzeyde gelişen biyokimyasal değişikliklerin sistematik olarak incelenmesi, erken risk tayini ve tedavi yanıtının değerlendirilmesi açısından tamamlayıcı bir perspektif sunabilir. Bu bilgiler, ALP zehirlenmesi için kanıta dayalı, standart bir tedavi protokolü oluşturma yolunda önemli bir temel oluşturmaktadır.
Anahtar Kelimeler: Alüminyum fosfit, fosfin, mitokondriyal disfonksiyon, oksidatif stres, antioksidan tedaviler, metabolomiks

Clinical approaches and future perspectives in aluminum phosphide poisoning

Abstract

Aluminum phosphide (ALP) poisoning is a critical public health problem, particularly in developing countries, characterized by high mortality rates. Its easy accessibility and the lack of a specific antidote make it a global toxicological emergency. The toxicity of ALP stems from phosphine (PH_3) gas, which is released upon contact with stomach acid or moisture. The primary toxic mechanism of phosphine gas is its non-competitive inhibition of the mitochondrial electron transport chain, particularly cytochrome c oxidase (Complex IV), thereby blocking cellular respiration. This leads to decreased ATP production, a significant energy crisis, and intense oxidative stress. The clinical picture is dominated by refractory cardiogenic shock, profound metabolic acidosis, and multiple organ failure, which is the most frequent cause of death. In the absence of a specific antidote, treatment relies on aggressive supportive care in intensive care settings. This approach aims to maintain hemodynamic and respiratory function but is generally insufficient to reduce mortality. In recent years, research on adjuvant therapies targeting the underlying pathophysiology of poisoning has yielded promising results. In particular, N-acetylcysteine (NAC), a potent antioxidant, and Glucose-Insulin-Potassium (GIK) or high-dose insulin therapy, which supports

myocardial energy metabolism, have been shown to statistically significantly reduce mortality in meta-analyses and clinical trials. Gastric lavage with coconut oil and other antioxidants such as Coenzyme Q10 also have the potential to improve clinical outcomes. Furthermore, systematically examining the biochemical changes at the cellular level following aluminum phosphide exposure using metabolomic approaches can offer a complementary perspective for early risk assessment and evaluation of treatment response. This information forms an important foundation for establishing an evidence-based, standardized treatment protocol for ALP poisoning.
Keywords: Aluminum phosphide, phosphine, mitochondrial dysfunction, oxidative stress, antioxidant therapies, metabolomics

GİRİŞ

Alüminyum fosfit (ALP) zehirlenmesi, özellikle gelişmekte olan ülkelerde, yüksek toksisitesi, tarımsal amaçlarla yaygın kullanılması ve kolay erişilebilir olması ve en önemlisi spesifik bir antidotunun bulunmaması nedeniyle son derece yüksek mortalite oranlarına sahip, kritik bir halk sağlığı sorunudur. Pestisitler dünya genelinde yılda yaklaşık 300.000 ölüme neden olmakta ve ALP, bu vakalar arasında %30-80 arasında değişen ölüm oranlarıyla en ölümcül ajanlardan biri olarak öne çıkmaktadır (Ullah ve ark., 2024; Hooshangi Shayesteh ve ark., 2024; Hájek ve ark., 2024; Sedaghattalab, 2022; Khodavysi ve ark., 2023).

Halk arasında "pirinç tableti" olarak da bilinen ALP, tahıl ve diğer depolanmış ürünleri zararlılardan korumak amacıyla yaygın olarak kullanılan katı formda bir fumigant, insektisit ve rodentisittir (Ullah ve ark., 2024; Hooshangi Shayesteh ve ark., 2024). Zehirlenme vakalarının artmasının ardındaki temel nedenler, ALP'nin kasıtlı (intihar amaçlı) kullanım için kolayca satın alınabilmesi ve bu ölümcül zehirlenmeyi geri döndürebilecek etkili ve spesifik bir antidot tedavisinin bulunmamasıdır (Ullah ve ark., 2024; Hooshangi Shayesteh ve ark., 2024; Salimi ve ark., 2022). Bu zehirlenmenin karmaşık patofizyolojisini ve yönetimindeki zorlukları anlamak, daha etkili tedavi stratejileri geliştirmek için elzemdir. Bu bağlamda, ALP'nin kullanım alanları, maruziyet yolları, toksik etki mekanizmaları ve güncel tedavi yaklaşımlarının ayrıntılı olarak ele alınması amaçlanmıştır.

Kullanım Alanları ve Maruziyet Yolları

ALP'nin tarımsal ve endüstriyel alandaki yaygın kullanımı, insan maruziyeti için önemli bir zemin hazırlamaktadır. Bu kullanım alanlarının ve maruziyet yollarının anlaşılması, zehirlenme risklerini belirleme ve önleme stratejileri geliştirme açısından stratejik bir öneme sahiptir.

ALP'nin birincil kullanım alanları şu şekilde özetlenebilir:

Tarım ve Depolama: Tahıl ve diğer gıda ürünlerinin depolanması sırasında zararlı böceklerden ve kemirgenlerden korunması amacıyla kullanılan katı bir fumiganttır (Ullah ve ark., 2024; Rahimi Kakavandi, 2022).

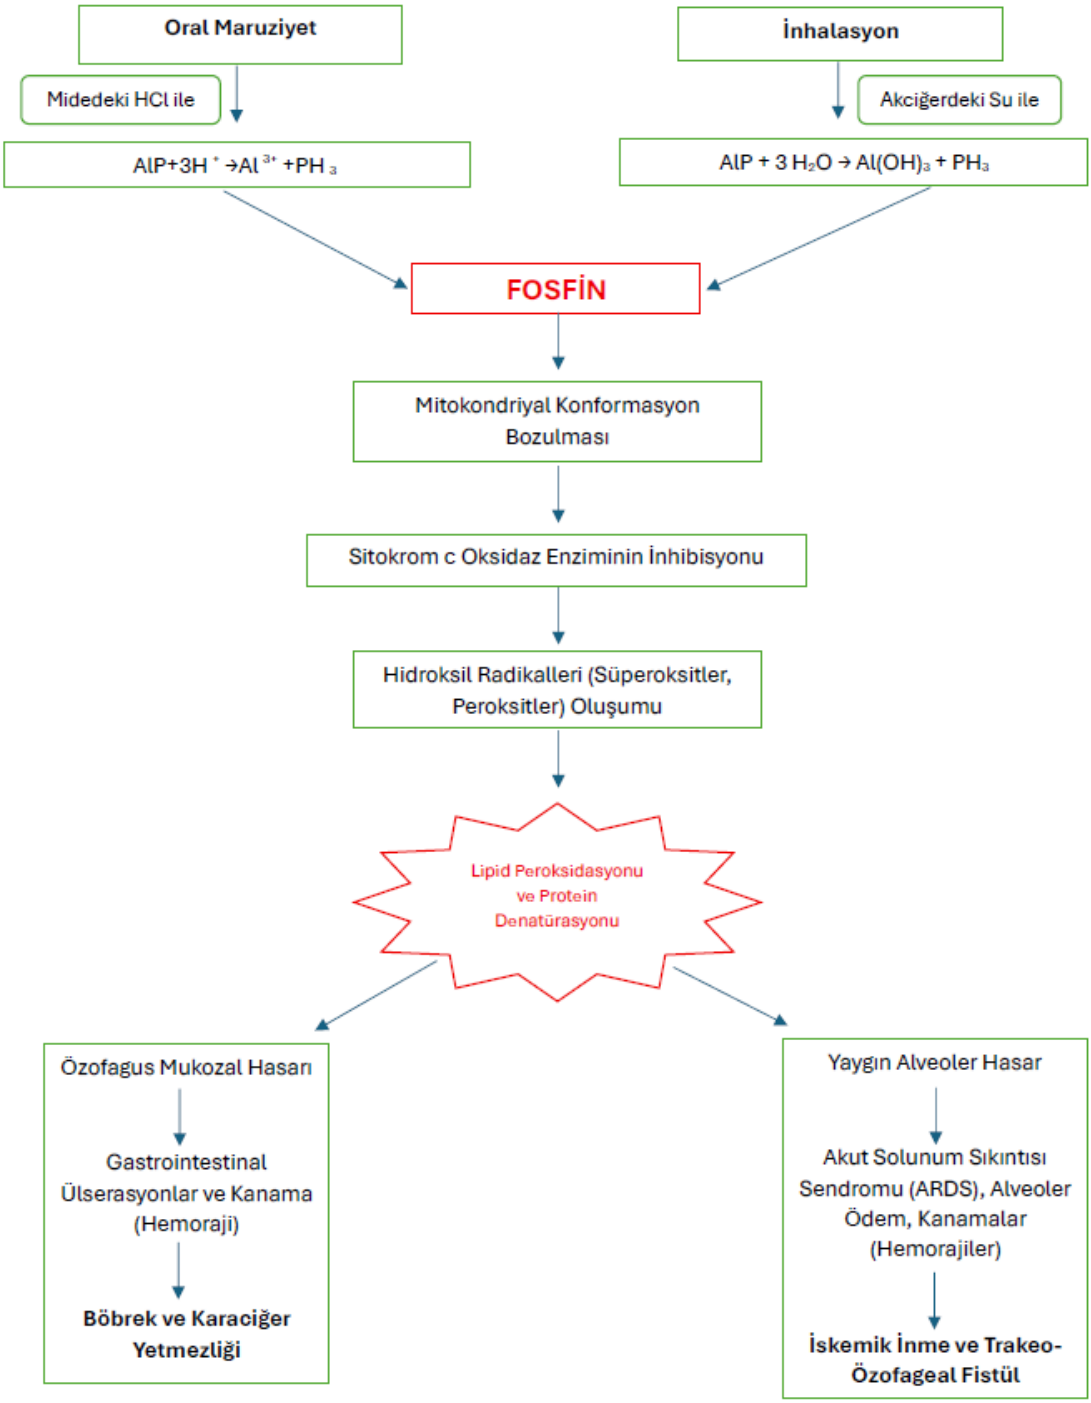
Endüstriyel Kullanım: Genel amaçlı bir insektisit (böcek ilacı) ve rodentisit (kemirgen ilacı) olarak da kullanılmaktadır (Ullah ve ark., 2024).

İnsanların ALP'ye maruz kalma yolları ise üç ana başlık altında incelenebilir:

Kasıtlı Maruziyet: Özellikle kolay erişilebilirliği ve yüksek toksisitesi nedeniyle, intihar amaçlı oral yolla alım, en yaygın ve en ölümcül maruziyet şeklidir (Ullah ve ark., 2024; Hooshangi Shayesteh ve ark., 2024).

Kazara Maruziyet: Çocuklarda tabletlerin kazara yutulması ve çiftçiler arasında güvenli olmayan depolama veya uygulama pratikleri sonucu mesleki maruziyetler de sıkça rapor edilmektedir (Elsharkawy ve ark., 2023).

İnhalasyon Yoluyla Maruziyet: Fumigasyon işlemi yapılan gemi konteynerleri, silolar veya bu alanlara bitişik binalar gibi kapalı mekanlarda, ortama salınan toksik fosfin gazının solunması yoluyla da ciddi zehirlenmeler meydana gelebilmektedir (Hájek ve ark., 2024; Sedaghattalab, 2022).



Bu maruziyet yollarının her biri, zehirlenmenin altında yatan ölümcül toksisite mekanizmalarını tetiklemektedir.

Toksisite Mekanizması

Alüminyum fosfit zehirlenmesinin yıkıcı etkileri, hücresel düzeyde başlayan karmaşık bir patofizyolojik süreçten kaynaklanır. Bu mekanizmayı anlamak, potansiyel tedavi hedeflerini belirlemede temel bir stratejik rol oynamaktadır. Toksik etkinin başlangıç adımı, katı haldeki ALP tabletlerinin mide asidi veya ortamdaki nem ile temas etmesi sonucu son derece toksik olan **fosfin gazını (PH_3)** açığa çıkarmasıdır (Ullah ve ark., 2024; Hooshangi Shayesteh ve ark., 2024; Khodavysi ve ark., 2023; Salimi ve ark., 2022). Bu gazın sistemik dolaşıma katılmasıyla hücresel hasara yol açan iki ana mekanizma devreye girer:

Mitokondriyal İnhibisyon ve Enerji Krizi: Fosfin, hücrenin enerji santralleri olan mitokondrilerde, elektron taşıma zincirinin son halkası olan **sitokrom c oksidazı (Kompleks IV)** başta olmak üzere diğer kompleksleri de (Kompleks I, II) non-kompetitif olarak inhibe eder. Bu inhibisyon, oksidatif fosforilasyonu, yani oksijen kullanarak ATP (hücresel enerji) üretme sürecini tamamen bloke eder. Sonuç olarak hücrede şiddetli bir enerji krizi başlar (Ullah ve ark., 2024; Hooshangi Shayesteh ve ark., 2024; Hájek ve ark., 2024; Rahimi Kakavandi ve ark., 2022; Abdelhamid ve ark., 2023). Kalp gibi metabolik aktivitesi ve enerji ihtiyacı çok yüksek olan organlar, bu enerji krizinden en ağır şekilde etkilenir ve bu durum, zehirlenmenin klinik seyrindeki kardiyovasküler kollapsın temelini oluşturur (Hooshangi Shayesteh ve ark., 2024; Rahimi Kakavandi ve ark., 2022).
Oksidatif Stres ve Hücresel Hasar: Mitokondriyal fonksiyonların bozulması, bir yan ürün olarak reaktif oksijen türlerinin (ROS) aşırı üretilmesine neden olur. Aynı zamanda fosfin, vücudun doğal antioksidan savunma sistemlerini oluşturan katalaz (CAT) ve süperoksit dismutaz (SOD) gibi enzimleri de baskılar. Bu iki etkinin birleşmesiyle hücrede kontrolsüz bir oksidatif stres tablosu ortaya çıkar. Aşırı ROS, hücre zarlarında lipid peroksidasyonuna, proteinlerin yapısının bozulmasına (denatürasyon), DNA hasarına ve nihayetinde apoptoz (programlanmış hücre ölümü) yoluyla hücre ölümüne yol açar (Salimi ve ark., 2022; Mahlooji ve ark., 2022; Parvizrad ve ark., 2022; Shaker ve ark., 2023; Zaare Nahandi ve ark., 2023).
Hücresel düzeyde yaşanan bu yıkım, çoklu organ sistemlerini etkileyen ciddi klinik bulgulara dönüşür.

Klinik Bulgular ve Toksisite Belirtileri
Alüminyum fosfit zehirlenmesinin klinik tablosu, altta yatan hücresel enerji krizi ve oksidatif stresin sistemik bir yansımasıdır. Bu bulguların erken dönemde tanınması, hayat kurtarıcı acil müdahalenin zamanında başlatılabilmesi açısından büyük önem taşımaktadır. Zehirlenmeye bağlı klinik belirti ve bulgular, etkilenen organ sistemlerine göre değerlendirilmektedir.
Kardiyovasküler Sistem: Kardiyovasküler sistem, alüminyum fosfit zehirlenmesinde en erken ve en ciddi şekilde etkilenen sistem olup, mortalitenin başlıca nedenini oluşturmaktadır. Klinik tabloda tedaviye dirençli (refrakter) hipotansiyon, kardiyojenik şok ve dolaşım kollapsı ön plandadır. Sinüs taşikardisi, atriyal fibrilasyon ve ventriküler aritmiler gibi ciddi ritim bozukluklarının sık görüldüğü bildirilmiştir. Miyokardiyal hasarı yansıtan ST segment elevasyonu veya depresyonu gibi elektrokardiyografik değişiklikler rapor edilmiş olup, fosfinin miyokard hücreleri üzerindeki doğrudan toksik etkisine bağlı olarak miyokardit ve perikardit gelişebileceği belirtilmektedir (Rahimi Kakavandi ve ark., 2022; Elsharkawy ve ark., 2023; Shaker ve ark., 2023).
Metabolik Bulgular: Dokuların yetersiz oksijenlenmesi (hipoperfüzyon) ve mitokondriyal solunum zincirinin bloke olması sonucu gelişen şiddetli metabolik asidoz ve laktik asidoz, alüminyum fosfit zehirlenmesinin en karakteristik laboratuvar bulguları arasında yer almaktadır (Ullah ve ark., 2024; Hooshangi Shayesteh ve ark., 2024; Hájek ve ark., 2024; Sedaghattalab, 2022; Khodavysi ve ark., 2023; Elsharkawy ve ark., 2023).
Solunum Sistemi: Solunum sistemi tutulumunda öksürük ve nefes darlığı (dispne) ile başlayan klinik tablo, hızla toksik akciğer ödemine ve akut solunum sıkıntısı sendromuna (ARDS) ilerleyebilmektedir. Bu durumda olguların önemli bir kısmında mekanik ventilasyon desteği gereksinimi ortaya çıkmaktadır (Abdelhamid ve ark., 2023; Shukla ve ark., 2024).
Gastrointestinal Sistem: Oral alımı takiben ilk klinik belirtiler genellikle gastrointestinal sistemde ortaya çıkmaktadır. Bulantı, kusma, ishal ve şiddetli karın ağrısı sık bildirilen bulgular arasında yer almaktadır (Sedaghattalab, 2022; Khodavysi ve ark., 2023; Abdelhamid ve ark., 2023; Shukla ve ark., 2024).
Nörolojik Sistem: Nörolojik bulgular baş dönmesi, baş ağrısı ve yorgunluk gibi hafif semptomlardan ataksi (denge bozukluğu), parestezi (uyuşma/karıncalanma) ve letarjiden komaya kadar ilerleyebilen bilinç bozukluklarına kadar geniş bir klinik spektrumda görülebilmektedir (Ullah ve ark., 2024; Shaker ve ark., 2023).
Diğer Organ Etkileri: Sistemik hipoperfüzyon ve fosfinin doğrudan toksik etkileri sonucunda akut karaciğer ve böbrek yetmezliği gelişiminin de klinik tabloya eşlik edebileceği bildirilmektedir (Ullah ve ark., 2024; Hooshangi Shayesteh ve ark., 2024; Shaker ve ark., 2023).
Bu ağır klinik tablonun ciddiyeti, mevcut tedavi yaklaşımlarının neden büyük ölçüde destekleyici nitelikte olduğunu ve özgül, geri döndürücü tedavilere duyulan gereksinimi açık bir biçimde ortaya koymaktadır.

Şekil 1: Alüminyum fosfitin toksik etki mekanizması.

MATERYAL VE METOT

Mevcut Tedavi Yaklaşımları

Alüminyum fosfit zehirlenmesi yönetimindeki en büyük zorluk, toksinin etkilerini doğrudan geri çevirecek, kanıta dayalı ve onaylanmış spesifik bir antidotun bulunmamasıdır. Bu nedenle tedavinin temelini, toksin vücuttan atılana kadar hayati organ fonksiyonlarının sürdürülmesini amaçlayan agresif destekleyici bakım oluşturmaktadır. Bu

özellikleri nedeniyle, alüminyum fosfit zehirlenmesi tanısı alan hastaların yönetimi tercihen 3. basamak yoğun bakım ünitelerinde yürütülmelidir (Rahimi Kakavandi ve ark., 2022; Parvizrad ve ark., 2022; Zaare Nahandi ve ark., 2023).

Tedavi planlamasında kabul edilmesi gereken ilk ve en temel gerçek, bu zehirlenme için spesifik bir antidotun mevcut olmamasıdır. Bu durum, tedavi yaklaşımının semptomlara ve gelişen komplikasyonlara yönelik olarak şekillendirilmesini zorunlu kılmaktadır. Oral alımı takiben özellikle ilk saatlerde, midede kalan tabletlerden fosfin gazı salınımını önlemek veya azaltmak amacıyla mide dekontaminasyonu uygulanabilmektedir. Su bazlı solüsyonların fosfin salınımını artırabileceğine dair endişeler nedeniyle, mide lavajında potasyum permanganat, sodyum bikarbonat ve fosfin salınımını azaltabileceği ve lokal antioksidan etki gösterebileceği düşünülen hindistancevizi yağı gibi yağ bazlı solüsyonların tercih edildiği bildirilmektedir (Ullah ve ark., 2024; Elsharkawy ve ark., 2023; Abdelhamid ve ark., 2023; Zaare Nahandi ve ark., 2023; Aghebat-Bekheir ve ark., 2024). Emilimi azaltmaya yönelik olarak aktif kömür uygulaması da tedavi seçenekleri arasında yer almaktadır (Elsharkawy ve ark., 2023; Shaker ve ark., 2023).

Hastanın hayatta kalması büyük ölçüde yoğun bakım koşullarında sağlanan destekleyici tedavilere bağlıdır. Özellikle dolaşım kollapsı, alüminyum fosfit zehirlenmesinin en sık mortal seyreden komplikasyonlarından biri olduğundan, agresif intravenöz sıvı resüsitasyonu ve kan basıncının sürdürülmesi amacıyla norepinefrin gibi vazopresör ajanların kullanımı kritik önem taşımaktadır (Elsharkawy ve ark., 2023; Aghebat-Bekheir ve ark., 2024). Dokularda gelişen hipoksi ve mitokondriyal fonksiyon bozukluğuna bağlı olarak ortaya çıkan şiddetli metabolik asidozun düzeltilmesi amacıyla intravenöz sodyum bikarbonat infüzyonu uygulanabilmektedir (Ullah ve ark., 2024; Sedaghattalab, 2022; Elsharkawy ve ark., 2023; Shaker ve ark., 2023).

Solunum sistemi tutulumu olan hastalarda hipoksinin düzeltilmesi için oksijen tedavisi temel yaklaşımlardan biridir. Akut solunum sıkıntısı sendromu (ARDS) gelişen olgularda ise erken entübasyon ve mekanik ventilasyon desteği hayat kurtarıcı olmaktadır (Hájek ve ark., 2024; Elsharkawy ve ark., 2023; Sobh ve ark., 2023).

Mevcut destekleyici tedavi yaklaşımlarının, özellikle ağır vakalarda, yüksek mortalite oranlarını anlamlı düzeyde düşürmedeki yetersizliği; alüminyum fosfit zehirlenmesinin temel patofizyolojik mekanizmalarını hedef alan yeni ve deneysel tedavi yöntemlerine yönelik araştırmaların artmasına neden olmuştur.

Araştırılan ve Mevcut Deneysel Tedavi Yöntemleri

Mevcut standart tedavilerin sınırlılıkları ve yüksek mortalite oranları göz önüne alındığında, ALP'nin temel toksik mekanizmaları olan oksidatif stresi ve mitokondriyal enerji krizini hedef alan deneysel ve adjuvan (destekleyici) tedavilerin araştırılması büyük bir stratejik önem taşımaktadır. Bu yaklaşımlar, zehirlenmenin temel patofizyolojisine müdahale ederek klinik sonuçları iyileştirme potansiyeli sunmaktadır.

Antioksidan Tedaviler

Bu tedaviler, fosfin gazının neden olduğu yoğun hücresel oksidatif stresi nötralize etmeyi veya azaltmayı hedefler. Bu gruptaki ajanlar arasında, N-asetilsistein (NAC) meta-analiz düzeyinde güçlü kanıtlarla desteklenirken, diğer antioksidanlar için kanıtlar daha çok tekil klinik çalışmalar veya hayvan modellerine dayanmaktadır (Sobh ve ark., 2023).

N-Asetilsistein (NAC): Güçlü bir antioksidan ve vücudun en önemli endojen antioksidanı olan glutatyonun öncül maddesidir. Yapılan çok sayıda klinik çalışmayı bir araya getiren meta-analizler, standart tedaviye eklenen NAC'nin mortaliteyi istatistiksel olarak anlamlı ölçüde azalttığını göstermiştir; bir meta-analiz bu azalmayı yaklaşık üç kat olarak, bir diğeri ise risk oranını yaklaşık 0.5 olarak belirlemiştir (Parvizrad ve ark., 2022; Shaker ve ark., 2023; Sobh ve ark., 2023).

Koenzim Q10 (CoQ10): Mitokondriyal elektron taşıma zincirinde rol alan ve aynı zamanda güçlü bir lipofilik antioksidan olan CoQ10, klinik çalışmalarda hemodinamik parametreleri (kan basıncı) ve vücudun toplam antioksidan kapasitesini iyileştirmiştir. Hayvan deneylerinde ise karaciğer koruyucu (hepatoprotektif) etkileri olduğu gösterilmiştir. Bununla birlikte, mevcut klinik çalışmaları birleştiren bir meta-analizde, CoQ10'un mortalite üzerinde istatistiksel olarak anlamlı bir etki göstermediği bulunmuştur (Hooshangi Shayesteh ve ark., 2024; Elsharkawy ve ark., 2023; Sobh ve ark., 2023).

Diğer Antioksidanlar: Bir meta-analizde, **Vitamin E**'nin mortaliteyi anlamlı ölçüde azalttığı bulunmuş, ancak bu bulgunun tek bir çalışmaya dayanması ve sonucun istatistiksel güven aralığının çok geniş olması nedeniyle güvenilirliğinin düşük olduğu ve daha fazla çalışmaya ihtiyaç duyulduğu vurgulanmıştır (Sobh ve ark., 2023). Hayvan modellerinde, **nanokurkuminin** karaciğer ve akciğer koruyucu etkileri gösterilmiştir (Khodavysi ve ark., 2023; Salimi ve ark., 2022; Mahlooji ve ark., 2022). **Melatonin** ve **L-karnitin** gibi diğer antioksidan ajanlar da

hem hayvan deneylerinde hem de klinik çalışmalarda araştırılmış ve potansiyel faydaları bildirilmiştir (Abdelhamid ve ark., 2023; Parvizrad ve ark., 2022; Zaare Nahandi ve ark., 2023).

Metabolik Destek Tedavileri

Bu yaklaşımlar, özellikle fosfinin neden olduğu enerji krizinden en çok etkilenen kalp kasının (miyokard) enerji metabolizmasını desteklemeyi amaçlar.

Glikoz-İnsülin-Potasyum (GIK) / Yüksek Doz İnsülin Tedavisi: Stres altındaki miyokardın birincil yakıtı olan glikozun hücre içine alımını ve kullanımını artırarak pozitif inotropik (kalp kasılma gücünü artırıcı) etki gösterir. Yapılan klinik çalışmalar ve bu çalışmaları özetleyen sistematik derlemeler, yüksek doz insülin içeren GIK tedavilerinin mortaliteyi anlamlı derecede düşürdüğünü ortaya koymuştur; örneğin, bir çalışmada GIK tedavisi almayan gruptaki %73'lük mortalite oranını %20'ye düşürdüğü bildirilmiştir (Ullah ve ark., 2024; Sedaghattalab, 2022; Shukla ve ark., 2024).

İleri Yaşam Desteği ve Diğer Yaklaşımlar

Yağ Bazlı Gastrik Lavaj: Özellikle **hindistancevizi yağı** gibi yağların, fosfin salınımını azaltma ve lokal antioksidan etki gösterme potansiyeli ile klinik çalışmalarda sonuçları iyileştirdiği raporlanmıştır (Elsharkawy ve ark., 2023).

Ekstrakorporeal Membran Oksijenasyonu (ECMO): Tedaviye dirençli şiddetli kardiyojenik şok ve/veya solunum yetmezliği olan seçilmiş vakalarda, kalp ve akciğer fonksiyonlarını geçici olarak devralan bir kurtarma tedavisi olarak kullanılmıştır (Hájek ve ark., 2024; Shukla ve ark., 2024).

Hiperbarik Oksijen Tedavisi (HBOT): Bir olgu sunumunda başarılı bir şekilde kullanıldığı ve bir hayvan çalışmasında sağkalım süresini uzattığı gösterilmiştir. Ancak bu alanda daha fazla araştırmaya ihtiyaç duyulmaktadır (Hájek ve ark., 2024).

Magnezyum Sülfat: Anti-aritmik ve membran stabilize edici özellikleri nedeniyle birçok merkezde destekleyici tedavi protokollerinin bir parçası olarak kullanılmaktadır (Ullah ve ark., 2024; Elsharkawy ve ark., 2023).

Sevelamer: Bir in vivo çalışmada, ALP zehirlenmesine karşı yeni bir antidot olarak araştırıldığı belirtilmiştir (Heidari ve ark., 2023).

Bu umut vaat eden yaklaşımların varlığına rağmen, her birinin kendi sınırlılıkları bulunmaktadır ve zehirlenme yönetimindeki genel zorluklar devam etmektedir.

Gelecek Perspektifleri

Alüminyum fosfit zehirlenmesinde klasik klinik parametreler ve biyobelirteçler, prognoz tayininde çoğu zaman yetersiz kalmaktadır. Bu sınırlılık, maruziyet sonrası erken dönemde hücresel düzeyde gelişen metabolik ve biyokimyasal değişikliklerin daha bütüncül yaklaşımlarla incelenmesini gündeme getirmektedir. Metabolomik analizler, hücrelerdeki enerji metabolizması bozuklukları, oksidatif stres yanıtları ve diğer biyokimyasal değişimleri sistematik olarak değerlendirme olanağı sunar. Bu tür biyoteknolojik yaklaşımlar, henüz klinik pratiğe doğrudan yansımamış olsa da, ileride erken risk sınıflaması, hastalık şiddetinin öngörülmesi ve tedavi yanıtının izlenmesi açısından önemli bir tamamlayıcı perspektif sağlayabilir (Wishart, 2022).

BULGULAR ve TARTIŞMA

Alüminyum fosfit zehirlenmesinde bildirilen son derece yüksek mortalite oranları, hem altta yatan patofizyolojik mekanizmaların ağırlığını hem de mevcut tedavi yaklaşımlarının sınırlılıklarını açıkça yansıtmaktadır. Fosfin gazının mitokondriyal solunumu hızlı ve büyük ölçüde geri döndürülemez biçimde inhibe etmesi, özellikle yüksek enerji gereksinimi olan kalp gibi organlarda hücresel enerji üretiminin durmasına yol açmaktadır. Bu süreç, standart tedavilere yanıt vermeyen refrakter kardiyojenik şok ve derin metabolik asidoz gelişimiyle sonuçlanmakta ve çoğu vakada ölümle sonlanan ortak patofizyolojik yol olarak karşımıza çıkmaktadır.

Tedavideki en temel ve kritik sınırlılık, bu yıkıcı süreci doğrudan hedefleyerek geri çevirebilecek spesifik bir antidotun bulunmamasıdır. Bu durum, alüminyum fosfit zehirlenmesinin yönetimini büyük ölçüde semptom kontrolü ve hayati organ fonksiyonlarının desteklenmesine dayalı bir yaklaşımla sınırlandırmaktadır.

Son yıllarda araştırılan N-asetilsistein, GIK/yüksek doz insülin tedavisi ve diğer antioksidan ajanlar, zehirlenmenin temel patofizyolojik mekanizmalarına yönelik müdahale potansiyelleri nedeniyle dikkat çekmektedir. Bu yaklaşımların öne çıkması rastlantısal değildir; N-asetilsistein oksidatif stresi doğrudan hedeflerken, insülin temelli

tedaviler fosfin toksisitesinin en belirgin etkilerinin görüldüğü miyokardda hücresel enerji üretimini destekleyen alternatif bir metabolik yol sunmaktadır. Bununla birlikte, bu tedavilere ilişkin mevcut kanıtların önemli bir bölümü küçük örneklemli klinik çalışmalara, hayvan deneylerine veya sınırlı sayıda olgu sunumuna dayanmaktadır. Bu nedenle elde edilen sonuçların geniş hasta popülasyonlarına doğrudan genellenmesi güçtür.
Özellikle N-asetilsistein ve yüksek doz insülin tedavisi gibi mortalite üzerine olumlu etkiler bildiren yaklaşımlar için, bu bulguların doğrulanması ve standart tedavi protokollerine entegrasyonu amacıyla daha geniş örneklemli, çok merkezli ve randomize kontrollü klinik çalışmalara ihtiyaç olduğu açıktır.

SONUÇ

Alüminyum fosfit zehirlenmesi, spesifik bir antidotunun bulunmaması ve yol açtığı yüksek mortalite oranları nedeniyle küresel ölçekte önemli bir toksikolojik acil durum olmaya devam etmektedir. Zehirlenmenin temel toksik mekanizması, fosfin gazına bağlı mitokondriyal solunum inhibisyonu ve bunun sonucunda gelişen şiddetli oksidatif stres ile hücresel enerji krizidir.
Güncel tedavi yaklaşımı, yoğun bakım koşullarında uygulanan agresif destekleyici tedavi ile sınırlı olup, özellikle ağır vakalarda sıklıkla yetersiz kalmaktadır. Bu nedenle, zehirlenmenin patofizyolojisini hedef alan adjuvan tedaviler giderek daha fazla önem kazanmaktadır. Mevcut literatür ışığında, N-asetilsistein gibi antioksidan yaklaşımlar ile GIK/yüksek doz insülin gibi metabolik destek tedavileri mortaliteyi azaltma potansiyeli açısından öne çıkan seçenekler arasında yer almaktadır. Bununla birlikte, bu tedavilerin etkinliğini ve güvenliğini kesin olarak ortaya koyacak, kanıta dayalı ve standartlaştırılmış bir tedavi protokolü oluşturabilmek için daha fazla yüksek kaliteli, çok merkezli klinik araştırmaya ihtiyaç bulunmaktadır.

Abstract

Chronic obstructive pulmonary disease (COPD) is a common pulmonary disease characterized by airway inflammations, associated with high morbidity and mortality, and increasing in prevalence with age. MicroRNAs (miRNAs) play critical regulatory roles in COPD pathogenesis. This study aimed to determine the diagnostic potential obtained by combining miR-126-3p and inflammatory clinical markers (CRP, WBC, etc.) using Machine Learning (ML) algorithms. To assess the limitations of traditional approaches, the Logistic Regression classification model (Traditional ML) was used as a reference for single miR-126-3p analysis. For the primary analysis, a powerful ensemble algorithm (Random Forest) classifier model was employed to model the non-linear complex interactions of the entire biomarker panel (miR-126-3p + 4 clinical parameters). Data were scaled with StandardScaler and split into Training/Test sets (%80/%20). Diagnostic performance was evaluated using Area Under the Curve (AUC), Accuracy, and the Confusion Matrix. The Logistic Regression model using single miR-126-3p exhibited limited performance in COPD diagnosis (AUC=0.58). The performance of the multi-parameter panel created with Random Forest combining miR-126-3p and clinical parameters increased substantially. The model achieved 100.00% accuracy and an AUC value of 1.0000 on the test data. Confusion Matrix analysis confirmed that the model recorded no False Positive or False Negative errors, thereby confirming its perfect (optimum) discriminatory power. Feature Importance analysis showed that miR-126-3p provided a significant independent contribution to the model's final decision alongside clinical markers. Our study proves that traditional statistical methods must be transcended to reveal the true clinical value of potential biomarkers. The resulting AUC 1.0000 demonstrates that combining miR-126-3p with clinical parameters via ML establishes a strong foundation for developing next-generation diagnostic tools with impeccable reliability in COPD diagnosis.

Keywords: COPD, miR-126-3p, Machine Learning, Random Forest

KOAH tanısında miR-126-3p ve inflamatuar klinik belirteçlerin tanısal gücünün random forest (RF) makine öğrenimi ile artırılması

Özet

Kronik obstrüktif akciğer hastalığı (KOAH), solunum yolu inflamasyonları ile karakterize edilen, yüksek morbidite ve mortaliteye sahip, yaygın bir akciğer hastalığıdır. MikroRNA (miRNA)'lar, KOAH patogenezinde kritik düzenleyici roller üstlenir. Bu çalışma, miR-126-3p'nin ve inflamatuar klinik belirteçlerin (CRP, WBC vb.) Makine Öğrenimi (ML) ile birleştirilmesi sonucu elde edilen tanısal potansiyeli belirlemeyi amaçlamıştır. Geleneksel yaklaşımların sınırlılıklarını değerlendirmek üzere, tekli miR-126-3p analizinde Lojistik Regresyon sınıflandırma modeli (Geleneksel ML) referans olarak kullanılmıştır. Birincil analiz olarak, tüm biyobelirteç panelinin (miR-126-3p + 4 klinik parametre) doğrusal olmayan karmaşık etkileşimlerini modellemek amacıyla güçlü bir ensemble (topluluk) algoritması olan Rastgele Orman (Random Forest) sınıflandırıcı modeli kullanılmıştır. Veriler StandardScaler ile ölçeklenmiş ve Eğitim/Test (%80/%20) olarak ayrılmıştır. Tanısal performans Eğri Altındaki Alan (AUC), Doğruluk ve Hata Matrisi ile değerlendirilmiştir. Tek başına miR-126-3p'yi kullanan Lojistik

Regresyon modeli, KOAH tanısında sınırlı performans göstermiştir (AUC=0.58). Random Forest ile oluşturulan multi-parametre panelinin performansı önemli ölçüde artmıştır. Model, test verisi üzerinde %100.00 doğruluk ve 1.0000 AUC değeri elde etmiştir. Hata Matrisi analizi, modelin hiçbir Yalancı Pozitif (False Positive) veya Yalancı Negatif (False Negative) hata kaydetmediğini, ayırma gücünün mükemmel (optimum) olduğunu teyit etmiştir. Özellik Önem Düzeyi analizi, miR-126-3p'nin klinik belirteçlere önemli bir bağımsız katkı sunduğunu göstermiştir. Çalışmamız, potansiyel biyobelirteçlerin klinik tanıdaki gerçek değerini ortaya çıkarmak için geleneksel istatistiksel yöntemlerin ötesine geçilmesi gerektiğini kanıtlamaktadır. Elde edilen AUC 1.0000 sonucu, miR-126-3p'nin klinik parametrelerle ML ile birleştirilmesinin, KOAH tanısında kusursuz güvenilirliğe sahip yeni nesil tanısal araçlar geliştirmek için güçlü bir zemin hazırladığını göstermektedir.

Anahtar Kelimeler: KOAH, miR-126-3p, Makine Öğrenimi, Random Forest

1. GİRİŞ

Kronik obstrüktif akciğer hastalığı (KOAH), kalıcı hava akımı kısıtlılığı ve kronik solunum yolu inflamasyonu ile karakterize olup dünya genelinde yüksek morbidite ve mortaliteye yol açan bir akciğer hastalığıdır. 2025 GOLD raporunda vurgulandığı üzere, hastalığın erken dönemde tanımlanması ve klinik seyrinin doğru öngörülmesi, hem kişiselleştirilmiş tedavi yaklaşımları hem de hastalık yükünün azaltılması açısından kritik önem taşımaktadır (GOLD, 2025).

Son yıllarda mikroRNA'lar (miRNA'lar), KOAH patogenezi ve klinik uygulamalar açısından önemli bir araştırma alanı hâline gelmişir. Bu küçük, kodlamayan RNA'lar inflamasyon, oksidatif stres, hücresel yaşlanma ve doku yeniden yapılanması gibi KOAH ile ilişkili temel biyolojik süreçleri düzenlemektedir. Kan ve doku örneklerinde değerlendirilen miRNA ekspresyon düzeyleri, hem stabil hastalık döneminde hem de alevlenme süreçlerinde potansiyel tanısal ve prognostik belirteçler olarak incelenmiştir. Meta-analiz ve sistematik çalışmalar, dolaşımdaki miRNA'ların KOAH'ın tanısal doğruluğunu artırma potansiyeline sahip olduğunu göstermektedir (Li ve ark., 2024; Zhu ve ark., 2023).

KOAH'ta miR-126-3p gibi miRNA'ların inflamasyon ve vasküler yapıdaki değişikliklerle ilişkili olduğu, bazı çalışmalarda bu molekülün hastalarda azalmış düzeylerde bulunduğu bildirilmiştir (Peng ve ark., 2022). Bununla birlikte, tek bir biyobelirtece veya CRP gibi klasik inflamatuar parametrelere dayalı tanısal yaklaşımların gücü, hastalığın biyolojik heterojenliği ve değişken inflamatuar yanıt nedeniyle çoğu zaman sınırlı kalmaktadır. Bu sınırlılıklar, çoklu biyobelirteç panelleri ve gelişmiş analiz yöntemlerinin kullanımını giderek daha gerekli hâle getirmektedir (Li ve ark., 2024).

Makine Öğrenimi (ML) yöntemleri, çoklu klinik ve moleküler değişkenler arasındaki doğrusal olmayan ilişkileri modelleyebilme, değişken önemini değerlendirebilme ve yüksek sınıflandırma doğruluğu sağlayabilme özellikleri sayesinde tıp alanında giderek daha yaygın kullanılmaktadır. KOAH özelinde yapılan derleme ve karşılaştırmalı çalışmalar, ensemble yöntemlerin ve özellikle Random Forest (RF) algoritmasının sınıflandırma performansı, değişken seçimi ve aşırı uyumu azaltmadaki başarısı nedeniyle biyobelirteç temelli tanısal modellerde öne çıktığını göstermektedir (Topalovic ve ark., 2019; Esteban ve ark., 2021).

Bu çalışmanın amacı, miR-126-3p ekspresyon düzeylerini CRP, WBC, NEU ve LYM gibi inflamatuar belirteçlerle birlikte değerlendirerek, Random Forest tabanlı makine öğrenimi modeli aracılığıyla bu biyobelirteç panelinin KOAH tanısındaki ayırt edici potansiyelini ortaya koymaktır.

2. MATERYAL VE METOD

Çalışmamız, miR-126-3p ekspresyon düzeyleri ile dört rutin klinik belirtecin (CRP, WBC, NEU, LYM) kombine edilerek KOAH tanısındaki ayırt edici gücünü ML algoritmaları aracılığıyla inceleyen ikincil (sekonder) ve hesaplamalı bir analizdir.

2.1 Çalışma Grubu

Bu analiz için kullanılan biyolojik ve klinik veriler, daha önce yayınlanmış olan bir prospektif çalışmadan elde edilmiştir (Yıldırım ve ark., 2026). Orijinal çalışma, toplam 53 KOAH tanılı hasta ile 52 sağlıklı bireyden oluşan kontrol grubunun verilerini içermektedir.

Orijinal veri toplama süreci, Tokat Gaziosmanpaşa Üniversitesi Tıp Fakültesi Dekanlığı Etik Kurulunun onayıyla gerçekleştirilmiş olup, tüm katılımcılardan Bilgilendirilmiş Onam Formu alınmıştır. Bu retrospektif ML analizi, mevcut veriler üzerinde yeni bir hesaplamalı yöntem uyguladığı için ayrıca bir etik onayı gerektirmemektedir.

2.2 Biyobelirteç Ölçümleri

2.2.1 Klinik Veriler

Çalışma grubuna ait CRP, WBC, NEU ve LYM düzeyleri, hastaların tanı anındaki rutin klinik laboratuvar kayıtlarından elde edilmiştir. Bu dört klinik parametre, miR-126-3p ile birlikte tanı panelini oluşturmuştur.

2.2.2 miR-126-3p Ekspresyon Analizi

miR-126-3p ekspresyon düzeyleri, hasta ve kontrol gruplarından toplanan kan örneklerinden izole edilen RNA'lar kullanılarak Gerçek Zamanlı Polimeraz Zincir Reaksiyonu (qRT-PCR) yöntemiyle ölçülmüştür. miR-126-3p için log2-delta delta CT ($2^{-\Delta\Delta Ct}$) yöntemiyle ekspresyon değerleri, bağımsız değişken olarak ML analizine dahil edilmiştir.

2.3 İstatistiksel ve Makine Öğrenimi Değerlendirmesi

2.3.1 Veri Ön İşleme ve Ayrımı

Makine öğrenimi modellemesinden önce, farklı ölçüm ölçeklerine sahip değişkenlerin model üzerindeki etkilerini eşitlemek amacıyla tüm sayısal veriler StandardScaler yöntemi ile normalize edilmiş ve ölçeklendirilmiştir. Veri seti, modelin genelleme yeteneğini ve test verisi üzerindeki performansını değerlendirmek için Eğitim (%80) ve Test (%20**)** veri setleri olarak rastgele ikiye ayrılmıştır.

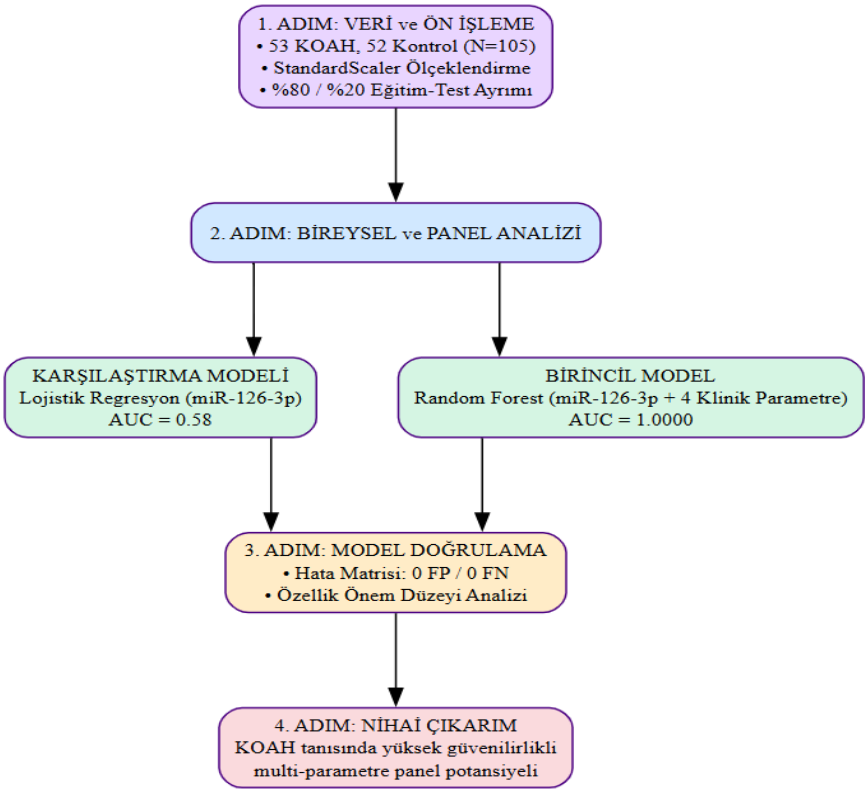
2.3.2 Makine Öğrenimi Modelleri

Karşılaştırma Modeli (Lojistik Regresyon): Tek başına miR-126-3p'nin tanısal gücünü standart bir ML yöntemiyle değerlendirmek için Lojistik Regresyon sınıflandırma modeli kullanılmıştır.

Birincil Model (Random Forest): Esas analiz, tüm biyobelirteç panelinin (miR-126-3p + 4 klinik parametre) doğrusal olmayan ve karmaşık etkileşimlerini modellemek amacıyla güçlü bir topluluk (ensemble) algoritması olan Random Forest (RF) Sınıflandırıcısı ile gerçekleştirilmiştir.

2.3.3 Performans Değerlendirmesi Metrikleri

Modellerin tanısal performansı, test veri seti üzerinde aşağıdaki metrikler kullanılarak değerlendirilmiştir:



Eğri Altındaki Alan (AUC): Modelin ayırma gücünün temel ölçütü olarak.

Doğruluk (Accuracy): Genel doğru sınıflandırma oranını temsil etmek üzere.

Hata Matrisi (Confusion Matrix): Yalancı Pozitif ve Yalancı Negatif hata sayılarını somutlaştırarak klinik güvenilirliği değerlendirmek için.

Özellik Önem Düzeyi (Feature Importance): Paneldeki her bir belirtecin (miR-126-3p, CRP, WBC vb.) nihai tanı kararına olan katkısını belirlemek için.

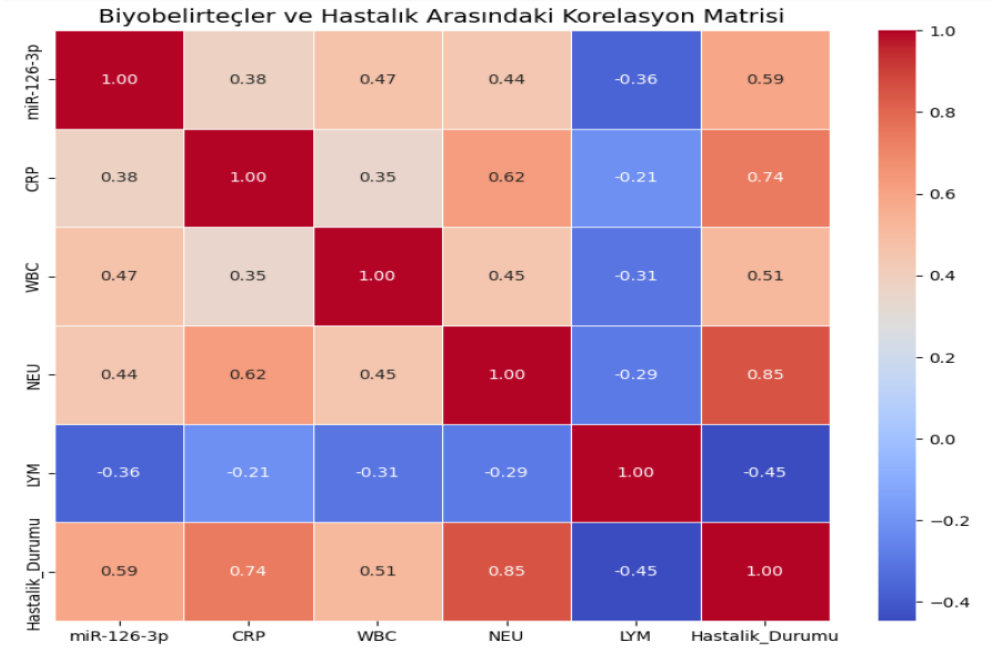
3. BULGULAR

Şekil 1. miR-126-3p ve Klinik Parametreler Panelinin KOAH Tanısındaki Geleneksel ve Random Forest Makine Öğrenimi Yaklaşımlarıyla Karşılaştırmalı Çalışma Akış Şeması.

Çalışmamız, miR-126-3p ekspresyon düzeylerinin tek başına tanısal gücünü geleneksel bir yaklaşımla değerlendirmiş ve klinik parametrelerle birleştirilerek Random Forest algoritması ile tanısal potansiyelini artırmıştır. Çalışmamızın tüm metodolojik akışı, kullanılan modeller ve ana sonuç karşılaştırması Şekil 1'de özetlenmiştir.

3.1. Çalışma Grubu Özellikleri ve İstatistiksel Analiz

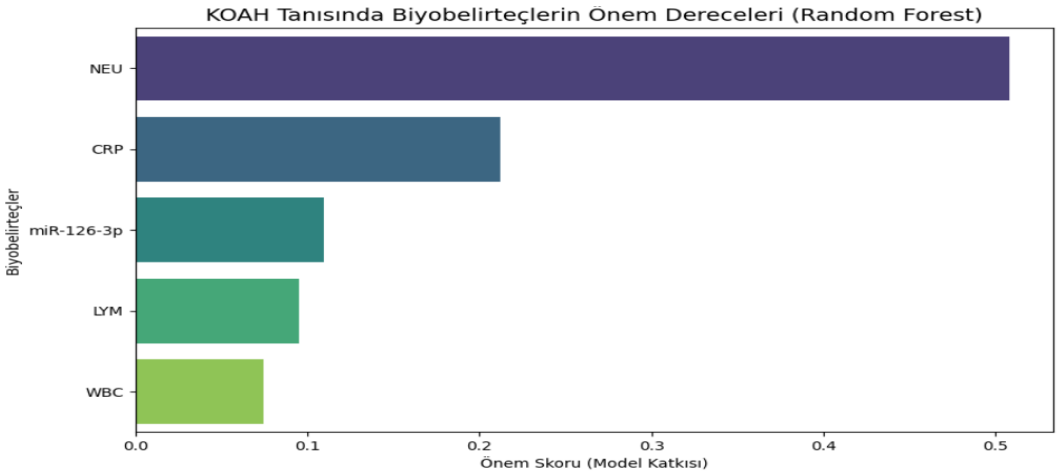
Çalışmaya dahil edilen 53 KOAH hastası ve 52 sağlıklı kontrolden oluşan grubun demografik ve klinik özellikleri Tablo 1'de gösterilmiştir. Gruplar arasında yaş ve cinsiyet açısından istatistiksel olarak anlamlı bir farklılık saptanmamıştır ($p>0.05$), CRP, WBC, NEU ve LYM gibi tüm inflamatuar belirteçler ile miR-126-3p ekspresyon düzeyleri KOAH grubunda istatistiksel olarak anlamlı farklılık göstermiştir ($p<0.05$). Özellikle, miR-126-3p düzeyleri KOAH hastalarında kontrol grubuna göre anlamlı derecede yüksektir ($p=0.034$).



Tablo 1. Çalışmaya dahil edilen KOAH hastaları ve kontrol grubunun demografik ve klinik özelliklerine ilişkin istatistiksel bulgular

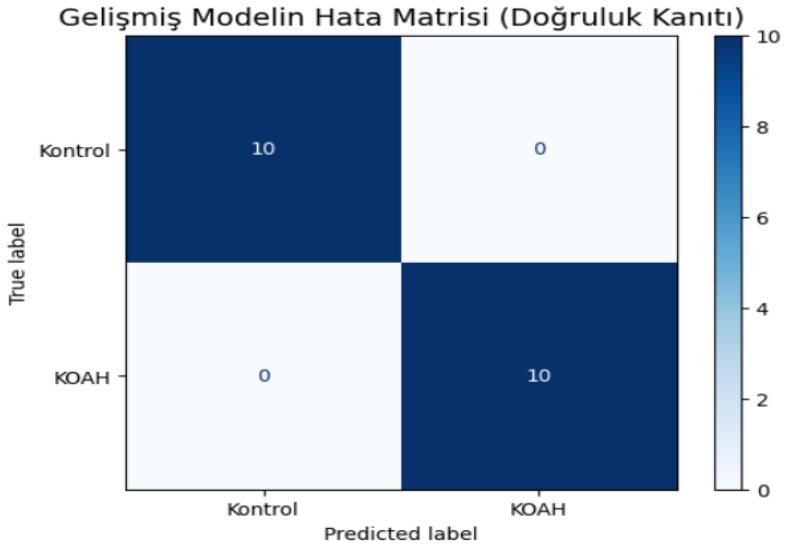
Değişkenler	KOAH Hastaları (n=53) Medyan [IQR]	Kontrol (n=52) Medyan [IQR]	p değeri
Cinsiyet, n(%)			
Kadın	10 (%18.9)	4 (%7.7)	0.150
Erkek	43 (%81.1)	48 (%92.3)	
Yaş (yıl)	72 [63–77]	66 [60–72.5]	0.075
CRP (mg/L)	16 [4.7–66]	1.88 [0.97–8.9]	**<0.001**
WBC (×10³/µL)	9010 [8220–10290]	7510 [6325–8605]	**<0.001**
NEU (×10³/µL)	6772 [5240–7800]	4060 [3350–5430]	**<0.001**
LYM (×10³/µL)	1580 [1060–2220]	1980 [1645–2520]	**0.023**
miR-126-3p ($2^{-\Delta\Delta Ct}$)	9.51 (3.61–53.02)	0.83 (0.17–8.40)	**0.034**

Cinsiyet verilerinin analizi için $\chi 2$ (Ki-Kare) testi kullanılmıştır. Nicel değişkenlerin normal dağılım göstermemesi nedeniyle (Shapiro–Wilk, $p<0.05$), Yaş, CRP, WBC, NEU, LYM ve miR-126-3p değerlerinin gruplar arası karşılaştırmaları Mann–Whitney U testi kullanılarak yapılmıştır. Sürekli değişkenler Medyan (Çeyrekler Arası Aralık, IQR) olarak, kategorik değişkenler ise sayı (yüzde) biçiminde sunulmuştur. KOAH hastaları ve kontrol grubu arasındaki karşılaştırmalar Mann–Whitney U testi ile değerlendirilmiş olup istatistiksel olarak anlamlı bulgular koyu olarak gösterilmiştir. Kısaltmalar: CRP, C-reaktif protein; WBC, beyaz kan hücresi; NEU, nötrofil; LYM, lenfosit.



Tek başına miR-126-3p'nin tanısal gücünü değerlendirmek amacıyla kurulan Lojistik Regresyon sınıflandırma modeli kullanılarak KOAH tanısındaki ayırt edici gücü açısından değerlendirilmiştir. Bu geleneksel modelleme sonucunda, miR-126-3p'nin tanısal performansı AUC=0.58 olarak belirlenmiştir. Bu değer, tek değişkenli belirteçlerin KOAH gibi heterojen bir hastalıkta sınırlı ayırma gücüne sahip olduğunu göstermektedir.

İkinci aşamada, miR-126-3p ekspresyonu ile dört klinik parametrenin (CRP, WBC, NEU, LYM) birleştirildiği multi-parametre paneli, Random Forest (RF) sınıflandırıcısı kullanılarak analiz edilmiştir. Bu ensemble yaklaşımı, tanısal performansı belirgin şekilde artırmış ve test veri setinde %100.00 doğruluk ile AUC = 1.0000 değerine ulaşmıştır. Bu sonuç, modelin hasta ve kontrol gruplarını hatasız biçimde ayırt edebildiğini göstermektedir (Şekil 2).



Şekil 2. Biyobelirteçler ile Klinik Parametrelerin KOAH Hastalık Durumu ile İlişkisinin Korelasyon Matrisi

Modelin klinik güvenilirliğini test veri setinde değerlendirmek amacıyla gerçekleştirilen Hata Matrisi (Confusion Matrix) analizi, bu hatasız sınıflandırma performansı doğrulamıştır. Şekil 3'te gösterildiği üzere, model sıfır (0) yalancı pozitif ve sıfır (0) yalancı negatif hata ile sınıflandırma yapmıştır. Ayrıca, Özellik Önem Düzeyi analizi, miR-126-3p'nin rutin klinik belirteçlerin yanı sıra yüksek ve bağımsız bir katkı sağladığını, böylece panelin tanısal gücünü belirgin şekilde artırdığını göstermiştir (Şekil 4).

Şekil 3. Random Forest Modelinde Biyobelirteçlerin Göreceli Önem Düzeyleri

Şekil 4. Test Veri Setinde Modelin Sınıflandırma Performansını Gösteren Hata Matrisi

4. TARTIŞMA

Bu çalışmanın temel amacı, miR-126-3p ekspresyon düzeylerinin hem tek başına hem de yaygın inflamatuar klinik belirteçlerle (CRP, WBC, NEU, LYM) oluşturulan bir panel içerisinde KOAH tanısındaki potansiyelini Makine Öğrenimi (ML) yaklaşımlarıyla değerlendirmektir. Elde edilen bulgular, miR-126-3p'nin klinik anlamı ve ML entegrasyonunun tanısal gücü artırmadaki kritik rolüne dair önemli çıkarımlar sağlamaktadır.

Karşılaştırmalı analizlerimiz, miR-126-3p ekspresyon düzeylerinin KOAH hastalarında kontrol grubuna kıyasla istatistiksel olarak anlamlı derecede farklı olduğunu göstermiştir ($p = 0.034$). Bu sonuç, miR-126-3p'nin KOAH ile ilişkili inflamasyon veya vasküler disfonksiyon süreçlerinde biyolojik bir role sahip olduğunu desteklemektedir. Bununla birlikte, KOAH'ın heterojen fenotiplere ve multifaktöriyel bir patogenezine sahip bir hastalık olması, tek bir moleküler belirteçle yüksek doğrulukta sınıflandırma yapılmasını güçleştirmektedir. Nitekim yalnızca miR-126-3p kullanılarak oluşturulan Lojistik Regresyon modelinin AUC=0.58 düzeyinde kalması, etkili tanısal modellerin birden fazla klinik ve biyolojik parametreyi entegre etmesi gerektiğini göstermiştir.

Tek başına miR-126-3p kullanılarak oluşturulan Lojistik Regresyon modelinin AUC = 0.58 gibi sınırlı bir performans göstermesi, KOAH'ın heterojen fenotiplere ve multifaktöriyel bir patogenezine sahip bir hastalık olmasıyla uyumludur ve yüksek doğrulukta sınıflandırma için birden fazla belirtecin entegrasyonunun gerekliliğini ortaya koymaktadır. Bu nedenle çalışmada, miR-126-3p'nin klinik belirteçlerle bir arada değerlendirildiği multi-parametre bir panel oluşturulmuştur.

Analizlerimizin ortaya koyduğu önemli sonuçlardan biri, miR-126-3p'nin dört inflamatuar belirteçle birlikte kullanılmasıyla oluşturulan panelin Random Forest algoritmasıyla değerlendirildiğinde AUC = 1.0000 ve %100.00 doğruluk değerlerine ulaşmış olmasıdır. Bu yüksek performans, RF algoritmasının ensemble yapısının belirteçler arasındaki doğrusal olmayan ilişkileri ve karmaşık etkileşimleri etkili biçimde modelleyebilme kapasitesiyle açıklanabilir. Bunun yanında, miR-126-3p'nin moleküler düzeydeki etkilerinin sistemik inflamasyon belirteçlerinin klinik yansımalarıyla birlikte değerlendirilmesi, panelin ayırt edicilik performansını artıran bir katkı sağlamıştır.

Modelin klinik uygulanabilirliği, test veri setinde elde edilen Hata Matrisi sonuçlarıyla da doğrulanmıştır. Model, sıfır Yalancı Pozitif (FP) ve sıfır Yalancı Negatif (FN) hata ile çalışarak hastalığın tespit edilememesi veya sağlıklı bireylerin yanlış sınıflandırılması gibi kritik klinik hataları tamamen ortadan kaldırmıştır. Ek olarak, Özellik Önem Düzeyi analizi, miR-126-3p'nin panelde bağımsız ve güçlü bir karar katkısı sağladığını göstermiştir.

Elde ettiğimiz sonuçlar, miR-126-3p gibi moleküler belirteçlerin rutin klinik parametrelerle birlikte kullanıldığında KOAH tanısal doğruluğunu artırma potansiyeli taşıdığını ortaya koymaktadır. Bununla birlikte, KOAH'ın heterojen fenotipleri ve multifaktöriyel patogenezi göz önünde bulundurulduğunda, bu bulguların doğruluğunu değerlendirmek için daha geniş örneklemli, çok merkezli ve bağımsız kohortlarda harici doğrulama (external validation) çalışmalarına ihtiyaç duyulmaktadır.

5. SONUÇ

Çalışmamızın bulguları, miR-126-3p gibi moleküler belirteçlerin rutin klinik parametrelerle birlikte Random Forest tabanlı bir makine öğrenimi (ML) modeli kapsamında değerlendirildiğinde KOAH tanısında son derece yüksek bir ayırt edicilik ortaya koyduğunu göstermektedir. Tek başına kullanıldığında sınırlı tanısal performans sunan miR-126-3p (AUC = 0.58), dört klinik parametre ile birlikte değerlendirildiğinde AUC = 1.0000 düzeyine ulaşmış ve modelin tanısal doğruluğunu kayda değer biçimde artırmıştır. Buna ek olarak, Hata Matrisi analizinde 0 yalancı pozitif (FP) ve 0 yalancı negatif (FN) değerin elde edilmesi, oluşturulan panelin klinik açıdan kritik yanlış sınıflandırmaları önleme potansiyeline işaret etmektedir. Bununla birlikte, KOAH'ın heterojen fenotipleri ve multifaktöriyel patogenezi dikkate alındığında, bu güçlü sonuçların klinik uygulamaya uyarlanabilmesi için daha geniş örneklemli ve çok merkezli harici doğrulama çalışmalarının yanı sıra panelin farklı KOAH fenotipleri üzerinde test edilmesine yönelik ileri araştırmalara ihtiyaç duyulmaktadır.

Abstract

Metal–organic frameworks (MOFs) are crystalline porous materials with exceptionally tunable structural architecture, pore geometry, chemical functionality, and stability. Enzymes are biocatalysts that exhibit high selectivity and activity; however, they are highly sensitive to environmental changes such as temperature, pH, organic solvents, or ionic strength. Consequently, their in-use stability is limited, limiting their applicability in industrial bioprocesses, environmental applications, biosensor technologies, and biocatalyst synthesis. In recent years, research on the use of MOFs for enzyme immobilization has accelerated. The aim of this study is to systematically classify metal–ligand–enzyme combinations, perform a comparative evaluation of MOF structures, and investigate the influence of cage structure, pore size, and ligand functionality on enzyme behavior. In this context, a bibliometric analysis was conducted based on 4,180 articles published in the Web of Science database between 2015 and 2025. Current development trends and future directions were identified through literature-based analyses. Future work may focus on developing scalable methods for MOF synthesis, expanding computational modeling for enzyme-MOF conformation, designing new functional ligands that control enzyme orientation, synthesizing mesoporous MOFs for larger enzymes, implementing MOF-enzyme hybrids at the reactor scale, and optimizing suitable structures for multi-enzyme cascade systems.

Keywords: Enzyme, immobilization, metal organic framework

INTRODUCTION

Enzymes are biocatalysts, mostly protein in structure, that enable reactions in biological systems to occur under mild conditions (pH 7.0, body temperature). The ability to exert their effects outside their natural environment, provided adequate conditions are met, allows enzymes to be utilized in many areas. Enzymes find wide applications for industrial, analytical, medical diagnostic, therapeutic, and drug design purposes (Wiseman, 1986). The enzyme market value was US$15.4 billion in 2025 and is expected to reach US$29.7 billion in 2035 (FutureMarketInsights, 2025). The raw material problem in enzyme production appears to have been largely solved via microbial sources. However, purifying enzymes from microbial sources is a very costly endeavor. In industrial applications, it is very difficult to recover the free enzyme without losing its activity. Because the free enzyme cannot be removed from the reaction medium at the desired time, the reaction is very difficult to control. Since it is impossible to remove the free enzyme used as a catalyst from the reaction medium without losing its activity, reuse of the enzyme is not possible. This is a significant cost factor due to the specific but expensive nature of enzymes. Furthermore, free enzymes are not suitable for continuous production systems. In addition to the laborious and expensive nature of enzyme purification processes, various immobilization techniques have been developed to overcome certain challenges encountered in industrial applications. Enzymes are immobilized by physical or chemical binding to a water-insoluble carrier, by incorporating the enzyme molecule as a monomer in a copolymerization process that yields an insoluble product, and by entrapping them in water-insoluble microcapsules (Klibanov, 1983).

Metal–organic frameworks (MOFs) are crystalline porous materials with exceptionally tunable structural architectures, pore geometries, chemical functionality, and stability. Since the late 1990s, thousands of different MOF structures have been developed. These structures are formed by arranging inorganic metal cations with organic ligands in specific coordination geometries. The ultra-high surface area, adjustable internal surface

chemistry, and amenability to post-synthetic modification of MOFs have increased their use in materials science, catalysis, adsorption processes, and biotechnological applications (Furukawa et al., 2013). Their ability to synthesize with a wide variety of ligand and metal sources allows them to be designed to meet diverse industrial needs. MOFs are used for various purposes in the food, chemical, environmental, and pharmaceutical industries. These applications include the retention of toxic chemicals, gas storage, catalysis, and drug delivery systems (Rogacka et al., 2025). Among these application areas, research on the use of MOFs in enzyme immobilization has gained significant momentum. Due to their rigid and porous structure, MOFs provide a protective and customizable microenvironment, preserving the enzyme's three-dimensional structure, increasing reusability, and reducing denaturation, thus providing solutions to the problems encountered in the use of free enzymes (Li et al., 2023; Pang et al., 2016). Studies have shown that a wide variety of metal cations are used. Examples of these metal cations include Zn^{2+}, Cu^{2+}, Zr^{4+}, Co^{2+}, Ni^{2+}, Ca^{2+}, Mg^{2+}, and Fe^{3+} ions, while molecules such as imidazole, 2-methylimidazole (Hmim), fumaric acid, p-aminobenzoate (PABA), terephthalic acid (BDC), and amino-terephthalic acid (NH_2-BDC) serve as ligands (**Figure 1**). These different combinations allow for the formation of a wide variety of MOF structures that are ideal for enzyme immobilization (Li et al., 2023).

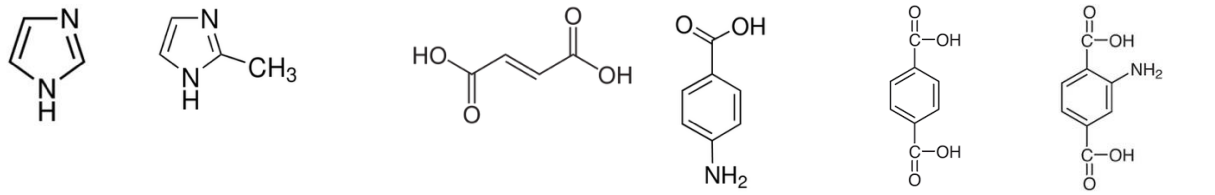

Figure 1. Commonly preferred ligands in MOF synthesis in enzyme immobilization.

MOFs have properties such as very high surface areas (most >1000 m^2/g) providing high enzyme loading capacity, coordination geometry that can be controlled at the atomic scale, tunable pore sizes that allow cage selection according to enzyme size, the ability to arrange hydrophilic or hydrophobic internal cavities, the ability to synthesize enzymes under mild conditions and in aqueous media, high chemical and thermal stability, suitability for surface functionalization with covalent or coordinate covalent bonds (with groups such as $–NH_2$, –OH, –COOH, imidazole, and sulfonate), and the potential to form hydrophobic/hydrophilic gradients. Due to these properties, they exhibit high performance that classical carriers (silica, alumina, chitin) cannot provide (Furukawa et al., 2013). Four basic methods are used for enzyme immobilization on MOFs: surface adsorption, covalent bonding, encapsulation, and co-precipitation (**Figure 2**).

Adsorption: The physical binding of the enzyme to the MOF surface. The main forces are: electrostatic attraction, hydrogen bonds, van der Waals interactions, and π–π interactions. Its advantages include mild conditions that do not damage the enzyme, suitability for immobilization of large enzymes, simple and rapid application, and high surface activity. While this method is suitable for large enzymes under mild conditions, its biggest drawback is the possibility of desorption.

Covalent attachment to the surface: The enzyme is covalently bonded via functional groups on the MOF surface. In some cases, silanization followed by activation processes such as glutaraldehyde binding are used to make the surface suitable for binding. In this method, the enzyme is not easily removed from the support, however, in some cases, a significant decrease in enzyme activity can occur (Zhang et al., 2022).

Pore encapsulation: The enzyme diffuses into the MOF pores and is retained there. Microporous structures are suitable for small enzymes, while mesoporous MOFs are suitable for larger enzymes. While enzymes exhibit high stability after immobilization, their biggest drawback is the diffusion limitations that may occur during immobilization (Weng et al., 2024).

Co-precipitation: The enzyme plays an active role during synthesis and crystallizes simultaneously with the MOF. This method provides the highest stability and maximizes MOF-enzyme compatibility. It is the most preferred method in the literature.

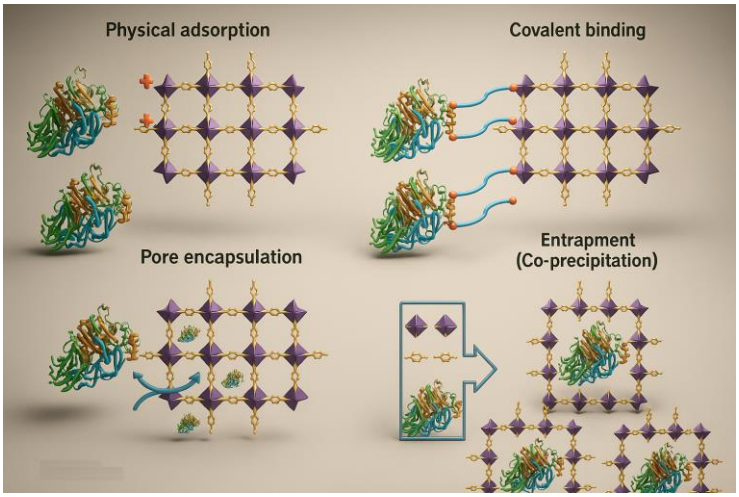

Figure 2. Enzymes to MOF immobilization used methods. The figure was re-illustrated using AI-assisted graphic tools based on the concepts described in Huang et al. (2022).

Enzyme leaching is a primary problem in preparing MOF-enzyme systems. Especially in studies where enzymes are immobilized onto MOFs by adsorption, enzymes can detach under conditions such as high ionic strength or low pH. This leads to a loss of catalytic efficiency, limits the reuse of the immobilized enzyme, and poses various challenges in reactor applications. High enzyme loading rates can block MOF pores, reducing substrate and product diffusion. This is a significant performance limiter, especially in small-pore MOFs and high-molecular-weight enzymes. Even when using the same metal-ligand system, minor changes such as solvent type, stirring speed, ligand/metal molar ratio, and synthesis time can lead to significant differences in the MOF crystalline phase. This makes comparative studies difficult. Some buffers (especially phosphate buffers) can bind metals, such as Zr-MOFs, by breaking coordinate covalent bonds, weakening MOF integrity, and reducing enzyme loading capacity. Most studies have been conducted on milligram-gram scales, under laboratory conditions, with purified substrates. Data on the long-term stability of MOF-enzymes in real wastewater streams or industrial bioreactors are scarce.

Today, various databases are available for bibliometric analysis. This study used the Web of Science (WoS) database. A bibliometric analysis of research and review articles on enzyme immobilization with MOFs published between 2015 and 2025 was conducted. Among these articles, traditional medicine studies were identified and analyzed from a bibliometric perspective.

MATERIALS AND METHODS

A search was performed using the SCI-EXPANDED index in the WoS database on 04.12.2025 with the keywords ((“enzyme immobiliz*” OR “immobilized enzyme” OR “enzyme encapsulat*” OR “enzyme load*” OR (“enzyme” AND (“incorporat*” OR “attach*” OR “fix*” OR “support*”))) AND (“MOF*” OR “metal organic framework*” OR “ZIF*” OR “UiO*” OR “MIL*” OR “HKUST*”)) in studies written in English. This search was conducted by searching titles, and the “Article and Review” option was used to retrieve data from original research articles and reviews. A total of 4,180 studies published between 2015 and 2025, the first publication date of which was determined in the WoS database on “enzyme immobilization with MOF” were retrieved. The obtained data were analyzed between December 1 and 7, 2025, for the number of citations, publication year, authors, countries, institutions and funding organizations and publishers. VOSviewer 1.6.20 and Bibliometrix was used in the bibliometric analyses (van Eck & Waltman, 2010; Aria & Cuccurullo, 2017). Tables and graphs were created from the database and the analyses, and these were used in the bibliometric evaluation. Used key with words unreachable and WoS data at the base unscanned publications This of the study limitation constitutes the word subject of the study realization for ethic board approval is not required.

RESULTS and DISCUSSION

The visualization of the co-word analysis (COA) performed on MOFs using the keywords given in the method section of WOS, regarding enzyme immobilization, in VOSviewer is given in **Figure 3**. As seen in the figure,

biosensors, lipase immobilization, ZIF-8, enzymes in the oxidoreductase and hydrolase classes, and cascade catalysis come to the fore.

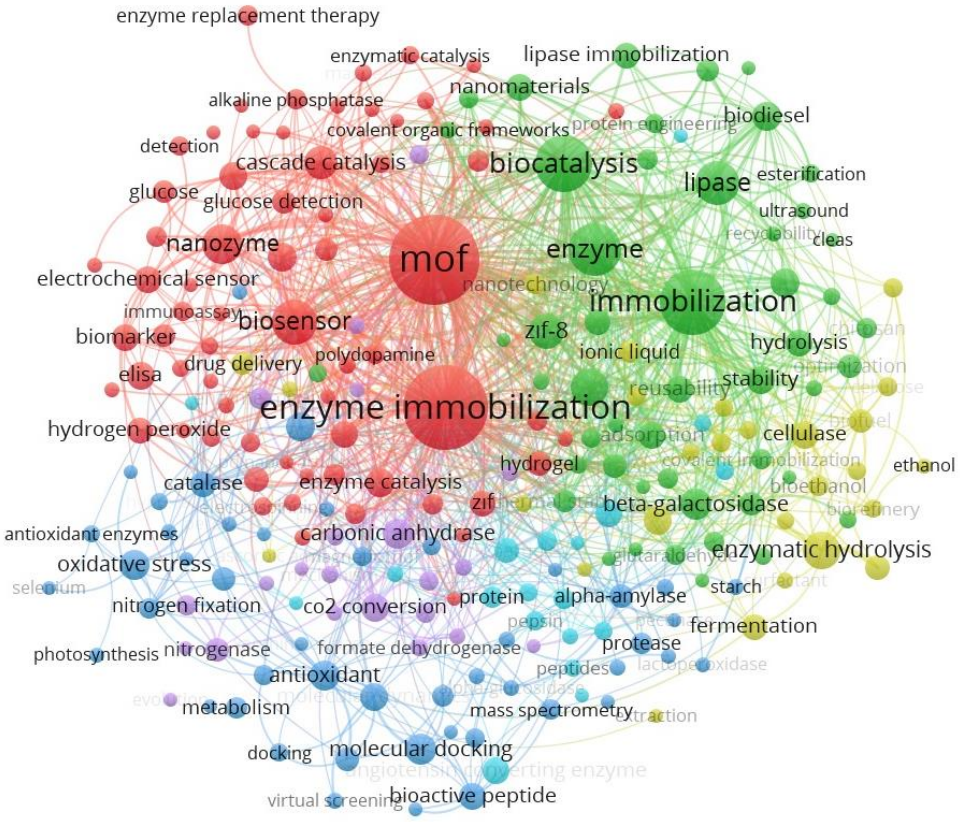

Figure 3. Keyword co-occurrence network generated using VOSviewer (version 1.6.20) based on the Web of Science Core Collection dataset (TS = ((“enzyme immobiliz*” OR “immobilized enzyme” OR “enzyme encapsulat*” OR “enzyme load*” OR (“enzyme” AND (“incorporat*” OR “attach*” OR “fix*” OR “support*”))) AND (“MOF*” OR “metal organic framework*” OR “ZIF*” OR “UiO*” OR “MIL*” OR “HKUST*”)); accessed on 4 December 2025).

The initial search of the WoS database on “enzyme immobilization with MOF” identified a total of 7.989 studies. A search for data from research and review articles yielded a total of 4.180 studis. It was determined that the largest number of research and review articles in the last decade was published in 2021 (n=995, 10.930%) (**Table 1**). Studies conducted in the last decade account for more than 60% of all research.

Table 1. Numerical and proportional distribution of studies on “enzyme immobilization with MOF” in the last decade

Publication Year	Publication Number	The rate
2025	631	15.085%
2024	506	12.097%
2023	440	10.519%
2022	447	10.686%
2021	434	10.375%
2020	394	9.419%

2019	306	7.315%
2018	309	7.387%
2017	208	4.973%
2016	228	5.451%
2015	205	4.901%

When the citation numbers were examined by years, it was observed that both the citation numbers and the number of studies increased (**Figure 4**).

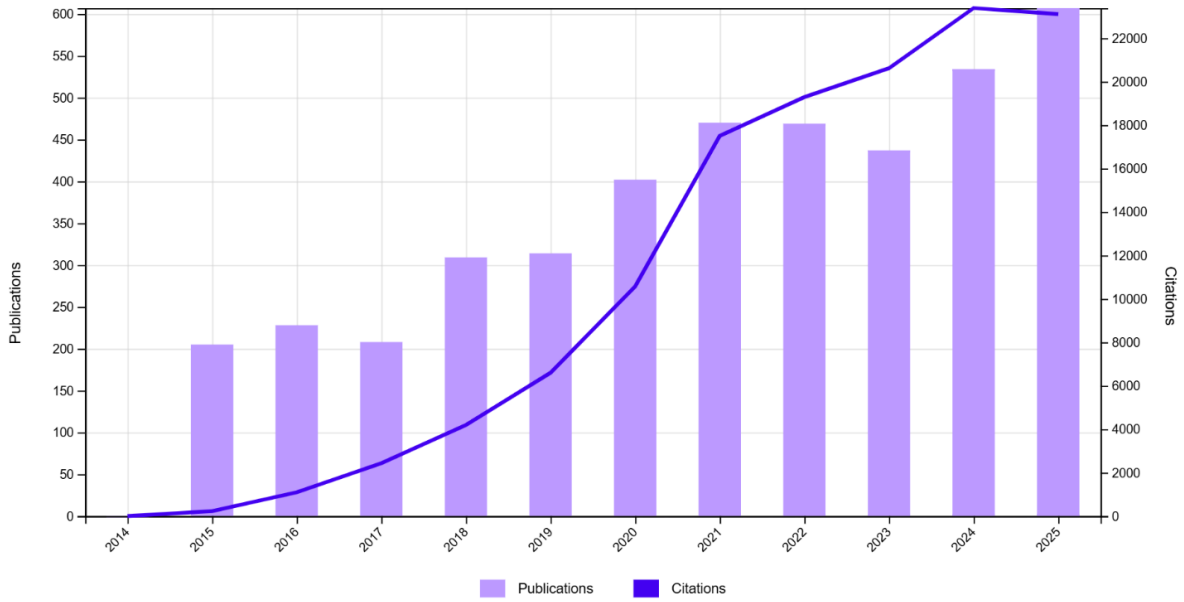

Figure 4. Number of publications and citations by year

The 10 authors with the most studies on "enzyme immobilization with MOF" are shown in **Table 2**. Elif Özyılmaz, who published the most articles on the subject in Turkey, has conducted the most research.

Table 2. The top 10 authors who published most on " enzyme immobilization with MOF", the number of publications, and the ratio of these publications to the total

Author	Publication Number	Rate (%)
Wang Y	47	1.124
Zhang Y	42	1.004
Liu Y	42	1.004
Zhang X	39	0.932
Chen Y	38	0.908
Li Y	37	0.885
Wang L	35	0.837
Li H	32	0.765
Wang J	31	0.741
Bilal M	29	0.693

The temporal distribution of publications produced by the most prolific authors over the last decade is shown in **Figure 5**. Overall, author productivity remained relatively low and scattered during 2015–2017, followed by a

gradual rise beginning in 2018. A marked increase is observed after 2020, where almost all leading researchers demonstrate both higher publication frequency and larger contribution magnitude, indicating intensified research activity in the field. Notably, Zhang X, Chen Y, and Zhang Y exhibit consistently high output, with pronounced peaks between 2019 and 2023, suggesting their central role in driving advancements in the topic. The continued presence of substantial publication activity in 2024–2025 further indicates that the field remains dynamic and rapidly evolving.

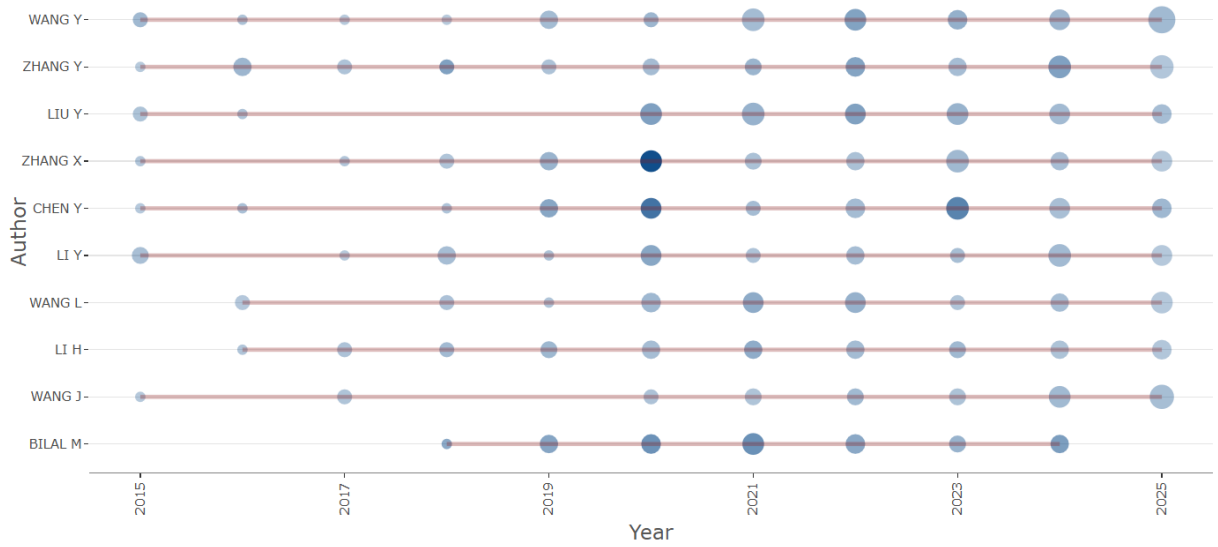

Figure 5. Annual scientific productivity of the top contributing authors in the field between 2015 and 2025.

The top 10 most cited articles are listed in **Table 3**. As a result of the evaluation conducted across Turkey, the study ranked first, receiving 124 citations (Atacan et al., 2016).

Table 3. The top 10 articles with the highest number of citations

According to the WoS category, the largest number of studies were conducted in the field of Chemistry Multidisciplinary (n=676, 16.161%). This was followed by Biochemistry Molecular Biology (n=567, 13.555%), Biotechnology Applied Microbiology (n=409, 9.778%), Materials Science Multidisciplinary (n=375, 8.965%), and Chemistry Physical (n=371, 8.869%).

Data analysis reveals that China (n=1.542) has the most published studies. This is followed by the US (n=777), India (n=337), and Germany (n=205) (**Figure 6**). Turkey ranks 16th out of 143 countries with 77 studies (1.841%).

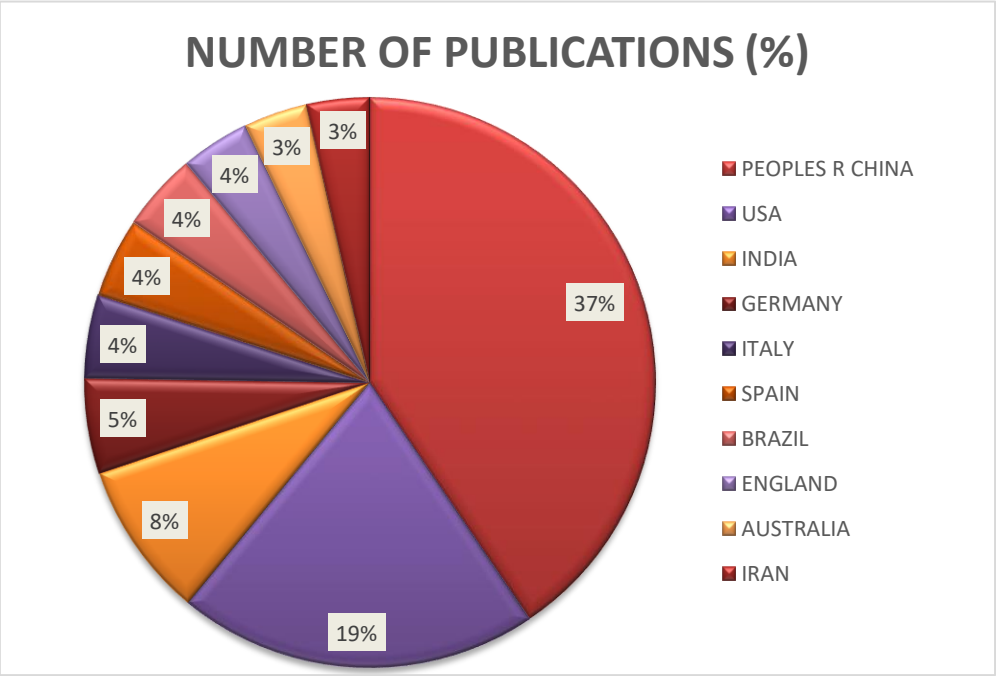

Figure 6. Proportional distribution of the number of publications by country.

Over 100 articles on " enzyme immobilization with MOF " have been published by 200 institutions from different countries. The top 10 leading institutions, their publication numbers, and their relative values are shown in **Table 4**.

Table 4. Top 10 institutions with the highest number of publications

Organisation	Publication Number	Rate (%)

United States Department of Energy Doe	46	1.100

The top three organizations providing the most financial support for the "enzyme immobilization with MOF" studies were NSFC from China (n=977, 23.356%), HHS (n=269, 6.431%), and NIH (n=264, 6.311%) from the USA. The most supported studies from Turkey were from TÜBİTAK (n=1, 14.286%). The publishers with the most studies were Springer Nature (n=1.739, 19.104%), Elsevier (n=1.722, 18.917%), and Wiley (n=860, 9.447%).

Successful MOF–enzyme coupling depends on four key parameters: the compatibility of the enzyme size with the MOF pore size, the MOF internal surface chemistry, the chemical nature of the metal cations, and compatibility with enzyme cofactors. MOFs with small pores, such as ZIF-8, are suitable for small enzymes. Mesoporous Cu-MOFs can accommodate large enzymes. Amine-functionalized MOFs exhibit high compatibility with polar

enzymes, while hydrophobic MOF–carbons increase the stability of enzymes such as lipases. The Cu^{2+} cation exhibits synergistic interactions with laccase, the Zr^{4+} cation provides stability in environmental applications due to its chemical resistance, and the Co^{2+} cation exhibits strong compatibility with aminotransferases. Redox enzymes are more stable in electron-dense MOF environments. Conformational protection is more critical for hydrolases.

Metal–organic frameworks (MOFs) are crystalline, three-dimensional structures formed by the coordination of metal cations or metal clusters with organic linkers. The inorganic metal cations that form the basis of these structures can be mononuclear metal ions or polynuclear clusters. Organic ligands are the fundamental elements that determine the MOF's topology, pore size, chemical functionality, and intrapore polarity (Furukawa et al., 2013).

Cu^{2+}–fumarate MOFs, Zr^{4+}–BDC (UiO-66**)** and amino-terephthalate (UiO-66-NH_2) MOFs, Zn^{2+}–imidazolate (ZIF-8) structures, Co^{2+}–aminoterephthalate MOFs, and ZIF-derived carbon materials are available in the literature (Li et al., 2023). The end groups of the ligands (NH_2, OH, COOH) can be easily modified for enzyme binding.

Zn^{2+} ions form tetrahedrally bonded imidazolate ligands to form ZIF (zeolitic imidazolate cage) structures. These structures have high chemical stability, hydrophobic interior surfaces, high surface area, and are suitable for room-temperature synthesis (Li et al., 2023). The hydrophobic structure of Zn-MOFs is particularly suitable for lipase and oxidoreductase enzymes.

Cu-MOFs are quite superior in terms of both coordination geometry and redox capacity. Their properties include square-planar or octahedral coordination, structures suitable for electron transfer, and electrostatic interactions between positively charged ionic centers and negative regions on the enzyme surface. These properties are particularly well-suited to multi-copper oxidases such as laccase. The literature reports that the Cu -MOF/laccase system exhibits high activity even at 95 °C. Mesoporous Cu-MOFs have reached very high enzyme loading capacities of 502 mg/g. Cu-BDC has been found to be effective in EE2 and dye removal. Therefore, Cu-MOFs play an important role in environmental bioremediation (Zhong et al. 2017).

Zr-MOFs (especially UiO-66 and UiO-67) are the most stable structures of the MOF family. This is due to the high bond energy of the Zr–O bonds and the resistance of the $Zr_6O_4(OH)_4$ clusters to hydrolysis and thermal degradation. Their advantages include high mechanical stability, durability over a wide pH range, and ease of operation in real wastewater environments. UiO-66-NH_2(30)/laccase degraded almost all antibiotics such as rifampicin and lincomycin. MMU-Zr-MOFs have demonstrated success in environmental catalysis with their very high loading capacity (Liu et al. 2023). Therefore, Zr-MOFs are one of the best options for enzymes that must operate under harsh chemical conditions.

Co^{2+} MOFs show very high activity recovery (up to 108%) in aminotransferases (Wang et al. 2023). Ni^{2+} MOFs are compatible with hydrolases, but few studies have been conducted. Mg/Ca MOFs have the advantage of biocompatibility. These metals enable targeted MOF design for specific enzyme classes.

The ligands of MOFs play a decisive role in enzyme immobilization. Imidazole ligands (e.g., ZIF-8, ZIF-67), hydrophobic interior cavities, and defined pore windows (~3.4 Å) provide high compatibility with lipases and redox enzymes. Carboxylate ligands (BDC, NH_2-BDC, fumarate) have the potential for hydrogen bonding, a polar interior, strong binding with metal clusters, and NH_2 functionality, facilitating loading, particularly in polar enzymes such as laccase. Aromatic amino ligands (PABA, aminoterephthalate) provide π–π interactions, high compatibility with specific enzyme surfaces, and an ideal environment for aminotransferases. MOF-derived carbon ligands, graphitic layers, and high surface area provide superior performance for hydrophobic enzymes (e.g., lipases).

CONCLUSION

MOFs are widely studied materials for enzyme immobilization, and studies are ongoing to obtain enzyme preparations with high catalytic activity and stability. A total of 4,180 studies published between 2015 and 2025, the first publication date of which was determined in the WoS database on “enzyme immobilization with MOF,” were retrieved. Biosensors, lipase immobilization, ZIF-8, enzymes in the oxidoreductase and hydrolase classes, and cascade catalysis come forward in the co-word analysis. Chinese Academy of Sciences is a leader institution. Future work may focus on developing scalable methods for MOF synthesis, expanding computational modeling for enzyme-MOF conformation, designing new functional ligands that control enzyme orientation, synthesizing

mesoporous MOFs for larger enzymes, implementing MOF-enzyme hybrids at the reactor scale, and optimizing suitable structures for multi-enzyme cascade systems.

ACKNOWLEDGEMENTS

We would like to acknowledge Research Assistant Fırat Çınar for his methodological evaluations and insightful comments that contributed to this study.

Abstract

Probiotic-derived extracellular vesicles (PEVs) are nanoscale lipid bilayer particles approximately 20 to 400 nm that package bacterial proteins, lipids, enzymes, metabolites, and nucleic acids, including small RNAs. With low immunogenicity, high physicochemical stability, and capacity to cross biological barriers, PEVs function as postbiotic effectors that deliver bioactive cargo to specific tissues without the viability and safety constraints of live probiotics. This review synthesizes preclinical evidence on mechanisms and applications across the gut, bone, skin, and nervous system. Mechanistically, PEVs engage pattern-recognition receptors, especially TLR2, to reprogram innate immunity. Across models, they promote anti-inflammatory M2 macrophage polarization, increase IL-10, and reduce pro-inflammatory mediators such as IL-1β and IL-6, while strengthening epithelial barrier function. In toxin-induced intestinal injury, *Lactobacillus murinus* PEVs mitigate deoxynivalenol-driven barrier disruption through TLR2 activation and M2 polarization, and *Lactobacillus johnsonii* PEVs similarly support mucosal homeostasis. Beyond the gut, PEVs from *Lactobacillus reuteri* and *Lactobacillus paracasei* accumulate in bone, enhance osteogenic differentiation, and attenuate osteoporosis-like phenotypes in vivo. In the nervous system, *Lactobacillus plantarum* PEVs increase brain-derived neurotrophic factor signaling and alleviate depression-like and Alzheimer's disease-like features in rodents, consistent with neuromodulatory cargo actions. In dermatology, PEVs from *Lactobacillus paracasei* and *Lactobacillus brevis* reduce TNF-α-driven inflammation, upregulate barrier-related proteins, including filaggrin, claudin-1, loricrin, and aquaporin-3, and protect against mechanical and UVB injury. *Lactobacillus plantarum* PEVs also show promise in atopic dermatitis and skin aging models. Antimicrobial effects and use as nanocarriers for small molecules or nucleic acids further broaden their scope. Key challenges include standardized high yield and high purity isolation, rigorous in vivo cargo to target mapping, long-term safety evaluation, and strain-specific potency metrics. Progress on these fronts, together with scalable bioprocessing, robust analytics, and pharmacokinetic and pharmacodynamic guided dosing, will be essential for clinical translation.

Keywords: Anti-inflammatory, Probiotic extracellular vesicles, Postbiotics, Pattern-recognition receptors, M2 macrophage polarization, *Lactobacillus* spp.

INTRODUCTION

Probiotics are widely recognized for their capacity to promote human health, yet the molecular vehicles by which they communicate with the host have only recently come into focus. Among these, extracellular vesicles (EVs) released by probiotic bacteria have emerged as pivotal mediators of cross-kingdom signaling (Yadav et al., 2025). These nanoscale, lipid-bilayer–bounded particles (typically ~20–400 nm in diameter) encapsulate proteins, nucleic acids, lipids, and small metabolites, enabling the protected transfer of bioactive cargo across biological barriers and into target cells (Hao et al., 2021). Functionally, they parallel many aspects of eukaryotic exosomes, orchestrating changes in host cell signaling, metabolism, and immunity without requiring direct cell to cell contact (Di Naro et al., 2025).

Within this broader landscape, *Lactobacillus*-derived extracellular vesicles (LDEVs) have attracted particular attention. Produced by Gram-positive bacteria, LDEVs are increasingly linked to immunomodulation, reinforcement of epithelial barrier integrity, maintenance of gut homeostasis, and modulation of neuroimmune pathways along the gut-brain axis. Proposed mechanisms include delivery of microbial enzymes, peptides, and small RNAs. Despite the thickness of the Gram-positive cell wall, accumulating evidence suggests that membrane blebbing and cell-wall remodeling can generate EVs with distinct molecular signatures and biological activities (Hao et al., 2021; Li et al., 2024; Yadav et al., 2025).

At the same time, methodological advances are rapidly maturing this field (Di et al., 2024; Gurunathan et al., 2019). Differential and density-gradient ultracentrifugation, size-exclusion chromatography (SEC), and emerging microfluidic strategies are being refined for EV isolation from complex probiotic cultures, while electron microscopy, nanoparticle tracking analysis (NTA), dynamic light scattering (DLS), and omics-level profiling, provides increasingly granular views of vesicle composition and heterogeneity (Caruana et al., 2021; Dean et al., 2019; Lazarus et al., 2023; Martora et al., 2019). Parallel progress in engineering approaches (e.g., surface functionalization, cargo loading, and strain-level tailoring) is opening the door to purpose-built EVs designed for precise therapeutic tasks (X. Liu et al., 2023; Ou et al., 2023; Sun et al., 2023).

This review study synthesizes current knowledge on probiotic-derived extracellular vesicles (PEVs) with an emphasis on LDEVs, focusing on three interlocking themes. First, we outline biogenesis and molecular composition, highlighting how vesicle origin and cargo determine biological function. Second, we survey methodological pipelines for isolation, characterization, and engineering. Third, we examine mechanistic pathways and biomedical applications, with dedicated sections on cancer therapy, immunomodulation, and gut-brain axis modulation. By integrating mechanistic insights with emerging preclinical data, our goal is to provide a coherent framework for understanding how probiotic EVs can be harnessed as stable, programmable, and biologically compatible nanosystems for next-generation therapeutics.

MATERIALS AND METHODS

Biogenesis and Characteristics

Bacterial EVs are produced by both Gram-negative and Gram-positive bacteria, albeit via somewhat different mechanisms. Gram-negative bacteria constitutively shed vesicles (often termed outer membrane vesicles, OMVs) by blebbing of the outer membrane, naturally enclosing periplasmic content and lipopolysaccharide (LPS) in the vesicle (Haas-neill and Forsythe, 2020). Gram-positive bacteria, once thought incapable of vesicle production due to their thick peptidoglycan cell wall (Y. Liu et al., 2018), are now known to also release EVs (Lee et al., 2009). In Gram-positives, vesicles form by protrusion of the cytoplasmic membrane through the cell wall, possibly aided by localized cell wall remodeling or membrane turgor stress. These vesicles lack LPS (since Gram+ have none) but often carry lipoteichoic acids (LTA) and peptidoglycan fragments on their surface, which can act as immune-active ligands (Haas-neill and Forsythe, 2020).

Proteomic analyses reveal that probiotic EVs contain a broad repertoire of bacterial proteins and enzymes. For example, EVs from *Lactobacillus plantarum* BGAN8 (a dairy isolate) were found to encapsulate over a thousand proteins, with enrichment in metabolic enzymes (e.g. glycolysis pathway) and membrane transport proteins (notably subunits of amino acid/peptide ABC transporters) (Bajic et al., 2020). These vesicles also carry nucleic acids (DNA and various RNAs) and small metabolites. In one striking example, EVs from the gut commensal *Bacteroides fragilis* were shown to contain the neurotransmitter γ-aminobutyric acid (GABA) along with its metabolic precursors (glutamate and α- ketoglutarate) (Zakharzhevskaya et al., 2017). This suggests probiotic EVs can ferry not only macromolecules but also small bioactive compounds. Their surface components also differ by species. Gram-negative probiotic EVs (e.g. from *Escherichia coli* Nissle 1917) will display LPS and outer membrane proteins, whereas Gram-positive probiotic EVs have components like LTA, peptidoglycan fragments, or polysaccharides that can interact with host pattern-recognition receptors. These molecular traits enable EVs to engage in host signaling, for instance, LTA on LDEVs can activate Toll-like receptor 2 (TLR2) on immune cells, modulating cytokine responses (Yadav et al., 2025).

Isolation and Purification

PEVs are isolated from clarified culture supernatants using a staged workflow that balances yield with purity (Yang et al., 2024). Probiotic strains (e.g., *Lacticaseibacillus/Lactobacillus* spp.) are typically cultivated in an appropriate medium (such as De Man-Rogosa-Sharpe, MRS) to late-log or stationary phase, when vesiculation is maximal. Whole cells are removed by low-speed centrifugation (~5,000–10,000 ×g) and 0.22 μm microfiltration to generate a cell-free supernatant. EVs are then concentrated and purified by ultrafiltration and high-speed ultracentrifugation (>100,000 ×g), with optional SEC or precipitation steps. Density-gradient ultracentrifugation (e.g., iodixanol/OptiPrep) further resolves vesicles from protein aggregates and similarly sized contaminants. Yields from batch cultures are modest (often in the ~μg mL^{-1} protein range over 24 h), but process optimization, medium formulation, harvest timing, bioreactor operation, and tangential-flow filtration can improve recovery and batch-to-batch consistency (W. Kim et al., 2020; Lei et al., 2024; Yang et al., 2024).

Characterization

Physicochemical and imaging assays are combined to confirm vesicle identity and quality. NTA or tunable resistive pulse sensing (TRPS) provide size distributions and particle counts, where LDEVs commonly span ~70–400 nm with modes near ~140 nm (Yang et al., 2024). Transmission electron microscopy (TEM) or cryo-EM visualizes lipid-bilayer-bound, roughly spherical particles and can reveal single or occasional double membranes (W. Kim et al., 2020). Bulk cargo is quantified by protein assays (e.g., bicinchoninic acid assay, BCA), while targeted immunoassays (e.g., LTA detection) help verify Gram-positive vesicle features and exclude lysis artifacts (Yang et al., 2024). Shotgun proteomics (LC–MS/MS) and complementary lipidomic/transcriptomic readouts profile cargo, noting that, unlike mammalian exosomes, no universal bacterial EV markers exist; thus, orthogonal criteria (size, morphology, density, and cargo) are recommended (Bajic et al., 2020).

Functional Validation

Cellular uptake and entry routes are assessed using fluorescently labeled EVs (e.g., PKH dyes) and confocal microscopy. LDEVs are readily internalized by mammalian cells including microglia within ~12 h of co-culture and pharmacological inhibition in epithelial models supports a predominantly clathrin-mediated endocytic pathway. Continued methodological advances, simplified, scalable isolation pipelines and engineered secretion systems are accelerating the production of well-defined, functional probiotic EV preparations suitable for downstream mechanistic and translational studies (Bajic et al., 2020; Lei et al., 2024; Sawant et al., 2025).

RESULTS and DISCUSSION

Immunomodulatory Effects

PEVs exert broad immunomodulatory effects across innate immune compartments. In vitro and in vivo studies consistently show that LDEVs rebalance cytokine milieus by elevating anti-inflammatory IL-10 while constraining pro-inflammatory mediators such as TNF-α, IL-6, and IL-1β under endotoxin (LPS) challenge (Hao et al., 2021; Yang et al., 2024). A prominent mechanism involves macrophage reprogramming, in which LDEVs shift THP-1–derived macrophages toward an M2-like, resolution-oriented state, downregulating M1 surface cues and promoting IL-10 production (W. Kim et al., 2020). EVs from other beneficial bacteria attenuate NF-κB signaling, supporting M1→M2 repolarization and reduced inflammatory tissue damage (Rodovalho et al., 2020). Similar anti-inflammatory signatures are observed in microglia, where LDEVs suppress IL-1β/IL-6 and increase IL-10, suggesting potential to temper neuroinflammation (Yang et al., 2024). Beyond macrophages, PEVs modulate antigen-presenting cells and mucosal adaptive responses. Evidence indicates effects on dendritic-cell maturation and mast-cell activity, as well as reinforcement of gut immune tolerance through enhanced IgA production, potentially via LTA-TLR2 signaling in gut-associated lymphoid tissue. In gastrointestinal models, including LPS-challenged poultry and murine colitis, EV administration preserves mucosal integrity and curbs excessive cytokine responses, thereby maintaining intestinal immune homeostasis (Yadav et al., 2025; Yang et al., 2024). Collectively,

these findings position PEVs as natural, cell-free immunotherapeutics that quell pathological inflammation while promoting disease resolution and barrier protection.

Gut Microbiome and Intestinal Health

PEVs shape intestinal ecology by acting as interkingdom messengers that influence both microbial communities and host epithelial physiology. In dextran sodium sulfate (DSS)-induced colitis, *L. plantarum* Q7 EVs restored microbial diversity, reduced Proteobacteria, and enriched beneficial taxa such as *Bifidobacterium* and *Muribaculaceae*, changes that coincided with clinical improvement (Hao et al., 2021). Mechanistically, EV cargo may include bacteriocins and signaling molecules that suppress pathobionts and favor commensals. At the same time, parallel effects on the epithelium, including upregulation of tight junction proteins, preservation of mucosal architecture, and possible stimulation of mucus production, reinforce the barrier and limit the translocation of luminal toxins (Melo-Marques et al., 2024). These ecosystem-level effects translate into suppressed mucosal inflammation across experimental inflammatory bowel disease (IBD) models. EV administration has been associated with longer colon length, reduced bleeding and weight loss, and lower tissue levels of IL-6, IL-1β, IL-2, and TNF-α, alongside increased regulatory pathways consistent with the broader immunomodulatory profile of probiotic EVs (Hao et al., 2021). Beyond IBD, EV-mediated pathogen antagonism (e.g., plantaricin-bearing vesicles) and barrier fortification suggest benefits for metabolic endotoxemia and, indirectly, colorectal cancer risk mitigation by reducing chronic inflammation and dysbiosis (Keyhani et al., 2022; Li et al., 2017). As cell-free "postbiotics" that cannot colonize or cause infection, probiotic EVs offer a scalable, potentially safer avenue for maintaining gut homeostasis and treating inflammatory disorders.

Gut-Brain Axis and Neurological Impacts

PEVs influence the gut-brain axis by curbing neuroinflammation and directly modulating central immune cells. By reducing intestinal inflammation, they indirectly lower inflammatory signaling to the brain. They also act within the central nervous system. In a murine perioperative neurocognitive disorder model, LDEVs crossed the blood-brain barrier, shifted microglia from an M1 to an M2 phenotype, decreased *iNOS*, increased *Arg1*, and rebalanced cytokines by lowering IL-1β and IL-6 while elevating IL-10. These changes dampened neuroinflammation and protected cognition (Yang et al., 2024). EVs can enhance neurotrophic support and stress resilience. In neuronal culture, *L. plantarum* EVs reversed corticosterone-induced suppression of BDNF, restoring *Bdnf* and *Sirt1* expression via pathways consistent with *Sirt1-Creb* signaling (Choi et al., 2019). In vivo, EV administration during chronic restraint stress preserved hippocampal BDNF and prevented depressive-like behaviors, indicating that EV cargo can engage intracellular programs that sustain plasticity (Choi et al., 2019). Given that *L. plantarum* produces neuromodulators such as GABA (Haas-neill and Forsythe, 2020), EV-borne small RNAs or metabolites may contribute to these antidepressant- and anxiolytic-like effects. A complementary mechanism is direct neurochemical signaling (Hermann et al., 2025). EVs carrying neurotransmitters or their precursors can enter circulation from the gut via epithelial transcytosis or immune-cell trafficking, cross the blood–brain barrier or access fenestrated regions, and potentially signal through the vagus. Once in the brain, they may release GABA or serotonin precursors or induce neurons and glia to upregulate neuroactive factors, including BDNF and NT-4/5 (Choi et al., 2019). Together, these pathways position probiotic EVs as candidate "psychobiotics" for conditions driven by dysbiosis, peripheral inflammation, or impaired neurotrophic signaling, with early preclinical data supporting applications in depression, anxiety, and neuroinflammatory disorders (Wu et al., 2022).

Anticancer Potential

PEVs display direct antitumor activity in preclinical models. EVs from *L. rhamnosus* GG (LGG) reduce viability of HepG2 hepatocellular carcinoma cells and shift the *Bax/Bcl-2* ratio toward apoptosis at 50–100 μg mL^{-1}, consistent with activation of intrinsic death pathways (Behzadi et al., 2017). Related work in colorectal cancer models reports LGG EV–mediated downregulation of carcinoembryonic antigen (CEA), pointing to additional marker-level antitumor effects (Keyhani et al., 2022). These findings suggest that EV cargo, such as cytotoxic peptides, enzymes, or regulatory RNAs can engage tumor-cell stress and death programs. EVs may also overcome chemoresistance by rewiring tumor metabolism. In 5-fluorouracil (5-FU)-resistant HCT116 cells, *L. plantarum*

EVs restored drug sensitivity by suppressing pyruvate dehydrogenase kinase-2 (PDK2) through a p53/p21-dependent pathway, thereby reversing glycolytic reprogramming and re-enabling apoptosis under 5-FU treatment (An and Ha, 2022). Because metabolic plasticity underlies many resistance phenotypes, this mechanism highlights EVs as rational adjuvants to standard chemotherapy. A third axis of activity is immune modulation within the tumor microenvironment. Probiotic EVs can act as natural adjuvants, increasing dendritic-cell recruitment and $CD8^+$ T-cell infiltration and potentially synergizing with direct tumor apoptosis to slow growth (Lu et al., 2023). EVs may also carry enzymes that activate prodrugs in situ or deliver beneficial metabolites and regulatory RNAs that tune oncogenic pathways. Looking ahead, engineered probiotic EVs-loaded with small interfering RNAs against oncogenes or pro-apoptotic proteins offer a biocompatible alternative to synthetic nanocarriers for targeted anticancer therapy (Lu et al., 2023).

Other Biomedical Applications

PEVs are being investigated across diverse indications beyond the gut and brain. In dermatology, LDEVs show anti-inflammatory activity in human skin culture and may benefit disorders marked by barrier disruption and hyperinflammation, such as atopic dermatitis (M. H. Kim et al., 2018). Early translational signals include improved collagen output in dermal fibroblasts and small clinical gains in skin elasticity and hydration (Jo et al., 2022; Krzyżek et al., 2023). Wound-healing applications are also emerging (Han et al., 2023). EVs from LGG accelerated re-epithelialization and angiogenesis by delivering miR-21-5p, suggesting utility for chronic wounds and diabetic ulcers (Wang et al., 2024). EVs may promote immune tolerance and antimicrobial defense at mucosal surfaces. *Bifidobacterium longum* EVs reduced food-allergy responses in mice by suppressing mast-cell degranulation, pointing to oral or intranasal "vaccines" that train tolerance or bolster mucosal immunity (J. H. Kim et al., 2016). Vaginal LDEV, specifically from *L. crispatus* BC3 and *L. gasseri* BC12, protected human T cells and ex vivo cervico-vaginal and tonsillar tissues from HIV-1 infection, with activity linked to EV cargo enriched in lactic acid and amino acids (Ñahui Palomino et al., 2019). Separately, EVs from the probiotic *E. coli* Nissle 1917 enhanced macrophage inhibition of *E. coli*, *Salmonella typhimurium*, and *Staphylococcus aureus* (Hu et al., 2020). Looking forward, probiotic EVs are attractive drug and gene-delivery vehicles due to their biocompatibility (H. Liu et al., 2022). Recent reviews highlight engineered EVs loaded with antimicrobial peptides or nucleic-acid cargos (e.g., siRNA) to silence inflammatory genes or enhance tumor targeting. Analogous strategies could encapsulate chemotherapeutics for site-directed delivery. Strain engineering to overproduce specific vesicles, together with surface functionalization using homing peptides, may improve targeting to tumors or inflamed tissue (J. H. Kim et al., 2016; Wei et al., 2025).

CONCLUSION

PEVs emerge as versatile, cell-free modalities that recapitulate many benefits traditionally attributed to live microbes, across preclinical models. These position PEVs as programmable "postbiotics" with relevance to many different indications. Clinical translation depends on identifying causal EV cargo and their host receptors, standardizing isolation, purity, and potency assays for EVs, and establishing scalable bioprocesses supported by rigorous quality control. Essential prerequisites include detailed pharmacokinetic and biodistribution analyses, along with comprehensive immunogenicity and safety assessments. With advances in vesicle engineering such as cargo loading and surface targeting, and rational combinations with existing therapies, probiotic EVs could mature from compelling preclinical tools into clinically actionable nanotherapeutics.

Abstract

Diabetic nephropathy (DN) is a major microvascular complication of diabetes mellitus and a leading cause of end-stage renal disease. Chronic hyperglycemia induces oxidative stress, lipid peroxidation, and iron dysregulation in renal cells, ultimately promoting ferroptosis, a regulated form of cell death distinct from apoptosis and necrosis. Ferroptosis is characterized by iron-dependent lipid peroxidation, accumulation of reactive oxygen species (ROS), mitochondrial shrinkage, and glutathione peroxidase 4 (GPX4) inactivation. These molecular events lead to podocyte injury, tubular dysfunction, and glomerular damage, contributing to the progression of DN.Diabetic nephropathy (DN) is a major microvascular complication of diabetes mellitus and a leading cause of end-stage renal disease. Chronic hyperglycemia induces oxidative stress, lipid peroxidation, and iron dysregulation in renal cells, ultimately promoting ferroptosis, a regulated form of cell death distinct from apoptosis and necrosis. Ferroptosis is characterized by iron-dependent lipid peroxidation, accumulation of reactive oxygen species (ROS), mitochondrial shrinkage, and glutathione peroxidase 4 (GPX4) inactivation. These molecular events lead to podocyte injury, tubular dysfunction, and glomerular damage, contributing to the progression of DN.Recent studies have highlighted the potential of natural compounds in counteracting ferroptosis and protecting renal function. Bioactive molecules such as glabridin, calycosin, mangiferin, glycyrrhizic acid, ginkgolide B, sennoside A, and umbelliferone have demonstrated renoprotective effects in both in vitro and in vivo diabetic models.Collectively, these findings indicate that ferroptosis is a central mechanism in DN progression and that targeting ferroptotic pathways may provide a promising therapeutic strategy. Natural compounds with anti-ferroptotic activity hold potential as adjunctive treatments to slow or prevent DN development. Further research, including clinical studies, is needed to validate efficacy, optimize dosing, and explore their translational potential in patients with diabetic nephropathy.

Keywords: Diabetic Nephropathy, Ferroptosis, Phytotherapy

INTRODUCTION

Diabetes mellitus (DM) is defined as a metabolic disease characterized by chronic hyperglycemia resulting from impaired insulin secretion, impaired insulin action, or both (Poznyak et al., 2020). According to 2025 data, 589 million adults are living with diabetes, and this number is estimated to reach 853 million by 2050 (Duncan et al., 2025). In diabetes, prolonged hyperglycemia affects various organs and tissues, leading to macrovascular and microvascular complications (Morrish et al., 2001). Damage caused by hyperglycemia affects the coronary and cerebrovascular arteries—known as macrovascular complications—as well as organs such as the kidneys, eyes, and nerves—referred to as microvascular complications—resulting in mortality among diabetic patients (Deshpande et al., 2008). Diabetic nephropathy (DN) is a complication that leads to end-stage renal disease and can ultimately result in death. Chronic hyperglycemia is considered one of the main causes of DN. According to data from the Centers for Disease Control and Prevention in the United States, 14% of individuals aged 20 years and older are affected by chronic kidney disease, and 30% of these individuals are diabetic (Lin et al., 2024). Approximately 30–40% of diabetic patients develop diabetic nephropathy (Umanath and Lewis, 2018; Qu et al., 2023). With the expected increase in diabetes incidence in the coming years, mortality related to diabetic complications is also anticipated to rise (Yang and Liu, 2022; Qu et al., 2023). Hyperglycemia triggers the production of reactive oxygen species (ROS), leading to the activation of various molecular pathways and causing kidney damage (Tonneijck et al., 2017). Factors involved in the development of kidney injury include the formation of advanced glycation end products, increased oxidative stress, activation of nuclear factor kappa B (NF-κB) and protein kinase C, upregulation of transforming growth factor-beta (TGF-β)/SMAD signaling, and increased lipotoxicity (Rout and Jialal, 2025). ROS, which play a major role in the progression of DN, not only cause

endothelial damage but also induce injury and apoptosis in podocytes—one of the key components of the glomerular filtration barrier—resulting in proteinuria and podocyte loss (Rayego-Mateos et al., 2020). While blockade of the renin–angiotensin–aldosterone system (RAAS) has been shown to reduce apoptosis in tubular epithelial cells, increased RAAS activation in diabetic kidneys is suggested to enhance tubular apoptosis (Satou et al., 2020). Additionally, in the polyol pathway, the accumulation of glucose by-products such as fructose and sorbitol increases intracellular osmotic pressure, leading to edema and subsequent membrane rupture, ultimately contributing to kidney injury. Moreover, urate—a by-product of fructose—further exacerbates insulin resistance, endothelial dysfunction, and tubular damage (Yang and Liu, 2022).

Ferroptosis is defined as a regulated cell death mechanism that is distinct from other forms of cell death such as apoptosis, autophagy, pyroptosis, and necrosis, and is characterized by iron dependence and lipid peroxidation (Stockwell et al., 2017; Mou et al., 2019). Iron accumulation leads to the generation of reactive oxygen species (ROS) through the Fenton reaction, causing oxidative stress, which in turn triggers lipid peroxidation—a key event in ferroptosis (Li et al., 2022). Recent studies have shown that hyperglycemia in diabetes leads to excessive ROS production, thereby promoting ferroptosis, particularly in diabetic nephropathy (DN), one of the major diabetes-related complications (Kang et al., 2014; Coughlan and Sharma, 2016; Park et al., 2020). For this reason, ferropto-reducing/inhibiting treatments are expected to be applied in the coming years. In recent years, the use of phytotherapeutic substances has been increasing and plays an important role in preventing the progression of DN (Liu et al., 2022; Zhao et al., 2022b; Yan et al., 2023). While the roles of programmed cell death mechanisms such as apoptosis, autophagy, and necroptosis in the pathogenesis of diabetic nephropathy are well established, the significance of ferroptosis has not been fully elucidated (Erekat, 2022). This review aims to provide insights into the potential mechanisms of ferroptosis, its role in diabetic nephropathy, and the effects of various phytotherapeutic interventions on DN (Anandhan et al., 2020).

MECHANISM OF FERROPTOSIS

Cells undergoing ferroptosis display distinct biochemical and morphological features, including mitochondrial shrinkage, increased mitochondrial membrane density, excessive accumulation of lipid peroxides and ROS, and a decreased antioxidant capacity (Zhao et al., 2020). Iron accumulation and excessive lipid peroxides are key factors triggering ferroptotic cell death by depleting or reducing glutathione peroxidase 4 (GPx4), the main enzyme regulating the antioxidant system (Sharma and Flora, 2021).Mitochondrial acetyl coactivators are involved in the production of polyunsaturated fatty acids (PUFAs) catalyzed by acetyl-CoA carboxylase (ACC) (Barrow et al., 2018). PUFAs are components of cell membranes and regulate various biological functions, including inflammation, immunity, synaptic plasticity, and cellular growth (Gill and Valivety, 1997). However, peroxidation of PUFAs can cause cellular damage. The mere presence of PUFAs in the environment does not directly induce ferroptosis. Studies have shown that ACSL4 plays a critical role as a biomarker in the execution of ferroptosis by influencing the catalysis of PUFAs (Doll et al., 2017). Circulating ferric iron (Fe^{3+}) binds to transferrin and is transported into cells via the membrane protein transferrin receptor-1 (TfR1). Once inside the cell, Fe^{3+} is reduced to ferrous iron (Fe^{2+}) by six-transmembrane epithelial antigen of prostate 3 (STEAP3) and stored in the labile iron pool (LIP) by binding to ferritin. Ferritin also prevents reactive Fe^{2+} from reacting with H_2O_2 (Harrison and Arosio, 1996; Xie et al., 2016). Excess accumulation of Fe^{3+} inside the cell or reduced Fe^{3+} export leads to elevated levels of free Fe^{2+}. Reactive Fe^{2+} reacts with H_2O_2 via the Fenton reaction, increasing the production of reactive oxygen species (ROS). ROS induce lipid peroxidation within cell membranes (Valko et al., 2005; Latunde-Dada, 2017). PUFAs are particularly susceptible to lipid peroxidation due to their unstable carbon–carbon double bonds. Free PUFAs are esterified by activated ACSL4 and incorporated into membrane phospholipids by lysophosphatidylcholine acyltransferase 3 (LPCAT3). They are then oxidized by lipoxygenases (LOXs) into toxic lipid peroxides. These peroxidized lipids and their byproducts, such as malondialdehyde (MDA) and 4-hydroxynonenal (4-HNE), damage mitochondrial and cellular membranes, initiating ferroptosis (Kagan et al., 2017) .

GPX4 is a selenoenzyme that serves as a central regulator and primary defense enzyme in ferroptosis by detoxifying small-molecule peroxides as well as more complex lipid peroxides (Yang et al., 2022). GPX4 binds to lipid peroxides and reduces ROS, thereby mitigating ROS-induced cellular damage. The intracellular antioxidant

system, System Xc^-, plays a key role in GSH synthesis. GSH serves as the main substrate for GPX4, which exerts protective effects on cells. Various diseases or external factors can lead to intracellular cysteine depletion or inhibition of System Xc^-. This reduces GSH production and consequently decreases GPX4 activity, resulting in increased ROS and lipid peroxidation, membrane damage, and ultimately the induction of ferroptosis (Jiang et al., 2021; Feng et al., 2022b). Cysteine is a critical component required for GSH biosynthesis, catalyzed by glutamate-cysteine ligase and glutathione synthase, and its depletion leads to a reduction in cellular antioxidant capacity (XL et al., 2022). Glutathione (GSH) is an essential cofactor for the proper functioning of GPXs. During glutamate-induced excitotoxic cell death, glutamate initiates ferroptosis through two main pathways: one via calcium influx and the other via inhibition of cystine uptake through System Xc^- (Dixon et al., 2012). While calcium chelators do not inhibit Erastin-induced ferroptosis, elevated glutamate levels suppress System Xc^- function and trigger ferroptosis. Reduced System Xc^- activity decreases cystine uptake, which in turn lowers GSH levels and indirectly decreases GPX4 activity. This leads to diminished cellular resistance to peroxidation, accumulation of lipid reactive oxygen species, and oxidative cell death (Kinowaki et al., 2021).

THE EFFECT OF PHYTOTHERAPEUTIC SUBSTANCES ON DIABETIC NEPHROPATHY

Glabridin

Glabridin is a prenylated isoflavone derived from the roots and rhizomes of *Glycyrrhiza glabra* L. Previous studies have demonstrated its hepatoprotective, neuroprotective, antidiabetic, and antioxidant effects in diabetic animal models (Hasanein, 2011; Wu et al., 2013; Komolkriengkrai et al., 2019; Yoshioka et al., 2019). Tan et al. (2022) reported that glabridin increased the activities of SOD, GSH, and catalase (CAT) in diabetic rats; upregulated GPX4, SLC7A11, and SLC3A2 expression; and downregulated TfR1, vascular endothelial growth factor (VEGF), p-AKT, and p-ERK1/2 expression, thereby reducing MDA levels and iron accumulation both in vitro and in vivo. Collectively, these findings indicate that glabridin suppresses ferroptosis by mitigating oxidative stress and delays the progression of diabetic nephropathy by inhibiting the VEGF/Akt/ERK signaling pathway.

Calycosin

Calycosin is an isoflavone phytoestrogen derived from *Astragalus membranaceus* and exhibits a broad range of pharmacological activities, including anti-inflammatory, antioxidant, antidiabetic, anti-osteoporotic, antitumor, hepatoprotective, neuroprotective, and cardioprotective effects (Deng et al., 2021). Huang et al. (2022) reported that calycosin improved kidney function in diabetic mice, alleviated tubular injury, and enhanced the viability of HK-2 cells exposed to high glucose. They further demonstrated that calycosin exerts its protective effects in diabetic nephropathy by suppressing ferroptosis, as evidenced by reduced levels of lactate dehydrogenase (LDH), MDA, and lipid ROS, alongside a significant increase in GPX4 expression driven by elevated GSH activity.

Mangiferin

Mangiferin is a natural flavonoid that is derived from mango (Sha et al., 2019). It has a wide range of pharmacological activities, including antioxidant, anti-inflammatory, antidiabetic, and nephroprotective (Akter et al., 2022; Feng et al., 2022a; Wang et al., 2022a). It has been demonstrated that mangiferin enhances the mevalonate-mediated antioxidant defense (through the FSP1/CoQ10 axis and GPX4) in DN rats, thereby reducing ACSL4-mediated lipid peroxidation and preventing ferroptotic cell death in the kidney (Zhao et al., 2022a).

Glycyrrhizic acid

Glycyrrhizic acid is a triterpene isolated from the medicinal plant *Glycyrrhiza glabra* and exhibits diverse pharmacological activities, including anti-inflammatory, antioxidant, antiviral, antidiabetic, anticancer, and organ-protective effects (Cao et al., 2020; Rehman et al., 2020). Recent studies have shown that glycyrrhizic acid upregulates GPX4 expression and reduces ROS production in mouse glomerular podocytes exposed to high glucose. These findings indicate that glycyrrhizic acid alleviates high glucose-induced podocyte injury, likely through the inhibition of ferroptosis (Wang et al., 2022b).

Ginkgolide B

Ginkgolide B is a diterpenoid isolated from Ginkgo biloba leaves and exhibits multiple pharmacological properties, including anti-inflammatory, antioxidant, anti-apoptotic, and anti-ferroptotic effects (Hu et al., 2018; Liu et al., 2020; Yang et al., 2020; Lin et al., 2021). Recently, Chen et al. (2022) reported that ginkgolide B upregulates the

ferroptosis-related proteins ferritin heavy chain 1 (FTH1) and GPX4, while downregulating TfR1, thereby reducing ROS levels and intracellular iron accumulation. They further demonstrated that ginkgolide B inhibits ferroptosis by preventing the ubiquitin-mediated degradation of GPX4 and sustaining GPX4 protein levels.

Anthraquinones

Rhubarb and senna are plants commonly used to treat constipation. Sennoside A, a bioactive compound derived from these plants, exhibits various pharmacological activities, including laxative, antidiabetic, antitumor, and hepatoprotective effects (Cao et al., 2018; Ma et al., 2020; Le et al., 2021; Zhu et al., 2021). In DN mice, Sennoside A has been shown to suppress ferroptotic cell death by reducing PTGS2 protein expression and MDA levels, enhancing GSH activity and GPx4 expression, and modulating the Nrf2/HO-1 signaling pathway (Ding and Wang, 2021)

Umbelliferone

Umbelliferone is a natural coumarin compound derived from *Eucommiae Cortex*, *Prunellae Spica*, and *Angelica dahurica*. It has been reported to exhibit diverse biological activities, including antidiabetic, antihyperlipidemic, antitumor, neuroprotective, cardioprotective, hepatoprotective, and renoprotective effects (Ramesh and Pugalendi, 2005; Yu et al., 2015; Hindam et al., 2020; Hassanein et al., 2021; Althunibat et al., 2022; Khadrawy and El Sayed, 2023). Umbelliferone increases GSH activity by inhibiting ROS production in diabetic mice and high glucose–induced HK-2 cells, while reducing MDA levels and iron accumulation, upregulating GPX4, Nrf2, and HO-1 expression, and downregulating ACSL4. These findings indicate that umbelliferone exerts inhibitory effects on oxidative stress and ferroptosis both in vitro and in vivo (Jin and Chen, 2022).

CONCLUSION

Increasing evidence indicates that ferroptosis plays a critical role in the pathogenesis and progression of diabetic nephropathy (DN). Hyperglycemia-induced oxidative stress, iron overload, and excessive lipid peroxidation contribute to GPX4 inactivation and glutathione depletion, ultimately triggering ferroptotic cell death in renal cells. These processes promote podocyte injury, tubular dysfunction, and glomerular damage, all of which are hallmarks of DN.Although no clinically approved therapies currently target ferroptosis directly, recent studies highlight the therapeutic potential of various natural compounds. Phytochemicals such as glabridin, calycosin, mangiferin, glycyrrhizic acid, ginkgolide B, sennoside A, and umbelliferone have been shown to modulate ferroptosis-related pathways by enhancing GPX4 activity, restoring GSH levels, reducing ROS and lipid peroxidation, regulating iron homeostasis, and influencing key signaling pathways including ACSL4, TfR1, and Nrf2/HO-1. These renoprotective effects suggest that targeting ferroptosis may offer a promising new direction for DN management.Further experimental and clinical studies are needed to validate these findings, determine optimal dosing strategies, and assess long-term safety and efficacy. Overall, ferroptosis represents an emerging therapeutic target, and natural compounds with anti-ferroptotic properties may provide valuable adjunctive strategies for slowing or preventing the progression of diabetic nephropathy.

Abstract

Background: Edentulism is an oral health condition that is associated with reduced ability of mastication, phonetic issues, esthetic issues, and reduced quality of life.
Case Presentation: A 68-year-old completely edentulous patient had intermittent right pre-auricular pain and muscle soreness on the right side of the face, which worsened by mastication. The patient had worn the same complete dentures for eight years, which had unilateral occlusion. Occlusal wear of the artificial teeth was observed. During the clinical examination, normal mandibular movements with mild discomfort on maximum opening were observed. During the palpation of the right temporomandibular joint, this caused a familiar pain. Palpation of the right masseter muscles also caused familiar pain that remained localized. Based on DC/TMD Axis I criteria, the diagnoses were right TMJ arthralgia and local myalgia. New dentures with adjusted vertical dimension, bilateral balanced occlusion, and with the third impression were constructed.
Results: A marked improvement in the oral health quality of life of the patient was noticed after 1 month and after one year of denture insertion. In clinical examination, there was significant improvement in the denture parameters; also, there was a lack of pain reported by the patient and confirmed clinically on palpation of the right TMJ and right masseter muscle.
Conclusion: The construction of the new dentures with bilateral balanced occlusion, adjusted vertical dimension, and through the piezography technique contributed to improved denture parameters, patient comfort, relief of the TMD symptoms, and also to an improvement in the patient's quality of life.

Keywords: Edentulism; Temporomandibular Disorders; Neutral Zone; Piezography; Complete Denture.

INTRODUCTION

Edentulism is still a major challenge worldwide, particularly among older populations. It is associated with functional limitations such as reduced masticatory efficiency, altered phonetics, and esthetic issues. All these factors influence in a negative way the oral health–related quality of life. Despite these consequences, the absence of natural dentition has important implications for temporomandibular joint (TMJ) health. Tooth loss might be the cause of several changes in the temporomandibular joint, such as condylar displacement, disc malposition, and flattening of the articular eminence.
Prosthodontic rehabilitation plays an important role not only in restoring esthetics and function but also in re-establishing neuromuscular balance and reducing TMJ overload. Bilateral balanced occlusion is particularly recommended in complete denture construction, as it ensures equal distribution of functional forces and reduces the destabilizing effects that the unilateral contacts cause.
The piezography impression can be registered during the final impression, centric occlusion record, and try-in stage. In our case, we made the registration in the try-in stage, recording the periprosthetic muscles' impression during function and phonetics.
With the aging of the population and the high prevalence of edentulism in many countries, the proper construction of total removable prosthetic restorations has high relevance.
This case report presents the prosthetic rehabilitation of a completely edentulous patient with TMD symptoms, treated through a combination of correctly constructed total removable dentures with a restored vertical dimension, bilateral balanced occlusion, and through the neutral zone technique.

CASE PRESENTATION

A completely edentulous 68-year-old patient came to the University Dental Clinic. He had worn the same dentures for 8 years (Fig.1). The patient referred about masticating mainly on the right side. The previous old dentures had unilateral occlusion, and the artificial teeth were worn. The patient described intermittent pain in the right pre-auricular area, which worsens when the patient chews harder foods. He also refers about muscle soreness in the right cheek region, particularly after prolonged mastication. He did not report joint noises, locking, or limitations in mouth opening.

During the clinical examination, mandibular movements were within normal limits, although the patient reported slight discomfort when he maximally opened the mouth. The palpation on the right TMJ caused the same pain the patient usually feels, and found it familiar. During the palpation of the right masseter muscle, that caused pain which was localized. No joint crepitus or clicking was found, excluding in this way degenerative joint disease and disc displacement with reduction.

Based on the DC/TMD Axis I, the following clinical diagnoses were made: local myalgia of the right masseter muscle and arthralgia of the right TMJ.

On intraoral examination, the following were observed: in the lower jaw, severe resorption of the residual ridge (Fig.2), and in the upper jaw, non-uniform resorption of the residual ridge was observed, especially in the posterior areas (Fig.3).

After careful examination of old dentures, the need to increase the vertical dimension was confirmed. New complete dentures with bilateral occlusion, adjusted vertical dimension and through the piezography technique were decided to be constructed. The goal was not only to restore function and esthetics but also to relieve the

temporomandibular disorder symptoms. Advice was also given to the patient, like the application of moist heat, gentle mandibular exercises, and also to avoid excessive parafunctional habits.

Primary impressions were made with alginate with stock trays. The definitive impressions were made with the addition silicone, light body (PVS) through individual trays made with photo-polymerizing resin, to ensure accurate registration of the resorbed ridges. Through the maxilla-mandibular records, the following were determined: the occlusal plane, vertical dimension, and centric relation. We used the facebow to register the position of the maxilla toward the intercondylar transverse hinge axis. The recording was then transferred to the semi-adjustable BioArt articulator (Fig. 4,5).

The vertical dimension of occlusion was increased by 3 mm compared with the old dentures, correcting the previous loss of support and allowing a more physiologic jaw relation. This was decided after several measurements were made to determine the correct vertical dimension. The measurements were based on phonetics, esthetics, and the measurement of the interocclusal rest space.

The artificial teeth were arranged in order to establish bilateral balanced occlusion (Fig. 6), eliminating in this way the unilateral contacts.

In the try-in stage (Fig.7), the centric occlusion, phonetic, and aesthetics were checked.

At the try-in stage, a third impression was performed using the piezography technique (Fig.8)**.** The patient was instructed to make functional movements such as smiling, whistling, swallowing, and pronouncing phonemes (oo, ee, m, p, b, s), which allowed the registration of the polished surfaces in harmony with the surrounding structures such as lips, cheeks, and tongue. This functional registration was particularly important given the severe mandibular ridge resorption, ensuring in this case, increased stability and reducing the destabilizing influence of muscular forces.

After the try-in procedure, the traditional cycle of flasking and polymerization was followed.

At the delivery stage, the centric occlusion was again checked (Fig.9). The patient was informed about instructions on adaptation and denture, and oral hygiene. The follow-up appointments were planned after 24 hours, one week, one month, three months, six months, and twelve months. The patient fulfilled the OHIP EDENT questionnaire at the beginning, after 1 month and after 1 year.

At the beginning, the patient reported moderate preauricular pain (VAS 6/10), familiar pain on palpation of the right TMJ and masseter, and also a negative impact on the oral health–related quality of life (OHIP-EDENT score 32). After the patient received the new dentures, significant improvements were noted after one month and also after one year. After 1 month, the patient reported a lack of pain, and both joint and muscle pain were absent. OHIP-EDENT score improved to 10, reflecting better function, stability, and comfort. At the 1-year follow-up, outcomes remained stable, with no recurrence of TMD symptoms and sustained improvement in quality of life (OHIP-EDENT score 6), Table 1.

Table 1. *Results of Complete Removable Denture Treatment*

Parameter	**Baseline (old dentures)**	**1-month follow-up (new dentures)**	**1-year follow-up (new dentures)**
TMJ arthralgia (VAS 0–10 & palpation)	VAS 6; familiar pain present on right TMJ palpation	VAS 0; no familiar pain on palpation	VAS 0; no familiar pain on palpation
Masseter muscle pain (patient report & palpation)	Patient reported right cheek soreness; familiar localized pain on palpation	Patient reported no muscle pain; palpation negative	Patient reported no muscle pain; palpation negative
OHIP-EDENT (0–56)	32	10	6
Denture stability/retention	Poor	Good	Good

DISCUSSION

Several radiographic and clinical studies have shown that edentulism is associated with reduced joint spaces, posterior displacement of the condyles, and flattening of the articular eminence, contributing in this way to functional overload and also TMJ discomfort (Zheng et al., 2023; Tabatabaei et al., 2024).
In the study of Diernberger et al. (2008), the authors found a strong association between unilateral chewing activity and asymmetric occlusion with temporomandibular symptoms.
In the study of Jouhadi et al. (2025), nearly one-third of the 130 completely edentulous patients included in their study had TMD symptoms. In the review of Nguyen et al. (2021), it was concluded that the lack of occlusal units has been linked to a higher risk for TMD, while balanced support helps in preventing TMD. In our case, the patient's previous dentures were constructed with unilateral occlusion, which likely contributed to muscular and preauricular pain. The construction of new dentures with bilateral balanced occlusion redistributed the occlusal forces evenly in both sides, minimizing lateral stresses and improving so stability. Balanced occlusion in the removable complete dentures is a key component as it reduces tipping forces during the process of mastication and also ensures smoother mandibular movements.

Another important clinical point is that, in edentulous patients, well-constructed dentures can act as functional appliances. In completely edentulous patients, however, the complete denture itself must serve both functional and therapeutic roles. Several authors have reported that complete denture therapy can alleviate mild functional TMD (Nimonkar et al., 2025; Abdelnabi & Swelem, 2015; Vasavi et al., 2023).

Nimonkar et al. (2025) included 110 edentulous patients with temporomandibular disorders, treated with new complete dentures. Using the Craniomandibular Index, mean scores significantly dropped after three months, showing a significant reduction in TMD symptoms. Abdelnabi and Swelem (2015) showed that replacing the old defective complete dentures significantly improved TMD symptoms in edentulous patients. In a two-year follow-up, clinical signs such as pain and joint noises showed improvement, also better disc positioning and reduced joint effusion were detected, though disc morphology remained unchanged. Vasavi et al. (2023) analyzed the effect that new complete dentures have on temporomandibular joint function using a Joint Vibration Analyzer, where they found significant reductions in vibration parameters, showing so smoother and more stable condylar movement.

The Diagnostic Criteria for Temporomandibular Disorders (DC/TMD) were used to determine the clinical diagnosis (Schiffman et al., 2014).

The use of the neutral zone (piezography) technique was an important step of the total removable denture construction. This technique records the functional dynamics of the organs that sound the periprosthetic zone: muscles of the lips, cheeks, and tongue leave their impression, by constructing so dentures in harmony with the neuromuscular environment. In clinical cases where there is a high resorption of the residual ridge, such as in our patient, the neutral zone technique is highly recommended, as it minimizes the tendency of dislodgment that the muscles have. Several studies have demonstrated that dentures that have been constructed using the neutral zone technique provide improved retention, improved phonetics, and higher patient satisfaction compared to dentures constructed with the conventional technique (Limpuangthip et al., 2024).

The follow-up is an important step for these cases. Advice on chewing bilaterally, having a soft diet during the phase of adoption, also advice on how to keep dentures and oral hygiene were given. In the check-up visits, pre-contacts, and minor occlusal adjustments should be considered to maintain a balanced occlusal support. The OHIP EDENT questionnaire (Allen & Locker, 2002) was used to analyze patients' perception of stability, comfort, social, and psychological aspects, etc, after treatment.

CONCLUSIONS

This case report highlights the importance of proper removable prosthetic rehabilitation in the management of completely edentulous patients with mild temporomandibular disorders. In edentulous patients with mild TMD, carefully constructed complete dentures, restoring vertical dimension, balancing occlusal contacts, and shaping polished surfaces via the piezography technique, can improve denture outcomes, relieve TMD symptoms, and improve oral health-related quality of life of the patients.

Anyway, further research is suggested to analyze the effect of total removable prosthetic rehabilitation in completely edentulous patients with temporomandibular disorders.

FUNDING AND ACKNOWLEDGMENT. We would like to express our appreciation to the National Agency for Scientific Research and Innovation (NASRI), Albania, for the financial support.
PATIENT CONSENT. The patient's written consent was taken.

Özet

Balık hastalıkları, küresel ölçekte akuakültür sektörünün en önemli kısıtlayıcı faktörlerinden biri olarak öne çıkmaktadır. Artan üretim kapasitesi ve yoğun yetiştiricilik uygulamaları, enfeksiyöz ajanların yayılımını hızlandırarak ekonomik kayıplara yol açmaktadır. Bu bağlamda, balıklarda hastalık direncini şekillendiren moleküler mekanizmaların anlaşılması, hem seçici ıslah hem de hastalık kontrol stratejileri için kritik öneme sahiptir. Son yıllarda moleküler biyoloji alanındaki gelişmeler, bakteriyel, viral ve paraziter balık hastalıklarının tanısı ve epidemiyolojisinin araştırılmasında yeni ufuklar açmıştır. Özellikle polimeraz zincir reaksiyonu (PCR) ve türevleri, restriksiyon fragment uzunluk polimorfizmi (RFLP), in situ hibridizasyon, DNA mikroarrayleri ve multipleks PCR gibi yöntemler; yüksek duyarlılık ve özgüllükleri sayesinde asemptomatik bireylerde dahi patojenlerin tespitini mümkün kılmaktadır. Bu teknikler, klasik yöntemlere kıyasla daha hızlı ve güvenilir sonuçlar sunmakta, antibiyotik kullanımını azaltarak dirençli bakteri gelişiminin önlenmesine katkı sağlamaktadır. Bununla birlikte, kontaminasyon ve hatalı negatif veriler gibi olası sorunların önüne geçilebilmesi için laboratuvar uygulamalarında titiz önlemler alınması gerekmektedir. Sonuç olarak, moleküler biyolojik yaklaşımlar balık hastalıklarının erken teşhisi ve kontrolünde modern akuakültür için vazgeçilmez araçlar haline gelmiştir.

Anahtar kelimeler: PCR, DNA, Moleküler Mekanizma, Balık Hastalık Kontrolü

Molecular mechanisms in the response to fish diseases

Abstract

Fish diseases stand out as one of the most significant limiting factors in the aquaculture sector worldwide. Increasing production capacity and intensive farming practices accelerate the spread of infectious agents, leading to substantial economic losses. In this context, understanding the molecular mechanisms shaping disease resistance in fish is of critical importance for both selective breeding and disease control strategies. In recent years, advances in molecular biology have opened new horizons in the diagnosis and epidemiological investigation of bacterial, viral, and parasitic fish diseases. In particular, methods such as polymerase chain reaction (PCR) and its derivatives, restriction fragment length polymorphism (RFLP), in situ hybridization, DNA microarrays, and multiplex PCR enable the detection of pathogens even in asymptomatic individuals due to their high sensitivity and specificity. Compared to classical approaches, these techniques provide faster and more reliable results, while contributing to the prevention of resistant bacterial development by reducing antibiotic usage. However, meticulous precautions in laboratory practices are required to prevent potential problems such as contamination and false negative results. In conclusion, molecular biological approaches have become indispensable tools for modern aquaculture in the early diagnosis and control of fish diseases.

Keywords: PCR, DNA, Molecular Mechanism, Fish Disease Control

1.Giriş

Dünya genelinde gıda üretimi ve güvenliği artan baskılarla karşı karşıyadır. Bu bağlamda akuakültür, insan beslenmesi ve sürdürülebilir gıda arzında kritik bir rol üstlenmektedir. Ancak bulaşıcı hastalıklar, balık ölümlerinin başlıca nedeni olup su ürünleri yetiştiriciliğinin verimliliği için küresel ölçekte ciddi bir tehdit oluşturmaktadır

(Robinson, 2017). Balıklarda hastalıklara karşı direnç geliştirmeyi amaçlayan genetik ıslah, hastalık kaynaklı kayıpları kalıcı ve etkili biçimde azaltma potansiyeli nedeniyle uzun süredir önceliklidir. Bununla birlikte, seçici ıslah ve hastalık kontrol programlarının başarısı, konak–patojen etkileşimlerini ve dayanıklılığı belirleyen moleküler süreçlerin ayrıntılı biçimde anlaşılmasına bağlıdır (Zhou et al., 2022). Öte yandan, doğal sucul ekosistemlerin insan faaliyetleri ve iklim değişikliği nedeniyle bozulması, yabani balık popülasyonlarında salgın riskini artırarak yönetim ve koruma çabalarını daha da güçleştirmektedir.

Hastalık direnci kavramı, konağın patojenlerin hedef dokulara girişini ve çoğalmalarını sınırlandırma kapasitesini tanımlar. Balıklarda bu direnç; epitel tabakalarının ve mukus örtüsünün bütünlüğünün korunması, makrofaj ve nötrofillerin fagositoz aktivitesi gibi özgül olmayan hücresel savunma unsurları, lizozim, kompleman sistemi ve transferrin gibi özgül olmayan humoral bileşenler ile özgül humoral ve hücresel bağışıklık yanıtlarını içermektedir (Blazer, 1992). Nicel özellik lokusu (QTL) haritalama ve genom çapında ilişkilendirme çalışmaları (GWAS), balıklarda hastalık direnci ile bağlantılı tek nükleotid polimorfizmleri (SNP'ler) ve genlerin belirlenmesine olanak sağlamıştır. Bu tür araştırmalar özellikle Atlantik somonu, gökkuşağı alabalığı ve Çin dilbalığında yürütülmüştür. Ayrıca, dirençli ve duyarlı bireylerin patojen enfeksiyonlarına karşı verdiği transkripsiyonel tepkilerin karşılaştırıldığı çalışmalar, farklı patojenler tarafından uyarılan gen yanıtlarının genellikle ortak bağışıklık mekanizmalarını içerdiğini ortaya koymuştur. Bu mekanizmalar arasında kompleman sistemi, bağışıklık sinyal iletim yolları, bazı enzimler ve kemokinler yer almakta olup, söz konusu bulgular Atlantik somonu, gökkuşağı alabalığı, sazan ve Çin dilbalığında da rapor edilmiştir. Sonuç olarak, yapılan araştırmalar dirençli ve duyarlı balıkların, geçici enfeksiyonlara maruz kaldıktan sonra farklı genetik özellikler ve moleküler yanıtlar sergilediklerini göstermektedir (Zhou et al., 2022).

Son yıllarda, balık patojenleri ve konaklarının moleküler biyolojisinin anlaşılmasında önemli gelişmeler kaydedilmiş ve moleküler biyoloji, balık hastalıklarının tanısı, kontrolü ve bakteriyel, viral ile paraziter hastalıkların epidemiyolojisinin araştırılmasında rutin bir araç haline gelmiştir. Nükleik asitlerin tespiti, zor ya da hiç kültüre edilemeyen ve hatta ölü mikroorganizmaların belirlenmesinde yararlı olmuş, böylece yeni ve alternatif tanı teknolojilerinin geliştirilmesine olanak sağlamıştır. Moleküler yöntemler, bu tür sorunların çözümünde kullanılabilmekte ve patojen tespitinde duyarlılığı ile özgüllüğü artırmaktadır. Bu teknikler arasında polimeraz zincir reaksiyonu (PCR), restriksiyon enzimi kesimi, prob hibridizasyonu, in situ hibridizasyon ve mikroarray sistemleri yer almaktadır. Konvansiyonel yöntemlere kıyasla daha hızlı ve hassas olan bu tanı teknikleri, asemptomatik balıklarda dahi patojenlerin saptanmasına imkân tanır. Böylece olası salgınların önüne geçilebilir, antibiyotik kullanımına duyulan ihtiyaç azalır ve antibiyotik dirençli bakteri oluşumunun önlenmesine katkı sağlanır (Altınok ve Kurt 2003).

2. Balık Hastalıklarının Saptanmasında Moleküler Teknolojiler

Ticari akuakültür işletmeleri için balıklarda hastalıkların yönetimi ve izlenmesi büyük önem taşımaktadır. Patojenlerin balıklarda bulunup bulunmadığının hızlı bir şekilde tespit edilmesi, ciddi ekonomik avantajlar sağlayabilir. Bunun yanında, enfeksiyöz organizmaların balıkta veya çevredeki yoğunluğunun belirlenebilmesi, popülasyondaki değişimlerin izlenmesine imkân tanır. Ayrıca, hastalık etkeninin bulunduğu bölgelerde balıkların taşıyıcılık durumunu doğru şekilde değerlendirebilecek bir sistemin geliştirilmesi, etkili hastalık yönetim programlarının oluşturulmasına katkı sunar.

Son yıllarda bakteriyel, viral ve paraziter balık hastalıklarının tanısında duyarlılık ve özgüllüğün artırılmasına yönelik önemli ilerlemeler kaydedilmiştir. Moleküler tanı tekniklerinde genellikle örneklerden DNA izolasyonu yapılır. Bu DNA, DNA hibridizasyonu veya restriksiyon parça uzunluk polimorfizmi (RFLP) ile analiz edilebilmektedir. Daha yaygın kullanılan yöntem ise özgül primerler aracılığıyla polimeraz zincir reaksiyonu (PCR) ile DNA'nın çoğaltılmasıdır. PCR uygulamasını, RFLP analizi, spesifik oligoprob hibridizasyonu ile ilişkili PCR teknikleri veya rastgele çoğaltılmış polimorfik DNA (RAPD) üretimine dayalı yöntemler takip edebilmektedir (McKeand, 1998).

2.1. Polimeraz zincirleme reaksiyonu

Polimeraz Zincir Reaksiyonu (PCR), karmaşık bir DNA havuzundan belirli bir DNA parçasının çoğaltılmasına olanak sağlayan basit fakat etkili bir enzimatik tekniktir. Bu yöntemi geliştiren Dr. Kary Mullis, PCR'ı "ilgilendiğiniz DNA bölümünü seçmenizi ve ondan sınırsız miktarda elde etmenizi mümkün kılar" sözleriyle tanımlamıştır (Mullis, 1990). PCR, periferik kan, deri, saç, tükürük ve mikroorganizmalar gibi çok çeşitli doku ve organizmalardan elde edilen DNA örnekleri üzerinde uygulanabilir. Sadece çok küçük miktarda DNA, PCR ile analiz için yeterli sayıda kopya üretmek açısından yeterlidir. Bu özelliği nedeniyle PCR oldukça duyarlı bir yöntem olarak kabul edilmektedir (Garibyan and Avashia, 2013).

Duyarlılık ve özgüllük açısından primer tasarımı kritik öneme sahiptir. Primerler yüksek bağlanma sıcaklığı sağlayacak kadar uzun olmalı, ancak aşırı uzun primerler yanlış bağlanmalara yol açabilir. PCR reaksiyon karışımı; şablon DNA (doku lizatı veya saf DNA), primerler, polimeraz enzimi ve nükleotidleri içerir. Termal döngü sürecinde DNA denatüre edilir, primerler tamamlayıcı dizilere bağlanır ve polimeraz enzimi yeni zincirlerin sentezini gerçekleştirir. Her döngüde ürün miktarı katlanarak artar. **Ters transkriptaz PCR (RT-PCR)**, mRNA düzeylerini tespit etmek ve gen ekspresyonunu ölçmek için yaygın olarak kullanılır (Koo ve Jaykus, 2000). Northern blot ve RNase koruma testi gibi yöntemlere kıyasla çok daha küçük örneklerden analiz yapılabilmesi ve tek bir hücreden RNA miktarının ölçülebilmesi en büyük avantajlarıdır. Son yıllarda geliştirilen yeni sistemler, PCR ürünlerinin gerçek zamanlı izlenmesine olanak tanımış ve **gerçek zamanlı RT-PCR**'yi gen ekspresyon değişimlerinin ölçümünde tercih edilen yöntem haline getirmiştir. Ayrıca, gen ekspresyonunu küresel ölçekte inceleyen yöntemlerden elde edilen bulguların doğrulanmasında da sıkça kullanılmaktadır. Yüksek özgüllük ve duyarlılık sağlaması, RT-PCR'yi gizli enfeksiyonların izlenmesi için de uygun kılar (Altinok ve Kurt 2003)

Ökaryotlarda olduğu gibi prokaryotların rRNA genlerinde de korunmuş bölgeler bulunur. Bu bölgeler tanımlama ve çoğaltma amacıyla kullanılabilirken, değişken bölgeler kültürü zor ya da imkânsız bakterilerin tespitinde yararlanılır (Barry ve ark., 1990). rRNA genleri, **Renibacterium salmoninarum** (Rhodes ve ark., 1998), **Aeromonas salmonicida** (Høie ve ark., 1999) ve **Yersinia ruckeri** (Altinok ve ark., 2000) için PCR testlerinde başarıyla uygulanmıştır. Benzer yöntemler ayrıca **Vibrio anguillarum**, **Lactococcus garvieae**, **Piscirickettsia salmonis**, **Flexibacter**, **Flavobacterium**, **Photobacterium** ve **Mycobacterium** gibi Avrupa Birliği mevzuatına dahil edilmeyen ancak önemli balık patojenlerinin tanısında da kullanılmaktadır.

2.2. Multipleks PCR

Aynı anda birden fazla patojeni belirlemeye yönelik multipleks PCR, zaman ve maliyet açısından önemli avantajlar sağlamaktadır (Williams ve ark., 1999). Bu yöntemde, birden fazla hedef diziyi çoğaltmak için farklı primer çiftleri aynı reaksiyonda kullanılabilir. Böylece testin güvenilirliği korunurken laboratuvarda ciddi ölçüde zaman ve emek tasarrufu elde edilir. Multipleks PCR; gen delesyonu analizi (Chamberlain ve ark., 1988, 1989), kantitatif analiz (Zimmermann ve ark., 1996; Rithidech ve ark., 1997), RNA tespiti (Zou, 1997) ve virüs, bakteri, mantar ile parazitlerin tanımlanmasında başarıyla uygulanmıştır.

2.3. Nükleik Asitlerin İşaretlenmesi ve Tespiti

Nükleik asit probları için farklı işaretleme ve tespit sistemleri geliştirilmiştir (Tijssen, 1993). Eskiden yaygın kullanılan radyoizotoplar güvenlik nedeniyle yerini biyotin veya digoksigenin gibi haptenlere bırakmıştır. Bu işaretler, antikor bağlanmasıyla floresan, kemilüminesans veya kolorimetrik yöntemlerle saptanabilmektedir (Tyagi ve Kramer, 1996; Gonzalez ve ark., 1997).

2.4. Restriksiyon Enzimleri ile Sindirim

Restriksiyon enzimleri (endonükleazlar), DNA'yı belirli dizilerden kesen özel enzimlerdir. Tip II restriksiyon enzimleri, genetik analiz ve mühendislikte en çok kullanılanlardır ve genellikle altı baz çifti uzunluğunda palindromik dizileri tanır, ancak dört ya da sekiz bazlık dizileri hedefleyenler de vardır. Bu enzimlerle DNA parçalanarak jel elektroforeziyle ayrıştırılır ve her DNA'ya özgü bir "parmak izi" deseni elde edilir. Ayrıca kesim

bölgeleri belirlenerek restriksiyon haritaları oluşturulabilir ve plazmid ya da DNA bölgelerinin tanımlanmasında kullanılabilir (Grizzle ve ark., 2002).

Tek baz değişiklikleri, restriksiyon bölgesinin oluşmasına veya kaybolmasına yol açabilir. Bu durum DNA parçalarının sayısını değiştirir ve RFLP (Restriction Fragment Length Polymorphism) adı verilen farklılıkları ortaya çıkarır. RFLP profilleri, adli incelemeler, babalık testleri, populasyon genetiği ve çeşitli hastalıkların tanısında önemli bir araç haline gelmiştir.

2.5. İn Situ Hibridizasyon

İn situ PCR, hem araştırma hem de klinik alanda enfeksiyon ve tümörlerin anlaşılması ve tanısında önemli bir araçtır. İn situ RT-PCR, düşük seviyedeki gen ekspresyonunu yüksek hassasiyetle saptayarak anatomik bilgi sağlar. Ancak düşük duyarlılık, tekrarlanabilirlik sorunları ve yüksek arka plan sinyali gibi kısıtlamaları vardır. Floresan işaretli in situ RT-PCR yöntemleri bu sınırlamaları azaltarak daha net sonuçlar sunar. Uygulama alanları arasında enfeksiyon etkenlerinin ve tümör hücrelerinin tanısı, genetik mutasyonların tespiti ve gen ekspresyonunun incelenmesi bulunur. Floresan in situ hibridizasyon (FISH) ise hücre veya kromozomları nükleik asit dizilerine göre işaretler. Yaklaşık 20 nükleotitlik floresan problar hedef RNA veya DNA dizilerine bağlanır. Bu şekilde işaretlenen hücreler, floresan mikroskopi ya da akış sitometrisiyle görüntülenebilir (Long, 1998; Nuovo, 1996).

2.6. DNA Mikroarrayler

DNA mikroarrayler, özgül DNA veya RNA dizilerini belirlemede kullanılan modern bir tekniktir. Test örneği floresanla işaretlenir ve çip üzerindeki uygun oligonükleotidlere bağlanan diziler özel dedektörlerle saptanır. Rekabetçi hibridizasyon yönteminde ise test DNA'sı, floresan işaretli rakip oligonükleotidlerle yarışarak çipe bağlanır. Uyumlu diziler hedefe tutunurken, uyumsuz olanlar yerini floresan işaretliye bırakır. Böylece tür veya suş spesifik diziler kolayca tespit edilir.

Mikroarrayler, klasik hibridizasyon yöntemlerine göre daha hızlı, hassas, düşük maliyetli ve otomasyona uygun sonuçlar verir (Shalon ve ark., 1996). GenBank'taki mevcut veriler sayesinde pek çok patojene özgü problar tek bir çipte toplanabilir ve aynı anda çok sayıda etken belirlenebilir (Southern, 1996; Mir, 2000). Bu teknoloji, özellikle balıklarda asemptomatik dönemdeki hastalıkların erken teşhisi için büyük potansiyel taşır (Zhou ve Dorothea, 2004).

Ayrıca mikroarrayler, gen ekspresyonunu incelemede de etkilidir. Belirli genlerin varlığı veya yokluğu, bir patojenin hastalık yapıcı olup olmadığını gösterebilir. Yüksek kurulum maliyetine rağmen, hazır sistemlerde test başına düşen maliyet düşük, analiz süresi ise oldukça kısadır.

3. Olası Sorunlar ve Kontaminasyonun Önlenmesi

PCR sonuçları, kullanılan dokuya ve örnekteki inhibitörlere bağlı olarak değişebilir. Hemoglobin, bakteriyel bileşenler veya konak DNA'sının fazlalığı çoğaltmayı engelleyebilir (Wilson, 1997; Høie ve ark., 1997). Bu nedenle yüksek kaliteli nükleik asit ekstraksiyon sistemleri tercih edilmelidir.

Kontaminasyonu önlemek için her balıkta tek kullanımlık aletler kullanılmalı veya ekipman çamaşır suyu ile temizlenip bol suyla durulanmalıdır. Alkol ve alev güvenilir değildir. Örnek homojenizasyonunda bulaşmayı önlemek için stomacher tercih edilmelidir. Ayrıca nekropsi, DNA ekstraksiyonu, PCR hazırlığı ve elektroforez işlemleri için ayrı odalar kullanılmalı; laboratuvar malzemeleri odalar arasında taşınmamalıdır. PCR ürünleriyle kontaminasyonu engellemek için dUTP ile birlikte UNG kullanılabilir. Yalancı negatif sonuçların önüne geçmek için β-aktin gibi iç kontroller önerilir; bu, amplifikasyonu engelleyen örneklerin kolayca belirlenmesini sağlar (Grizzle ve ark., 2003).

Sonuç

Balık sağlığında immünolojik ve moleküler tanı yaklaşımları, son dönemde önemli bir ivme kazanmış; PCR ve türevleri, multipleks PCR, restriksiyon temelli analizler, in situ hibridizasyon ve DNA mikroarrayleri gibi araçlar sayesinde patojenlerin yüksek duyarlılık ve özgüllükle, hatta asemptomatik evrede bile saptanması mümkün hale gelmiştir. Bu kazanımlar, salgınların erken bastırılmasına, tedavinin hedefe yönelik planlanmasına, antibiyotik kullanımının azaltılmasına ve direnç gelişiminin sınırlandırılmasına somut katkı sağlar. Bununla birlikte yöntemlerin güvenilirliği; kontaminasyon, inhibitör varlığı ve yalancı negatifler gibi teknik sınırlılıkların titizlikle yönetilmesine bağlıdır. Standartlaştırılmış protokoller, kaliteli nükleik asit ekstraksiyonu, uygun iç kontroller ve ayrık çalışma alanları zorunludur. Bu gereksinimler karşılandıkça, söz konusu teknolojilerin rutin izleme ve tanıda daha geniş yer bulacağı; karar süreçlerini güçlendirerek akuakültürde verimliliği artıracağı ve ekonomik kayıpları azaltırken sürdürülebilirliği destekleyeceği öngörülmektedir.

Özet

Pestisitler, modern tarım uygulamalarında zararlı organizmaların kontrolünde yaygın olarak kullanılmakta ve tarımsal verimliliğin artırılmasında önemli rol oynamaktadır. Neonikotinoid grubuna ait imidakloprid (IMI), böceklerle mücadelede sıkça tercih edilen bir insektisittir. Diğer yandan, endüstriyel bir kimyasal olan ve plastik üretiminde kullanılan bisfenol A (BPA)'nın toksisitesi belirlenmiş ve endüstriyel uygulamalarda plastikleştirici ajan olarak BPA'nın diğer türevleri olan bisfenol E (BPE) gibi alternatifleri kullanılmaya başlanmıştır. Bu iki kimyasal, sıklıkla kullanıldığı için sucul ekosisteme karışmakta olup birlikte etki gösterme potansiyeline sahiptir. Zebra balığı, genomunun iyi bilinmesi, insan ile ilgili ortak genlere sahip olması, hızlı üreme döngüsü, çevresel toksisite çalışmalarında duyarlılığı ve şeffaf yumurtalara sahip olması nedeniyle en çok tercih edilen model organizmalardan biridir. Bu projede, IMI ve BPE'nin zebra balığı embriyoları üzerindeki tekil ve kombine toksik etkileri gelişimin ilk 120 saatinde değerlendirilmiştir. Çalışma kapsamında kontrol, çözücü kontrol (% 0,1 DMSO), 12,16 mg/L IMI (%10 LC_{50}), 24,32 mg/L IMI (%20 LC_{50}), 1,36 mg/L BPE (%10 LC_{50}), 2,72 mg/L BPE (%20 LC_{50}), 12,16 mg/L IMI+ 1,36 mg/L BPE (Kombine %10), 24,32 mg/L IMI + 2,72 mg/L BPE (Kombine %20) olmak üzere 8 grup oluşturulmuştur. Morfolojik özellikler, gelişimsel anomaliler, koryondan çıkış süreleri, kalp atım hızı ve embriyo boy uzunluğu gibi gelişim parametreleri gözlemlenerek istatistiksel analizler yapılmıştır. BPE %10, BPE %20, IMI %10, IMI %20, kombine %10 ve kombine %20 konsantrasyon gruplarında; perikardiyal ödem, vitellus kesesi ödemi, omurga eğriliği ve çeşitli morfolojik bozukluklar gözlemlenmiştir. Ayrıca, BPE içeren tüm gruplarda embriyoların koryondan çıkışında gecikme tespit edilmiştir. Hücre ölümüne olan etkiler whole mount TUNEL yöntemi kullanılarak değerlendirilmiştir. Kontrol grubuna kıyasla 1,36 mg/L BPE grubunda anlamlı bir değişiklik gözlenmezken, 2,72 mg/L BPE ve her iki IMI grubunda apoptotik hücre sayısında belirgin artışlar kaydedilmiştir. Kombine maruziyet gruplarında ise, tekil maruziyetlere kıyasla daha belirgin bir artış izlenmiş ve sinerjistik toksik etkiler tespit edilmiştir.

Anahtar Kelimeler: İmidakloprid, Bisfenol E, Kombine toksisite, Zebra balığı, apoptoz

Morphological anomalies and apoptotic response induced by combined exposure to imidacloprid and bisphenol E in zebrafish embryos

Abstract

Pesticides are widely used in modern agriculture to control harmful organisms and play a crucial role in enhancing crop productivity. Imidacloprid (IMI), a neonicotinoid insecticide, is among the most commonly used agents for pest control. Meanwhile, the toxicity of bisphenol A (BPA), an industrial chemical used in plastic production, has been well documented, leading to the increased use of alternative derivatives such as bisphenol E (BPE). Due to their frequent use, IMI and BPE are prone to entering aquatic environments, where they may exert combined effects on non-target organisms. Zebrafish (*Danio rerio*) is a widely preferred model organism in ecotoxicological research owing to its well-characterized genome, genetic similarity to humans, rapid reproductive cycle, high sensitivity to pollutants, and transparent embryos.This study aimed to evaluate the individual and combined toxic effects of IMI and BPE on zebrafish embryos during the first 120 hours of development. Eight experimental groups were established: control, solvent control (0.1% DMSO), 12.16 mg/L IMI (10% LC_{50}), 24.32 mg/L IMI (20% LC_{50}),

1.36 mg/L BPE (10% LC_{50}), 2.72 mg/L BPE (20% LC_{50}), 12.16 mg/L IMI + 1.36 mg/L BPE (combined 10%), and 24.32 mg/L IMI + 2.72 mg/L BPE (combined 20%).

Developmental parameters, including morphological abnormalities, pericardial and yolk sac edema, spinal deformities, hatching time, heart rate, and body length, were assessed and statistically analyzed. Pericardial edema, yolk sac edema, spinal curvature, and various morphological defects were observed in the BPE 10%, BPE 20%, IMI 10%, IMI 20%, combined 10%, and combined 20% groups. Delayed hatching was detected in all BPE-treated groups. Whole-mount TUNEL analysis revealed no significant change in apoptotic cell counts at 1.36 mg/L BPE, whereas significant increases were observed at 2.72 mg/L BPE and in both IMI groups. Combined exposure groups showed a more pronounced increase than single exposures, indicating synergistic toxic effects.

Keywords: Imidacloprid, Bisphenol E, Combined toxicity Zebrafish, Apoptosis

GİRİŞ

Pestisitler, zararlıları önlemek, yok etmek, uzaklaştırmak veya azaltmak için kullanılan kimyasal maddelerdir. Genelde, hedef aldıkları zararlı grubuna göre insektisitler, fungisitler, herbisitler, rodentisitler, molluskisitler, nematisitler gibi benzer kimyasalları ifade eder (Eldridge., 2008 ; Tiryaki ve ark., 2010). Neonikotinoid grubu insektisit pestisitlerinden olan IMI, böceklerin nikotinik asetilkolin reseptörlerine (nAChR) bağlanarak nörotoksik bir etki oluşturarak felç ve ölüme sebep olur (Tomizawa ve Casida, 2003 ; Yadav ve ark., 2020). Yaygın olarak kullanılan IMI toprakta 3000 güne kadar kalıntısı bulunabilmekteyken sucul ekosistemdeki etkisini anlamak büyük önem taşımaktadır (Bhende ve Dafale, 2023).

BPA, gıda ambalajları, içecek şişeleri, oyuncaklar vb. gibi plastik ürünlerde ve plastik malzemelerin sertleştirilmesinde yaygın olarak kullanılmaktadır. BPA östrojen hormonunu taklit edici özelliği olduğu, dolayısıyla endokrin bozucu etki göstererek potansiyel sağlık riski taşıdığı bilinmektedir (Moreman ve ark., 2017). BPA kullanımına yönelik kısıtlamaların artmasıyla birlikte, endüstride alternatif bisfenol türevlerinin kullanımına yönelim olmuştur. Bu alternatiflerden biri olan BPE, kimyasal yapısal benzerliği nedeniyle BPA yerine polimer ve plastik üretiminde giderek daha yaygın kullanılmaktadır (Czarny-Krzymińska ve ark., 2024). BPE'nin, artan kullanımına bağlı olarak sucul ekosistemde IMI gibi diğer kirleticilerle birlikte bulunma ve etkileşime girme olasılığı yüksektir.

Zebra balığı (*Danio rerio*), omurgalı model organizma olarak, birçok kimyasalın ekosistem üzerindeki olumsuz etkilerinin araştırılmasında önemli rol oynar. Hızlı gelişim döngüsü, şeffaf embriyo yapısı ve genetik manipülasyona uygunluğu sebebiyle gelişimsel toksisite, nörotoksisite, endokrin bozucu ve genotoksik etkilerini incelemek için idealdir (Stegeman ve ark., 2010). Bu çalışmada, BPE ve IMI tekil ve kombine toksisitesinin araştırılması amaçlanmıştır.

MATERYAL VE METOT

Embriyo Eldesi

Çalışma kapsamında, Sakarya Üniversitesi Fen Fakültesi Biyoloji Bölümü Balık Yetiştirme Laboratuvarı bünyesinde akvaryumlara kloru uzaklaştırılmış musluk suyu ile doldurulmuştur. Su sıcaklığı 28 ± 1 °C düzeyinde ve 12 saat aydınlık – 12 saat karanlık olacak şekilde sirkadiyen ışık döngüsü sağlanmıştır.

Toksisite Testleri

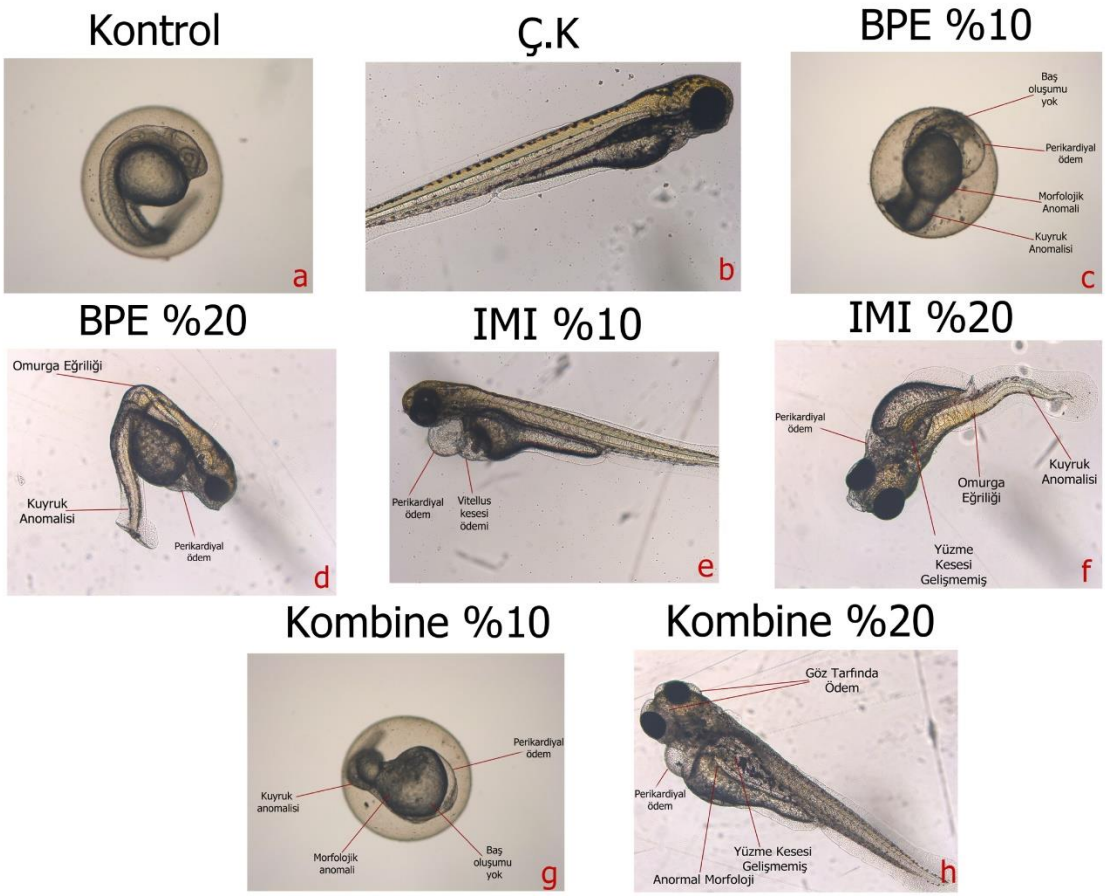
Tüm toksisite testleri OECD FET Test (2013)'e uygun olarak yapılmıştır. Deneyler 3 tekrarlı olarak gerçekleştirilmiştir. Toksisite testlerinde 24 kuyucuklu plakalar kullanılmıştır. Her kuyucuğa 1 embriyo ve 2 ml E3 ortamı eklenmiştir. Kontrol ve deney grupları aşağıdaki şekilde oluşturulmuştur.

Kontrol: Hiçbir uygulama yapılmamıştır.
Çözücü Kontrol: % 0.1 DMSO
Bisfenol E %10: 1.36 mg/L (%10 LC_{50})

Bisfenol E %20: 2.72 mg/L (%20 LC_{50})
İmidakloprid %10: 12.16 mg/L (%10 LC_{50})
İmidakloprid %20: 24.32 mg/L (%20 LC_{50})
Kombine %10: 1.36 mg/L BPE (%10 LC_{50}) + 12.16 mg/L IMI (%10 LC_{50})
Kombine %20: 2.72 mg/L BPE (%20 LC_{50}) + 24.32 mg/L IMI (%20 LC_{50}) uygulanmıştır.

Gelişim anomalileri 24, 48, 72, 96 ve 120. saatlerde mikroskop altında gözlenmiştir.

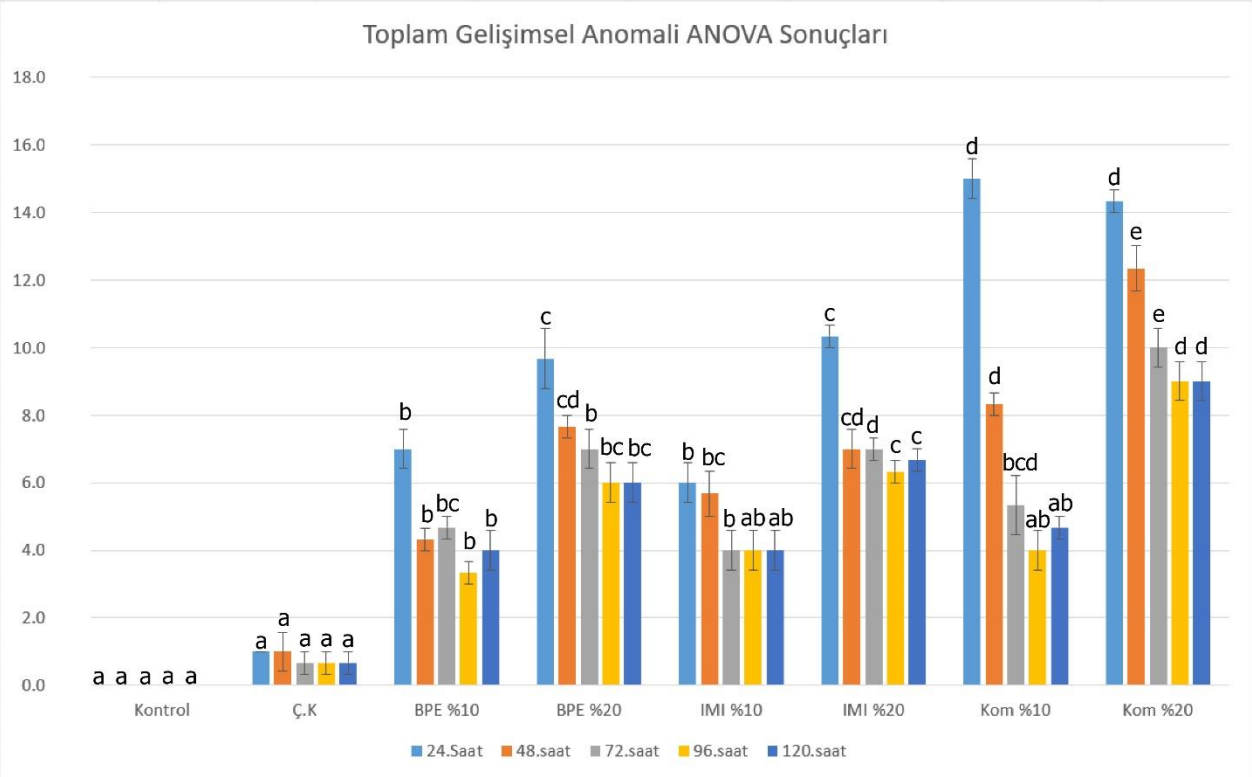
Whole-Mount TUNEL



Whole-mount TUNEL analizi ticari kit kullanılarak yapılmıştır. Kontrol ve deney gruplarına ait dekoryonize edilmiş 24 saatlik embriyolar, %4'lük paraformaldehit içerisinde 24 saat boyunca fikse edilmiştir. Uygulamadan sonra örnekler boyanarak ve kahverengi renkteki apoptotik hücreler ışık mikroskobu altında gözlenmiştir.

İstatistiksel Analizler
Tüm istatistiksel analizlerde SPSS 25.0 programı kullanılmıştır. Tüm analizlerde istatistiksel anlamlılık ANOVA testi kullanılarak belirlenmiştir. ANOVA Post Hoc testlerinden Tukey HSD testi kullanılarak araştırılmıştır. İstatistiksel anlamlılık düzeyi $p<0,05$ olarak kabul edilmiştir (Bertoni ve ark., 2024).

BULGULAR

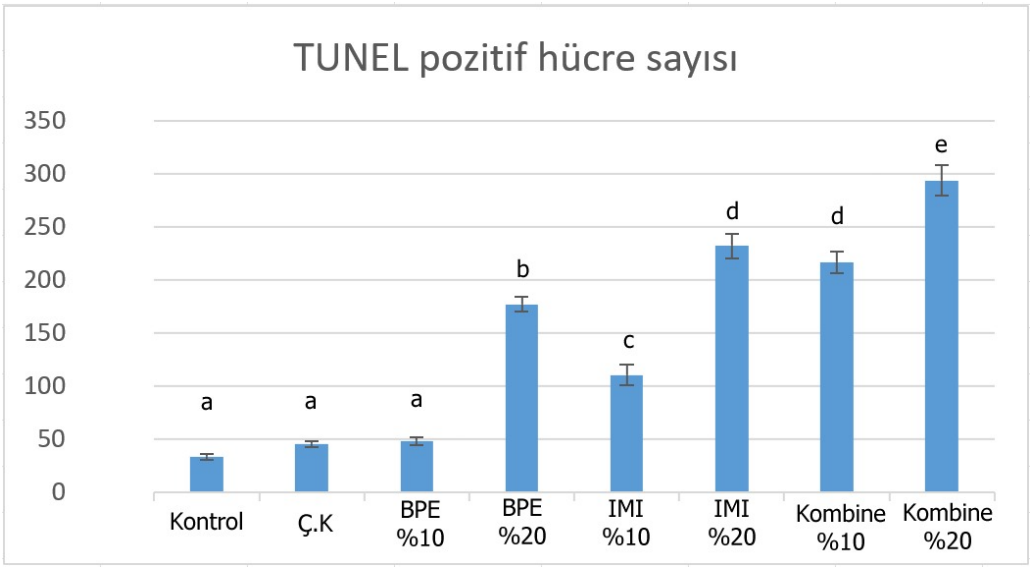


Gelişimsel Morfolojik Bulgular

Gelişimsel morfolojik bulgular incelendiğinde gruplarda farklı zamanlarda birçok anomali gözlenmiştir. Kontrol ve çözücü kontrol grupları süreç boyunca normal gelişim göstermiştir. %10 BPE uygulanan grupta asefali, perikardiyal ödem, kuyruk deformitesi ve morfolojik olarak anormal bir görünüm gözlemlenmiştir. BPE %20 uygulanan deney grubunda, omurga eğriliği, perikardiyal ödem ve kuyruk yamukluğu tespit edilmiştir. %10 IMI grubunda perikardiyal ödem ve vitellus kesesi ödemi görülmüştür. IMI %20'de ise perikardiyal ödem, yüzme kesesi gelişiminde gecikme, kuyruk deformitesi ve omurga eğriliği görülmektedir. Kombine %10 grubunda morfolojik bozukluk olarak, perikardiyal ödem, kuyruk malformasyonu, ve asefali görülen tespit edilmiştir. Kombine %20 uygulanan grupta ise göz çevresinde ödem, perikardiyal ödem ve yüzme kesesi gelişiminde gecikme gözlemlenmiştir. Kontrol, çözücü kontrol, BPE ve IMI gruplarında 24. saatten 120.saate kadar olan gelişimsel anomaliler aşağıda Şekil 1'de verilmiştir.

Şekil 1. BPE ve IMI uygulaması sonucu zebra balığında gözlenen gelişim anomalileri (a) kontrol, (b) çözücü kontrol, (c) BPE %10, (d) BPE %20, (e) IMI %10, (f) IMI %20, (g) kombine %10, (h) kombine %20 grubu

Gelişimsel anomalilere bakıldığında kontrol gruplarına kıyasla önemli ölçüde teratojenik etki gösterdiğini ve kombine maruziyet durumunda bu etkilerin sinerjistik şekilde arttığını göstermektedir. Kontrol grubunda anomali gözlemlenmezken, çözücü kontrol grubunda minimum düzeyde anomali gözlenmiştir. Fakat, istatistiksel olarak kontrol ve çözücü kontrol grupları arasında anlamlı bir fark tespit edilmemiştir. BPE ve IMI uygulamalarında anomali sıklığının konsantrasyon artışına paralel olarak arttığı görülmüştür. Kombine gruplarda ise özellikle erken gelişim evresinde (24. saat) yüksek düzeyde anomaliler tespit edilmiş, bu değerlerin tekil maruziyet gruplarına kıyasla belirgin şekilde daha yüksek olduğu görülmüştür (Şekil 2). Sonuç olarak, IMI ve BPE'nin birlikte maruziyeti, tekil uygulamalara göre daha şiddetli gelişimsel bozukluklara yol açmakta ve kimyasalların birlikte bulunması durumunda toksik etkilerinin güçlendiğini ortaya koymaktadır.



Şekil 2: Zebra balığı embriyolarında farklı gruplara (Kontrol, Çözücü Kontrol, BPE %10, BPE %20, IMI %10, IMI %20, Kombine %10, Kombine %20) ve zaman noktalarına ait toplam gelişimsel anomali sayıları

Whole mount TUNEL ile Apoptotik Hücrelerin Tayini

Çalışmada, 24 saatlik embriyolar üzerinde TUNEL analizi, zebra balığı embriyolarında hem tekil hem de kombine maruziyetlerin apoptoz üzerine etkilerini ortaya koymuştur. Her bir grupta mikroskop altında kahverengi renkte gözlenen TUNEL pozitif hücre sayımları yapılmış (Şekil 3) ve istatistiksel analizler gerçekleştirilmiştir (Şekil 4). Kontrol ve çözücü kontrol gruplarında apoptotik hücre sayısı düşük seviyede kalmış, aralarında istatistiksel olarak anlamlı bir fark bulunmamıştır. Bu durum çözücünün apoptoz süreci üzerinde herhangi bir etkisinin olmadığını göstermektedir. BPE gruplarında ise doza bağımlı bir artış gözlenmiştir. %10 BPE grubunda kontrol ile benzer sonuçlar elde edilirken, %20 BPE grubunda apoptotik hücre sayısı anlamlı biçimde yükselmiştir. Bu bulgu, BPE'nin yüksek konsantrasyonlarda apoptotik hücre ölümünü tetikleyebildiğini göstermektedir. IMI gruplarında (%10 ve %20) apoptotik hücre sayısı kontrol grubuna kıyasla belirgin biçimde artmıştır. Bu durum, IMI'nin tek başına dahi güçlü bir apoptotik etki ortaya çıkardığını ve hücresel düzeyde toksisiteye yol açtığını göstermektedir. Kombine gruplarda (özellikle %20'de), apoptotik hücre sayısındaki artış tekil maruziyetlere kıyasla daha da belirgindir. Özellikle kombine %20 grubunda apoptotik aktivitenin en üst düzeye ulaştığı tespit edilmiştir. Bu bulgu, IMI ve BPE'nin birlikte maruz kalındığında sinerjistik bir etki yaratarak apoptotik hücre ölümünü şiddetlendirdiğini düşündürmektedir.

Şekil 3. 24 saatlik zebra balığı embriyolarında gerçekleştirilen TUNEL analizi bulguları. TUNEL pozitif hücreler kahverengi renkte gözlenmektedir. (a) kontrol, (b) çözücü kontrol, (c) BPE %10, (d) BPE %20, (e) IMI %10, (f) IMI %20, (g) kombine %10, (h) kombine %20 grubu

Şekil 4. Zebra balığı embriyolarında 24. saatte TUNEL yöntemi ile belirlenen apoptotik hücre sayıları ($p<0,05$).

TARTIŞMA

Bu çalışmada IMI ve BPE'nin tekil ve kombine uygulamalarının zebra balığı embriyolarında belirgin gelişimsel anomalilere ve apoptoza yol açtığı ortaya konmuştur. Özellikle kombine maruziyetlerde gözlenen sonuçlar, bu iki kimyasalın birlikte bulunduğunda sinerjistik etki yaratarak toksisiteyi artırdığını göstermektedir.

Gelişimsel parametrelerde, perikardiyal ödem, vitellus kesesi ödemi, omurga eğriliği ve kuyruk malformasyonu gibi anomaliler tekil uygulamalarda da gözlenmiş, ancak kombine gruplarda bu anomalilerin daha yüksek oranda ve daha erken dönemde görüldüğü tespit edilmiştir. Bu durum, IMI ve BPE'nin embriyonik gelişim üzerinde güçlü bir teratojenik potansiyele sahip olduğunu göstermektedir.

TUNEL analizi bulguları da bu değerlendirmeleri desteklemektedir. BPE %20 grubunda apoptoz belirgin şekilde artarken, IMI gruplarında kontrolle kıyaslandığında apoptotik hücre sayısının anlamlı düzeyde yükseldiği görülmüştür. Özellikle kombine %20 grubunda apoptotik hücre sayısının en yüksek seviyeye ulaşması, iki kimyasalın birlikte maruziyetinde apoptozun sinerjistik biçimde şiddetlendiğini ortaya koymuştur. Bu sonuç, IMI ve BPE'nin benzer veya farklı toksikolojik mekanizmaları aynı anda tetikleyerek hücresel ölümü artırdığını düşündürmektedir.

Literatür bulguları da çalışmamızı desteklemektedir. IMI'nin düşük konsantrasyonlarda dahi zebra balığı embriyolarında gelişimsel anomalilere yol açtığı daha önce rapor edilmiştir (Santiago ve ark., 2023). Bizim çalışmamız da benzer şekilde IMI'nin tek başına bile güçlü bir apoptozu tetikleyici olduğunu ortaya koymuştur. Benzer şekilde, Gao ve ark. (2022), BPE maruziyetinin vitellus kesesi ödemi ve omurga deformasyonuna sebep olduğunu bildirmiştir. Çalışmamızda kombine gruplarda apoptozun en üst düzeye ulaşması, çevresel risk değerlendirmelerinde kimyasalların birlikte etkilerinin göz ardı edilmemesi gerektiğini göstermektedir.

Sonuç olarak, bu çalışma IMI ve BPE'nin zebra balığı embriyolarında yalnızca tekil toksisiteye yol açmadığını, aynı zamanda birlikte maruziyet koşullarında sinerjistik toksik etki oluşturduğunu ortaya koymuştur. Bu bulgular, endüstriyel kimyasalların çevredeki kombinasyonlarının potansiyel risklerini anlamak açısından önem taşımakta ve çevresel risk değerlendirmelerinde kombine toksisite parametresinin mutlaka dikkate alınması gerektiğini vurgulamaktadır.

Abstract

Betalains are water-soluble nitrogenous pigments found mainly in plants of the *Caryophyllales* order. They are widely appreciated for their bright coloration and biological properties, including antioxidant and anti-inflammatory activities. Due to these dual functions, betalains are considered promising alternatives to synthetic dyes in food, nutraceutical, and pharmaceutical applications. Nevertheless, their use remains limited because they are highly sensitive to heat, light, pH changes, and oxygen, which results in rapid degradation and loss of color intensity. This review examines the relationship between extraction methods and betalain stability. Solvent choice is a crucial factor: while water and ethanol mixtures are commonly used, glycerol and natural deep eutectic solvents (NADES) have emerged as protective media that reduce degradation and improve bioaccessibility. In addition, novel technologies such as ultrasound- and microwave-assisted extraction have demonstrated the ability to accelerate pigment recovery under milder conditions, limiting exposure to factors that trigger instability. Pressurized hot water extraction also shows potential when carefully optimized to balance efficiency with pigment preservation. A further step forward is the development of integrated "extract-and-protect" strategies, where stabilization occurs simultaneously with pigment recovery. By embedding protective conditions directly in the extraction medium—such as antioxidant-rich solvents or oxygen-limiting systems—betalains can be better preserved for downstream applications. İn conclusion, the evidence suggests that extraction should not be regarded solely as a recovery process but as a decisive stage influencing the stability and usability of betalains. A deeper understanding of solvent–pigment interactions and optimized processing conditions will facilitate the transition from laboratory-scale studies to industrial applications, enabling betalains to become sustainable, safe, and functional natural colorants.

Keywords: Betalains, deep eutectic solvents, extraction, ultrasound, microwave, stability

INTRODUCTION

Natural pigments are gaining increasing relevance in food, cosmetic, and pharmaceutical applications, driven by consumer preference for "clean label" products and health-promoting ingredients. Within this context, betalains—classified into red-violet betacyanins and yellow-orange betaxanthins—stand out because they provide intense and appealing coloration while simultaneously exhibiting biological activities, such as antioxidant, anti-inflammatory, and antimicrobial effects (Sadowska-Bartosz & Bartosz, 2021). These characteristics have encouraged their exploration in nutraceuticals and functional food formulations, positioning betalains as versatile compounds of dual functional and aesthetic value.

Betalains are water-soluble nitrogenous pigments found in members of the botanical order *Caryophyllales*, including *Beta vulgaris*, *Amaranthus*, and *Opuntia*, as well as in certain fungi (Leal-Alcázar et al., 2025). Their structural uniqueness, compared to anthocyanins or carotenoids, provides specific advantages but also presents considerable challenges. Despite their promising application potential, betalains remain limited in large-scale use because of their inherent instability. After extraction, they are particularly prone to degradation when exposed to

heat, light, extreme pH, oxygen, and catalytic factors such as enzymes or metal ions (Kumorkiewicz-Jamro et al., 2021; Eyshi et al., 2024).

Thermal stress accelerates betalain breakdown, typically through decarboxylation, dehydrogenation, or isomerization reactions, which can occur even at moderate processing temperatures above 50–70 °C (Martinez et al., 2024). pH also exerts a decisive role: betalains are most stable within a moderately acidic range, whereas highly acidic or alkaline conditions promote hydrolysis and pigment discoloration (Eyshi et al., 2024). Light and oxygen exposure further aggravate instability, initiating photooxidation and radical-mediated degradation, thereby reducing both chromatic intensity and bioactive function (Leal-Alcázar et al., 2025). In addition, co-extracted matrix components, such as sugars, phenolics, or proteins, may interact synergistically or antagonistically with betalains, further influencing their degradation kinetics (Kumorkiewicz-Jamro et al., 2021).

Given these multiple destabilizing factors, it has become increasingly clear that not only extraction yield but also the *mode of extraction* significantly determines betalain integrity. Recent advances emphasize that solvent choice, extraction conditions, and the presence of protective agents can dictate the extent of pigment preservation. Mild and emerging extraction techniques—such as ultrasound, microwave, or pressurized hot water—are particularly attractive, as they can both enhance yield and mitigate degradation compared to harsher methods (Eyshi et al., 2024). Moreover, integrated "extract-and-protect" strategies are gaining attention, where the extraction medium itself functions as a stabilizing environment, for example by limiting oxygen exposure, lowering water activity, or simultaneously incorporating natural antioxidants (Leal-Alcázar et al., 2025).

In this context, the present review first outlines the structural features, classification, and instability mechanisms of betalains, and subsequently provides a critical discussion of how different extraction techniques, particularly mild or green approaches, affect pigment stability. Special emphasis is placed on solvent systems (water, ethanol, glycerol, and natural deep eutectic solvents), innovative energy-assisted techniques, and emerging integrated approaches that combine extraction and stabilization in a single step.

Betalain Structure, Classification, and Instability Mechanisms

Betalains are a unique class of water-soluble pigments derived from the amino acid L-tyrosine through a biosynthetic pathway distinct from that of anthocyanins. Structurally, they are immonium derivatives of betalamic acid, which serves as the chromophore backbone (Kumorkiewicz-Jamro et al., 2021). Based on their conjugation partners, betalains are divided into two main groups: betacyanins, which impart red to violet colors (e.g., betanin in beetroot), and betaxanthins, which produce yellow to orange hues by forming Schiff base conjugates with amino acids or amines (Wybraniec & Stintzing, 2020). The balance of these two subgroups determines the final hue in plant tissues, and their relative ratios are influenced by both genetics and environmental conditions (Leal-Alcázar et al., 2025).

Despite their structural attractiveness and high molar extinction coefficients, betalains are chemically labile. Their instability arises from a series of degradation pathways triggered by external stress factors. Thermal degradation is among the most critical, where elevated temperatures lead to decarboxylation, dehydrogenation, and hydrolytic cleavage of glycosidic bonds, resulting in discoloration and loss of bioactivity (Esatbeyoglu & Rohn, 2021). pH sensitivity is another determinant; betalains are most stable under mildly acidic conditions (pH 4–6), but instability increases under strongly acidic or alkaline environments, causing hydrolytic and oxidative breakdown (Eyshi et al., 2024).

Light and oxygen also play major roles in betalain instability. Photooxidation induced by UV or visible light exposure leads to bleaching and pigment fragmentation, while oxygen accelerates radical-mediated degradation (Leal-Alcázar et al., 2025). In addition, metal ions such as Cu^{2+} or Fe^{3+} can catalyze oxidation, further exacerbating color loss (Sadowska-Bartosz & Bartosz, 2021). Matrix components co-extracted with betalains—such as sugars, organic acids, or phenolic compounds—may either protect pigments through copigmentation or contribute to instability through pro-oxidant reactions (Wybraniec & Stintzing, 2020).

Recent analytical studies have provided insights into these mechanisms at the molecular level. High-resolution mass spectrometry and nuclear magnetic resonance have revealed intermediate products such as neobetanin (an oxidized derivative of betanin), which is often used as a marker of degradation (Kumorkiewicz-Jamro et al., 2021). Similarly, kinetic modeling approaches demonstrate that betalain degradation follows first-order or pseudo-first-order kinetics, with activation energies dependent on both matrix and environmental conditions (Martinez et al., 2024).

In summary, betalains present a delicate balance between vivid chromatic properties and high susceptibility to degradation. Understanding their structural classification and instability mechanisms is essential for designing effective extraction and stabilization strategies, which is the focus of the subsequent sections.

Relationship Between Extraction Techniques and Betalain Stability

Effect of solvents (water, ethanol, glycerol, NADES) on stability

Solvent selection determines not only yield but also the microenvironment that governs betalain oxidation, hydrolysis, and isomerization after extraction. Hydroalcoholic media (water–ethanol) typically maximize recovery while keeping pH in a range (≈3–6) compatible with pigment integrity; however, high ethanol fractions can dehydrate the chromophore and accelerate color loss if temperature rises or oxygen is not controlled (Eyshi et al., 2024).

Designing the solvent to "protect while extracting" is increasingly effective. Deep eutectic solvents (DES/NADES) can hydrogen-bond with the iminium and phenolic sites of betalains, reduce dissolved oxygen, and suppress photooxidation. In beetroot waste, a $MgCl_2 \cdot 6H_2O$–urea DES preserved ~75% of initial betalain content after 340 days in amber storage and 150 days under visible light—far exceeding aqueous extracts (Hernández-Aguirre et al., 2021).

Glycerol deserves special mention as a benign, food-grade polyol that both extracts and stabilizes. Ultrasound extraction of prickly-pear betalains in ~23% glycerol followed by in-situ encapsulation delivered high encapsulation efficiency (≈94%) and markedly extended shelf-life (e.g., modeled ~404 days at 4 °C in amber), with improved bioaccessibility versus conventional extracts (Mehta et al., 2024).

Beyond beets, DES built from choline chloride with organic acids/sugars have extracted betalains from red beet and cactus/pitaya matrices with superior pigment retention and in vitro bioaccessibility compared with conventional solvents, underscoring the stabilizing role of eutectic H-bond networks (Kaba et al., 2024; Liu et al., 2025).

Mild extraction (ultrasound, microwave, PHWE) as a means to reduce degradation

Lower-energy, short-time processes limit thermal and oxidative stress during cell disruption. Optimized ultrasound-assisted extraction (UAE) from beet matrices increases betalain yield at modest temperatures and short times, preserving color attributes relative to long conventional macerations (Tabio-García et al., 2021; Eyshi et al., 2024).

Microwave-assisted extraction (MAE) can be protective when pulse-programmed and time-limited: pulsed microwave regimes (controlling power, duty cycle, seconds-scale exposure) enhanced beet betalain recovery while minimizing thermal decomposition compared with continuous heating (Hazervazifeh et al., 2023). Mechanistically, fast volumetric heating expedites mass transfer, allowing extraction at lower overall thermal load if exposure is tightly bounded (Hazervazifeh et al., 2023; Eyshi et al., 2024).

Pressurized hot-water (subcritical water; PHWE/SWE) is attractive because water's dielectric constant drops with temperature, increasing solvating power for moderately polar pigments. Recent work on beet leaves/stems showed that carefully optimized 150–170 °C, short-time SWE can extract betalains alongside phenolics for active packaging, although excessive time/temperature risks pigment breakdown—therefore time–temperature–pH windows must be narrow (de Carvalho et al., 2025).

Integrated "extract-and-protect" approaches

A converging trend is to engineer the extraction medium and unit operation so the pigment exits the plant matrix already protected against light, oxygen, metals, and pH drift. Two practical archetypes are evident:

Solvent-stabilization: DES/NADES and glycerol create low-oxygen, H-bond-rich matrices that slow chromophore degradation; the $MgCl_2$–urea DES case above demonstrates multi-month stability at room conditions, while glycerol-based UAE plus encapsulation boosts shelf-life and bioaccessibility (Hernández-Aguirre et al., 2021; Mehta et al., 2024). **Process-integration:** Combine rapid cell disruption (UAE/MAE) with immediate phase management or separation to remove pro-oxidants. Examples include pulsed-MAE to minimize heat load (Hazervazifeh et al., 2023) and one-step, thermoreversible aqueous biphasic systems that extract/separate betalains

from chlorophyll-rich beet by-products—reducing downstream exposure to degradative cofactors (Rosa et al., 2023).

Across techniques, the design principle is consistent: keep temperature-time integrals low, exclude oxygen/light/transition metals, and embed the pigment in protective hydrogen-bonding or encapsulating networks as early as possible—ideally during extraction—to conserve the native chromophore state for downstream formulation (Eyshi et al., 2024; Hernández-Aguirre et al., 2021).

CONCLUSION

Betalains are valuable natural pigments with strong potential as food colorants and bioactive ingredients, yet their practical application is restricted by their chemical fragility. The present review highlights that extraction is not a neutral step but rather a decisive factor influencing pigment integrity. The choice of solvent, the intensity of applied processing, and the design of the extraction medium all contribute to the stability of these compounds.

Studies demonstrate that hydroalcoholic mixtures, glycerol, and especially deep eutectic solvents not only enhance pigment yield but also create protective environments that limit degradation. Likewise, techniques such as ultrasound- and microwave-assisted extraction allow shorter processing times and milder conditions, reducing exposure to heat and oxygen. Pressurized hot water extraction can be effective when carefully optimized, while integrated approaches that combine extraction and stabilization simultaneously appear particularly promising.

Looking ahead, there is a need to refine these methods across different plant sources and to establish protocols that maintain pigment integrity throughout industrial processing and storage. A deeper understanding of solvent–pigment interactions, combined with scalable process optimization, will support the wider use of betalains as safe, sustainable, and functional alternatives to synthetic dyes in the food sector.

Abstract

In this study, regenerated cellulose-chitosan based bioaregels were produced by the simple lyophilisation method. Cellulose was dissolved using the LiCl/DMAc (lithium chloride-N,N-dimethyl acetamide) solvent system, and after the regeneration process, regenerated cellulose (RC) was obtained by incorporating aldehyde groups into its structure. Bioaerogels were produced by mixing RC with chitosan (CH) biopolymer at different mixing ratios (70-30, 50-50, and 30-70). Porosity-density, BET surface area, liquid absorption performance (water, NaCl, $MgCl_2$), water vapor transmission (WVTR), crystallinity index (CI), and antibacterial activity of the produced bioaerogels were determined, and their micro morphological structures were imaged using SEM to determine general characterization properties. In addition to the 100% polymer (RC and CH)-based sample, bioaerogels produced at 70-30, 50-50, and 30-70 mixing ratios showed low density (0.0166-0.0198 g/cm³) and, in contrast, almost high porosity values. The high porosity values obtained by all samples were in the range of 96.77%-99.02%; however, the maximum value was obtained by the 100% RC-based sample. Both liquid absorption performance and WVTR results were decreased by the addition of CH into RC composition. The specific surface area values of the samples were tested, revealing high levels ranging from 279.631 m²/g to 386.221 m²/g, with pure CH exhibiting the greatest value. Antibacterial performance versus *S. aureus* and *E. coli* results revealed that all aerogels both pure polymers (100% RC and 100% CH) and compositions with different mixing ratios (70-30, 50-50, and 30-70) showed antibacterial performances with different efficiencies. As a being known as one of the most popular antibacterial polymers, CH and higher levels of CH in RC compositions performed better antibacterial performances, and the inhibition zone measured higher for *E. coli* compared to *S. aureus*.

Keywords: Cellulose, Bioaerogel, Regenerated Cellulose, Chitosan

INTRODUCTION

RC is a cellulose precursor characterized by a cellulose II crystal structure, obtained by dissolving natural cellulose polymer in polar solvents and subsequently recrystallizing. This structure, identified as its crystalline form of cellulose II, has superior strength qualities compared to natural cellulose (cellulose I) owing to its negligible structural abnormalities (Eichorn et al., 2001; Shafizadeh et al., 1985). The initial endeavors to generate RC occurred 150 years ago, aimed at dissolving cellulose-rich substances like cotton and inner bark. Advancements in technology have led to the testing and development of several solvents and chemical methods for cellulose dissolving. A prevalent technique employed in RC manufacturing is the NMMO (N-methyl morpholine-N-oxide) procedure. The technique of dissolving cellulose in an NMMO solution is commercially referred to as the "Lyocell" approach. Subsequent to dissolution, the cellulose is extruded and then subjected to a washing procedure to eliminate the NMMO liquid from the cellulose fibers. The primary benefit of this procedure is the recovery of over 99% of the solvent. The cellulosic fibers generated by this process exhibit exceptional strength characteristics in both dry and wet conditions, enabling the use of these materials in the fabrication of thin, lightweight structures (Woodings, 2001). Numerous researchers, including Krysztof et al., (2018), Peng et al., (2021), Makarov et al., (2022), and Zhang et al., (2022), have conducted studies on the utilization of NMMO for cellulose solubilization. Another production technique used in RC production is the NaOH/Urea solubilizer system. During this manufacturing method, the NaOH/Urea combination is pre-cooled to -12 °C, cellulose is incorporated into the

mixture, and the dissolving process transpires within a brief duration of two minutes (Liebert et al., 2010). Recent research by Wei et al., (2020), and Armir et al., (2022) have investigated the efficacy of the NaOH/Urea system in solubilizing cellulose. The LiCl/DMAc binary process was initially discovered and utilized by DuPont for the dissolving and spinning of synthetic fibers, then adapted to cellulose-based polymers. This solvent system is reported to be highly effective, with no undesirable side reactions occurring in cellulose during the reaction, and it can solubilize even very high molecular weight (10^6) celluloses under ambient conditions (Matsumoto et al., 2002; Ishii and Isogai, 2008). Ionic liquids are molten organic salts composed of cationic and anionic species, with a melting point below 100 °C. Asymmetric organic cation structures engage with organic or inorganic anions, undermining the stability of the crystal lattice system and rendering it unstable. The most notable characteristic of these liquids is that their chemical and physical properties, including viscosity, conductivity, hydrophilic-hydrophobic nature, polarity, and hydrogen bonding capacity, can be altered by choosing the appropriate cation or anion or by incorporating specific functional groups into the structure (Rabideau et al., 2020; Azimi et al., 2022). Owing to these characteristics, these liquids are distinguished as a simple and eco-friendly method in RC manufacturing (Huang et al., 2022).

CH is a natural polymer derived from the partial or complete deacetylation of chitin, characterized by a primary chain of 1-4 linked 2-amino-deoxy-β-D-glucopyranose units. Its polycationic structure in acidic conditions, attributed to the presence of amino groups, facilitates gelation properties (Yang et al., 2007). The inherent chemical characteristics of this polymer varies mostly based on the degree of deacetylation (DAD) and the molecular weight (MA) of the polymer (Roberts, 1992; Bodek, 2006). This polymer has been utilized for numerous years in sectors including water treatment, papermaking, medicinal and pharmaceutical applications, agriculture, biotechnology, food additives, textiles, and membrane manufacture (Struszczyk, 2002).

This study involved the production of bioaerogel through the dissolution of cellulose using a LiCl/DMAc solvent system. Aldehyde groups were subsequently introduced into the structure following the regeneration process. The resultant RC and CH biopolymer were mixed in varying ratios, and the overall characterization of the final products was assessed through measurements of porosity-density, BET surface area, liquid absorption performance, WVTR, XRD, antibacterial activity, and micromorphological imaging via SEM.

MATERIALS AND METHODS

MATERIALS

The cellulose constituting the basic structure of the bioaerogels developed in this study was sourced from bleached magnesium bisulfite soluble pulp (MBP) and provided in sheet form by Solucell Lenzing AG (Austria). CH, LiCl, DMAc, $NH_2OH.HCl$, NaOH, NaCl, MgCl, and $NaIO_4$ utilized in the experiment were procured from Merck Sigma Aldrich, whereas acetone, as a technical chemical, was purchased from the appropriate industrial supplier.

METHODS

Aldehyde Process with LiCl/DMAc (N-N-Dimethylacetamide)

RC was obtained by the LiCl/DMAc method as described by Ishii and Isogai (2008). To expedite the reaction of cellulose with DMAc and reduce the reaction duration, the pulp was initially maintained in a vacuum oven at 60 °C for 24 hours, followed by immersion in water for 24 hours prior to extraction in acetone. Subsequent to substituting the water in the structure with acetone, the cellulose underwent treatment with the LiCl/DMAc combination. The cellulose was solubilized in an 8% LiCl/DMAc solution (3:97 by weight) at ambient temperature, and the resultant cellulosic gel was precipitated in acetone. RC, synthesized at a 4% concentration, was oxidized to an aldehyde structure at pH 4.5 and 45 °C for 4 hours in darkness, utilizing an RC/$NaIO_4$ ratio of 0.6. Subsequent to the procedure, the resultant RC containing the aldehyde portion was thoroughly rinsed with copious amounts of water and preserved at +4 °C for utilization in aerogel fabrication (Sun et al., 2015).

Determination of Aldehyde Content of RC

The aldehyde concentration of RC was measured using the methodology of Sirvio et al., (2011). To achieve this, 0.1 g of thoroughly desiccated RC was combined with 30 ml of water. The pH was modified to 4.5 using HCl, and 0.43 g of $NH_2OH.HCl$ was incorporated into 20 ml at pH 4.5. The suspension was agitated at 200 rpm for 24 hours prior to titration with 0.1 N NaOH, and the quantity of aldehyde groups was ascertained based on the volume of NaOH utilized.

$$\text{Aldehyde Amount}\left(\frac{\text{mmol}}{\text{g}}\right)=\frac{V * N}{W} \quad (1)$$

Where:
V: Amount of NaOH consumed in the titration (ml)
N: Normality of NaOH used in the titration (mol/L)
W: Amount of completely dry aldehyde fractionated RC used in the titration (g)

Production of RC-CH-Based Bioaerogels

Composite manufacturing was accomplished by a straightforward lyophilization method. To do this, an RC suspension and CH solution, both produced at a 1% polymer concentration, were combined at polymer ratios of 100%, 70%-30%, 50%-50%, and 30%-70% using a homogenizer at 10.000 rpm for 3 minutes. The solution was transferred onto glass Petri plates and subjected to pre-freezing at -86°C for 24 hours. The samples were thereafter positioned in a lyophilizer and subjected to lyophilization at -55°C and a vacuum of -50 mbar for 48 hours. The specimens were thereafter kept in sealed polyethylene bags for analysis.

Determination of Density and Porosity Values of Bioaerogels

The density of composites was determined by weight/volume measurements, and porosity was determined using a helium pycnometer (Quantachrome Ultrapyc 1200 E) using the formula below.

$$\text{Porosity}\ (\%) = \frac{[V1 - V2]}{V2} \text{x}\ 100 \quad (2)$$

Where:
V1: Measured volume of bioaerogels (cm^3)
V2: Volume measured by pycnometer (cm^3)

Liquid Absorption Performance

Liquid absorption (water, NaCl, MgCl) performances of bioaerogels were determined by placing approximately 0.005 g of sample in 50 ml of liquid and waiting for 24 hours, then weighing the bioaerogel at the end of the period. The liquid absorption value was determined as a percentage using the formula below.

$$\text{Liquid Absorption}\ (\%) = \frac{[Mt - Mo]}{Mo} \text{x}\ 100 \quad (3)$$

Where:
Mt: Sample weight measured after 24 hours (g)
Mo: Initial weight of sample (g)

WVTR

The WVTR of the samples was determined in accordance with ASTM E96-90 (Procedure D). The samples were positioned in a desiccator with 6 ml of deionized water, measuring 8.5 cm in length, 1.2 cm in breadth, and 0.6 cm in mouth diameter, under a 40% humidity environment created by a saturated solution of $MgCl_2 \cdot 6H_2O$. The samples were maintained at 37 °C for 24 hours, and the WVTR was determined using the formula below.

$$\text{WVTR} = \frac{(G/t)}{A} \quad (4)$$

Where:
G/t: The gradient of the weight variation in relation to time (g/h)
A: Test area (m^2)

BET Surface Area

A Quantachrome Nova Touch LX4 instrument used to determine the specific surface areas of the bioaerogels. A vacuum treatment was employed to remove any water from the samples initially. Nitrogen adsorption-desorption

isotherms were employed to determine specific surface areas using the methodology established by Brunauer, Emmett, and Teller (1938).

CI

The CI variations in the compositions of bioaerogels, derived from pure polymers (RC, CH) and their combinations at various ratios were assessed utilizing a Bruker D8 Advance X-ray powder diffractometer (Billerica/Massachusetts, U.S.A.). Sample measurements were conducted using a radiation source (Cu Kα) with a wavelength of λ = 0.154 nm, a scanning range of 3°≤2Θ≤90°, and a scanning speed of 2°/min. The index values were computed using the formula provided by Segal et al., (1959).

$$CI = \frac{[I002 - Iam]}{I002} x\ 100 \qquad (5)$$

Where:
I002: Cellulose crystalline region peak (2Θ=21.5°-22.9°)
Iam: Cellulose amorphous region peak (2Θ=16.9°-18.2°)

Antibacterial Performance

The antibacterial efficacy of the composite materials was evaluated using the usual disk diffusion method. Bacteria cultured in SS (*E. coli*) and BHA (*S. aureus*) enriched media were inoculated onto agar media using the swab method. Subsequently, samples with a diameter of 1 cm were placed in contact with the bacterial medium. The medium was incubated at 28 °C for 24 hours. At the conclusion of this period, inhibitory zones on the agar medium were assessed at many sites, and averages were calculated.

Micromorphological Views

The material's micromorphology was examined using a scanning electron microscope (FEI Quanta FEG 250, 11 kV). Prior to imaging, samples were sectioned with a scalpel and coated with gold-palladium at 40 mA and 50 mbar pressure.

RESULTS and DISCUSSION

Density and Porosity

The density and porosity metrics of RC/CH-based bioaerogels are presented in Table 1. Bioaerogels have elevated porosity levels. The analysis of porosity data reveals that the maximum porosity, recorded at 99.02%, was found in pure RC samples. Bioaerogels based on 100% pure CH had a porosity of 96.77%, whereas RC/CH-based samples demonstrated porosity values of 98.28%, 98.01%, and 97.29% for mixture ratios of 70-30, 50-50, and 30-70, respectively. The reduced porosity of materials fabricated with CH polymers, in contrast to pure RC polymers, influenced the compositions, resulting in porosity values of RC/CH-based composites aligning with those of pure polymers. The density values of bioaerogels were determined to be in the range of 0.01 g/cm³. The addition of CH to the RC structure resulted in lower density and porosity values. The aldehyde group generated in the RC structure (0.613 mmol/g) by $NaIO_4$ oxidation likely interacted with the amine groups in the CH structure, resulting in the proximity of molecular chains and the formation of bigger cluster structures, which consequently reduced porosity values.

Table 1. Density and porosity values of bioaerogels

Bioaerogel	Density (g/cm³)	Porosity (%)
RC	0.0198	99.02
CH	0.0166	96.77
RC/CH 70-30	0.0186	98.28
RC/CH 50-50	0.0176	98.01
RC/CH 30-70	0.0168	97.29

Liquid Absorption Performance

Figure 1 illustrates the absorption values of water, NaCl, and $MgCl_2$ in the composites. The examination of water absorption values in bioaerogels revealed that the maximum absorption value was 1813.56% in 100% RC bioaerogels, whilst the minimum absorption rate was 1102.36% in composites created with a 30-70 mixing ratio. Nonetheless, water absorption values could not be ascertained in 100% CH-based composites owing to their very hydrophilic nature. Variations in porosity levels corresponded with alterations in water absorption performance. The values of water absorption diminished as porosity decreased. As the concentration of CH inside the structure increased, porosity values diminished, leading to a corresponding influence on water absorption. Besides porosity, the reduction in absorption attributed to the increased quantity of CH can be elucidated by the highly hydrophilic nature of CH, which induces progressive structural degradation in water and the disintegration of the aerogels' surface structure due to the gelation effect occurring at the surface.

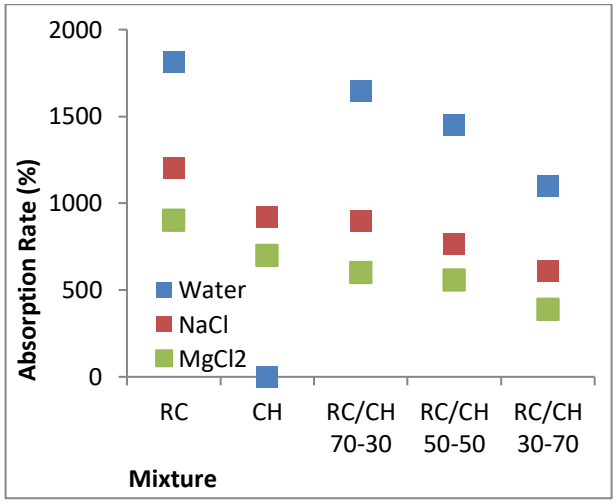

Figure 1. Liquid absorption performances of bioaerogels

Figure 1 also presents the NaCl and $MgCl_2$ absorption findings of the bioaerogels, alongside the water absorption data. The trend in salt absorption performance followed that of water absorption. NaCl, due to its reduced molecular size, diffused more readily into the bioaerogel matrix than $MgCl_2$, leading to elevated absorption levels.

WVTR Results of Bioaerogels

The WVTR of bioaerogels derived from RC/CH-based and pure polymers are presented in Figure 2. The figure illustrates that the maximum value for RC-based bioaerogels was 203.66 g/h m^2, but the minimum value for pure CH-based bioaerogels was 121.58 g/h m^2. Water vapor transpires when water vapor diffuses vertically through the medium. The transfer of water vapor through the composite structures operates via pores, with the size of these holes and the resultant porosity directly influencing the transfer rate, leading to variations in water vapor transfer that correspond with changes in porosity. The graph clearly illustrates that the incorporation of CH into the RC structure resulted in a reduction in the WVTR corresponding with the porosity data.

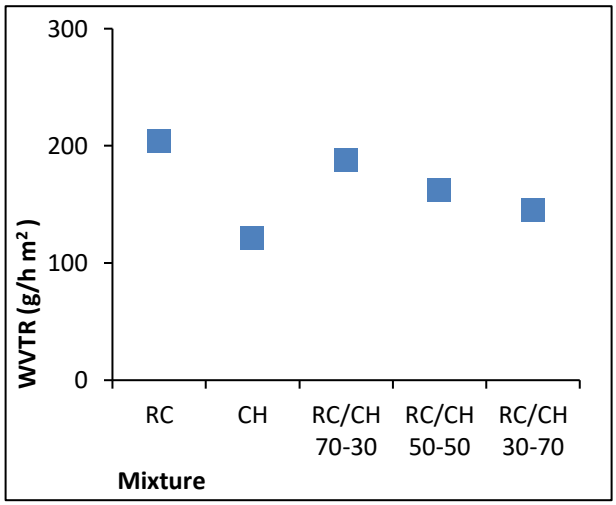

Figure 2. WVTR of bioaerogels

BET Surface Area

Table 2 presents the BET surface area measurements of bioaerogels. Upon examination of the table, the specific surface area values were determined to vary from 279.631 to 386.221 m^2/g. The maximum specific surface area, 386.221 m^2/g, was seen in pure CH-based samples, whilst the minimum surface area, 276.631 m^2/g, was recorded in pure RC-based composites. Although the specific surface area values of materials generated with CH incorporation into the RC structure were inferior to those of pure CH, a higher CH concentration in the structure enhanced the specific surface area values of the samples. These composites, characterized by elevated porosity and specific surface area, are thought to be appropriate for diverse applications including liquid-gas absorption, sound insulation, and thermal insulation.

Table 2. Surface area values of bioaerogels

Bioaerogel	Surface Area (m^2/g)
RC	279.631
CH	386.221
RC/CH 70-30	291.256
RC/CH 50-50	328.256
RC/CH 30-70	351.042

CI

The CI values of bioaerogels are provided in Table 3. The CI value for MBP was established at 74.55%, while the CI value for RC was determined to be 48.22%. However, the CI value of 100% CH-based bioaerogel could not be ascertained due to the predominantly amorphous nature of its structure. Dissolving cellulose using the LiCl/DMAc solvent system induces a transformation of the cellulose I crystal structure into the cellulose II crystalline form, resulting in a subsequent decrease in the crystallinity index values (Eichorn et al., 2001; Shafizadeh et al., 1985). With the incorporation of amorphous CH polymer into the RC structure and the progressive increase in its quantity, the crystallinity index values were observed to be lower.

Table 3 . CI values of bioaerogels

Bioaerogel	CI (%)
MBP	74.55
RC	48.22
CH	-
RC/CH 70-30	21.02
RC/CH 50-50	19.33
RC/CH 30-70	17.06

Bacterial Resistance

The findings of the inhibition zone measurements for the antibacterial efficacy of bioaerogels are displayed in Table 3. An analysis of the table indicates that all bioaerogel structures exhibit resistance to both bacterial species, hence reducing bacterial proliferation. Bioaerogels demonstrate superior resistance to the gram-negative bacteria *E. coli*. The positively charged amine groups $(NH_2)^+$ in the CH polymer structure compromise the integrity of bacterial cell walls, inhibiting adhesion to the material and so providing antibacterial resistance. The same is true for RC, where the aldehyde fractions in the structure likely interact with bacterial cell wall components, inhibiting bacterial adhesion to the matrix and proliferation.

Table 4 . Inhibition zone measurements of bioaerogels

Bioaerogel	Inhibition Zone (*S. aureus*)	Inhibition Zone (*E. coli*)
RC	0.25	0.33
CH	0.58	0.64
RC/CH 70-30	0.33	0.41
RC/CH 50-50	0.42	0.53
RC/CH 30-70	0.49	0.58

Macro and Micro Views of Bioaerogels

Figure 3 shows the macro surface and micro SEM images of bioaerogels produced with RC and RC/CH 50-50 compositions. As seen in both figures, the bioaerogels have a homogeneous macro surface structure, and with the addition of CH, the structure becomes more yellow due to CH. The micro-surface morphology of the RC structure without CH addition exhibits denser and tighter pore walls, but the pore structures in the RC/CH 50-50 configuration are broader, corroborated by the porosity and specific surface area findings. SEM images of bioaerogels demonstrate elevated liquid absorption, significant specific surface area, and WVTR values that correlate directly with porosity.

a

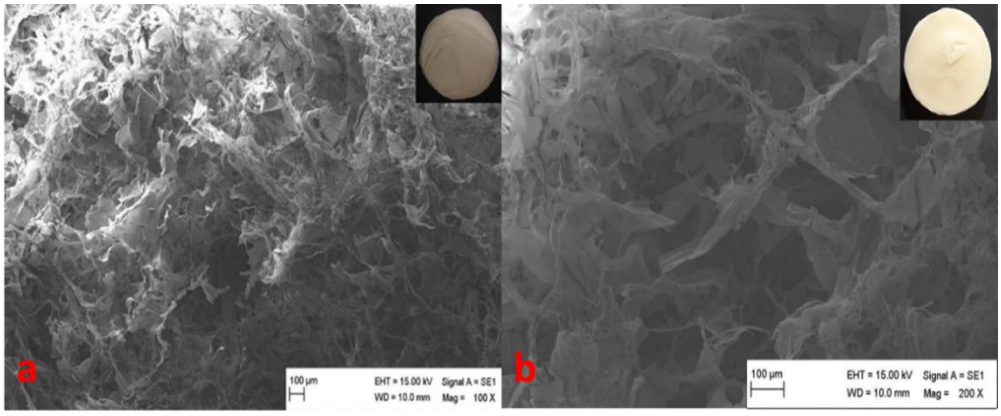

Figure 3. Macro and micro images of pure RC (a) and RC/CH 50-50 based bioaerogels

CONCLUSION

In this study, bioaerogel production was accomplished by dissolving cellulose using the LiCl/DMAc solvent system, introducing aldehyde groups into the structure following the regeneration process, and mixing the resulting RC and CH biopolymers at various ratios. The general characterization properties of the bioaerogels were assessed through measurements of porosity and density, BET surface area analysis, liquid absorption performance (water, NaCl, and MgCl2), WVTR, CI, antibacterial activity, and the examination of their micromorphological structures via SEM. The density of the produced bioaerogels was found to range from 0.0168 to 0.0198 g/cm³, while their porosity values ranged from 96.77% to 99.02%. Furthermore, although all bioaerogels demonstrated high liquid absorption capacity, the incorporation of CH into the RC structure adversely impacted their liquid absorption

performance. The WVTR values of the bioaerogels were determined to vary from 121.58 g/h·m² to 203.66 g/h·m², while the surface area measurements were notably high, corresponding to their porous structures. However, both the WVTR and surface area measurements tended to decline with the incorporation of CH into the RC structure. In addition to these properties, it is believed that RC/CH-based bioaerogels, which exhibit resistance to *S. aureus* and *E. coli* bacteria, can be assessed for application in various fields.

Abstract

In this work, synthesis of novel 2-((5-chlorobenzothiazol-2-yl)thio)-*N*-(4-(2-(substituted)thiazol-4-yl)phenyl)acetamide (**4a-4c**) derivatives and physicochemical properties investigation were aimed. Synthesis of the compounds is carried out with according to the synthesis scheme. Pathway of synthesis had two simple and affordable steps. The structures of final compounds were proven with hydrogen and carbon nuclear magnetic resonance (NMR) spectral analysis. Physicochemical and toxicity properties were investigated via SwissADME and Deep-PK software. Further investigation was evaluated via SwissTarget and BioFinder prediction software. Kinase and family AG coupled receptors were main targets of the compounds.

Keywords: Benzothiazole, *In silico* studies, Pharmacokinetic properties, Thiazole, Toxicity profile.

INTRODUCTION

Human health takes place as biggest cause of concern of people from the past to the present. All fields of science make effort to understand and solve the mystery of human body. While some diseases heal via hydration and rest, some other diseases need complicated treatment. These treatments can include chemotherapy, radiotherapy, hormone replacement therapy, immunotherapy, bone marrow replacement, targeted therapy and drug therapy (Kaur et al., 2023; Wargo et al., 2015; Zafar et al., 2025). Among given therapies chemotherapy with various types of drugs is preferred to treat common diseases (Mathan et al., 2022). Sometimes drugs lose effectiveness against pathogens because of incorrect use of dosage, unrelated disease-medication combination, unnecessary usage. Therefore, synthesizing new compounds and investigating their activities is highly important. Today, thanks to computational chemist predictions can be made about compounds before synthesizing (Engkvist et al., 2018; Goh et al., 2017; Keith et al., 2021). Various software provides H-bond acceptor (HBA), H-bond acceptor (HBD), topologic polar surface area (TPSA), solubility class (water) (SC), gastrointestinal absorption (GIA), skin permeation (Log K_p), rule of five (violation number), Ghose filter, leadlikeness information (Bakchi et al., 2022; Daina et al., 2017; Yurttaş et al., 2022). Predictions provide an opportunity to make modifications on compounds. Thus, finalize compounds investigate to find their possible targets such as enzymes, receptors, nucleic acids (Sanad et al., 2023; Tshiluka et al., 2025). Before expensive and tedious *in vitro* and *in vivo* studies, compounds investigate via *in silico* studies. *In silico* studies are planned according to the results of the target predictions. If the obtained results are found to be reasonable, the next step is to plan the synthesis and activity studies of the molecules.

Thiazole and benzothiazole rings frequently are seen in drugs and drug candidates (Cheekatla, 2025; Rouf & Tanyeli, 2015; Yadav et al., 2023). Thiazole is found in structures of sulphathiazole (antibiotic) (Meşeli et al., 2021), fanetizole (anti-inflammatory) (Potewar et al., 2007), combendazole (antifungal) (Desai et al., 2012), niridazole (schistozomicidal) (Moczon & Swiderski, 1983), meloxicam (NSAID) (Luger et al., 1996), thiamine (vitamin B1) (Tylicki et al., 2018), dasatinib (anticancer) (Das et al., 2006), and ritonavir (antiviral) (Samuels & Sevrioukova, 2019). On the other hand, benzothiazole is found in structures of riluzole (treatment of ALS) (Hollingworth et al., 2024), ethoxzolamide (carbonic anhydrase inhibitor) (Johnson et al., 2015), zopolrestat (antidiabetic) (Yahya et al., 2022), thioflavin T (diagnostic agent) (Khurana et al., 2005), frentizole (immunosuppressant) (Chrienova et al., 2023). Researchers investigated the combination of these two rings on

various activities (Irfan et al., 2020; Meltzer-Mats et al., 2013; Radwan et al., 2022). We have synthesized seven molecules containing both thiazole and benzothiazole rings and investigated their possible activities via *in silico* studies.

RESULTS and DISCUSSION

Chemistry

Chemical synthesis part of this study started with acetylation of 4-aminoacetophenone. Then, 2-mercapto-5-chlorobenzothiazole and *N*-(4-acetylphenyl)2-chloroacetamide (**1**) in equal molars as shown in **Scheme 2**. Obtained mid-product (**2**) used to synthesis of final products. Next step is bromination of the intermediate product, followed by reaction of the resulting product with thiobenzamide/4-methoxythiobenzamide/thiourea (**4a-4c**). Total three novel final compounds (**Table 5**) and investigated. Structural analyses of the compounds evaluated with hydrogen and carbon nuclear magnetic resonance spectroscopic (NMR) techniques. In ^{1}H-NMR spectra aliphatic peaks were observed between 3.84-4.44 ppm range. Hydrogen peaks belonging to -CH_2 group were seen as singlet at 4.43-4.44 ppm range, protons of -OCH_3 group were detected as singlet peaks at 3.84 ppm. And also -NH hydrogens can be clearly seen at the spectra of compounds. -NH hydrogen was observed at 10.58-10.62 ppm range. The other aromatic hydrogen was observed between 7.06-8.08 ppm as expected. ^{13}C-NMR spectra also indicated specified peaks. Aliphatic -CH_2 carbon peak was observed at 33.87-38.34 ppm. The carbon peak observed at 83.66 ppm is considered to belong to the -OCH_3 group. Carbon peaks at 160.60-171.94 ppm proved that there were carbonyl peaks in our structure.

2-((5-Chlorobenzothiazol-2-yl)thio)-N-(4-(2-phenylthiazol-4-yl)phenyl)acetamide (4a)

$C_{24}H_{16}ClN_3OS_3$, yield 60%, M.P.: 206°C. ^{1}H-NMR (300 MHz, DMSO-d_6, ppm) δ 4.44 (s, 2H, C$\underline{H}_2$), 7.43 (dd, 1H, J_1: 2.07 Hz, J_2: 8.58 Hz, Ar-C$\underline{H}$), 7.51-7.56 (m, 3H, Ar-C$\underline{H}$), 7.71 (d, 2H, *J*: 8.70 Hz, Ar-C$\underline{H}$), 7.90 (d, 1H, *J*: 2.01 Hz, Ar-C$\underline{H}$), 8.01-8.04 (m, 4H, Ar-C$\underline{H}$), 8.08 (m, 2H, Ar-C$\underline{H}$), 10.60 (s, 1H, N$\underline{H}$). ^{13}C-NMR (75 MHz, DMSO-d_6, ppm) δ 38.20, 114.17, 119.80, 120.95, 121.04, 123.87, 125.06, 126.66, 127.20, 129.75, 129.91, 131.73, 134.08, 139.22, 155.33, 165.57, 171.94.

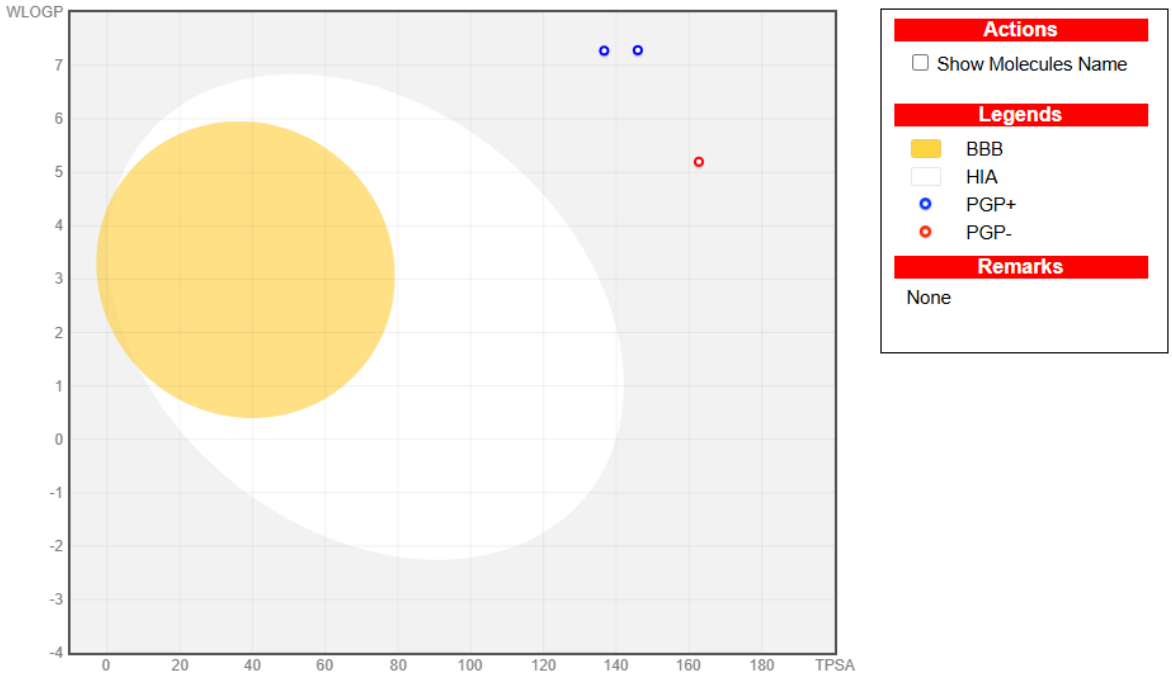
2-((5-Chlorobenzothiazol-2-yl)thio)-N-(4-(2-(4-methoxyphenyl)thiazol-4-yl)phenyl)acetamide (4b)

$C_{25}H_{18}ClN_3O_2S_3$, yield 65%, M.P.: 198°C. ^{1}H-NMR (300 MHz, DMSO-d_6, ppm) δ 3.84 (s, 3H, OC$\underline{H}_3$), 4.44 (s, 2H, C$\underline{H}_2$), 7.08 (dd, 2H, J_1: 2.07 Hz, J_2: 6.80 Hz, Ar-C$\underline{H}$), 7.43 (dd, 1H, J_1: 2.07 Hz, J_2: 8.58 Hz, Ar-C$\underline{H}$), 7.70 (d, 2H, *J*: 8.76 Hz, Ar-C$\underline{H}$), 7.90-8.02 (m, 6H, Ar-C$\underline{H}$), 8.08 (d, 1H, *J*: 8.61 Hz, Ar-C$\underline{H}$), 10.58 (s, 1H, N$\underline{H}$). ^{13}C-NMR (75 MHz, DMSO-d_6, ppm) δ 33.87, 83.66, 95.05, 113.00, 115.07, 119.75, 127.16, 128.26, 129.85, 131.88, 146.55, 148.11, 156.85, 160.60, 161.38, 165.59.

N-(4-(2-Aminothiazol-4-yl)phenyl)-2-((5-chlorobenzothiazol-2-yl)thio)acetamide (4c)

$C_{18}H_{13}ClN_4OS_3$, yield 68%, M.P.: 165°C. ^{1}H-NMR (300 MHz, DMSO-d_6, ppm) δ 4.43 (s, 2H, C$\underline{H}_2$), 7.06 (s, 1H, Ar-C$\underline{H}$), 7.43 (dd, 1H, J_1: 2.04 Hz, J_2: 8.58 Hz, Ar-C$\underline{H}$), 7.65-7.72 (m, 4H, Ar-C$\underline{H}$), 7.88 (d, 1H, *J*: 1.98 Hz, Ar-C$\underline{H}$), 8.07 (d, 1H, *J*: 8.58 Hz, Ar-C$\underline{H}$), 10.62 (s, 1H, N$\underline{H}$). ^{13}C-NMR (75 MHz, DMSO-d_6, ppm) δ 38.34, 102.06, 102.45, 104.53, 115.69, 116.88, 118.82, 119.67, 123.84, 125.04, 126.90, 131.16, 131.85, 135.72, 136.85, 139.51, 139.73, 155.28, 156.06, 159.34, 165.78.

In Silico Studies



The use of computational software allows for the prediction of compounds' physicochemical properties, pharmacokinetic properties, and lead-likeness properties. The predictions obtained from SwissADME (SwissADME, 2021) are listed in **Table 1**. ADME parameters such as H-bond acceptor, H-bond acceptor, topological polar surface area, Log Po/w, aqueous solubility, skin permeability, gastrointestinal absorption, Lipinski's rule of five were calculated and has been converted into a table. When we investigated the results of the study, all of our compounds have low gastrointestinal absorption and also, they did not dissolve in water sufficiently. Our compounds structure is highly lipophilic, so this finding was found accurate. According to Lipinski's rule of five, compounds **4a** and **4c** fit the criteria for druglikeness. Compound **4b** only violated one criterion. None of our compounds passed the leadlikeness property described by Teague and team. SwissADME software also predicted blood-brain barrier (BBB) transition states of molecules between WLOGP and TPSA. This

prediction is displayed in **Scheme 1** illustrated as the boiled egg. None of the compounds penetrate BBB and also did not show gastrointestinal absorption.

Table 1. Physicochemical and pharmacokinetic properties of synthesized compounds from SwissADME.

	HBA	HBD	TPSA	Log $P_{o/w}$	SC	Log K_p	GIA	RoF (V)	Leadlikeness (V)
4a	3	1	136.66	6.03	Poorly	-4.27	Low	0	No (2)
4b	4	1	145.89	6.11	Poorly	-4.47	Low	1	No (3)
4c	3	2	162.68	4.37	Moderately	-5.32	Low	0	No (2)

HBA: H-bond acceptor, **HBD**: H-bond acceptor, **TPSA**: Topological polar surface area, **Log $P_{o/w}$:** Log Po/w (-6.5 / 0.5), **SC:** Aqueous solubility, **Log K_p:** skin permeability (cm/hr), **GIA**: Gastrointestinal absorption, **RoF (V):** Rule of Five (violation number).

Scheme 1. The boiled egg illustration of blood-brain barrier penetration.

With SwissTargetPrediction (SwissTargetPrediction, 2021) and BioFinder (BioFinder, 2025) software before *in vitro* and *in vivo* studies target enzyme, receptor, or nucleic acids can be predicted. This prediction can save time, money, and unnecessary use of biological substances. Possible targets of our compounds identified with SwissTarget software. First fifteen targets were selected and investigated. Targets above 10% probability rate are listed in **Table 2**. Compounds **4a**, **4b** and **4c** were determined to target kinase with 40.0-80.0 percentage rate. Compound **4b** were also found to target the AG protein-coupled receptor family in second place. The potential targets of oxidoreductase are **4a**, and **4c**, with a percentage of 6.7. Further, **4c** can target the enzyme over with ratio of 26.7%. Only compound that targets the eraser (histone deacetylase, NAD-dependent deacetylase sirtuin) is **4b** with 13.3%. By blocking the histone deacetylase enzyme, molecule can induce apoptosis, and this way shows anticancer activity. However, BioFinder predictions suggest that among the synthesized compounds, **4b** is predicted to target the most and various proteins and receptors. Only compound that targets both glycogen synthase kinase-3 alpha and beta is **4b** despite the substituent position and groups being different. Unlike other compounds, **4a** and **4b** might target the vasopressin V2 receptor, replicase polyprotein 1ab, and the nicotinamide phosphoribosyltransferase enzyme.

SwissADME and BioFinder software gave different enzymes, protein, and receptors with each other. Biofinder software gave more specified targets, while SwissADME gave more general targets such as enzyme family. It is

believed that BioFinder software will be more useful and convenient before detection of in vitro study aspect. Difference of predicted targets may have result of the unvalidated software.

Table 2. SwissTarget prediction of synthesized compounds (**4a-4c**) (%).

	Kinase	Family AG protein-coupled receptor	Protease	Eraser	Enzyme	Oxidoreductase	Phosphodiesterase
4a	46.7	13.3	6.7	-	13.3	6.7	-
4b	40.0	26.7	6.7	13.3	6.7	-	6.7
4c	40.0	-	-	-	26.7	6.7	6.7

Table 3. BioFinder prediction of synthesized compounds (**4a-4c**).

	4a	4b	4c
Neuropeptide Y receptor type 2	x	x	x
Transient receptor potential cation channel subfamily A member 1			x
Calcium-activated potassium channel subunit alpha-1			x
Neuropeptide Y receptor type 5	x	x	
Glycogen synthase kinase-3 alpha		x	
Glycogen synthase kinase-3 beta		x	
Vasopressin V1a receptor	x	x	
Carbonic anhydrase 1		x	x
Carbonic anhydrase 2	x	x	x
Alkaline phosphatase, tissue-nonspecific isozyme			
Adenosine receptor A2b			
Kallikrein-1

Toxicicity profile of the compounds predicted via Deep-PK (DeepPK, 2024) software and results displayed in **Table 4**. This website makes predictions on Ames toxicity, maximum tolerated dose, hERG blockers, oral rat acute toxicity, oral rat chronic toxicity, hepatoxicity, respiratory diseases, skin sensitization, eye irritation, carcinogenesis, biodegradation etc. Ames toxicity indication of mutagenicity of chemicals by various mechanisms. While **4a**, and **4b** predicted to be not show Ames toxicity, predictions on compound **4c** indicated otherwise. Maximum tolerated dosage of the compounds predicted to be between 0.44-1.05 log mg/kg/day. It has been detected that **4c** is the least tolerated one, while **4a** is the most tolerated one. Compound **4a** has been estimated that they are toxic to the hERG blockers. Oral rat acute toxicity detected range of 2.41-2.71 log[1/(mol/kg)], oral rat chronic toxicity detected range of 0.61-0.89 log(mg/kg_bw/day). Hepatotoxic effects are expected to occur in all compounds. None of the compounds have been expected to show respiratory diseases, skin or eye irritation, carcinogenic effects. Biodegradation of compounds is not anticipated.

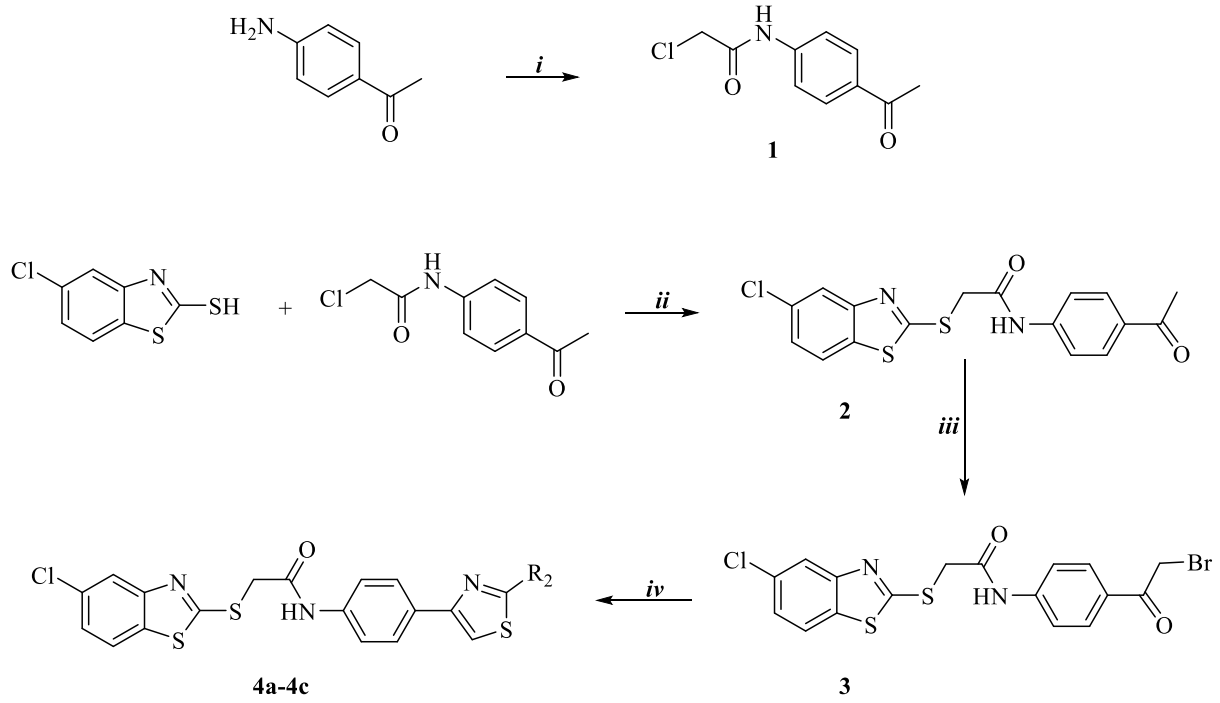

Table 4. Toxicity profiles of the compounds (**4a-4c**) predicted using Deep-PK software.

	4a	4b	4c
Ames toxicity	No	No	Yes
Max. tolerated dose (log mg/kg/day)	0.70	0.69	0.44
hERG blockers	Yes	No	No
Oral Rat Acute Toxicity (log[1/(mol/kg)])	2.41	2.71	2.71
Oral Rat Chronic Toxicity [log(mg/kg_bw/day)]	0.80	0.61	0.89
Hepatoxicity	Yes	Yes	Yes
Respiratory diseases	Yes	No	No
Skin sensitization	No	No	No
Eye irritation	No	No	No
Carcinogenesis	No	No	No
Biodegradation	No	No	No

MATERIAL METHODS

Chemistry

All the chemicals used to synthesize final compounds provided from Merck Co (Darmstadt, Germany). Reactions in the procedure monitored by thin layer chromatography (TLC) analysis. Melting points of final molecules detected by Electrothermal 9300 digital melting point apparatus (Essex, UK). Structural analysis of the compounds made by nuclear magnetic resonance spectrometry (^{1}H and ^{13}C spectrometer, Bruker Bioscience, USA).

Scheme 2. Synthetic scheme. *Reaction conditions:* **i)** THF, TEA, Chloracetyl chloride, 0°C, **ii)** Acetone, K_2CO_3, 1 hour, rt, **iii)** Bromine, HBr, AcOH, 1 hour, rt, **iv)** Thiobenzamide/4-methoxythiobenzamide/thiourea, EtOH, 1 hour, rt.

Table 5. Synthesized compounds and substituents.

Compounds	R_2
4a	Phenyl
4b	4-OCH_3 Phenyl
4c	NH_2

N-(4-acetylphenyl)-2-chloroacetamide (1)

4-Aminoacetophenone (1 eq) dissolved in tetrahydrofuran (THF). Reaction cooled to 0°C to slowed down the reaction. 1.5 eq dimethyl formamide added to reaction mixture as a catalyst. Acetylation agent chloracetyl chloride diluted with THF and added dropwise to the reaction. After chloracetyl chloride addition completed TLC analysis conducted, according to the result reaction finalized by evaporating the solvent. Dried content washed with water, filtered and dried.

N-(4-Acetylphenyl)-2-((5-chlorobenzothiazol-2-yl)thio)acetamide (2)

2-Mercapto-5-chlorobenzothiazole (1 eq) and *N*-(4-acetylphenyl)2-chloroacetamide (1eq) dissolved in acetone. Then potassium carbonate (1.5 eq) added to the flask and stirred for 1 hour at room temperature. After TLC analysis reaction condition determined and finalized. All solvent evaporated obtained crude washed with water and filtered. Finally recrystallized from ethanol.

N-(4-(2-bromoacetyl)phenyl)-2-((5-chlorobenzothiazol-2-yl)thio)acetamide (3)

N-(4-Acetylphenyl)-2-((5-chlorobenzothiazol-2-yl)thio)acetamide (**2,** 1 eq) dissolved in acetic acid. Reaction flask placed in ice-cold bath. Hydrogen bromide (HBr) added at catalytic amount approximately 5-6 drops. For bromination, first bromine (1.2 eq) diluted in acetic acid, then added dropwise to the reaction. After bromine addition was done, reaction checked with TLC. Reaction mixture was poured into ice-cold water, formed solid product filtered and dried.

2-((5-Chlorobenzothiazol-2-yl)thio)-N-(4-(2-(substituted)thiazol-4-yl)phenyl)acetamide (4a-4c)

N-(4-(2-Bromoacetyl)phenyl)-2-((5-chlorobenzothiazol-2-yl)thio)acetamide (**3**, 1 eq) and thiobenzamide/4-methoxythiobenzamide/thiourea (1 eq) dissolved in ethanol and stirred for 1 hour at room temperature. Reaction checked via TLC analysis. Formed final compound filtered and dried. Compounds are recrystallized from ethanol.

In Silico Studies

SwissADME and CAS BioFinder software programs calculated the physicochemical parameters of the compounds. Compounds have been launched to the program with their Smile codes. SwissADME program also provided BBB penetration rates as boiled egg illustration. The prediction of potential activity and toxicity profiles was performed using SwissTarget Prediction and Deep-PK software programs.

CONCLUSION

Novel seven benzothiazole/thiazole based compounds (**4a-4c**) were synthesized according to the procedure and structural analyses were evaluated via spectral analysis. Physicochemical, pharmacokinetic and toxicity profile of the compounds were estimated via various software. Kinase and family AG protein-coupled receptors were main targets of the most compounds results of the SwissADME prediction. More distinguished targets were predicted by BioFinder. The carbonic anhydrase enzyme was the most widely targeted compound. By validating these software programs, more accurate results can be obtained, and further research can be planned based on the data obtained. According to the results obtained, **4b** is the most promising compound to investigate for further investigations. To advance the work to the next level, it is necessary to derivatize the compounds. *In vitro* studies must be supported by molecular docking and dynamics simulation, according to the findings.

Aldent University, Faculty of Medical Thecnical Sciences, Tirana, Albania.

Abstract

University students often experience elevated stress levels, particularly during exams and assignment deadlines, which may lead to unhealthy lifestyle habits. This study aimed to assess the relationship between perceived stress and eating behaviors among University students. A cross-sectional descriptive study was conducted among 400 students, from Aldent University of whom 85% were female and 15% male, mostly aged 18–20 years (69.5%). Data were collected through a structured online questionnaire and analyzed using descriptive statistics. Questionnaires were distributed among the students as an electronic form. They were encouraged to answer honestly. Findings revealed that 39% of students reported high stress levels. The main sources of stress were exams, tight deadlines, and academic overload. Regarding sleep, 50% reported sleeping 5–6 hours per night. Stress significantly influenced eating patterns: 59.3% experienced loss of appetite. 35.5% consumed more sweets and fast food under stress. Caffeine and energy drink consumption increased in 16.5% of respondents, while 35.3% consumed them daily. Fast food was consumed two to three times weekly by 36.5% of participants. Nearly half of the students (47.7%) reported irregular meals, and 48.5% did not engage in any physical activity. Over half (56.5%) believed that stress affects their body weight, while 38% acknowledged insufficient nutritional knowledge. Encouragingly, 61.3% expressed interest in training programs on stress management and healthy nutrition. High academic stress among university students is closely linked to irregular eating habits, reduced sleep duration, and low physical activity. Interventions focusing on stress management and nutritional education are essential to promote healthier coping behaviors and overall student well-being.

Keywords: Academic stress, eating habits, nutritional education

INTRODUCTION

University students represent a population particularly vulnerable to stress due to academic pressures, lifestyle changes, and the transition toward independent living. Academic stress, which arises from exams, tight deadlines, and heavy coursework, can significantly influence both mental and physical health outcomes. According to the **World Health Organization (WHO, 2023)**, stress-related disorders are among the most common psychological challenges affecting young adults, with direct implications for their eating behavior and general well-being.

Previous research has shown that elevated stress levels are often linked to **emotional eating, increased consumption of high-calorie or sugary foods**, and decreased physical activity. Studies conducted by **Harvard Health (2023) and Elsevier (2022)** emphasize that students under stress tend to consume more caffeine, snacks, and fast food, while neglecting balanced meals. Such behaviors not only contribute to weight changes but also to nutrient imbalances, sleep disturbances, and long-term metabolic issues. In addition, university life often introduces irregular daily routines, limited time for meal preparation, and social or emotional triggers that further alter eating patterns. Evidence from **Oxford Academic (2021)** indicates that stress-related eating habits during university years may persist into adulthood, increasing the risk of obesity, hypertension, and cardiovascular diseases.

In Albania, little is known about how academic stress affects students' dietary patterns and physical activity. This study, conducted at **Aldent University**, aims to explore the relationship between stress, eating behaviors, and perceived weight changes among students from different study programs. Understanding these associations is crucial for designing effective health promotion strategies and educational interventions targeting young adults in academic environments.

MATERIALS AND METHODS

Study design and participants

A cross-sectional descriptive study was conducted among students of Aldent University, a private higher education institution in Tirana, Albania. The research aimed to evaluate the relationship between academic stress, eating habits, and weight-related behaviors. A total of 400 students participated in the study, recruited voluntarily through an online questionnaire distributed via Google Forms. Participation was anonymous and confidential. The inclusion criteria required students to be enrolled in undergraduate health programs, including Nursing, Pharmacy, Dentistry, Physiotherapy, Laboratory Technology, and Imaging Technology.

2.2 Research instrument

Data were collected using a structured, self-administered questionnaire designed specifically for this study. The instrument consisted of four main sections:

Demographic information (gender, age, and study program),

Academic stress (frequency, intensity, and sources of stress such as exams, deadlines, and workload),

Eating habits and nutritional behaviors (meal frequency, food type preferences, caffeine and fastfood consumption, appetite changes under stress),

Physical activity and lifestyle factors (exercise frequency, sleep patterns, and self-perception of weight).The questionnaire was validated by a panel of academic experts from the Faculty of Health Sciences, and a **pilot test** was conducted with 20 students to ensure clarity and reliability. Cronbach's alpha coefficient was calculated at **0.87**, indicating good internal consistency.

Data collection procedure

Data collection took place over a two-week period in 2025. Participants completed the questionnaire electronically, requiring approximately **10–15 minutes**. Prior to participation, students were informed about the purpose of the research and provided digital consent.

Data analysis

Data were entered and analyzed using **Microsoft Excel and IBM SPSS Statistics (version 26.0)**. Descriptive statistics (frequencies, means, and percentages) were used to summarize categorical variables. **Pearson's correlation coefficient (r)** was applied to examine the relationship between stress levels and dietary behaviors, physical activity, and nutrition knowledge. Statistical significance was set at $\mathbf{p < 0.05}$.

2.5 Ethical considerations

The study was approved by the **Ethics Committee of Aldent University**. Participation was voluntary, and no personal identifying information was collected. All responses were treated with strict confidentiality and used

exclusively for academic and research purposes.

Tables and Figures

Demographic characteristics of participants

Table 1. Gender distribution of participants (N = 400)

Gender	Frequency (n)	Percentage (%)
Male	60	15.0
Female	340	85.0
Total	**400**	**100.0**

The study population was predominantly female, representing 85% of participants.

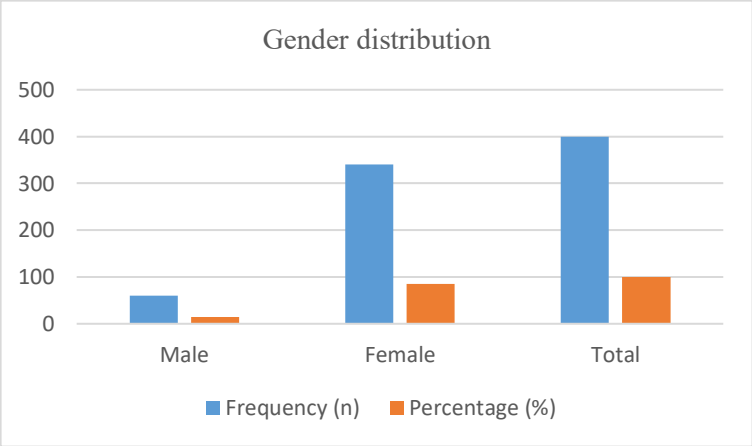

Figure.1 Gender distribution of participants.

Table 2. Age distribution of participants (N = 400)

Age group (years)	Frequency (n)	Percentage (%)
18–20	278	69.5
21–23	109	27.3
24–26	8	2.0
Above 26	5	1.2
Total	**400**	**100.0**

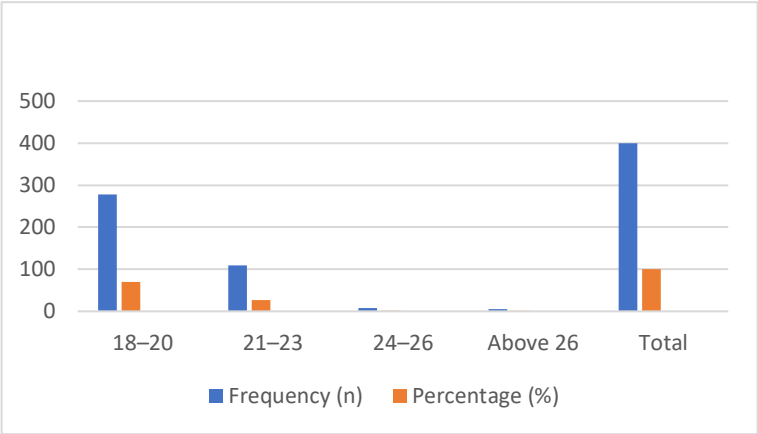

Figure 2. Age distribution of participants (N = 400)

Most respondents were aged between 18–20 years, consistent with typical undergraduate demographics.

Table 3. Distribution of students by field of study (N = 400)

Study program	Frequency (n)	Percentage (%)
Nursing	175	43.8
Pharmacy	59	14.8
Dentistry	58	14.5
Laboratory technology	51	12.8
Physiotherapy	16	4.0
Imaging technology	38	9.5
Total	**400**	**100.0**

Nursing students constituted the largest group, followed by Pharmacy and Dentistry students.

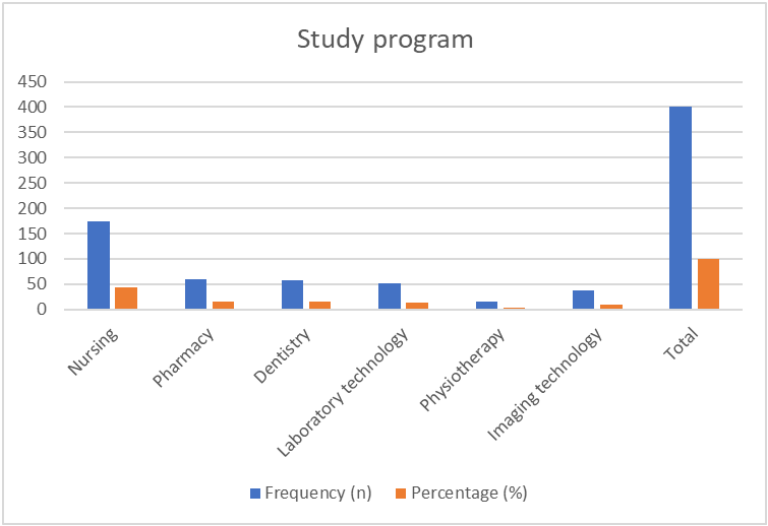

Figure 3. Distribution of students by field of study (N = 400)

Table 4. Housing status among students (N = 400

Housing status	Frequency (n)	Percentage (%)
Living with parents	172	43.0
Living independently	228	57.0
Total	**400**	**100.0**

More than half of students (57%) reported living independently. The results indicate that a slight majority of students (57%) live independently, while 43% continue to live with their parents. Living independently may influence lifestyle behaviors, including eating habits, stress levels, and time management. Students living on their own may face additional pressures related to academic workload, financial responsibilities, and household tasks, potentially contributing to less structured meal patterns and higher stress levels. Conversely, students living with parents may benefit from greater emotional, financial, and nutritional support, which can positively influence their overall well-being.

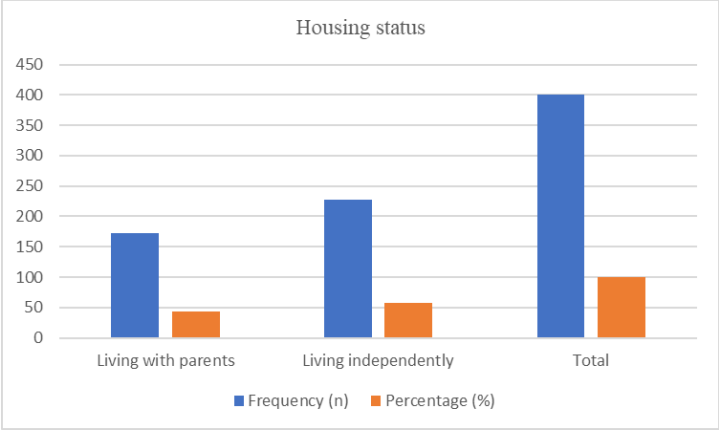

Figure 4. Housing status among students (N = 400)

Table 5. Frequency of stress during exams (N = 400)

Response	Frequency (n)	Percentage (%)
Always	158	39.5
Often	157	39.3
Sometimes	70	17.5
Rarely	10	2.5
Never	5	1.2
Total	**400**	**100.0**

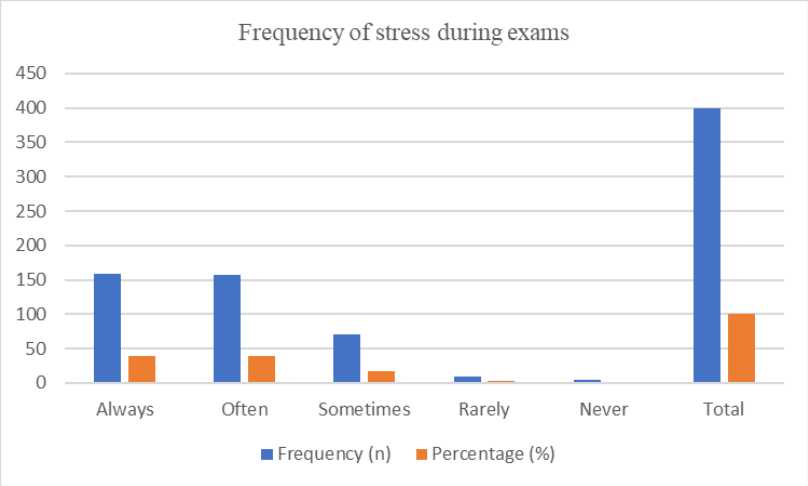

Figure 5. Frequency of stress during exams (N = 400)

The results show that stress during exams is highly prevalent among university students, with the majority reporting frequent stress. Specifically, 39.5% of students indicated that they always feel stressed during exam periods, and an additional 39.3% reported feeling stressed often. Together, this accounts for nearly 79% of the total sample, demonstrating that exam-related stress is a widespread and persistent issue.

A smaller proportion of students (17.5%) reported experiencing stress only sometimes, suggesting that while they may not experience constant pressure, exam periods still trigger significant emotional tension. Very few students reported rarely (2.5%) or never (1.2%) experiencing stress, indicating that minimal stress during exams is uncommon.

Table 6. Perceived overall level of stress during studies (N = 400)

Stress level	Frequency (n)	Percentage (%)
Very high	60	15.0
High	156	39.0
Moderate	169	42.3
Low	8	2.0
Very low	7	1.7
Total	**400**	**100.0**

A total of 81.3% of students reported moderate to high stress levels during their studies.

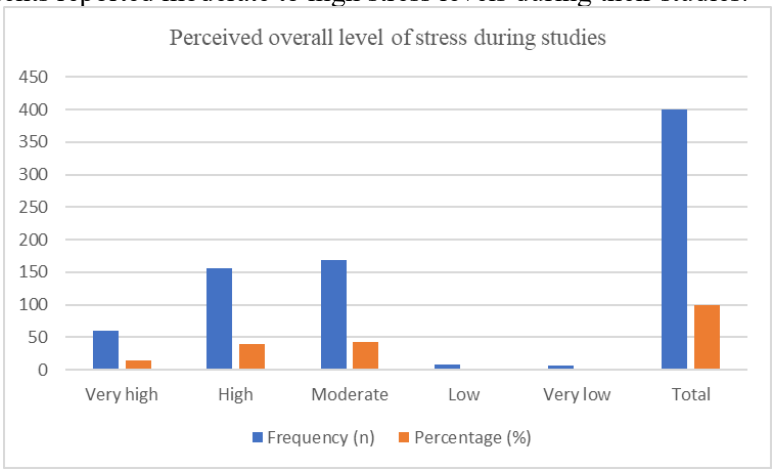

Figure. 6 Perceived overall level of stress during studies (N = 400)

Table 7. Average hours of sleep per night (N = 400)

Sleep duration	Frequency (n)	Percentage (%)
Less than 5 hours	38	9.5
5–6 hours	200	50.0
7–8 hours	152	38.0
More than 8 hours	10	2.5
Total	**400**	**100.0**

Half of the students reported sleeping only 5–6 hours per night, indicating reduced rest likely associated with academic stress.

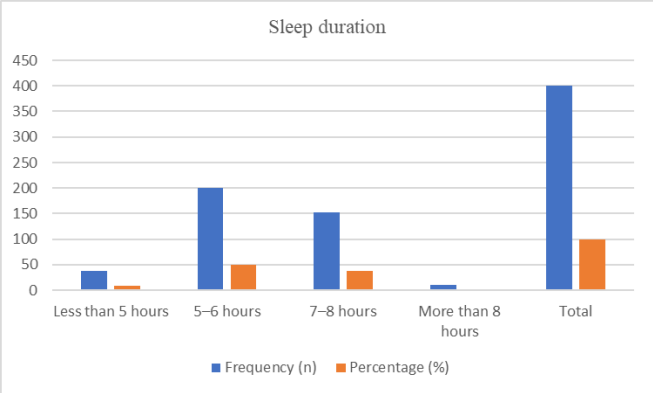

Figure 7. Average hours of sleep per night among students (N = 400)

Half of the participants (50%) reported sleeping 5–6 hours per night, which is below the commonly recommended 7–9 hours for young adults. Additionally, 9.5% sleep less than 5 hours, indicating a concerning level of sleep deprivation within a segment of the student population. Only 38% of students reported sleeping 7–8 hours, falling within the optimal range for healthy cognitive and physiological functioning. A very small proportion (2.5%) reported sleeping more than 8 hours, which may reflect individual variation or compensatory sleep patterns following periods of sleep deficit.

These findings suggest that inadequate sleep is prevalent among university students. Insufficient sleep has been widely documented in the literature as a significant contributing factor to stress, impaired concentration, decreased academic performance, emotional instability, and unhealthy eating behaviors. The high percentage of students sleeping fewer than 6 hours per night may help explain the elevated levels of stress and irregular dietary patterns observed in this study.

Eating habits under stress

Table 8. Changes in eating behavior when stressed (N = 400)

Behavioral change	Frequency (n)	Percentage (%)
Eat less than usual	92	23.0
Eat more than usual	70	17.5
Consume more sweets / fast food	53	13.3
Increase caffeine / energy drinks	66	16.5
No change	119	29.7
Total	**400**	**100.0**

The most common coping behavior under stress was eating less (23%) or consuming more caffeine and energy drinks (16.5%).

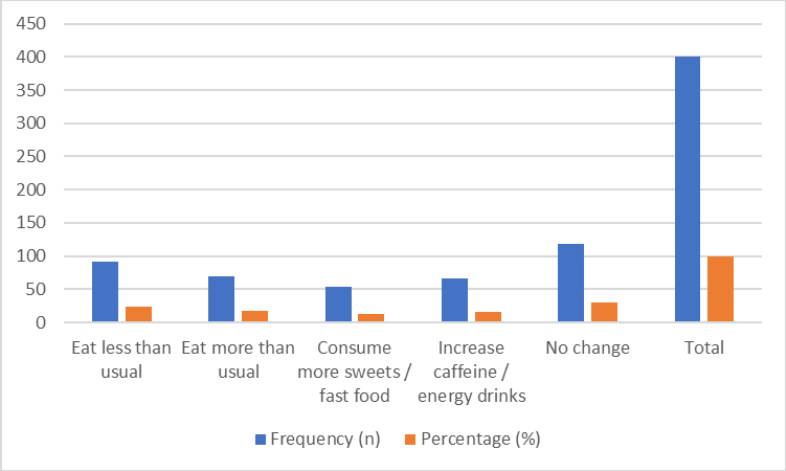

Figure 8. Stress-related changes in eating habits (N = 400)

This figure demonstrates the variations in eating habits during stressful periods. Reduced appetite and increased caffeine consumption were the most reported responses.

Table 9. Frequency of physical activity among students (N = 400)

Frequency	**Frequency (n)**	**Percentage (%)**
Daily	26	6.5
3–4 times per week	41	10.0
1–2 times per week	140	35.0
Rarely	99	24.5
Never	94	24.0
Total	**400**	**100.0**

Almost half of the participants (48.5%) reported engaging in physical activity rarely or never, reflecting sedentary tendencies.

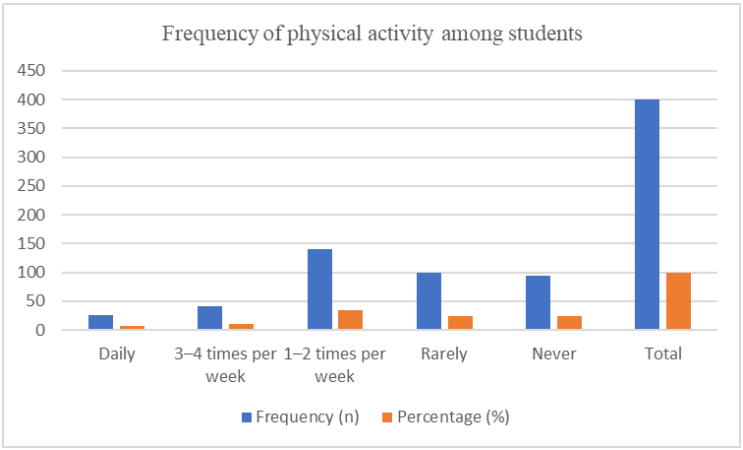

Figure 9. Frequency of physical activity among students (N = 400)

This figure illustrates the physical activity distribution. Only a small portion of students (6.5%) exercise daily.

Table 10. Students' perception of whether nutrition affects stress-coping (N = 400)

Response	Frequency (n)	Percentage (%)
Yes, it affects positively	144	36.0%
Yes, it affects negatively	108	27.0%
Not much	148	37.0%
Total	**400**	**100.0%**

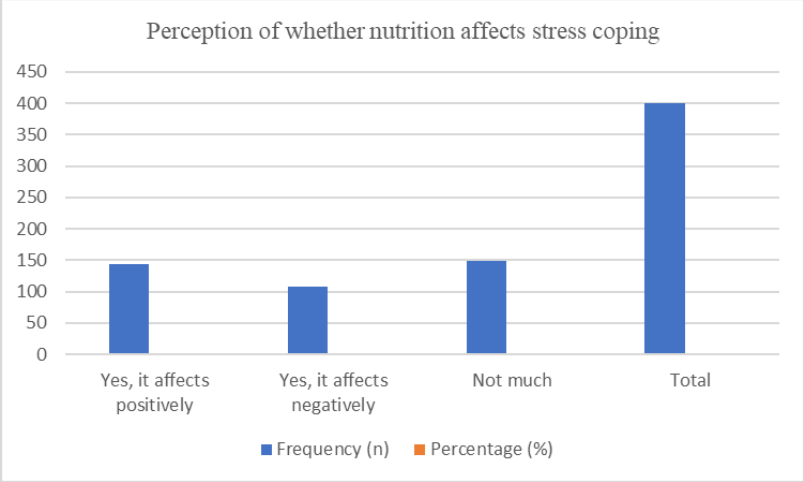

Figure.10 Students' perception of whether nutrition affects stress-coping (N = 400)

Specifically, 36% of respondents believe that nutrition has a positive impact on how they manage stress. This suggests that more than one-third of students perceive healthy eating habits as supportive in enhancing resilience, mood stability, and overall stress management.

Meanwhile, 27% of students report that nutrition affects their stress-coping ability negatively. This group may associate poor dietary patterns—such as increased consumption of fast food, sweets, or caffeine—with heightened stress levels or reduced emotional stability. This aligns with existing literature showing that unhealthy eating behaviors can exacerbate stress responses and decrease cognitive functioning. Interestingly, the largest group, 37%, stated that nutrition does not significantly influence how they cope with stress. This indicates that a substantial proportion of students may not fully understand or acknowledge the role that diet plays in psychological well-being, or they may prioritize other factors such as sleep, social support, or physical activity.

Overall, the results highlight a diversity of perceptions among students. However, the combined 63% who believe nutrition has either a positive or negative effect suggests a general awareness that dietary behaviors are intertwined with stress experiences. This underscores the importance of educational interventions that emphasize the role of nutrition in mental health and stress regulation.

Table 11. Students' Perception of Having Sufficient Information on Healthy Nutrition (N = 400)

Response	Frequency (n)	Percentage (%)
Yes	106	26.5%
No	152	38.0%
Not sure	142	35.5%
Total	**400**	**100.0%**

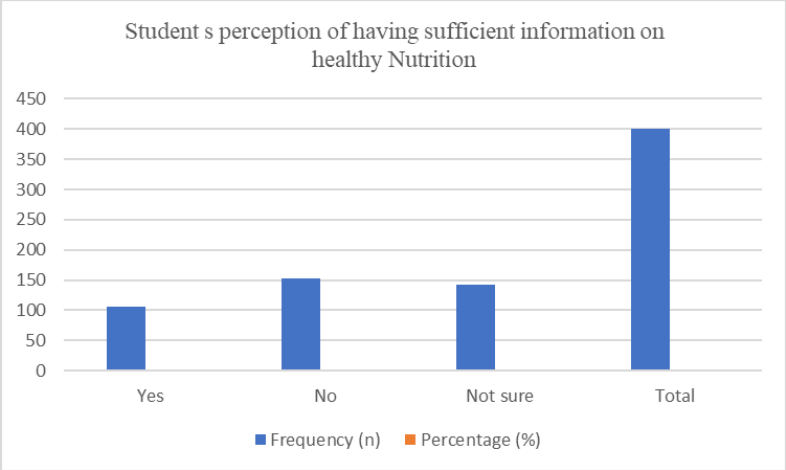

Figure 11. Students' Perception of Having Sufficient Information on Healthy Nutrition

The results indicate that a considerable proportion of students feel uncertain or uninformed about healthy nutrition. Specifically, 38% of respondents believe that students do not have sufficient information on healthy eating, making this the largest response group. This finding suggests significant gaps in nutritional knowledge among the student population. Additionally, 35.5% of students report being unsure whether they have adequate information on healthy nutrition. This high level of uncertainty highlights a lack of confidence in their nutrition-related understanding and may reflect inconsistent exposure to reliable dietary education or unclear sources of nutritional guidance.

Table 12. Interest in Seminars or Training on Stress Management and Healthy Nutrition (N = 400)

Response	**Frequency (n)**	**Percentage (%)**
Yes	245	61.3%
No	61	15.2%
Maybe	94	23.5%
Total	**400**	**100.0%**

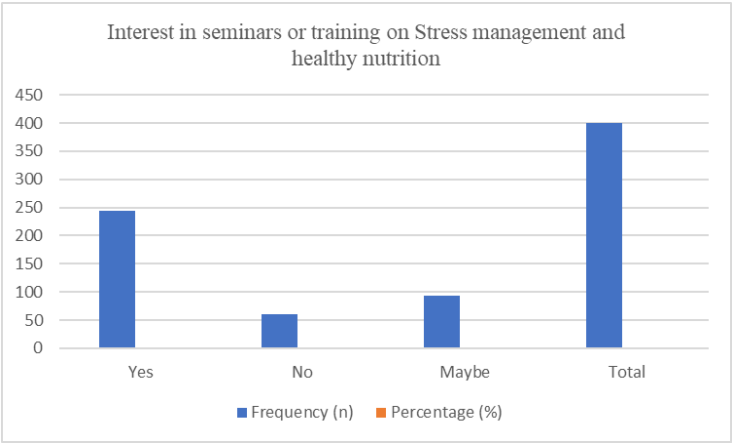

Figure 12. Interest in Seminars or Training on Stress Management and Healthy Nutrition (N = 400)

The findings show a strong level of interest among students in receiving additional education on stress management and healthy nutrition. Specifically, 61.3% of respondents indicated that they would be interested in seminars or training on these topics. This majority response suggests that students recognize the value of such educational initiatives and may be actively seeking strategies to better manage stress and improve their dietary habits.

Table 13. Students' perception of whether stress has influenced their weight (N = 400)

Response	Frequency (n)	Percentage (%)
Yes, a lot	226	56.5%
Sometimes	144	36.0%
Not at all	30	7.5%
Total	**400**	**100.0%**

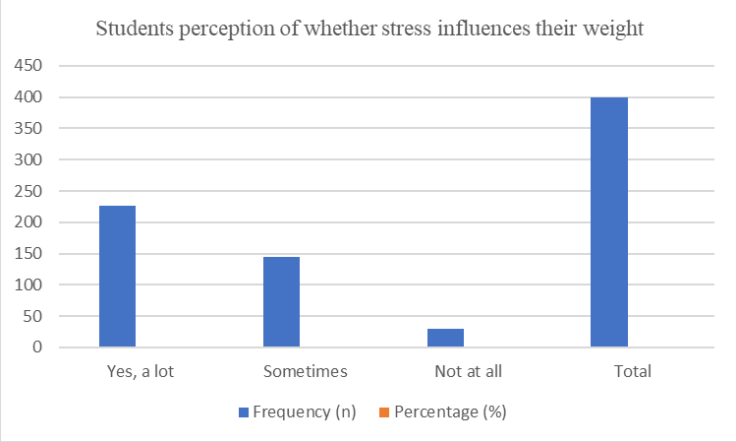

Figure 13. Students' perception of whether stress has influenced their weight

The results show that more than half of the students (56.5%) believe that stress has significantly contributed to either weight gain or weight loss. This indicates that stress is perceived as a major factor affecting body weight among university students. Another 36% reported that stress has influenced their weight sometimes, suggesting that even for students who do not consistently experience stress-related weight changes, stress still plays a noticeable role in their physical well-bein

Correlation analysis

Table 14. Correlation between stress level and selected variables (N = 400

Variables	r-value	p-value	Interpretation
Stress ↔ Fast food consumption	0.42	< 0.01	Moderate positive correlation
Stress ↔ Sweet food preference	0.36	< 0.01	Positive correlation
Stress ↔ Caffeine intake	0.33	< 0.01	Positive correlation
Stress ↔ Physical activity	–0.38	< 0.01	Moderate negative correlation
Field of study ↔ Nutrition knowledge	0.29	< 0.05	Weak positive correlation
Stress ↔ Weight change	0.41	< 0.01	Moderate positive correlation

Significant correlations were observed between higher stress levels and increased consumption of fast food, sweets, and caffeine, as well as reduced physical activity.

The correlation analysis provides important insights into the relationship between academic stress and key lifestyle behaviors among university students. First, a moderate positive correlation was found between stress level and fast-food consumption ($r = 0.42$, $p < 0.01$). This indicates that students experiencing higher stress are more likely to consume fast food more frequently. This trend aligns with well-documented evidence showing that students often rely on convenience foods when under pressure due to time constraints, emotional burden, and reduced motivation for healthy meal preparation.

Similarly, stress showed a positive correlation with sweet food preference ($r = 0.36$, $p < 0.01$). This suggests that as stress increases, students are more likely to crave or consume sugary snacks, consistent with research linking stress to emotional eating and increased preference for high-sugar, high-fat foods as short-term coping mechanisms. A positive correlation between stress and caffeine intake was also observed ($r = 0.33$, $p < 0.01$). This means that students with higher stress levels tend to consume more caffeinated beverages such as coffee and energy drinks, likely as an attempt to maintain alertness during academic overload. This behavior is frequently reported among university populations facing tight deadlines and exam-related pressure.

In contrast, stress was moderately and negatively correlated with physical activity ($r = –0.38$, $p < 0.01$). This demonstrates that students who experience higher stress levels are less likely to engage in regular exercise. High stress may reduce motivation, energy, or available time for physical activity, which could further exacerbate stress and negatively impact overall well-being.

Finally, the correlation between field of study and nutrition knowledge was weak but positive ($r = 0.29$, $p < 0.05$). This suggests that students in health-related programs (e.g., Nursing, Physiotherapy, Dentistry, Pharmacy) tend to have slightly better nutrition knowledge compared to those in non-nutrition-focused fields. However, the weakness of this correlation indicates that nutrition knowledge is not exclusively determined by program of study and may depend on personal interest, exposure to health topics, or prior education.

The correlation between stress and weight change ($r = 0.41$, $p < 0.01$) indicates a moderate positive relationship, meaning that as stress levels increase, students are more likely to experience fluctuations in weight—either weight gain or weight loss. This aligns with the descriptive data, where 56.5% of participants reported that stress affected their weight “a lot,” and another 36% said it affected their weight “sometimes.”

This positive correlation supports existing evidence that high stress disrupts eating patterns, appetite regulation, and metabolic balance, contributing to both overeating or appetite suppression depending on the individual.

Collectively, these correlations underscore a pattern where higher academic stress is associated with unhealthy eating behaviors, higher caffeine use, and reduced physical activity—factors that can further undermine mental and physical health. The findings highlight the urgent need for university-based interventions that integrate stress management, nutrition education, and physical activity promotion to support healthier coping mechanisms among students.

The scatter plot illustrates positive relationships between stress and unhealthy eating behaviors and a negative relationship between stress and physical activity.

RESULTS

The findings of this study revealed that the majority of participants were young female students, primarily enrolled in Nursing and Pharmacy programs. Most students reported experiencing frequent or constant stress during exams, with perceived stress levels categorized as moderate to high in over 80% of cases. Sleep deprivation was common, with half of the respondents sleeping only 5–6 hours per night.

Stress significantly influenced students’ eating habits: nearly one in four students ate less under stress, while others increased their consumption of fast food, sweets, and caffeine. Physical activity levels were generally low, with almost half of participants reporting no regular exercise.

Correlation analysis demonstrated a positive association between stress and unhealthy eating behaviors (fast food, sweets, and caffeine intake) and a negative correlation between stress and physical activity. Additionally, students from health-related programs exhibited higher nutrition awareness, indicating the importance of educational background in promoting healthier coping mechanisms.

Overall, these findings emphasize the need for targeted interventions within universities to reduce academic stress, promote mental well-being, and encourage balanced nutrition and physical activity among students.

DISCUSSION

The findings of this study demonstrate a significant relationship between academic stress, eating behaviors, and physical activity among university students. The high prevalence of stress reported (nearly 80% experiencing

frequent or constant stress) aligns with evidence from international studies published in **PubMed** and **Elsevier**, which indicate that academic pressure is one of the most consistent predictors of poor mental well-being among young adults (Lee et al., 2022; Shankar & Park, 2023).

Consistent with the results of the current research, studies have shown that psychological stress often triggers **emotional or compensatory eating behaviors**, leading to the consumption of **high-calorie, sugar-rich, or processed foods** (Adam & Epel, 2021; Torres & Nowson, 2022, *PubMed Central*). In this study, 36.5% of participants reported eating fast food 2–3 times per week, and 35.3% consumed caffeine daily—habits that mirror global trends among university students (Harvard Health Publishing, 2023). Such stress-induced dietary choices are associated with transient relief of anxiety but may result in metabolic dysfunction, including weight gain and sleep disturbances.

The study also identified that **stress negatively affects physical activity**, with almost half of the students (48.5%) reporting a sedentary lifestyle. This observation is supported by findings from **WHO (2023)** and **Oxford Academic (2021)**, which emphasize that chronic academic stress contributes to fatigue, low motivation, and reduced engagement in exercise, further increasing the risk of obesity and cardiovascular disorders.

An encouraging observation is that students from health-related disciplines demonstrated higher levels of nutritional knowledge ($r = 0.29$, $p < 0.05$). Similar associations were observed in research indexed on **PubMed** (Al-Rethaiaa et al., 2021; Musaiger et al., 2020), suggesting that health sciences curricula can promote awareness and preventive behaviors related to diet and stress management.

Overall, the results reinforce the growing concern that **academic stress significantly alters health-related behaviors**, increasing the likelihood of unhealthy dietary intake, irregular meal patterns, and reduced physical activity. These findings highlight the urgent need for university-based interventions focused on **mental health support, nutritional education, and lifestyle counseling**, as recommended by **WHO's Global Strategy on Health Promotion (2023)**.

CONCLUSION

This study highlights the strong relationship between academic stress and lifestyle behaviors among university students, revealing significant implications for their mental and physical health. The findings showed that 39.5% of students experienced constant stress during examinations, and an additional 39.3% frequently felt stressed. Nearly half of the participants (39%) rated their stress as high, and 15% as very high, confirming that academic stress is a widespread issue in higher education (Solomou & Constantinidou, 2023; Choi et al., 2020).

Consistent with previous evidence, students under higher stress reported poor dietary patterns and reduced physical activity (El-Zayat et al., 2025; Mitri et al., 2025). In this study, 23% reported eating less when stressed, while 17.5% consumed more food than usual, often favoring sugary and high-calorie foods. Approximately 36.5% consumed fast food two to three times per week, and 35.3% reported daily intake of caffeine or energy drinks. These results align with prior research linking academic stress to emotional or disordered eating (Adam & Epel, 2007; Caso et al., 2020; Shatwan et al., 2024). Moreover, 56.5% of respondents believed that stress directly influences their body weight, reflecting findings by Nowson and Torres (2007) on stress-related metabolic changes.

Sleep deprivation emerged as a major concern, with 50% of students sleeping only 5–6 hours per night and nearly 10% reporting fewer than 5 hours of sleep. Prior studies confirm that stress and irregular sleep significantly impair cognitive function and increase vulnerability to anxiety and depression (Huang et al., 2024; Vega-Martínez et al., 2023). Likewise, 48.5% of participants reported never engaging in physical activity, underscoring the sedentary habits typical of stressed students (Teuber et al., 2024; White et al., 2024).

Encouragingly, 61.3% of students expressed interest in educational programs focused on stress management and healthy nutrition. This suggests a readiness among young adults to adopt healthier coping mechanisms if supported institutionally. Such findings reinforce global recommendations emphasizing early preventive strategies for student mental health and lifestyle improvement (WHO, 2023; Vasconcelos et al., 2025). Additionally, many students lack sufficient knowledge about healthy nutrition, and more than half show strong interest in attending training or seminars on stress management and healthy eating. This indicates a significant educational gap and a clear opportunity for universities to develop evidence-based health promotion programs.

Overall, the findings highlight the need for targeted interventions that address both academic stress and nutritional education. Universities should consider integrating workshops, counseling services, and structured wellbeing programs aimed at fostering healthier coping strategies, improving dietary behaviors, and reducing the negative impact of stress on students' physical and mental health.

RECOMMENDATIONS

Based on the findings of this study, several recommendations can be made to support student well-being, promote healthier lifestyle behaviors, and reduce the negative effects of academic stress:

Implement university-based stress management programs

Given that more than 80% of students reported moderate to high stress levels, universities should establish structured stress management initiatives. These may include mindfulness training, time-management workshops, mental health counseling, and peer-support systems. Consistent exposure to evidence-based stress-reduction techniques can improve students' emotional resilience and academic performance.

Integrate nutrition education into university curricula

With only 26.5% of students believing they possess sufficient nutrition knowledge, there is a clear need for comprehensive dietary education. Universities should incorporate optional or mandatory modules, guest lectures, or seminars focused on healthy eating, dietary planning, and understanding stress-related eating patterns.

Promote healthier food environments on campus

Since stress was positively correlated with fast-food and sweet consumption, educational institutions should ensure the availability of affordable, nutritious food options on campus. Introducing healthier cafeteria menus, vending-machine alternatives, and awareness campaigns can help shift student choices toward balanced nutrition.

Encourage regular physical activity through accessible programs

The strong negative correlation between stress and physical activity suggests that exercise is an underused coping mechanism. Institutions should promote physical activity by offering free or low-cost gym access, organizing sports clubs, and integrating short physical-activity breaks into academic schedules.

Develop targeted interventions for high-risk groups

Students with higher stress levels and irregular eating patterns should be prioritized for early intervention. Counseling services, nutritional coaching, or personalized support programs can help them build healthier behaviors and reduce long-term health risks.

Utilize digital platforms for health promotion

Given that university students are highly engaged with technology, mobile apps, online webinars, and virtual coaching programs can effectively deliver nutrition education, stress-coping strategies, and motivational tools for healthier behaviors.

Strengthen collaboration between academic departments and student wellness offices

Interdisciplinary cooperation—between health sciences, psychology, nursing, and nutrition units—can lead to comprehensive wellness initiatives and improve the reach and effectiveness of health promotion activities.

Conduct periodic monitoring and follow-up studies

Universities should regularly assess students' stress levels and lifestyle habits to identify emerging trends and evaluate the effectiveness of interventions. Longitudinal research is recommended to explore how academic stress impacts long-term physical and mental health outcomes.

Universities should integrate structured, multidisciplinary programs that promote stress management, balanced nutrition, adequate sleep, and physical activity. Collaborative interventions involving healthcare professionals, educators, and psychologists can mitigate the adverse health impacts of chronic academic stress and foster resilience among students. Future longitudinal and intervention-based studies are recommended to further explore causal pathways between academic stress, eating behaviors, and metabolic health (Donnelly et al., 2024; Jurado-Gonzalez et al., 2025).

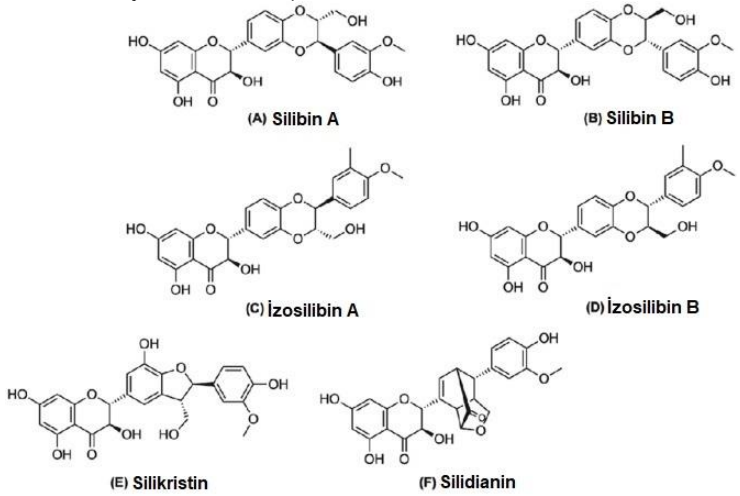
Özet
Silimarin, süt devedikeni (*Silybum marianum*) bitkisinin tohumlarında bulunan bir flavonolignan kompleksidir. Geleneksel tıpta uzun zamandır bitkisel bir takviye olarak kullanılmaktadır ve modern bilimsel çalışmalar da potansiyel sağlık yararlarını desteklemektedir. Bu kompleks silibin, izosilibin, silikristin ve silidianin içermektedir. Silimarin, günümüzde hem insan hem de hayvan sağlığında tamamlayıcı ve destekleyici bir tedavi seçeneği olarak bilimsel çalışmaların konusudur. Hayvan sağlığı ile ilgili deneysel ve klinik çalışmalarda, silimarinin birçok sistem üzerinde önemli faydalı etkilere sahip olduğu bildirilmiştir. Silimarin, karaciğer hücre yenilenmesini destekleyerek, inflamasyonu baskılayarak, toksinlerin hücrelere girmesini ve fibrozu önleyerek karaciğer hastalıklarında koruyucu ve tedavi edici bir destek olarak başarıyla kullanılmaktadır. Güçlü antioksidan özellikleri sayesinde silimarin, serbest radikallerin neden olduğu oksidatif hücre hasarını önleyerek çeşitli organların, özellikle de karaciğerin işlevsel bütünlüğünün korunmasında önemli bir rol oynamaktadır. Antiinflamatuar etkisi inflamasyonu azaltmaya yardımcı olmakta, bağışıklık sistemini desteklemekte ve inflamatuar hastalıklar için diğer tedavilerle birlikte kullanılmaktadır. Silimarinin deneysel modellerde insülin direncini azalttığı, diyabet gelişimini önlediği, glukoz metabolizmasını artırdığı ve diyabetle ilişkili komplikasyonları önlediği gösterilmiştir. Silimarinin nöronları oksidatif strese karşı koruduğu ve merkezi sinir sistemindeki inflamasyonu baskılayarak nörodejeneratif süreçlere karşı potansiyel nöroprotektif etkiler gösterdiği gözlemlenmiştir. Klinik ve deneysel çalışmalar silimarinin, tümör hücrelerinin çoğalmasını engellediğini göstermiştir. Silimarin metabolik bozukluklar, karaciğer hastalıkları, nörodejeneratif hastalıklar, oksidatif stres ve inflamasyon ile kanserle ilişkili birçok sağlık sorununda tamamlayıcı tedavi seçeneği olarak başarıyla kullanılmaktadır. Ancak silimarinin biyoyararlanımı, etkinliği ve güvenlik profili türler arasında değiştiğinden doz-cevap ilişkileri ve emilimi, dağılımı, metabolizması ve atılımı ile ilgili süreçler hakkında daha kapsamlı araştırmalara ihtiyaç duyulduğu düşünülmektedir.

Anahtar kelimeler: Hayvan sağlığı, fitoterapötik, silimarin.

A phytotherapeutic hope: Clinical and experimental evidence on the effects of silymarin in animal health



Abstract
Silymarin is a flavonolignan complex found in the seeds of the milk thistle (*Silybum marianum*) plant. Traditional medicine has long used it as an herbal supplement, and modern scientific studies also support its potential health benefits. This complex contains silybin, isosilybin, silicristin, and silidianin. Silymarin is currently the subject of scientific studies as a complementary and supportive treatment option in both human and animal health. In experimental and clinical studies related to animal health, silymarin has been reported to have significant beneficial effects on many systems. Silymarin is successfully used as a protective and therapeutic support in liver diseases by supporting liver cell regeneration, suppressing inflammation, preventing toxins from entering cells, and preventing fibrosis. Owing to its potent antioxidant properties, silymarin plays a significant role in protecting the functional integrity of various organs, particularly the liver, by preventing oxidative cell damage caused by free radicals. Its anti-inflammatory effect helps reduce inflammation, supports the immune system, and is used alongside other treatments for inflammatory diseases. Silymarin has been shown to reduce insulin resistance, prevent the development of diabetes, enhance glucose metabolism, and prevent diabetes-related complications in experimental models. Silymarin has been observed to protect neurons against oxidative stress and exhibit potential neuroprotective effects against neurodegenerative processes by suppressing inflammation in the central nervous

system. Clinical and experimental studies have shown that silymarin inhibits the proliferation of tumor cells. Silymarin has been successfully used as a complementary treatment option in many health problems associated with metabolic disorders, liver diseases, neurodegenerative diseases, oxidative stress, and inflammation, as well as in cancer. However, since the bioavailability, efficacy, and safety profile of silymarin vary between species, it is thought that more comprehensive research is needed on dose-response relationships and the processes related to its absorption, distribution, metabolism, and excretion.

Keywords: Animal health, phytotherapeutic, silymarin.

1. GİRİŞ

Silimarin, Asteraceae familyasına ait deve dikeni (*Silybum marianum*) tohumlarında ve meyvesinde bulunan silibin, izosilibin, silikristin ve silidianini içeren biyoaktif polifenolik maddeler ailesidir (Dixit ve ark., 2007; Akhtar ve ark., 2023) (Şekil 1). Bitkinin tohumlarından ve meyvelerinden elde edilen silimarin kompleksi, flavonolignanlar, flavonoidler ve polifenoller bakımından oldukça zengin olup bu kompleksin yaklaşık %50-60'ını oluşturan silibinin, diğer flavonolignan izomerleriyle birlikte yaklaşık %35'ini oluşturmakta ve silimarinin terapötik potansiyelinin temelini oluşturmaktadır (Kren ve ark., 2013; Jaffar ve ark., 2024).

Şekil 1. Silimarinin kimyasal yapı formülü (Kesharwani ve ark., 2020).

Geleneksel tıpta uzun süredir kullanılan silimarinin hepatoprotektif, antiinflamatuar, immünomodülatör, antioksidan, antiviral ve antikanser etkiler sergilediği bilimsel olarak kanıtlanmıştır (Bahmani ve ark., 2015; Surai, 2015; Zhao ve Li, 2015; Ahmad ve ark., 2018; Cui ve ark., 2018; Liu ve ark., 2019). Silimarin, oksidatif strese ve hücre hasarına yol açabilen hücresel metabolizmanın zararlı yan ürünleri olan reaktif oksijen türlerinin güçlü bir temizleyicisidir. Serbest radikalleri nötralize eden silimarin karaciğer hücrelerini oksidatif hasardan korumakta ve karaciğer fonksiyonlarını desteklemektedir (Jaffar ve ark., 2024). Silimarin, serbest radikalleri doğrudan temizlemenin yanı sıra, süperoksit dismutaz (SOD), katalaz ve glutasyon peroksidaz (GPX) gibi endojen antioksidan enzimlerin aktivitesini de artırmaktadır. Bunun yanında, hücresel faaliyetler sonucunda oluşan maddelerin detoksifiye edilmesinde görev alan hücre içi bir antioksidan olan glutasyon seviyelerini de artırmaktadır (Taleb ve ark.,2018). Silimarin, proinflamatuar gen ekspresyonuna aracılık eden bir transkripsiyon faktörü olan nükleer faktör kappa B (NF-κB) aktivasyonunu baskılayarak çeşitli inflamatuar yolları düzenlemektedir (Karimi ve ark., 2011). Silimarin proinflamatuar sitokinler olan tümör nekroz faktörü-alfa (TNF-α) ve interlökin-6 (IL-6) salınımın baskılamaktadır (Jaffar ve ark., 2024). Karaciğer fibrozu ve hücresel apoptoz süreçlerinde silimarinin hücre sağkalım yollarını desteklemek suretiyle koruyucu etkileri gözlemlenmiştir (Gillessen ve Schmidt, 2020). Klinik çalışmalar, silimarin takviyesinin karaciğer fonksiyonlarının önemli belirteci olan alanin aminotransferaz (ALT) ve aspartat aminotransferaz (AST) aktivitelerinin referans aralıkta tutulmasını sağladığını ve karaciğer fonksiyonunun desteklediğini göstermiştir (Malik ve ark., 2024).

2. SİLİMARİNİN HAYVAN SAĞLIĞI ÜZERİNDEKİ ETKİLERİNE İLİŞKİN KLİNİK VE DENEYSEL KANITLAR

2.1. SİLİMARİNİN ATLARIN SAĞLIĞINA ETKİLERİ

Silimarinin atlarda antiinflamatuar, antioksidan, hepatoprotektif ve nöroprotektif etkileri sayesinde enerji metabolizması ve genel sağlık üzerinde faydaları olduğu bildirilmiştir (Dockalova ve ark., 2021b). Atlarda silimarin biyoyararlanımının düşük olduğu, oral yolla uygulanan silibinin-fosfolipit formunun biyoyararlanımının %0,6 düzeyinde olduğu gözlemlenirken nazogastrik uygulamada %2,9'a yükseldiği rapor edilmiştir (Hackett ve ark., 2013). Silibininin, atların periferik kan mononükleer hücrelerinde (PBMC) lipopolisakkarit (LPS) kaynaklı inflamatuar yanıt üzerindeki etkisinin değerlendirildiği in vitro bir çalışmada, 10 μM ve 50 μM silibininin koruyucu etkileri olduğu ve LPS'nin neden olduğu TNF-α, IL-1β, IL-6 ve IL-8 düzeylerindeki artışı önlediği bildirilmiştir. LPS ile uyarılmış at PBMC'leri üzerinde yapılan bu çalışmanın sonucunda araştırmacılar, silibininin atlarda çeşitli inflamatuar durumların tedavisi veya önlenmesinde yararlı bir farmakolojik yaklaşım olabileceğini ifade etmişlerdir (Gugliandolo ve ark., 2020).

Atlarda sindirilebilirlik açısından en uygun silimarin dozunun 400 g/gün olabileceği belirtilirken (Dockalova ve ark., 2021a), en uygun doz ve uygulama aralığını doğrulamak için karaciğer hastalığı olan atlarda farmakokinetik ve güvenlik değerlendirmesi gerekliliği vurgulanmıştır (Hackett ve ark., 2013).

2.2. SİLİMARİNİN RUMİNANTLARIN SAĞLIĞINA ETKİLERİ

Ruminantlarda özellikle geçiş döneminde silimarinin hepatoprotektif etkilerinin ve bazı biyokimyasal parametrelerin araştırıldığı çalışmalara rastlanmaktadır (Tedesco ve ark., 2004; Garavaglia ve ark., 2015; Onmaz ve ark., 2017). Onmaz ve ark. (2017), doğum öncesi ve doğum sonrası dönemde Holstein ineklerin rasyonlarına 20 g/hayvan/gün silimarin takviyesinin laktasyonun başlangıcında süt ineklerinin metabolik adaptasyon sürecini hızlandırdığını, pik süt verimine daha erken sürede ulaşılmasını sağladığını belirlemişler ve geçiş döneminde silimarin kullanılmasını tavsiye etmişlerdir. Benzer şekilde geçiş döneminde süt ineklerine uygulanan silimarinin laktasyon performansını ve vücut kondisyonunu olumlu yönde etkilediği ortaya konulmuştur (Tedesco ve ark., 2004). Doğal bir hepatoprotektif olan silimarin, subklinik yağlı karaciğer hastalığına maruz kaldıkları peripartum döneminde süt ineklerine buzağılama tarihinden 10 gün önce buzağılama sonrası 15. güne kadar 10 g/gün dozda oral yolla uygulanmıştır. Silimarin takviyesi alan ineklerin almayanlara kıyasla süt üretiminlerinin daha yüksek olduğu belirlenmiştir (Tedesco ve ark., 2004). Doğum öncesi ve doğum sonrası erken dönemde doğal bir hepatoprotektif madde olan silimarin ile güçlü bir antioksidan olan likopenin birlikte kullanılması, süt verimini artırmış, ayrıca somatik hücre sayısı ve oksidatif stres belirteçlerinde olumlu etkiler rapor edilmiştir (Garavaglia ve ark., 2015). Sığırlarda fasioliazise bağlı gelişen karaciğer hasarında, antihelmintik tedaviye ek olarak silimarinin, hepatoprotektif etkileriyle iyileşme sürecine katkı sağladığı rapor edilmiştir (Alabbody, 2025). Ketotik süt ineklerinde yürütülmüş bir çalışmada % 2,34 silibin ve silidianin içeren süt devedikeni tohumlarının rasyona ilavesi ile kandaki aseton, asetoasetik asit ve β-hidroksibutirik asit düzeylerinde azalma, ketonüri derecesinde düşüş ve daha yüksek süt verimi gözlemlenmiştir (Vojtísek ve ark., 1991). Besi sığırlarında % 0,50 silimarin içeren rasyonla yürütülen 6 aylık bir besleme denemesi, kas kütlesi, mermerleşme puanı ve kalite derecesinde artış, düşük ALT aktivitesi ile sonuçlanmıştır. Bu bulgulara göre araştırmacılar, silimarinin etkili bir besin takviyesi olarak kullanılabileceğini ve besi dönemi sonunda sentetik bileşiklere göre daha güvenli ve tüketiciler tarafından daha kabul edilebilir bir alternatif olabileceğini ifade etmişlerdir (Kim ve ark., 2013).

Silimarin doğal bir hepatoprotektör olarak koyun ve keçi gibi küçük ruminantlarda da kullanım potansiyeli göstermektedir. Koyunlarda postpartum dönemde rasyona silimarin ilavesinin, hepatoprotektif ve antioksidan fonksiyonları yoluyla süt kalitesini iyileştirmek için etkili bir strateji olduğu ileri sürülmüştür (Khamisabadi, 2020). Sanjabi koyunlarının rasyonuna postpartum 15 gün boyunca 2000 mg/kg silimarin takviyesinin; doğum sonrası canlı ağırlık kaybını azalttığı, yem tüketimini artırdığı ve süt veriminde pik seviyeye ulaşma süresini komtrol grubuna göre anlamlı derecede kısalttığı bildirilmiştir. Buna ek olarak silimarin takviyesinin kan serumunda HSP70 geninin ekspresyonunu azalttığı; ayrıca, reaktif oksijen türleri ve malondialdehit (MDA) düzeyini kontrol grubuna göre anlamlı derecede düşürdüğü; glutasyon peroksidaz, süperoksit dismutaz ve katalaz aktivitelerini ise artırdığı rapor edilmiştir (Khamisabadi, 2020)

Günde üç kez 80 mg'lık dozda silymarin, koyunlarda gentamisin tarafından indüklenen nefrotoksisitenin patogenezini hafifletmiş, böbreği antimikrobiyal toksik etkilerden koruyan böbrek hasarı belirteçlerini azaltmıştır. Bu çalışma, silimarinin koyunlarda gentamisin kaynaklı nefrotoksisiteye karşı koruma potansiyelini göstermektedir

(Mashayekhi, 2012). Yapılan literatür taramaları, keçi rasyonlarına silimarin ilavesinin süt verimi, süt bileşimi ve süt yağ asidi profilini olumlu yönde etkilediğini göstermektedir. Dört ay süreyle yürütülen ve farklı seviyelerde silimarin açısından zengin özütlerin (10 g, 20 g veya 30 g) kullanıldığı bir besleme denemesi sonucunda, protein ve yağ konsantrasyonlarının artarak süt bileşiminin ve kalitesinin iyileştiği, süt veriminin arttığı; ayrıca doymamış yağ asitleri oranı artarken doymuş yağ asitlerinin azaldığı bildirilmiştir (Shedeed ve ark., 2023). Isı stresi altındaki Barbari keçilerinde 90 günlük periyot boyunca bazal rasyona ilave edilen 600 mg/kg/gün silimarinin oksidatif ve metabolik stresi, lipit peroksidasyonunu azalttığı ve antioksidan kapasiteyi iyileştirdiği rapor edilmiştir (Maurya ve ark., 2025). Genel olarak ruminantlarda peripartum dönemde silimarin uygulamasının, laktasyon döneminin metabolik adaptasyonunu teşvik edebileceği sonucuna varılabilir (Tedesco ve Guerrini, 2023).

2.3. SİLİMARİNİN KEDİ VE KÖPEKLERİN SAĞLIĞINA ETKİLERİ

Kedi ve köpeklerde silimarinin hepatotoksisiteye karşı koruyucu ve iyileştirici etkisi olduğu bildirilmiştir (Avizeh ve ark., 2010; Sgorlon ve ark., 2016; Gogulski ve ark., 2020; Gogulski ve ark., 2021). Hepatopatili hayvanlar için silimarin takviyesinin potansiyel bir terapötik seçenek olabileceği ifade edilmiştir (Tedesco ve Guerrini, 2023). Kedilerde mebendazol kaynaklı hepatotoksisiteye karşı silimarinin güçlü hepatoprotektif etkisi gözlemlenmiştir (Mosallanejad ve ark., 2012). Bu konuda yapılan bir çalışmada, kedilerde silimarinin özellikle mebendazol uygulamasından sonraki ilk iki saat içinde verildiğinde, oksidatif strese bağlı karaciğeri koruduğunu göstermiştir (Mosallanejad ve ark., 2012). 30 mg/kg-BW dozunda silimarinin, kedilerde asetaminofen zehirlenmesinden kaynaklanan karaciğer hasarının tedavisinde N-asetilsistein ile aynı etkiye sahip olduğu ve karaciğer dokusunu oksidatif hasara karşı koruyabileceği ileri sürülmüştür (Avizeh ve ark., 2010). Sağlıklı kedilere 5 gün boyunca oral yolla 10 mg/kg/gün silibinin-fosfatidilkolin kompleksi (SPC; %31 silibin içeren) uygulanmasının ardından granülositlerde glutasyon düzeylerinin anlamlı olarak arttığı, *Escherichia coli* ile gerçekleştirilen *in vitro* fagositoz testinde fagositik hücre oranı ve antioksidatif yanıtın uyarıldığı bildirilmiştir. Araştırmacılar, bu bulgulardan yola çıkarak silimarinin oksidatif stresle ilişkili hastalıklarda potansiyel fayda sağlayabileceğini vurgulamışlardır (Webb ve ark., 2009). Köpekler için de benzer şekilde nutrasötik uygulamalar, genel sağlık durumunun iyileştirilmesi ve bağışıklık yanıtının modülasyonu amacıyla yaygın olarak kullanılmaktadır (Sgorlon ve ark., 2016). Silimarinin, köpekler için % 50 öldürücü dozunun (LD_{50}) 140 mg/kg damar içi ve 10 g/kg ağızdan maksimum tolere edilebilir dozun ise 300 mg/kg olduğu; ayrıca embriyonik gelişim üzerinde herhangi bir etkisinin görülmediği, dolayısıyla silimarinin akut, subakut ve kronik toksisitesinin çok düşük olduğu ve güvenli bir nutrasötik olarak değerlendirilebileceği ileri sürülmektedir (Fraschini ve ark., 2002; Gogulski ve ark., 2020). Genel olarak, silibin takviyesinin, hepatopatiye sahip köpekler için etkili bir terapötik seçeneği olabileceği belirtilmiştir (Gogulski ve ark., 2020; Gogulski ve ark., 2021). Ayrıca köpeklerde sepsis tedavisinde silimarinin rutin kortikosteroid tedavisinden daha etkili olduğu bildirilmiştir (Soltanian ve ark., 2020). Köpeklerde prolipozom ile kapsüllenmiş silimarinin oral uygulanmasının, saf silimarin veya silibin uygulamasına göre daha yüksek biyoyararlanıma sahip olduğu saptanmıştır (Yan-yu ve ark., 2006). Diyetlerine günlük 10 mg/kg dozunda silimarin eklendiğinde, deneyin başlangıcında yüksek ALT aktivitelerine sahip olan köpeklerde, 60 gün sonunda bu enzim aktivitelerinde azalma gözlendiği bildirilmiştir (Sgorlon ve ark., 2016). Köpeklerde silimarin ve E vitamininin birlikte uygulanmasının, gentamisin kaynaklı nefrotoksisiteyi hafiflettiği rapor edilmiştir. Silimarinin bu koruyucu etkisinin, antioksidan aktivitesinden kaynaklandığı ifade edilmiştir (Varzi ve ark., 2007).

2.4. SİLİMARİNİN KÜMES HAYVANLARININ SAĞLIĞINA ETKİLERİ

Kümes hayvanlarında silimarin uygulamalarına yönelik araştırmalar; büyüme performansı, yemden yararlanma, bağışıklık yanıtı ve antioksidan kapasite gibi çok yönlü parametreler üzerinde olumlu etkiler gösterdiğini ortaya koymaktadır (Armanini ve ark., 2021; Shanmugam ve ark., 2022). Özellikle yumurtacı tavuklar üzerinde yürütülen çalışmalar, silimarin takviyesinin yumurta kalitesiyle ilişkili parametrelerde genel bir iyileşme sağladığını göstermektedir (Guo ve ark., 2024; Khan ve ark., 2024). Yirmi sekiz haftalık Hy-Line Brown yumurtacı tavuklarda yapılan 12 haftalık bir besleme denemesinde rasyonlarına % 0,02, % 0,04 ve % 0,06 düzeylerinde misel silmarin ilave edilmiş ve yumurta üretim yüzdesi, yumurta ağırlığı, kabuk kalınlığı, kabuk dayanıklılığı gibi kalite parametrelerinde iyileşme gözlemlenmiştir (Khan ve ark., 2024). Başka bir çalışmada, yumurtacı tavuk rasyonuna 12 hafta boyunca 250 mg/kg, 500 mg/kg, 750 mg/kg, 1000 mg/kg silimarin takviyesi ile; yumurta ağırlığı, yumurta üretim oranı, yem-yumurta verim oranı gibi performans parametrelerinde iyileşme kaydedilmiş ve bu etki, karaciğer lipit metabolizması ve çekum mikrobiyota fonksiyonunun iyileşmesiyle ilişkilendirilmiştir. Genel olarak en olumlu etkilerin, rasyona 500 mg/kg silimarin katkısıyla görüldüğü bildirilmiştir (Guo ve ark., 2024).

Ross 308 broiler civcivlerinde yürütülen bir yedirme denemesinde, % 0,06 silimarin ilavesi ile, büyüme performansı, besin sindirilebilirliği, bağırsak Lactobacillus sayısının arttığı, kan profili ve et kalitesi özelliklerinin iyileştiği anlaşılmıştır (Shanmugam ve ark., 2022). Ross broiler civcivlerinde, 0,5 ppm ve 2 ppm aflatoksine maruziyette 500 ppm ve 1000 ppm silimarin takviyesinin, ortalama günlük yem tüketiminde ve ağırlık kazancında belirgin bir artışla ve yemden yararlanma oranı değerlerinde iyileşmeyle sonuçlandığı saptanmıştır. Yüksek aflatoksin düzeyleri ileal bölgede *Escherichia coli*, *Salmonella* ve *Klebsiella* gibi bakterilerin popülasyonlarını artırırken, silimarin takviyesi bu bakteriyel yükü baskılamıştır (Jahanian ve ark., 2017). Piliç yemine silimarin eklenmesinin, mikotoksinin büyüme performansı, sağlık durumu, karaciğer oksidatif stresi ve et yağ asidi profilleri üzerindeki olumsuz etkilerini azaltıp azaltamayacağını değerlendiren bir çalışmanın bulguları, silimarinin üretim döngüsünün sonunda büyüme performansındaki bozulmayı azalttığını, oksidatif stresi önlediğini, et kalitesini iyileştirdiğini ve çoklu doymamış yağ asitleri düzeyini artırdığını göstermiştir (Armanini ve ark., 2021).
Broilerlerde kurşun kaynaklı oksidatif stres üzerine yapılan bir çalışmada, 200 mg/kg düzeyinde silimarin takviyesinin süperoksit dismutaz aktivitesini anlamlı düzeyde artırdığı, buna karşılık malondialdehit konsantrasyonu ile heterofil/lenfosit oranını azalttığı bildirilmiştir. Araştırmacılar, elde edilen bulgular doğrultusunda silimarin takviyesinin kurşunla indüklenen oksidatif strese karşı koruyucu etki gösterdiğini ve antioksidan savunma sistemini güçlendirdiğini ifade etmişleridir (Ebrahimi ve ark.,2014).

2.5. SİLİMARİNİN DENEYSEL MODELLERDE KANITLANMIŞ ETKİLERİ

Karbon tetraklorür indüklü karaciğer hasarı rat modelinde ağız yoluyla 3 hafta boyunca haftada dört kez oral olarak 200 mg/kg silimarin uygulamasının serum AST, ALT ve alkalen fosfataz (ALP) aktivitelerinin yükselmesini önemli ölçüde azalttığı ve karaciğer dokusunda alfa-düz kas aktinin değişmiş ifadelerini tersine çevirmek suretiyle hepatoprotektif etkiler sergilediği rapor edilmiştir (Tsai ve ark., 2008). Karbon tetraklorürle oluşturulan karaciğer fibrozu rat modelinde haftada beş kez oral gavajla 50 mg/kg ve 200 mg/kg dozlarında silimarin uygulamasının hepato-sitolizi, oksidatif stresi, fibrozu, hepato-sitolizi, Kupffer hücrelerinin aktivasyonunu, α-SMA ve TGF-β1 ekspresyonunu azalttığı, 50 mg/kg doz uygulamasının daha etkin olduğu saptanmıştr. Araştırmacılar, fibrotik değişikliklerin erken evrelerinde uygulanan silimarinin fibrogenetik mekanizmayı ve karaciğer fibrozisinin ilerlemesini inhibe ettiğini vurgulamışlardır (Clichici ve ark., 2015). Ratlarda iskemik reperfüzyon ile oluşturulan akut karaciğer hasarında reperfüzyondan hemen önce 5 mg/kg silibinin intravenöz uygulamasının pro-inflamatuar sitokinler TNF-α, IL-6, kemokin monosit kemotaktik protein-1 (MCP-1) ve matriks metalloproteinaz (MMP) ekspresyonunu azalttığını, aynı zamanda doku inhibitörü (TIMP-2) düzeylerini artırdığı ve bu sayede karaciğeri koruduğu rapor edilmiştir (Betsou ve ark., 2021). Farelerde yüksek yağlı diyetle tetiklenen non-alkolik yağlı karaciğer hastalığını iyileştirmek amacıyla silimarinin tek başına veya salvianolik asit B ve puerarin ile kombinasyonunun 16 hafta boyunca diyetle takviyesinin karaciğer fonksiyonlarını iyileştirdiği, bağırsak mikrobiyotasını ve metabolizmasını düzenlediği gözlemlenmiştir (Wang ve ark., 2024). Silibininin MPTP ile indüklenen Parkinson hastalığı fare modelinde, MPTP'nin neden olduğu dopaminerjik nöron kaybını etkin şekilde azalttığı, bu etkisini antioksidan veya antiinflamatuar etkilerden ziyade mitokondriyal membran potansiyelinin stabilizasyonu yoluyla nöroprotektif etki göstererek sergilediği bildirilmiştir. Araştırmacılar,
Silibininin mitokondriyi koruduğunu ve Parkinson hastalığının semptomlarının iyileştirilmesinde ve tedavilerin geliştirilmesinde silibinin potansiyel olduğunu ifade etmişlerdir (Lee ve ark., 2015). On iki hafta boyunca yüksek yağlı diyetle beslenen C57BL/6 farelere 1 ay boyunca günde 30 mg/kg oral silimarin uygulamasının hepatik SIRT1 yolunu aktive ederek diyet kaynaklı obezitede bozulmuş glukoz metabolizmasını iyileştirdiği saptanmıştır (Feng ve ark., 2021). Silimarinin, reaktif oksijen türlerinin aracılık ettiği bir deri inflamasyonu fare modelinde kulak ödemini %74'e kadar azalttığı ve histopatolojik lezyonları hafifletiği bildirilmiştir (Mota ve ark., 2025). Deneysel otoimmün ensefalomiyelit C57BL/6 fare modelinde, silimarin takviyesinin klinik semptomlarını vönemli ölçüde azalttığı, inflamasyonu hafiflettiği, demiyelinasyonu önlediği, beyin kolesterol metabolizmasında rol oynayan genlerin ekspresyonunu düzenlediği belirlenmiştir. Araştırma ekibi, silimarinin kolesterol takviyeli bir diyetle birlikte kullanımının, multipl skleroz için potansiyel koruyucu bir strateji olarak klinik çalışmalarla desteklenmesi gerekliliğini vurgulamışlardır (Mosaddeghi ve ark., 2025). Silimarinin, septik farelerde, sağkalımı belirgin şekilde iyileştirdiği, sepsis skorlarını ve dolaşımdaki proinflamatuar sitokin düzeylerini düşürdüğü ve inflamatuar hastalıklar için bir ilaç olma potansiyeli olabileceği ileri sürülmüştür (Lim ve Yi, 2025).

3. SONUÇ

Silimarin, içeriğindeki silibin başta gelmek flavonolignan kompleksi ile hayvansal organizma için önemli biyolojik etkilere sergilemektedir. Geleneksel tıpta daha çok hepatoprotektif etkilerinden yararlanılmış olan silimarin günümüzde antioksidan, antiinflamatuar, antifibrotik, immumodülatör, nefroprotektif etkinliği sayesinde önemli bir fitoterapötik konumundadır. Silimarinin terapötik etkinliği bitkisel ekstraksiyonun standardizasyonu, biyoyararlanım profili, kullanılan doz ve süreye göre değişkenlik göstermektedir. Hayvanlarda karaciğer hastalıklarının tedavisinde, mikotoksin maruziyetinin olumsuz etkilerinin giderilmesinde, metabolik bozuklukların hafifletilmesinde silimarin takviyeleri umut vaad etmektedir. Silimarin, atlarda enerji metabolizmasını regüle etmekte, geviş getiren hayvanlarda rumen fermentasyonunu desteklemekte, kümes hayvanlarında büyüme performansını artırmakta, koyun, kedi ve köpeklerde karaciğer enzim aktivitelerini normalize etmektedir. Bilimsel çalışmalar, silimarinin veteriner hekimlikte tamamlayıcı ve destekleyici tedavide önemli bir potansiyele sahip olduğuna işaret etmektedir.

Abstract

The genus *Prunus* comprises numerous fruit species of significant economic importance worldwide, including peach, apricot, cherry, and plum. Among these, plum (*Prunus* spp.) stands out due to its cultural and economic value, with Japanese plum (*Prunus salicina*) and European plum (*Prunus domestica*) being the most widely cultivated forms. Quantitative trait locus (QTL) analysis is an important tool for elucidating the genetic basis of complexly inherited quantitative traits, and it has been applied to plum species since the 2010s. Although studies conducted to date remain limited, Japanese plum has been the most extensively investigated species in QTL mapping research. In several studies, molecular markers such as SNPs, SSRs, and EST-SSRs have been used to construct high-density linkage maps, leading to the identification of major loci associated with quality parameters including fruit ripening time, fruit weight, skin and flesh color, sugar and acid content, flesh firmness, and phenolic compounds. These findings provide a valuable basis for marker-assisted selection (MAS) and genomic breeding strategies. In contrast, QTL analyses in polyploid species such as European plum remain scarce, and their application to wild genotypes is nearly absent. In conclusion, the current state of research highlights the need for more comprehensive QTL mapping studies encompassing different species and their wild relatives in order to fully elucidate the genetic diversity of plum species.

Keywords: Molecular markers, *Prunus* spp., Plum, QTL analysis

INTRODUCTION

Within the Rosaceae family, the genus Prunus, belonging to the subfamily Prunoideae and the subgenus Prunophora, comprises approximately 200-230 species. This genus encompasses agriculturally significant stone fruit species, including peach, apricot, cherry, Japanese plum, myrobalan plum, and European plum. A substantial proportion of these species is widely cultivated worldwide due to their high nutritional value and considerable economic importance, serving both the fresh fruit market and various processing industries. Among them, plum (Prunus spp.) is particularly prominent owing to its broad genetic diversity and adaptability to diverse ecological conditions. In particular, Japanese plums (*Prunus salicina*) and European plums (*Prunus domestica*) are extensively cultivated throughout Asia, Europe, and the Americas, contributing significantly to both fresh fruit production and processed commodities such as dried plums, jams, and juices. Their capacity to thrive under a wide range of climatic and soil environments has positioned plums among the globally important fruit species in terms of production volume. Moreover, the extensive genetic resources of plum species make them a valuable asset for breeding programs, contributing strategically to the improvement of traits such as yield, fruit quality, and resistance to diseases and pests. According to FAO (2025) statistics, the global average yield of plum and sloe production was 4,763.7 kg per hectare (approximately 4.76 t/ha). The Japanese plum (*P. salicina*), which possesses a diploid chromosome complement (2n = 2x = 16), is self-incompatible and has been cultivated for nearly 4,000 years for both fruit production and ornamental purposes. In contrast, the European plum (*P. domestica* L.) exhibits marked genetic differentiation due to its hexaploid genome structure (6n = 2x = 48) (Salazar et al., 2014; Carrasco et al., 2018; Salazar et al., 2017; Okie and Hancock, 2008; Hartmann and Neumüller, 2009; Faust and Surányi, 1999; Boonprakob et al., 2011; FAO, 2023).

In recent years, molecular research has gained increasing prominence as a means to elucidate the extensive genetic diversity present in plums and to harness this variability more efficiently in breeding programs. Because

morphological and physiological traits are highly influenced by environmental conditions, classical selection approaches often fail to yield reliable, stable differentiation (Hartmann and Neumüller, 2009). Consequently, molecular markers have emerged as powerful analytical tools for assessing genetic diversity, clarifying interspecific relationships, and monitoring target traits within breeding schemes (Kumar et al., 2018; Vieira et al., 2005). Although marker-assisted selection (MAS) provides substantial advantages-particularly in improving complex traits such as yield, fruit quality, and tolerance to biotic and abiotic stresses-it is well established that these traits are typically governed by multiple genes (Salazar et al., 2020). Therefore, MAS alone is insufficient, and identifying quantitative trait loci (QTLs) is essential for deciphering the genetic architecture underlying such traits (Zhang et al., 2020; Battistoni et al., 2022).

Quantitative trait loci (QTLs) are chromosomal regions that underlie continuously varying phenotypes and are influenced by multiple genetic factors. These loci are identified through statistical associations between genotypic data (molecular markers) and phenotypic measurements of the target traits. During QTL mapping, genetic linkage maps are integrated with phenotypic datasets to identify the specific genomic regions that govern trait variation (Miles and Wayne, 2008; Kushanov et al., 2021). The most commonly employed molecular markers in QTL analyses include simple sequence repeats (SSRs) and single nucleotide polymorphisms (SNPs). SNPs can be detected with high resolution using advanced high-throughput sequencing platforms (Mammadov et al., 2012). In contrast, SSRs remain valuable due to their co-dominant inheritance, high allelic variability, and practical applicability (Kumar, 2024). Localizing QTLs on genetic linkage maps enables the precise implementation of marker-assisted selection strategies. It facilitates the identification and isolation of potential candidate genes underlying the quantitative traits of interest (Collard et al., 2005).

Molecular markers, such as SSRs and SNPs, are widely used in QTL mapping studies across Prunus species. For instance, QTLs associated with fruit quality and chilling requirement in peach have been identified using SSRs and high-density SNP arrays (Martínez-García et al., 2013). In contrast, GBS-derived SNPs and SSR markers were used to detect QTLs linked to fruit quality and postharvest traits in the F1 population derived from Japanese plum (98-99) × 'Angeleno' (Salazar et al., 2017, 2020). These investigations clarify the genetic architecture underlying traits such as fruit quality, phenology, and disease resistance, and facilitate the development of robust markers to support MAS applications (Valderrama-Soto et al., 2021). Consequently, QTL mapping not only elucidates the genetic determinants of complex traits but also enhances the precision and efficiency of MAS-based breeding strategies (Collard et al., 2005). Moreover, the notable ecological adaptability of plums and the availability of cultivars with high commercial value further underscore the importance of QTL research in this genus; such studies provide a strategic framework for improving key attributes including fruit quality, yield potential, and biotic/abiotic stress resistance (Battistoni et al., 2022; Valderrama-Soto et al., 2021).

QUANTITATIVE TRAIT LOCI (QTLs) ON PLUM

Genetic linkage maps for the Japanese plum (*P. salicina*) cultivars 'Chatard' and 'Santa Rosa' were constructed by Vieira et al. (2005) using a pseudo-testcross strategy and AFLP markers. The mapping population consisted of 88 individuals derived from a cross between these two cultivars. They differ in several ways, including how easily they develop plum leaf blight. The linkage map generated for the 'Chatard' cultivar comprised 56 markers distributed across 11 linkage groups, spanning a total length of 905.5 cM with an average intermarker distance of 16.2 cM. In contrast, the 'Santa Rosa' map contained 84 markers across 14 linkage groups, covering 1349.6 cM with a mean intermarker interval of 16.1 cM. The authors emphasized that these maps represent a foundational framework for genetic and breeding studies in Japanese plum; however, they also noted that further marker enrichment is needed to improve their resolution and applicability for broader breeding objectives.

Milošević and Milošević (2011) established a trial orchard in Prislonica in 2000, planting seven F_1 genotypes and control cultivars derived from three hybrid combinations of *P. domestica* L. ('Čačanska Lepotica' × 'Stanley', 'Čačanska Najbolja' × 'Stanley', and 'Stanley' × 'Stanley'). Biological and fruit quality traits were assessed between 2005 and 2007. The results revealed substantial variation among genotypes. All F_1 progenies exhibited later flowering times compared with their parental cultivars; the earliest harvest occurred in genotype 'P4,' whereas genotype 'P7' reached maturity the latest. The highest yield was recorded in genotype 'P5,' while genotype 'P4' was superior in fruit weight, flesh proportion, fruit size, soluble solids, fructose content, and total sugar levels.

Overall, the authors reported that the cross 'Čačanska Lepotica' × 'Stanley' produced the most biologically and qualitatively promising genotypes.

Salazar et al. (2017) conducted a genotyping-by-sequencing (GBS) study based on SNP markers to identify QTLs associated with fruit quality in Japanese plum. The primary objective of the study was to improve the implementation of marker-assisted selection (MAS) for complex fruit-quality traits under the influence of numerous genes. For this purpose, 272 seedlings derived from crosses involving the cultivars 'Angeleno,' 'September King,' and 'September Queen,' using '98-99' as the female parent, were genotyped, resulting in the detection of 42,909 SNPs. In addition, a high-resolution genetic linkage map containing 981 SNPs was constructed for the '98-99' × 'Angeleno' population. Across two consecutive years, 55 seedlings were phenotypically evaluated for fruit-quality parameters, including fruit weight, skin and flesh color, firmness, soluble solids content, and ripening time. QTL analysis revealed several genomic regions associated with these traits. The findings demonstrated that GBS is a highly effective approach for identifying genetic variants underlying fruit-quality traits in Japanese plum and holds considerable promise for integration into MAS-oriented breeding programs.

Zhang et al. (2020) constructed a high-density genetic linkage map using Specific-Locus Amplified Fragment (SLAF) sequencing technology in an F_1 population derived from the Japanese plum cross '09-16' × 'Fortune'. The resulting map comprised 3,341 SLAF markers and 720 loci distributed across eight linkage groups, spanning a total genetic distance of 869.9 cM with an average inter-marker interval of 1.21 cM. The map showed strong collinearity with the peach (*Prunus persica*) reference genome. The authors noted that this work represents one of the most comprehensive linkage maps developed for Japanese plum to date and provides a valuable foundation for both marker-assisted selection (MAS) and future reference genome assembly studies.

Salazar et al. (2020) developed a genetic linkage map integrating SNP and SSR markers using 151 individuals derived from the '98-99' × 'Angeleno' F1 population and evaluated phenological, fruit quality, and postharvest traits over three years. QTL analyses demonstrated that fruit development duration was strongly associated with loci on LG4, whereas fruit weight was predominantly associated with regions on LG2. Although the QTLs detected for postharvest characteristics exhibited comparatively lower statistical significance, minor-effect QTLs influencing fruit firmness were consistently identified on LG4 and LG5. The authors emphasized that these results provide important insights into the genetic regulation of fruit development, quality, and postharvest performance in Japanese plum, and that they represent a valuable resource for advancing marker-assisted breeding strategies in this species.

Valderrama-Soto et al. (2021) employed the same F1 population ("98-99" × "Angeleno") used in previous studies to characterize quantitative trait loci (QTLs) governing phenolic compound accumulation in both the fruit peel and flesh. Phenotypic data collected over two consecutive years were integrated with high-resolution genetic linkage maps, resulting in the identification of 21 QTLs-13 contributed by the "98-99" parent and eight by "Angeleno." These loci accounted for 12-27% of the observed phenotypic variation and were predominantly associated with cyanidin-3-glucoside and cyanidin-3-rutinoside (LG4), total flavonoids and procyanidins (LG5, LG8), and reduced concentrations of certain anthocyanin compounds (LG3, LG4). The authors emphasized that these findings provide a robust foundation for improving the precision and efficiency of marker-assisted breeding strategies to develop new plum cultivars with elevated phenolic compound content.

Almansa et al. (2021) examined the inheritance patterns and interrelationships of 15 agronomic traits-including phenological characteristics (onset of flowering, full bloom time, flowering intensity, and ripening date) and pomological attributes (yield, fruit weight, diameter, shape, skin and flesh coloration, firmness, soluble solids, and acidity)-in Japanese plum (*P. salicina* Lindl.) across two years and three distinct hybrid populations. The results demonstrated substantial phenotypic variation and pronounced segregation, particularly within the 'Black Splendor' × 'Pioneer' progeny. The distribution patterns for skin and flesh color indicated that a limited number of significant genes likely govern these traits. In contrast, the near-normal distribution observed for the remaining characteristics suggested polygenic control influenced by multiple loci. Moreover, strong correlations were detected among several phenological and fruit-quality traits. The authors emphasized that these findings markedly enhance the efficiency of Japanese plum breeding programs and provide a robust foundation for future QTL mapping and marker-assisted selection initiatives.

Battistoni et al. (2022) examined the genetic regulation of flavan-3-ol compounds in Japanese plum by evaluating the '98-99' × 'Angeleno' F1 population across two growing seasons. The concentrations of these compounds in both peel and flesh were quantified and integrated with linkage maps constructed using the reference genome of *P. salicina* cv. 'Sanyueli'. The analyses revealed that QTL clusters governing flavan-3-ol composition-particularly in individuals inheriting alleles from 'Angeleno'-accounted for much of the variation in the catechin/epicatechin (C/EC) ratio. Moreover, a novel major genomic region on LG1 was identified as a key determinant directing the biosynthesis toward either catechin or epicatechin. This study provides valuable insights into the metabolic pathways underlying fruit quality and nutritionally important traits; however, the authors highlight that further validation across diverse genotypes and incorporation into breeding programs are essential for practical application.

The study conducted by Lili et al. (2022) sought to construct a genetic linkage map for Japanese plum (*P. salicina* L.) using ISSR and SRAP molecular markers. To support the development of new cultivars of this economically significant species in northeastern China, the cultivars 'Jilin 6' and 'Longyuan Qiuli' were selected as parental lines, and the authenticity of the resulting F1 progeny was verified using SSR primers. Marker data derived from ISSR and SRAP analyses were subsequently processed with JoinMap 4.0 employing the double-pseudotestcross strategy. The study identified 120 marker loci from 72 validated F1 individuals, ultimately generating a genetic map comprising 16 linkage groups with a total length of 528.5 cM. The authors emphasized that this linkage map provides a valuable framework for QTL detection, marker-assisted selection, and gene mapping in plums and represents an important foundational resource for breeding programs in cold-climate regions.

Lili et al. (2023) conducted genetic mapping studies on six fruit-related traits-including fruit weight, transverse and longitudinal diameters, shape index, flesh thickness, and total sugar content-using F1 populations derived from the Japanese plum cultivars Jilin 6 and Longyuanqiuli grown in northeastern China. The analyses revealed strong positive correlations between fruit weight and both diameter measurements, whereas total sugar content exhibited a negative correlation with the remaining traits. QTL mapping identified 11 loci distributed across linkage groups LG2, LG3, LG8, and LG15, explaining approximately 10-14% of the phenotypic variation. The researchers emphasized that these findings provide a valuable scientific foundation for implementing molecular-assisted breeding strategies in plum, particularly for programs targeting cultivar improvement in cold-climate regions.

Osorio et al. (2025) established a core collection to more effectively harness the genetic diversity of Japanese plums and facilitate the identification of quantitative trait loci (QTLs). In their study, a large population of 1,062 individuals, genetically characterized through sequencing data, was evaluated, and several core collection alternatives were generated based on genetic distance metrics and allelic representation. Comparative assessments led to the selection of a set of 108 individuals that maintained the highest level of genetic diversity while accurately reflecting the overall population structure. The robustness of this selection was validated through linkage disequilibrium and population structure analyses. Moreover, the practical utility of the core collection was demonstrated by the successful mapping of QTLs for flowering time and fruit ripening. The authors emphasized that this core collection constitutes a valuable resource not only for elucidating phenological traits but also for improving the understanding of fruit quality attributes and plant responses to biotic and abiotic stresses, thereby providing a strong foundation for marker-assisted breeding programs.

CONCLUSION

QTL-based genetic improvement studies in plums remain relatively scarce, with most existing research concentrated on Japanese plum (*P. salicina*). Several major factors underlying this limitation have been highlighted in the literature. Foremost, QTL mapping resolution in Prunus species has generally been constrained by the small size of mapping populations; many studies do not meet the recommended range of 50-250 individuals, and such limited populations tend to detect only large-effect QTLs. Moreover, the diploid genome structure of Japanese plum, its amenability to controlled hybridization, and the availability of broad genetic resources make this species particularly well-suited for QTL analyses. The existence of a high-quality reference genome for Japanese plum ('Sanyueli') has further facilitated GBS-based SNP discovery and the development of high-density linkage maps, thereby accelerating QTL research in this species. In contrast, the absence of fully assembled and annotated reference genomes for other plum species substantially impedes progress in their QTL mapping studies. Finally, the high commercial relevance of Japanese plum cultivars and their adaptability across diverse ecological regions

have increased scientific and economic interest in this species, resulting in a disproportionate focus on *P. salicina* within QTL research efforts.

Consequently, the scarcity of QTL studies in plums can largely be attributed to constraints related to mapping population size, limited genomic resources, and species-specific genetic advantages. To overcome these limitations, future QTL research should be expanded to encompass additional species such as the European plum (*P. domestica*), *Prunus cerasifera*, and wild taxa, including *Prunus spinosa*. The development of high-quality reference genomes, the use of larger and genetically diverse populations, and the application of multi-population high-resolution analyses are essential. Such efforts will enable the field to transcend the current knowledge base, which is predominantly centered on Japanese plum, and will generate novel insights from a broader spectrum of plum species. Ultimately, this comprehensive approach will enhance the effectiveness of breeding programs and substantially bridge the existing knowledge gap in plum genomics.

Abstract

Among berry-like fruits, grapevine (*Vitis vinifera* L.) is one of the leading species both worldwide and Turkey in terms of production volume and economic value. However, viticulture is increasingly affected by abiotic stress factors such as drought, high temperature, salinity and frost, which are exacerbated by climate change. These conditions significantly limit plant growth and lead to considerable reductions in yield and fruit quality. In particular, cluster and berry development, as well as quality parameters such as sugar, acidity, and aroma compounds, are directly influenced by these stresses. In recent years, molecular-level studies have come to the forefront in order to better understand the effects of these stress factors on grapevine. Research conducted in Turkey has mainly focused on cultivar identification through molecular markers, with special emphasis on resolving homonym and synonym confusions. Moreover, the identification of genomic regions associated with tolerance to abiotic stresses and their examination through linkage analyses has also emerged as an important research area. The combined use of different marker systems provides a more comprehensive evaluation of genetic diversity in grapevine and contributes to a deeper understanding of stress tolerance. In conclusion, the molecular investigation of abiotic stress factors in grapevine represents a strategic field of research for both the development of stress-tolerant cultivars and the sustainability of viticulture.

Keywords: Abiotic stress, Grape (*Vitis vinifera* L.), Molecular characterization, Viticulture

INTRODUCTION

Fruits constitute a critical component of human nutrition, serving as rich sources of vitamins, minerals, and antioxidant compounds. Nevertheless, the growth and productivity of fruit crops are highly dependent on prevailing environmental conditions. Climate change–associated factors such as elevated temperatures, water scarcity, and soil salinity adversely affect both yield and fruit quality. Grapevines (*Vitis vinifera* L.) are particularly vulnerable to extended periods of heat stress, drought, and salinization, all of which impair vegetative development, berry enlargement, and overall fruit quality (Ren et al., 2025).

Stress in plants arises from both biotic (viruses, bacteria, fungi, insects) and abiotic factors (drought, salinity, extreme temperatures, waterlogging, radiation, chemical exposure, and nutrient deficiencies), all of which can cause substantial reductions in yield (Odabaşıoğlu et al., 2018). In recent years, the impact of global warming on agricultural productivity has intensified, making it increasingly critical to increase yields from the limited arable land available. Consequently, there has been a growing emphasis on breeding and selecting cultivars and rootstocks that can adapt to adverse abiotic stress conditions. (Küskü and Söylemezoğlu, 2022).

Turkey possesses a long-standing viticultural tradition and harbors extensive grapevine genetic diversity owing to its favorable climatic conditions and its position at the crossroads of major Vitis gene centers. However, global warming, natural disasters, unplanned urban expansion, and biotic stresses such as phylloxera have reduced vineyard areas, thereby heightening the risk of losing uncharacterized or unprotected genetic resources. Safeguarding this genetic diversity is essential for ensuring food security and for enabling the development of stress-resilient cultivars. Moreover, because most current conservation initiatives focus on only a limited subset of

species, integrating wild relatives into the genetic pool is crucial for sustaining long-term breeding and conservation success (Baykul, 2022; Marwah and Jamwal, 2024).

In viticultural research conducted in Turkey, molecular marker technologies have thus far been employed predominantly for genotype identification. However, the persistent confusion caused by the use of homonyms and synonyms in grapevine cultivars necessitates further clarification, and studies focusing on stress tolerance must be broadened. Employing multiple marker systems in combination can yield more comprehensive and robust results (Sabır et al., 2008; Bozkuş and Bozkuş, 2024). The rich diversity of cultivated varieties and wild grapevine genotypes present in Turkey provides valuable genetic resources for introgressing resistance traits into commercial cultivars, thereby supporting the development of new grape varieties capable of withstanding environmental stresses while also meeting market expectations (Arslan, 2023).

In this context, the conservation of grapevine genetic resources and the elucidation of molecular-level stress-tolerance mechanisms are critical for ensuring the long-term sustainability of viticulture and facilitating the development of novel cultivars that can adapt to changing climatic conditions.

Grape (*Vitis Vinifera* L.)

Grapevines belong to the order Rhamnales, and among the three families represented within this order, only the Vitaceae (also referred to as Vitidaceae, Ampelidaceae, or Ampelidae) include true grapevine species. This family comprises approximately 12 genera and 700 species, with the genus Vitis being the most prominent (Şahin, 2009). The genus Vitis contains nearly 60 species, among which *Vitis vinifera* L. is the most extensively cultivated due to its broad climatic adaptability. Nevertheless, the high sensitivity of this species to various stress factors has underscored the importance of wild grapevine relatives as valuable reservoirs of adaptive genetic variation. North American species such as *Vitis riparia, Vitis rupestris*, and *Vitis berlandieri* are widely employed in the development of rootstocks with enhanced resistance to abiotic stresses. Traditional grapevine breeding predominantly relies on hybridization and subsequent selection; however, the inherently long juvenile phase of grapevines significantly prolongs the breeding cycle (Bozkuş and Bozkuş, 2024).

Turkey has a long-standing tradition of viticulture owing to its favorable climatic conditions, its position within the grapevine gene centers, and its location at the crossroads of ancient trade routes (Baykul, 2022). This placement at the intersection of grapevine gene pools has endowed the country with vibrant grape genetic diversity. To conserve and evaluate this diversity, the National Collection Vineyard Project was initiated in 1965 (Candar et al., 2020). Grapes (*Vitis vinifera* L.) represent the most economically significant berry crop both globally and within Turkey. According to data from TÜİK (2025), Turkey produces 3.47 million tons of grapes across 3.72 million decares of cultivated land, with 1.82 million tons designated for table consumption, 1.26 million tons for drying, and 380,000 tons allocated for winemaking. This production volume highlights the strategic agricultural and economic importance of grape cultivation in the country.

Abiotic stress

Biotic and abiotic stress factors can induce substantial morphological, physiological, and biochemical alterations in plants, thereby disrupting their normal growth and development. Abiotic stress manifests through diverse symptoms triggered by unfavorable environmental conditions; however, these effects often remain imperceptible during the early stages. Consequently, early and accurate diagnosis is essential for minimizing stress-related yield and quality losses. Although traditional diagnostic approaches primarily rely on visible symptoms-such as leaf discoloration, necrotic lesions, or wilting-these indicators are frequently insufficient for precise identification of the underlying stressor. Thus, more systematic and integrative diagnostic strategies are required to reliably detect and characterize stress conditions before irreversible damage occurs (Gao, 2020).

Plants' responses to stress depend on their genetic makeup. When stress is detected, signal transduction processes are initiated, and transcriptional regulators activate target genes, generating physiological and metabolic adaptation responses (Ors and Ekinci, 2015). The duration and recurrence of stress, the plant's developmental stage, and its genetic characteristics determine the level of these responses (Bahar et al., 2024). Furthermore, applying exogenous substances to plants under stress conditions, particularly with plant growth regulators, can increase resistance to abiotic stresses such as drought and metal toxicity (Nasircılar et al., 2019)

Salinity represents one of the foremost abiotic constraints limiting agricultural productivity, affecting nearly 20% of irrigated lands worldwide. Elevated salt concentrations impede water absorption and disrupt cellular osmotic equilibrium, while excessive ion accumulation can induce toxicity. Consequently, plants experience a range of detrimental effects, including growth inhibition, impaired root system development, chlorosis, necrosis, and significant yield reduction (Dölarslan and Gül, 2012). Grapevine (*Vitis vinifera* L.), in particular, exhibits low tolerance to salinity owing to its glycophytic nature and is considered more susceptible to salt-induced stress compared with many other cultivated species (Odabaşıoğlu et al., 2018).

Drought constitutes a major abiotic stress factor in plants, and conventionally, drought-resistant cultivars have been developed through selection and hybridization based on naturally occurring variation. However, these breeding approaches are inherently slow and resource-intensive. Marker-assisted selection (MAS) markedly accelerates improvement efforts by enabling the identification and introgression of genomic regions associated with drought tolerance into breeding populations. In particular, the characterization of stress-responsive genes-most notably members of the DREB (Dehydration Responsive Element Binding) transcription factor family-has significantly advanced the development of new grapevine genotypes capable of adapting to water-limited conditions (Çirka, 2024).

Wild grapevines constitute a crucial genetic reservoir for both rootstock development and hybridization in viticulture, owing to their broad resistance to diverse biotic and abiotic stresses. While American species provide strong resistance to salinity, drought, and major grapevine diseases, Asian species are notable for their high tolerance to low temperatures. Molecular approaches such as marker-assisted selection (MAS), together with genetic analyses employing SNP and SSR markers, play a pivotal role in identifying resistance-associated genomic regions within these taxa. Moreover, introgressive hybridization between wild grapevines and cultivated *Vitis vinifera* genotypes represents a key strategy for transferring these resistance traits into elite cultivars (Şehit, 2024).

Other applications for abiotic stress tolerance

The role of salicylic acid (SA) in mediating defense responses and stress tolerance in grapevines has been extensively investigated. Nasircılar et al. (2019). Demonstrated that SA enhances photosynthetic activity, strengthens defense pathways, and mitigates oxidative damage under various abiotic stresses, including drought, salinity, elevated temperatures, and heavy metal toxicity; however, its effectiveness varies depending on species and application conditions. In another study, Altıncı et al. (2020). Reported that exogenous SA application in the 'Narince' grapevine cultivar improved growth parameters such as shoot length and root biomass, thereby enhancing tolerance to heat stress. Similarly, Rahman et al. (2022). Showed that *Vitis davidii* exhibits natural resistance to white rot (*Coniella diplodiella*), with higher endogenous SA levels recorded in resistant genotypes. Transcriptome (RNA-seq) analyses conducted following SA treatment in susceptible *V. vinifera* cultivars revealed differential expression of 511 genes, notably the induction of key defense regulators such as VvWRKY1/2, VvNPR1, VvTGA2, and VvPR1. Additionally, SA-responsive cis-regulatory elements were identified in the promoter region of the VvPR1 gene, further highlighting SA's central role in grapevine immunity.

Various approaches beyond salicylic acid have also been shown to enhance abiotic stress tolerance in grapevines. Salicylic acid (SA) is well known for its ability to enhance plant resilience to heat, drought, and other environmental stresses. Similarly, methyl jasmonate (MeJA) plays a key regulatory role in plant defense and stress signaling. Hakeem et al. (2025). Demonstrated that MeJA strengthened antioxidant defense systems, safeguarded photosynthetic performance, and activated stress-responsive gene expression in grapevines subjected to salinity, drought, and cold stress. These findings indicate that MeJA, much like SA, functions as a critical modulator of abiotic stress tolerance in grapes. Moreover, Meng et al. (2014). Examined the effects of melatonin application on wine grape seedlings exposed to PEG-induced water deficit. Melatonin alleviated PEG-induced growth inhibition and oxidative damage while helping preserve Photosystem II efficiency, chlorophyll content, and structural integrity. Collectively, these results suggest that melatonin confers protective effects against drought stress in grapevines.

Molecular studies on abiotic stress resistance

In recent years, molecular approaches have advanced substantially in elucidating genetic diversity in plants. Traits such as extended life cycles, long generation intervals, and widespread vegetative propagation increase the relevance and utility of these techniques in fruit crops (Marwah and Jamwal, 2024). Genome-wide association

studies (GWAS) and genomic selection (GS) in grapevine play a pivotal role in improving stress tolerance by uncovering associations between genetic markers and key agronomic traits. Nevertheless, overcoming challenges posed by large datasets and computational complexity will further enhance the effectiveness of these approaches in advancing agricultural productivity (Huang, 2024).

Wang et al. (2023). Conducted whole-genome sequencing of 77 widely used grape rootstock genotypes and identified more than 2.8 million SNPs. Based on their genetic composition, the rootstocks were classified into ten groups derived from five ancestral components. The study demonstrated that the Chinese species *Vitis amurensis* and *Vitis davidii* possess markedly high resistance to both biotic and abiotic stresses, and it revealed numerous candidate genomic regions associated with tolerance to phylloxera, root-knot nematodes, salinity, drought, cold, and waterlogging. In addition, Motha et al. (2018). Evaluated the genetic diversity of grape rootstocks tolerant to abiotic stress using ISSR and SSR markers, reporting 88% polymorphism and PIC values ranging from 0.66 to 0.86 for ISSRs and 24 alleles with PIC values between 0.43 and 0.78 for SSRs. Both marker systems grouped genotypes into two major clusters, and PCA results were highly consistent with the dendrogram analyses.

High temperatures associated with global warming exert markedly detrimental impacts on grapevine development and fruit quality. Zhang et al. (2023) reported that elevated temperatures cause substantial reductions in both yield and quality and analyzed miRNA-derived SSR polymorphisms to identify molecular markers linked to heat tolerance. Their study identified eight SSR markers capable of discriminating heat-tolerant and heat-sensitive cultivars, among which the VMIRSSR167c3 marker exhibited particularly high accuracy in differentiating thermotolerant from thermosensitive genotypes.

Zhang et al. (2024) investigated the molecular responses of 38 grapevine germplasm accessions to high-temperature stress and identified 177 previously characterized and 20 novel miRNAs using next-generation sequencing. Their analyses revealed that 65 miRNAs exhibited differential expression under heat stress. Vvi-miR3633a was significantly downregulated at elevated temperatures, and heterologous expression assays in Arabidopsis confirmed that this miRNA functions as a regulator of thermotolerance. These findings underscore the pivotal role of miRNAs in the adaptive heat-stress response to grapevine. Cold-stress tolerance in grapevines is similarly governed by key physiological and molecular regulatory mechanisms, with C-repeat binding factor (CBF) genes representing central components of the cold-response network. Aazami and Mahna (2017) reported that exogenous application of salicylic acid (SA) in the Iranian *Vitis vinifera* cultivar ‘Sultanina’ markedly enhanced VvCBF4 expression, with the highest transcriptional activation observed when SA was applied six hours before cold exposure.

Shi et al. (2024) conducted another genome-wide investigation, comprehensively characterizing the CBS gene family in grapevine and identifying 32 VvCBS genes distributed across 15 chromosomes. Phylogenetic and structural analyses showed that these genes clustered into three major subgroups. Expression profiling demonstrated that many family members exhibited high transcript abundance across multiple tissues and showed differential regulation in response to cold, drought, and salinity stress. Moreover, the cloning of VvCBS27 and its localization to the plasma membrane, cytoplasm, and nucleus suggest multifaceted functional roles of CBS proteins in abiotic stress responses in grapevine. This work provides a valuable foundation for elucidating the biological functions of the CBS gene family in Vitis species. In another study, Wang et al. (2024) developed robust SSR markers (e.g., OMT2.1-211, SIRT276) capable of discriminating cold tolerance across eight hybrid grape populations. Collectively, these findings highlight that both transcription factors and molecular markers are essential tools for deciphering cold-tolerance mechanisms in grapevine and for advancing the development of stress-resilient cultivars.

Drought and salinity represent major abiotic constraints that substantially reduce productivity in grapevine cultivation. To identify genes associated with tolerance to these stresses, Hanana et al. (2014) isolated the dehydrin gene VvDhn from the Cabernet, Sauvignon cultivar and demonstrated that its expression is markedly elevated, particularly during the late stages of seed embryogenesis. VvDhn expression was strongly induced by salt and drought stress and ABA treatment. Under salinity stress, transcript levels were significantly higher in the tolerant cultivar Razegui, whereas no detectable change was observed in the sensitive cultivar Syrah. Although both cultivars exhibited increased expression under drought stress, the magnitude of induction was greater in the tolerant genotype. Collectively, these findings indicate that VvDhn constitutes a vital candidate gene involved in abiotic stress tolerance mechanisms in grapevine.

CONCLUSION

This review highlights the vital roles of both physiological and molecular mechanisms in governing grapevine responses to major abiotic stresses-including drought, salinity, heat, and cold-in sustaining viticultural productivity. Previous studies have demonstrated that signaling molecules such as salicylic acid, methyl jasmonate, and melatonin enhance stress resilience by augmenting antioxidant defense pathways and modulating the expression of stress-responsive genes. Moreover, integrative analyses based on GWAS, SSR and SNP markers, miRNA profiling, and transcriptomics have identified key stress-associated loci-including VvPR1, VvWRKY transcription factors, the CBF gene family, Dhn genes, and members of the CBS gene family-which collectively provide a strong genomic foundation for targeted breeding strategies. The substantial genetic variability within wild Vitis species represents a critical resource for developing stress-tolerant cultivars. In this context, it is essential to integrate physiological datasets with molecular evidence and incorporate this information into modern breeding programs to ensure the long-term sustainability and adaptability of viticulture under changing environmental conditions.

Özet

Deronectes hakkariensis türü ilk kez Wewalka (1989) tarafından Türkiye'nin Güneydoğu Anadolu Bölgesi'nde yer alan Şırnak ilinin Uludere ilçesinden toplanan tek bir erkek örneğe dayanarak tanımlanmıştır. Daha sonraki arazi çalışmalarında bu tür Türkiye'nin kuzeydoğusundaki yer alan Erzurum İl'inde de kaydedilmiştir. Her iki çalışmada da yalnızca bu türe ait erkek örnekler ayrıntılı olarak tanımlanmış, dişi örnekler tanımlanmamıştır. Çalışmamızda *Deronectes hakkariensis* türüne ait örnekler Türkiye'nin Doğu Anadolu Bölgesi'nde yer alan Elâzığ ili Arıcak ilçesi Akdağlar Yaylası'ndan toplanmıştır. *D. hakkariensis*'in vücut yapısı ve genel görünümü ile dişi genital organları ilk kez çizilmiş ve şekillerle ayrıntılı bir şekilde gösterilmiştir. Elâzığ ilinden toplanan örneklerimiz daha önce tanımlamaları yapılan orijinal örneklere ile uyumluluk göstermektedir ve incelenen dişiler erkeklere dış morfolojik açıdan benzerlikler göstermektedir.

Anahtar Kelimeler: Yırtıcı dalgıç böcekleri, Kın kanatlılar, Dalgıç böcekleri, Elâzığ, Türkiye

First description of the female of *Deronectes hakkariensis* Wewalka, 1989b from Elazığ province, Türkiye (Coleoptera, Dytiscidae, Hydroporinae)

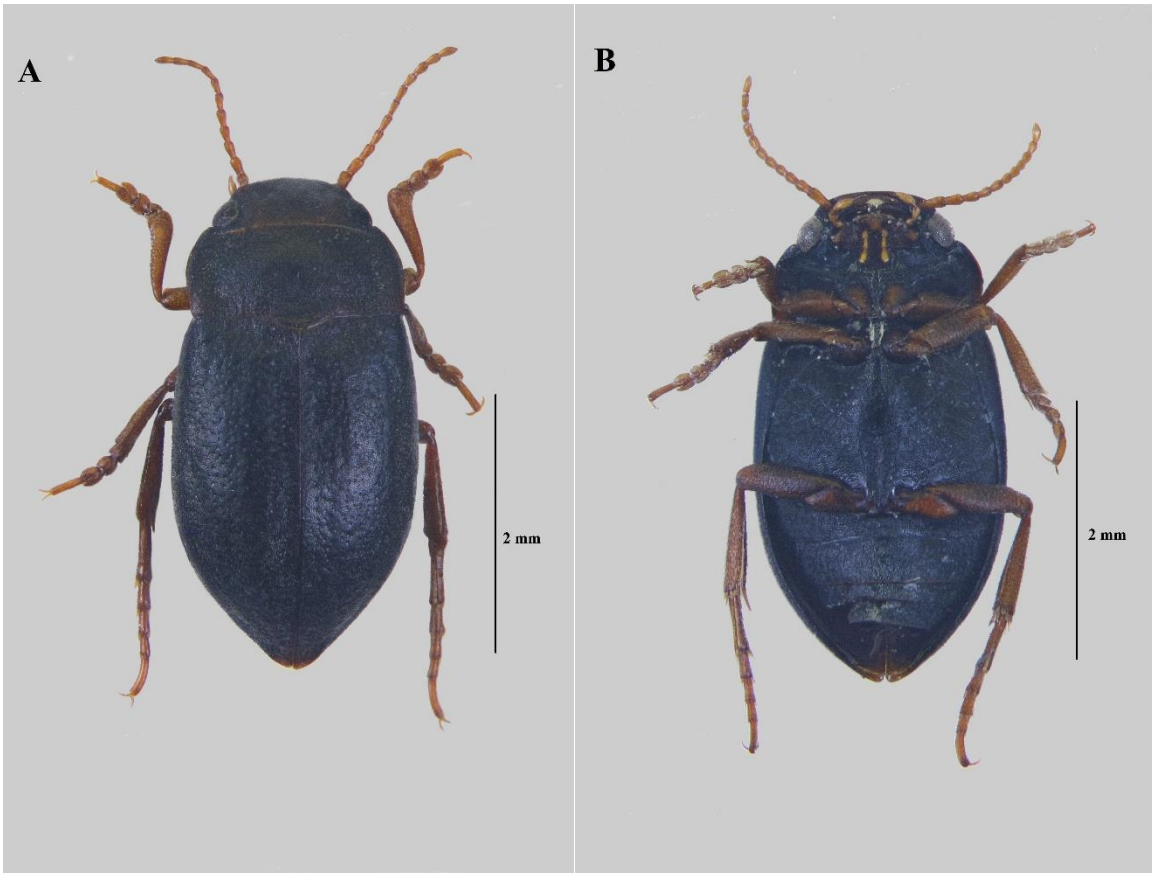
Abstract

Deronectes hakkariensis was firstly described by Wewalka (1989) based on a single male specimen collected from the Uludere district of Şırnak Province, located in Southeastern Anatolian region of Türkiye. Subsequent field studies have also recorded this species in Erzurum Province northeastern of Türkiye. In both of these studies, only male specimens were described in detail, while female specimens remained undescribed. In our study, the specimens belong to *Deronectes hakkariensis* were collected from the Akdağlar Plateau of Arıcak district in Elazıg province located in Eastern Anatolian Region of Türkiye. The habitus and the female genitalia of *D. hakkariensis* are illustrated and figures for the first time. The specimens collected from Elazığ Province are consistent with the original description and the examined females exhibit external similarities to males.

Key words: Predaceous diving beetles, Coleoptera, Dytiscidae, Elâzığ, Türkiye

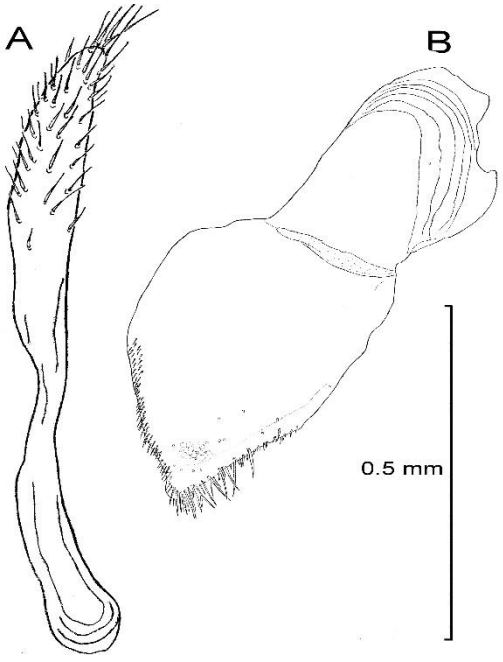
GİRİŞ

Sucul habitatların biyotasında önemli bir yere sahip olan Dytiscidae familyasının üyeleri, yırtıcı dalgıç böcekleri olarak da bilinmektedir. Bu familyaya ait böceklere genellikle bütün tatlı su habitatlarında rastlamak mümkündür. Dytiscidae familyası günümüzde 182 cinse ait 4600 civarında tür ile temsil edilmektedir (Nilsson ve Hájek, 2025). Dytiscidae familyasına ait *Deronectes* Sharp, 1882 cinsi, yeryüzünde 61 tür ile temsil edilmektedir. Deronectes cinsinin üyeleri tamamen Palearktik bölgeye ait olup, ağırlıklı olarak batıda Fas'tan başlayarak Avrupa'nın büyük bir bölümünde ve Orta Asya'da Batı Çin'e kadar dağlık alanlarda görülür (Fery ve Brancucci, 1997; Fery ve Hosseinie, 1998; Fery, 2003; Aykut ve Ark., 2018; 2019). *Deronectes* cinsine ait türler genellikle akan sularda



yaşar istinai olarak durgun sularda ve göletlerde bulunanları da mevcuttur (Fery, 2003). Bu cinse ait Türkiye'den şu ana kadar 15 endemik türün varlığı bildirilmiştir (Aykut ve Ark., 2018; 2019). Ayrıca Son 10 yıl içerisinde bölgede yapılan çalışmalar ile Türkiye'nin Doğu ve Güneydoğu'sundan Dytiscidae familyasına ait beş yeni tür ve bir alt tür bilime eklenmiştir: *Hydroporus karabegan* (Aykut ve ark., 2025), *Bidessus anatolicus adiyaman* (Aykut ve ark., 2021*). Deronectes kabilcevz* ve *D. propedoriae* (Aykut ve ark., 2019), *Deronectes taron* (Aykut ve ark., 2018), *Scarodytes costatus* (Aykut ve Fery, 2017). Ayrıca, *Hydaticus (Prodaticus) histrio* Clark, 1864 (Erman ve ark., 2018) ve *Hydroporus inscitus* (Sharp, 1882) (Aykut, 2018) Türkiye için ilk kez kaydedilmiştir. Bu çalışmalar ile Türkiye'den bilinen Dytiscidae tür ve alt tür sayısı 178'e ulaşmış olup, bunların 40'ı ülkemiz için endemiktir. Bu durum Dytiscidae familyasının çeşitliliğinin Türkiye'de yüksek olduğunu göstermektedir. Bu çalışmanın amacı Türkiye için endemik olan ve henüz dişi örnekleri tanımlanmamış olan *Deronectes hakkariensis* türünün dişisinin ayrıntılı tanımlanmasını yapmaktır.

MATERYAL VE METOT



Çalışmaya konu olan böcek örnekleri 4 Haziran 2024 tarihinde Elâzığ İli, Arıcak İlçesi Akdağlar Yaylası'ndan (Şekil 1) gözenek çapı 0,5 ile 1mm arasında değişen elek, süzgeç ve sucul ağ kullanılarak toplanmıştır. Çalışma yapılan ve böcek örneği alınan istasyonun koordinat ve yükselti bilgileri el GPS'i (Global Position System; Küresel Konumlama Sistemi) kullanılarak (Magellan Explorist 610) kayıt altına alınmıştır. Arazi çalışmalarında toplanan böcek örnekleri çalışma alanında %70'lik etil alkole alınıp etiketlenerek laboratuvara getirilmiştir. Laboratuvara getirilen böcek örnekleri teşhis işlemi için ince fırçalar ve ultrasonik aletler ile temizlenmiştir. Örnekler temizlendikten sonra teşhisleri yapılmıştır. Teşhisi yapılan örnekler etiketlenerek, muhafaza edilmek üzere, birinci yazarın Dicle Üniversitesi Ziya Gökalp Eğitim Fakültesinde bulunan kişisel koleksiyonunda depolanmaktadır.

Şekil 1. *Deronectes hakkariensis* örneklerinin toplandığı istasyon

Şekil 2. *Deronectes hakkariensis* (dişi) genel görünüşü: **(A)** sırttan; **(B)** karından

Şekil 3. *Deronectes hakkariensis*, dişi: gonocoxae (A) ve gonocoxosternum (B).

BULGULAR

Taksonomi

Tür lokalitesi: Elâzığ İli, Arıcak İlçesi, Akdağlar Yaylası, Türkiye. 38^{0}07'23"K, 40^{0}10'32"D, Rakım: 2086 m. Küçük, çamurlu kaynak suyu.

Genel tanım: Vücut genel görünümü dar, uzun ve oval, elitra kenarları ilk iki üçte birlik kısımda yuvarlak omuzların arkasında zayıf ve aşağı yukarı eşit şekilde yuvarlak, daha arkada ise daha belirgin bir şekilde kavislidir (Şekil 2). Maksimum genişlik, uzunluğun ortasından hemen öncedir. Pronotum gövdeden belirgin şekilde daha dardır ve omuzlardaki vücut hatlarının sürekliliği belirgindir. Baş hariç sırt yüzeyi ipeksi parlaklıktadır ve kısa, şeffaf kıllarla kaplıdır, ancak bazı kısımlarda kıl yoktur.

Renk: Sırt yüzeylerinin rengi siyah; sadece başın tepe noktası ve pronotumun arka kenarı kahverengimsi, dar bir şekilde parlıyor. Alt yüzey baskın olarak siyah; ağız parçaları ile üçüncü ila beşinci abdominal ventrillerin arka kenarları kahverengimsi. Bacaklar genellikle koyu kahverengi. Antenler ve palpler kahverengimsi, IV ila X anten segmentleri uca doğru giderek koyulaşmış.

Baş: Tüm yüzey belirgin şekilde ağsı, gözenekler küçük, çokgen. Noktalama seyrek, düzensiz, bazen çift. Gözenekler arası mesafe klipeusta yaklaşık dört nokta, alında yaklaşık beş nokta kadar. Klipeustaki büyük deliklerin çapı, küçük olanların yaklaşık iki katı, alında ise daha da büyük; küçük delikler arasında düzensiz olarak serpiştirilmiş. Klipeus olukları büyük, uzun ve noktalama belirgin şekilde daha yoğun. Gözlerin iç kenarı boyunca, birkaç büyük delik de dahil olmak üzere, derin ve keskin bir şekilde sınırlanmış bir oluk bulunur. Başın ön kenarı çok zayıf bir şekilde girintili çıkıntılıdır. Klipeus oluklarında çok az kıl, diğer yerlerde kıl yoktur.

Pronotum: Kenarlar büyük kısımda neredeyse eşit şekilde kavisli, ön açılardan kısa, biraz daha düz, arka açılardan kısa içbükey, kıvrımlı, arka açılar az çok dikdörtgen. Arka üçte birlik kısımda dar bir baskıyla yan kenara paralel, özellikle arka açılara yakın derin baskı. Orta kısmın sağ ve solunda ön kenarın arkasında zayıf baskı, arka kenardan önce daha güçlü baskı; bu nedenle pronotum diski şişkin görünüyor. Yan kenarlar parlak kenarlı, ön açılardan kısa kenar oldukça inceliyor. Tüm yüzey ağsı, poligonal ağlar baştakinden biraz daha küçük. Noktalama düzgün, delikler baştaki daha küçük delikler kadar küçük, delikler arasındaki mesafe aşağı yukarı iki veya üç ağ kadar. Diskin merkezinde derin baskı, büyük delik; Ön kenarın arkasında ve arka kenarın önünde çok düzensiz düzenlenmiş büyük delikler mevcut. Tüm yüzeyde kıllar mevcut, diskte daha seyrek, yanlarda daha yoğun.

Elitra: Yuvarlak, omuzlar belirgin; omuzların arkasındaki yanlar uç hizasından hemen öncesine kadar eşit şekilde kavisli; burada çok belirsiz bir şekilde kıvrımlı ve sonra uca doğru daha güçlü bir şekilde kavisli; elitra uzunlamasına şişkinliklere sahip değil, uç hizasından önce çok belirgin ve büyük bir izlenime sahip. Üst yüzeyde dik görünümde, yan görünümde, yan kenar omuzlara doğru güçlü bir şekilde yükseliyor; epipleuron omuzlara kadar görülebilir. Yüzeyin büyük kısımları ağ şeklinde değil, sadece kenarlara yakın ve arka üçte birlik kısımda bazı ağ çizgileri algılanabilir. Yüzey az çok eşit şekilde küçük deliklerle kaplı; delikler pronotumun merkezinden daha küçük; delikler arasındaki mesafe yaklaşık olarak çapları kadar veya biraz daha fazla. Tüm yüzey, bazı kısımlar hariç, oldukça uzun kıllarla az çok eşit şekilde kaplıdır.

Alt yüzey: Vücudun alt yüzeyi neredeyse tamamen yoğun noktacıklı olduğundan genellikle mattır; büyük delikler yoktur (Şekil 2). Başın alt kısmı ağsı değildir, ince deliklerle yoğun bir şekilde kaplıdır, ön kenarın arkasında uzunlamasına birkaç belirgin kırışıklık vardır; daha ortada, daha büyük deliklerin enine düzensiz çizgisi vardır, arkasında ağsıdır. Gözlerin yanında üçgen düz bir alan mevcuttur. Prosternal çıkıntı prosternal kolona hafifçe eğimlidir, çıkıntının ucu biraz yukarı kıvrıktır. Prosternal kolon dardır; prosternal çıkıntı mızrak şeklindedir, ucu genişçe yuvarlaktır; çıkıntı belirgin şekilde tonozludur, yanal olarak, yan kenara paralel delik çizgileriyle; kenar kenarlı değildir.

Bacaklar: Femur ve tibiaların şekli normaldir. Ön protarsal pençe biraz kalınlaşmış, tabana yakın kavisli, sonra neredeyse düz, uçta tekrar kavisli. Ön mezotarsal pençe de biraz kalınlaşmış, aşağı yukarı eşit şekilde kavisli. Metafemurun tepesi arkaya doğru lobludur.

♀**: Dişi eşey yapılar:** Gonocoxae ve gonocoxosterna Şekil 3'te verilmiştir.

Vücut Ölçümleri: Toplam uzunluk: 3.95- 4.30 mm (4.05 mm), Maksimum genişlik: 2.05- 2.15 mm (2.06 mm), Toplam uzunluk / Maksimum genişlik: 1.93- 2.00 (1.97).

TARTIŞMA

Deronectes hakkariensis türü ilk kez Wewalka tarafından 1989 yılında Hakkari ilinin Uludere ilçesinden toplanan tek bir erkek örneğe dayanarak tanımlanmıştır. 18 Mayıs 1990 tarihinde Şırnak'ın il olması ile Şırnak'a bağlandı. Örnek teşhis edildiğinde Uludere ilçesi Hakakri İli'ne bağlı olduğu için örneğe *Deronectes hakkariensis* ismi verilmiştir. Daha sonraki arazi çalışmalarında bu tür Türkiye'nin kuzeydoğusundaki yer alan Erzurum İl'inde de kaydedilmiştir. Her iki çalışmada da yalnızca bu türe ait erkek örnekler ayrıntılı olarak tanımlanmış, dişi örnekler tanımlanmamıştır. Bu çalışma ile *Deronectes hakkariensis* türünün dişi bireyleri ilk kez tanımlanmış oldu. Elâzığ ilinden toplanan örneklerimiz daha önce tanımlamaları yapılan orijinal örneklere ile uyumluluk göstermektedir ve incelenen dişiler erkeklere dış morfolojik açıdan benzerlikler göstermektedir.

SONUÇ

Ülkemiz için endemik bir tür olan *Deronectes hakkariensis*'in dişi bireyleri ilk olarak bu çalışma ile ayrıntılı bir şekilde tanımlanmıştır. Gelecekteki ayrıntılı ve kapsamlı saha faaliyetlerinin Türkiye'deki Dytiscidae türlerinin sayısını daha da artırması oldukça muhtemeldir.

TEŞEKKÜR

Bu çalışma, Dicle Üniversitesi Bilimsel Araştırma Projeleri Koordinatörlüğü (DÜBAP) tarafından ZGEF. 23.018 proje numarasıyla desteklenmiştir. DÜBAP yönetimine destekleri için teşekkür ederiz.

Abstract

The concept of functional foods first emerged in Japan in the 1980s and gained legal status under the term "FOSHU" (Foods for Specified Health Use). These foods aim to improve overall health by supporting physiological functions beyond basic nutrition, particularly enhancing immune, cardiovascular, digestive, skeletal, and nervous system health. They also contribute to reducing the risk of chronic diseases through their antioxidant and metabolic regulatory effects. Eggs are considered an important animal-derived functional food due to their high-quality protein content and natural bioavailability. In addition to their nutritional value, eggs contain biologically active compounds such as phosvitin, ovalbumin, lysozyme, ovotransferrin, and lutein, which exhibit antioxidant, antimicrobial, immunomodulatory, and cholesterol-regulating properties. Furthermore, with the development of food processing technologies, eggs enriched with omega-3 fatty acids, vitamin D, selenium, probiotics, or lutein have become functional egg products designed to provide specific health benefits. This review summarizes the current literature on functional egg production techniques, market trends, and consumer perceptions. It also discusses the growth potential of the functional egg market and future research directions. Findings indicate that consumer preferences are increasingly shaped by health, naturalness, and ethical production, positioning functional eggs as a strategic product within these dynamics.

Keywords: Functional food, egg, consumer trends, bioactive compounds, food market, functional egg

INTRODUCTION

In recent years, the understanding of food science has gone beyond meeting basic nutritional needs and focused on developing foods that protect health and help prevent disease. The concept of "functional food," which has gained importance with this approach, defines products that offer additional health benefits to the body in addition to their basic nutritional value (Hardy, 2000; Kwak & Jukes, 2001). In this context, eggs attract attention as an ideal functional food due to both their valuable components in their natural structure and their suitability for fortification applications. Although eggs are an important source of animal protein, they have faced negative perceptions for many years due to debates about their cholesterol content. However, current scientific data shows that dietary cholesterol has no direct effect on blood cholesterol levels in healthy individuals (Rehault-Godbert, et al., 2019). These developments have increased confidence in the nutritional value of eggs and paved the way for the development of "functional eggs" enriched with omega-3 fatty acids or various vitamins (Surai & Sparks, 2001). However, a product's scientific superiority does not guarantee its success in the market. Consumer perceptions and preferences regarding health, price, and reliability play a critical role in the acceptance of functional foods. The burgeoning global population necessitates a substantial increase in egg production, concurrently driving a demand for diverse, high-quality, and sustainably produced egg options (El-Sabrout, et al., 2022; Rondoni, et al., 2020). This escalating demand, coupled with increased consumer awareness regarding nutrition and ethical production practices, has propelled the egg industry into a transformative era, moving beyond basic commodity production towards value-added differentiation (Zollman Thomas, et al., 2023). This paradigm shift focuses on developing novel egg products that offer enhanced nutritional profiles, improved functional properties, and cater to specific

dietary needs and ethical considerations (Miranda, et al., 2015; Vlaicu, et al., 2023). This evolution encompasses advancements in conventional egg production, such as enriched eggs and those derived from insects, as well as the emergence of innovative alternatives like plant-based and precision fermentation-derived egg products (Rondoni, et al., 2020; Rondoni, et al., 2021). The increasing prevalence of egg allergies, coupled with a growing consumer shift towards vegan diets and heightened environmental sustainability awareness, further accentuates the market demand for these innovative alternatives (Boukid & Gagaoua, 2022).

Consumer habits, attitudes toward sustainability, health, and animal welfare significantly influence purchasing decisions for eggs (Rondoni, et al., 2020). A substantial proportion of consumers in various countries, such as China, Malaysia, the Philippines, and Thailand, express a willingness to pay more for cage-free eggs, indicating a growing preference for products aligned with higher animal welfare standards (Sinclair, et al., 2022). This willingness to pay a premium extends to other animal welfare considerations, such as the removal of beak trimming practices or the provision of enriched environments with perches and nesting areas for hens (Rondoni, et al., 2020). This shift towards ethical sourcing is further evidenced by consumer preferences in regions where cage-free options are not yet widely available, indicating a clear market opportunity for producers to diversify into higher-welfare systems (Sinclair, et al., 2022). Moreover, a deeper understanding of the influence of demographics, dietary identity, and consumption habits on the acceptance of novel egg products, particularly through direct exposure in retail or food service environments, is crucial for market penetration and sustained growth (Zollman Thomas, et al., 2023). Furthermore, exploring how consumer perceptions of product quality, safety, and sensory attributes, such as taste and texture, contribute to the acceptance of value-added eggs is essential for developing successful marketing strategies and product formulations (Harju, C., et al., 2023; Rondoni, et al., 2020). Conversely, a lack of comprehensive understanding regarding the nuanced differences between terms like 'cage-free' and 'free-range' can inadvertently influence consumer preferences, sometimes favoring caged eggs due to misconceptions about outdoor exposure and predation risks (Sinclair, et al., 2022). Therefore, clear and transparent labeling, coupled with consumer education initiatives, is paramount to fostering informed purchasing decisions that align with ethical production practices.

The aim of the study is to bring together the existing scientific literature on functional eggs and consumer perceptions to provide a comprehensive overview of the subject. In this context, a comprehensive search was conducted in international academic databases such as Web of Science and ScienceDirect using the keywords “functional egg,” “designer egg,” “functional food,” “consumer perception,” and “consumer perception.” Accordingly, the data were examined under the headings of “functional properties of eggs,” “fortification methods,” and “consumer perception.”

This review synthesizes current literature on consumer behavior, perceptions, and preferences concerning value-added eggs and egg products, highlighting key drivers and barriers to adoption (Rondoni, et al., 2020). It also examines how socio-economic factors, cultural backgrounds, and geographical locations impact the adoption rates of these specialized products (Ajetunmobi & Laobangdisa, 2024). Moreover, it explores the impact of increasing consumer awareness regarding health, sustainability, and animal welfare on the market for conventional, enriched, and alternative egg products. This review further investigates the influence of labeling, certifications, and marketing strategies on consumer trust and purchasing decisions for these diverse egg offerings (Harju, C., et al., 2023; Rondoni, et al., 2020) Finally, it assesses the potential future trajectories for the value-added egg market, considering emerging technologies and evolving consumer expectations. This comprehensive analysis aims to bridge existing research gaps by identifying areas where consumer understanding is limited, particularly regarding the benefits of omega-3-enriched eggs, which may lead to an unwillingness to pay a premium (Rondoni, et al., 2020). Such hesitancy often stems from insufficient clear communication regarding the specific health advantages and production methods associated with these specialized products (Harju, C., et al., 2023). Consequently, effective communication strategies that delineate the specific health benefits and the rigorous production standards of omega-3-enriched eggs are vital to enhancing consumer willingness to invest in such premium products (Usturoi, et al., 2025). This is further complicated by consumer misconceptions, such as associating brighter yolk color with enhanced health benefits, irrespective of actual nutritional content, or believing brown eggs are inherently healthier than white eggs. Moreover, preferences for specific sensory attributes, like yolk color and egg size, along with the perceived freshness and safety associated with them, significantly influence purchasing decisions across diverse consumer segments. For instance, consumers from various countries, including Malaysia, Ghana, and Spain, often exhibit a preference for larger eggs, driven by perceptions of greater healthfulness and suitability for common recipes. Similarly, preferences for bright yellow yolk color are common, stemming from an association with

freshness, healthfulness, and safety, although surprisingly, caged eggs have shown higher yolk color acceptance in some comparative studies. Beyond visual appeal, the production method itself significantly influences consumer preferences, with studies indicating a complex perceived interaction between farming practices and attributes like healthfulness, food safety, and sensory qualities (Rondoni, et al., 2020). This complexity highlights the need for transparent communication strategies that educate consumers about the true benefits of various egg types, moving beyond superficial indicators like yolk color or size. To address this, future research should delve into measuring consumers' perceptions and investigating how sociodemographic backgrounds, personal values, beliefs, and knowledge influence purchasing preferences for egg products related to sustainability aspects. Such research could illuminate the factors driving willingness to pay for attributes like local origin and animal welfare, which have been shown to influence consumer choices in other functional food categories (Harju, C., et al., 2023; Migliore, et al., 2022). Furthermore, understanding the interplay between extrinsic cues, such as labeling and certifications, and intrinsic attributes like taste and texture, is crucial for developing effective marketing strategies that resonate with diverse consumer segments (Merlino, et al., 2025). For instance, some consumers show preferences for brown eggs over white eggs, while others prioritize specific yolk colors or reject eggs with visible shell imperfections, all of which influence their purchasing decisions. This underscores the necessity for comprehensive consumer education campaigns that clarify the actual benefits and production methodologies behind different egg types, thereby dispelling common misconceptions and fostering informed purchasing behaviors (Rondoni, et al., 2020). Such campaigns could leverage insights from studies indicating that younger, well-educated females tend to value sustainable product properties more, thereby allowing for targeted messaging to key demographics. Consequently, understanding these demographic nuances and tailoring communication strategies to emphasize environmental impact and ethical production practices can significantly enhance market penetration for sustainably produced eggs. Conversely, a disconnect often exists between consumers' stated preferences for sustainability and their actual purchasing behavior, necessitating a deeper examination of the factors that bridge this attitude-behavior gap (Harju, C., et al., 2023; Li, et al., 2024). This gap is particularly evident in the market for higher quality products, where despite expressed preferences for sustainable and ethically produced options, actual purchasing decisions may still be heavily influenced by price considerations (Bosseaux, et al., 2024). This attitudinal-behavioral disparity highlights the critical role of economic accessibility and perceived value in the adoption of premium egg products (Schaufele & Janssen, 2021). Therefore, future research should explore the efficacy of price signaling mechanisms and their interaction with consumer trust to bridge this gap and encourage greater adoption of sustainably produced eggs. This includes analyzing the influence of regulatory frameworks and public policy interventions, such as eco-labeling and certification systems, which could mitigate the cost sensitivity of consumers and foster broader market acceptance for sustainable egg production (Bosseaux, et al., 2024).

MATERIALS AND METHODS

This study is a qualitative review based on an analysis of current literature published between 2015 and 2025. Data were obtained by searching the Scopus, Web of Science, and Google Scholar databases using the keywords functional food, egg, consumer trends, bioactive compounds, food market and functional egg. In addition, European Union, TÜBİTAK, and KOSGEB reports were also examined in detail to assess the current market dynamics of the sector. Finally, all data obtained were systematically analyzed, taking into account the future of egg industry, the functional food market and consumer trends. Thus, the study provides a comprehensive assessment based on both academic literature and sectoral reports. The literature review identified three main themes that reveal the value of eggs as a functional food and how this value is perceived by consumers.

1. Natural Functional Properties of Eggs

Even without any fortification, eggs naturally contain numerous bioactive compounds that are beneficial to health. These properties make eggs a functional food in their own right.

Lysozyme and Ovotransferrin: These proteins, found particularly in egg whites, exhibit strong antimicrobial properties (Abdou & Awad, 2024; Yüceer, 2022; Yüceer, et al., 2023).

Lutein and Zeaxanthin: These carotenoids, which give egg yolks their color, are antioxidants that play a role in protecting eye health and may reduce the risk of age-related macular degeneration.

Phosphovitins and Bioactive Peptides: Phosphovitins in egg yolk are powerful antioxidants. In addition, peptides produced by the digestion of egg proteins may have blood pressure-regulating and immune system-supporting effects (Yüceer, 2019).

Table 1: Natural Bioactive Components of Eggs and Their Functions (Yüceer, 2019)

Bioactive Component	Location	Potential Functional Effect
Lysozyme	Egg White	Exhibits antimicrobial and antiviral properties.
Ovotransferrin	Egg White	Has antimicrobial and antiviral effects; inhibits bacterial growth by binding iron ions.
Phosvitin	Egg Yolk	Strong antioxidant; has mineral-binding properties.
Lutein and Zeaxanthin	Egg Yolk	Protects eye health; strong antioxidants that help reduce the risk of age-related macular degeneration.
Bioactive Peptides	Egg Proteins (Post-Digestion)	May show antihypertensive (blood pressure regulating) and immunomodulatory (immune-regulating) effects.

2. Enrichment Methods

The nutritional value of eggs can be enhanced to target specific health benefits by adjusting the chickens' feed. These products, called "designer eggs," aim to meet specific consumer needs (Lesnierowski & Stangierski, 2018; Surai & Sparks, 2001).

Omega-3 Fatty Acids: The omega-3 content of eggs is increased by adding flaxseed or fish oil to feed. These eggs are often marketed with the claim of supporting cardiovascular health (Abdel-Nour & Ngadi, 2011; Açıkgöz & Önenç, 2006)

Vitamins (especially vitamin D): Supplements added to feed increase the vitamin D content of eggs, aiming to contribute to bone health and the immune system.

Selenium: Eggs are produced with the aim of strengthening the body's defense system by adding selenium, a powerful antioxidant, to feed.

3. Factors Shaping Consumer Perception

The scientific properties of a product alone do not guarantee its success in the market. Consumer perception and preferences are decisive at this point.

The Importance of Production Methods: Despite the rich nutrient content mentioned above, some of the factors are limits egg consumption and therefore affects consumer preferences (age, lifestyle, income level, education level, animal welfare, price, health concerns, etc.). Consumers view labels such as "organic" and "free-range" not only as a production standard but also as an indicator of health, naturalness, and animal welfare (Rondoni, et al., 2020). Therefore, clear and transparent labeling, along with consumer education initiatives, are crucial for encouraging informed purchasing decisions that align with ethical production practices. This educational requirement is further complicated by regional variations in consumer awareness, such as in Australia and the UK, where consumers still exhibit uncertainty about predominant egg production systems despite the prevalence of cage-free egg production. This highlights the need for clearer communication strategies to accurately convey the welfare standards associated with different production systems to the general public (Rondoni, et al., 2020). This underscores the need for targeted, region-specific information campaigns to enable consumers to make informed choices that reflect their ethical and sustainability values (Sinclair, et al., 2022).

Price Sensitivity and Lack of Information: One of the most significant barriers to functional eggs is price. Consumers are reluctant to pay higher prices because they do not fully understand the health effects of supplements such as omega-3. This highlights the importance of effective and understandable labeling. This situation is further complicated by consumer misconceptions, such as associating a brighter yellow color with enhanced health benefits regardless of actual nutritional content or believing that brown eggs are naturally healthier than white eggs Understanding the interaction between external cues such as labeling and certifications and internal characteristics such as taste and texture is crucial for developing effective marketing strategies that resonate with various consumer segments (Rondoni, et al., 2020).

Market Potential: Although per capita egg consumption in Turkey is increasing, it remains below recommended levels, indicating room for growth with the right market management strategies. Furthermore, researching the role of government incentives and industry collaborations in promoting the production and consumption of these products is essential for developing a more sustainable and economically viable egg market.

It is important to analyze whether consumers in different regions place more value on external sustainability cues, such as organic or free-range chicken certifications, when making purchasing decisions, rather than internal product characteristics, such as perceived freshness or nutritional content (Harju et al., 2023) (Piras et al., 2023).

RESULTS and DISCUSSION

Overcoming Barriers in Consumer Perception: Communication and Marketing Strategies

The functional egg market can be expanded by developing niche products tailored to the needs of specific demographic groups, rather than adopting a "one-size-fits-all" approach.

1. Target Audience-Focused Product Development

Consumer demand for functional foods is not homogeneous. Market success depends on developing products that meet the needs of specific demographic and lifestyle groups, rather than a "one size fits all" approach. In this context, four main target audiences stand out for the functional egg market:

- **Athletes and Active Individuals:** With its high bioavailable protein structure, eggs are a natural choice for muscle repair and development. For this audience, eggs with an optimized amino acid profile or anti-inflammatory properties hold strategic value.
- **Elderly Population:** Functional eggs can play an important protective role against the increased risk of chronic diseases associated with aging. Eggs enriched with lutein and zeaxanthin for eye health, vitamin D for bone health, and choline and DHA for cognitive function and memory directly address the specific needs of this group.
- **Children and Pregnant Women:** Choline, critical for brain and nervous system development in early life, and DHA content, which can be increased through feed manipulation, can be marketed to this target audience with the "smart egg" concept.
- **Health-Conscious Millennials and Generation Z:** For these generations, the product's story is as important as its health benefits. Ethical production conditions, animal welfare, and environmental sustainability are decisive factors in this segment's purchasing decisions.

2. Sustainability, Ethics, and Legal Frameworks

Modern consumers care not only about their own health but also about the health of the planet. The future of functional eggs depends on the ability to minimize the environmental footprint of production processes. The transition from traditional cage systems to alternative systems (cage-free, free-range) following animal welfare regulations introduced in the European Union in 2012 is the most concrete manifestation of this trend. Consumers believe that eggs produced under higher animal welfare standards are safer and healthier and are willing to pay a higher price for these products. The sustainability of feed sources also plays a critical role at this point. For example, using innovative feed additives such as microalgae, which have a lower environmental impact, instead of unsustainable fish oil sources for omega-3 enrichment will strengthen the product's sustainability claim. Eggshell, the industry's largest by-product, is a valuable source of calcium, while eggshell membrane is a source of collagen and other bioactive components that can be utilized in the nutraceutical industry. Marketing a product as "functional" is subject to strict legal frameworks. Both international authorities (e.g., EFSA in Europe) and Turkey's Turkish Food Codex Nutrition and Health Claims Regulation require that any health claim on a food package, such as "strengthens immunity," be supported by scientific evidence. These legal controls play a fundamental role in protecting consumers from false claims and establishing trust in products on the market (Leinonen, et al., 2012; Rondoni, et al., 2020).

3. Competitor Products and Market Positioning

Functional eggs are not alone in the market. Consumers can also meet their omega-3 needs from fish oil capsules, flaxseed, or other enriched foods such as plant-based milks. The rapid increase in the consumption of plant-based milk, meat, and egg alternatives in recent years has created a new competitive environment for animal products. In this competitive environment, the biggest advantage of functional eggs is that they are a "natural whole food." Therefore, the marketing strategy should emphasize that eggs are not just a single enriched ingredient; rather, they are a holistic food source that provides valuable nutrients such as protein, vitamins, and bioactive peptides. The increasing prevalence of egg allergies, the growing consumer shift towards vegan diets, and rising environmental sustainability awareness further emphasize the market demand for innovative alternatives (Boukid & Gagaoua, 2022). This significant market growth underscores a major shift in consumer preferences driven by factors such as

allergen reduction, improved food safety, healthier nutritional profiles, and environmental sustainability growing awareness is significantly influencing market dynamics and product development (Bianchi & Simonato, 2025).
Furthermore, a deeper understanding of the impact of demographic characteristics, dietary identity, and consumption habits on the acceptance of new egg products, particularly through direct exposure in retail or food service settings, is crucial for market penetration and sustainable growth. Additionally, investigating how consumer perceptions of product quality, safety, and sensory attributes such as taste and texture contribute to the acceptance of value-added eggs is essential for developing successful marketing strategies and product formulations (Harju, A., et al., 2023; Zollman Thomas, et al., 2023).

Conclusion and Future Perspectives

Eggs hold a strategic position in the functional food market due to both their naturally occurring bioactive components (lysozyme, phosvitin, lutein, etc.) and their potential to be enriched with valuable components such as omega-3, selenium, and vitamin D. As one of the world's largest egg producers, Turkey has the opportunity to transform this potential into value-added products both in the domestic market and for export. However, fully realizing this potential requires reshaping technology and marketing strategies with a consumer-centric approach.
Ultimately, the future of functional eggs depends on addressing information gaps through transparent labeling, building trust with science-based health claims, and meeting modern consumers' ethical expectations through sustainable production practices.

• **Transparent Communication:** Developing labeling and marketing strategies that clearly explain the product's added functional components, natural composition, and production methods to address consumer information gaps.
• **Scientific Credibility:** Supporting health claims with scientific evidence and presenting them to consumers with approval from credible authorities.
• **Holistic Approach:** Develop products that meet consumer expectations for health, naturalness, and ethical production as a whole.

Future research should examine in more detail the market acceptance of new functional eggs developed for the specific needs of different consumer segments (athletes, seniors, etc.) and the potential impact of the growing plant-based egg alternatives on this market. Eliminating the risk of these scientifically superior products failing to pass the consumer's perception filter on the market shelf will only be possible with this multifaceted approach.

CONCLUSION

In conclusion, the trajectory of value-added egg products is heavily influenced by the evolving interplay between consumer perceptions, technological advancements, and sustainable production practices, requiring a dynamic approach to product development and market positioning. This entails a continuous effort to align product innovation with consumer expectations, particularly regarding health, ethical considerations, and environmental impact, while simultaneously addressing existing knowledge gaps through transparent communication. For instance, emphasizing the superior nutritional profiles of certain value-added eggs, such as those enriched with omega-3 fatty acids or vitamins, could appeal to health-conscious consumers. Moreover, future research should investigate the impact of emerging trends like insect-fed eggs on both nutritional properties and consumer preferences, alongside exploring the market potential and consumer acceptance of plant-based egg alternatives. These studies should also consider the potential for precision fermentation-derived egg proteins to disrupt traditional egg markets, examining consumer attitudes towards such novel food technologies and their willingness to integrate them into their diets. Finally, understanding consumer behavior, perceptions, and preferences towards eggs and egg products is crucial for producers to develop appropriate strategies and policies that can satisfy the complex and diverse demands of consumers.

ORAL PRESENTATION

DPP4 (CD26) geninin akut myeloid lösemi patogenezindeki rolünün değerlendirilmesi

Deniz Aşlar Öner (*Orcid: https://orcid.org/ 0000-0002-9515-0073*)

Afyonkarahisar Sağlık Bilimleri Üniversitesi, Atatürk Sağlık Hizmetleri Meslek Yüksekokulu, Afyonkarahisar, Türkiye

*Sorumlu yazar e-mail: deniz.oner@afsu.edu.tr

Özet

Bu çalışma, in silico yaklaşımlar kullanılarak *DPP4* (dipeptidil peptidaz-4/CD26) geninin Akut Miyeloid Lösemi (AML) patogenezindeki olası rolünü ekspresyon, mutasyon ve protein stabilitesi düzeyinde kapsamlı biçimde değerlendirmeyi amaçlamıştır. AML, genetik ve epigenetik değişimlerin etkisiyle hematopoietik kök hücrelerin farklılaşma yeteneğini kaybettiği, yüksek mortalite oranına sahip bir malignitedir. Bu nedenle, hücre yüzeyinde yer alan ve sinyal iletiminde rol oynayan DPP4 gibi genlerin moleküler etkilerinin anlaşılması, hastalığın biyolojik temellerinin aydınlatılmasında kritik önem taşımaktadır. AML hastalarına ait transkriptom verileri The Cancer Genome Atlas (TCGA-LAML) veri tabanından, normal kemik iliği örnekleri ise GTEx veri tabanından alınmıştır. GEPIA aracıyla yapılan analizlerde, DPP4 ekspresyonunun AML örneklerinde normal kontrollere göre anlamlı şekilde arttığı belirlenmiştir ($p<0.05$). Mutasyon analizinde PolyPhen-2 aracı kullanılmış; G633E mutasyonu "probably damaging", I107L mutasyonu ise "benign" olarak tanımlanmıştır. I-Mutant 2.0 ve DynaMut2 sonuçları, G633E mutasyonunun DPP4 proteininin termodinamik kararlılığını azalttığını ($\Delta\Delta G$ = -1.05 kcal/mol) ve yapısal bütünlüğü zayıflattığını göstermiştir. HOPE analizi, glisin yerine geçen glutamik asidin daha büyük ve negatif yüklü olması nedeniyle lokal elektrostatik dengeyi bozabileceğini ve hidrofobik çekirdek stabilitesini zayıflatabileceğini ortaya koymuştur. Sonuç olarak, bu çalışma *DPP4'ün* AML'deki rolünün yalnızca ekspresyon artışıyla sınırlı olmadığını, aynı zamanda yapısal varyasyonların da genin biyolojik işlevlerini etkileyebileceğini göstermektedir. Ancak bu öngörülerin kesinleştirilmesi için deneysel doğrulama ve fonksiyonel analiz çalışmalarına ihtiyaç vardır. DPP4, mevcut veriler ışığında, AML'nin moleküler patogenezinin anlaşılmasına katkı sağlayabilecek potansiyel bir biyobelirteç olarak değerlendirilebilir.

Anahtar Kelimeler Akut Myeloid Lösemi, DPP4, CD26, mutasyon

Evaluation of the role of the DPP4 (CD26) gene in the pathogenesis of acute myeloid leukemia

Abstract

This study aimed to comprehensively evaluate the potential role of the *DPP4* (dipeptidyl peptidase-4/CD26) gene in the pathogenesis of Acute Myeloid Leukemia (AML) using in silico approaches at the expression, mutation, and protein stability levels. AML is a malignancy with a high mortality rate, where hematopoietic stem cells lose their ability to differentiate due to genetic and epigenetic alterations. Therefore, understanding the molecular effects of genes such as DPP4, which are located on the cell surface and play a role in signal transduction, is critical for elucidating the biological basis of the disease. Transcriptome data from AML patients were obtained from The Cancer Genome Atlas (TCGA-LAML) database, and normal bone marrow samples were obtained from the Genotype-Tissue Expression (GTEx) database. Analysis using the GEPIA (Gene Expression Profiling Interactive Analysis) tool revealed that DPP4 expression was significantly increased in AML samples compared to normal controls ($p<0.05$). The PolyPhen-2 tool was used for mutation analysis; the G633E mutation was identified as "probably damaging" and the I107L mutation as "benign". I-Mutant 2.0 and DynaMut2 results showed that the G633E mutation reduces the thermodynamic stability of the DPP4 protein ($\Delta\Delta G$ = -1.05 kcal/mol) and weakens its structural integrity. HOPE (Have (y)Our Protein Explained) analysis revealed that the larger and more negatively charged glutamic acid replacing glycine may disrupt local electrostatic equilibrium and weaken the stability of the

hydrophobic core. In conclusion, this study demonstrates that the role of DPP4 in AML is not limited to increased expression; structural variations can also affect the biological functions of the gene. However, experimental validation and functional analysis are needed to confirm these predictions. In light of the available data, DPP4 can be considered as a potential biomarker that can contribute to the understanding of the molecular pathogenesis of AML.

Keywords: Acute Myeloid Leukemia, DPP4, CD26, mutation

GİRİŞ

Akut myeloid lösemi (AML), erişkinlerde en sık görülen akut lösemi türü olup, lösemiler arasında en yüksek yıllık mortalite oranına sahiptir. Son yıllarda hedefe yönelik tedaviler ve düşük yoğunluklu tedavi rejimleri özellikle mutasyon pozitif AML alt tiplerinde ve 65 yaş üzeri hastalarda kullanılmaya başlanmıştır (Tallman ve ark., 2019). Bu gelişmeler bazı hasta alt gruplarında klinik sonuçları iyileştirse de, genel olarak AML prognozu halen kötüdür ve beş yıllık sağkalım oranı yalnızca %29'dur. AML tedavisinde en önemli zorluklardan biri, lösemik hücrelerde sınırlı sayıda özgül terapötik hedefin tanımlanabilmiş olmasıdır. Ayrıca mevcut tedavi yaklaşımları çoğunlukla normal hematopoietik hücreleri de etkileyerek ciddi yan etkilere yol açmaktadır (Kumar, 2011). Bu bağlamda, klasik kemoterapi rejimleri veya kök hücre nakli yüksek morbidite ve mortalite oranları ile ilişkilidir (Sanford ve Ravandi, 2015). Bu nedenle AML için etkili ancak tolere edilebilir yeni tedavi stratejilerine ihtiyaç duyulmaktadır.

Hücre yüzey proteinleri, hem hücresel belirteç olarak rolleri hem de ekstrasellüler erişilebilirlikleri nedeniyle önemli terapötik hedeflerdir. Bununla birlikte, bu yüzey proteinlerinin ekspresyonu ve fonksiyonu, lösemik hücreler ile normal hematopoietik hücreler arasında belirgin farklılıklar gösterebilmektedir (Wang ve ark., 2023). Bu farklılıkları temel alan bir tarama çalışmasında, insan ve fare AML hücrelerinde eksprese edilen hücre yüzey proteinlerini hedefleyen bileşikler incelenmiş ve bu analiz sonucunda *DPP4/CD26*, AML tedavisinde potansiyel bir hedef olarak tanımlanmıştır. DPP4 pek çok hücre tipinde ve farklı organ sistemlerinde, hematopoietik sistem dahil olmak üzere, eksprese edilmektedir (Nistala ve Savin, 2017). Ayrıca *DPP4*, hem kronik myeloid lösemi (CML) hem de akut lenfoblastik lösemi (ALL) kök hücreleri için bir biyobelirteç ve terapötik hedef olarak tanımlanmıştır (Herrmann ve ark., 2014; Castillo ve ark., 2012; Blatt ve ark., 2018). Ancak *DPP4'ün* AML hücrelerindeki kesin fonksiyonu ve AML gelişimindeki rolü tam olarak aydınlatılamamıştır.

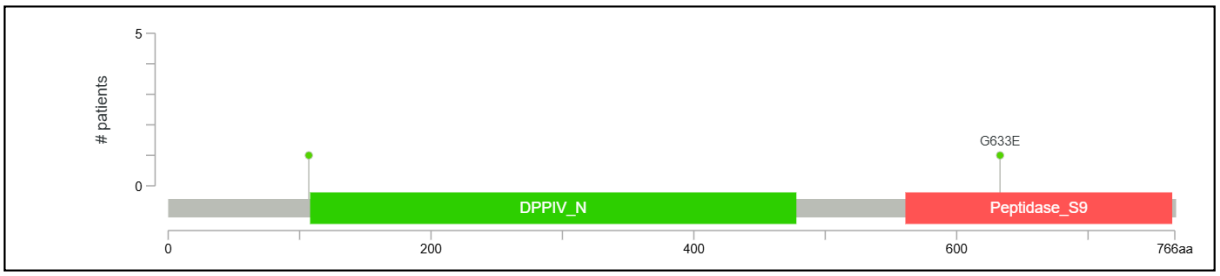
Bu çalışmada, *DPP4* geninin AML patogenezindeki olası rolünü değerlendirmek amacıyla in silico yaklaşımlar kullanılarak genin ekspresyon düzeyleri ve mutasyon profillerinin belirlenmesi hedeflenmiştir. Bu kapsamda elde edilecek bulguların, *DPP4'ün* AML ile ilişkili moleküler mekanizmalarının anlaşılmasına katkı sağlaması ve gelecekteki deneysel doğrulama çalışmalarına temel oluşturması amaçlanmıştır.

MATERYAL VE METOT

Bu çalışmada AML hastalarına ait gen ekspresyon verileri The Cancer Genome Atlas (TCGA-LAML) veri tabanından elde edilmiştir. Toplam 200 AML hastasına ait transkriptom verileri indirilmiş, karşılaştırmalı analizlerde ise normal kemik iliği örnekleri Genotype-Tissue Expression (GTEx) veri tabanından alınmıştır. AML ve normal örneklerde gen ekspresyon farklılıklarını değerlendirmek amacıyla GEPIA (Gene Expression Profiling Interactive Analysis) web aracı kullanılmıştır. Ekspresyon düzeyleri $\log_2$ (TPM + 1) dönüşümü sonrası normalizasyonla elde edilmiş, $p < 0.05$ anlamlılık sınırı olarak kabul edilmiştir.

AML hasta verilerinde *DPP4* genine ait potansiyel varyantların fonksiyonel etkilerini değerlendirmek için PolyPhen-2 (Polymorphism Phenotyping v2) aracı kullanılmıştır (Adzhubei ve ark., 2013). Bu analiz, aminoasit değişimlerinin proteinin yapısal bütünlüğü ve fonksiyonu üzerindeki olası etkilerini "benign", "possibly damaging" veya "probably damaging" olarak sınıflandırmıştır. Çalışmada mutasyon ve ekspresyon profillerinin yanı sıra *DPP4* geninin sağkalım üzerine olan etkisi de %95 güven aralığı ile belirlenmiştir

DPP4 proteininde gözlenen varyantların termodinamik kararlılık değişimi, I-Mutant 2.0 yazılımı kullanılarak analiz edilmiştir. Ayrıca, aynı varyantın yapısal stabilite değişimleri DynaMut2 aracı kullanılarak değerlendirilmiştir (Rodrigues ve ark., 2018). DynaMut2, wild-type ve mutant protein modelleri arasında serbest enerji farkını ($\Delta\Delta G$) hesaplayarak mutasyonun proteinin konformasyonel kararlılığı üzerindeki etkisini öngörmüştür.

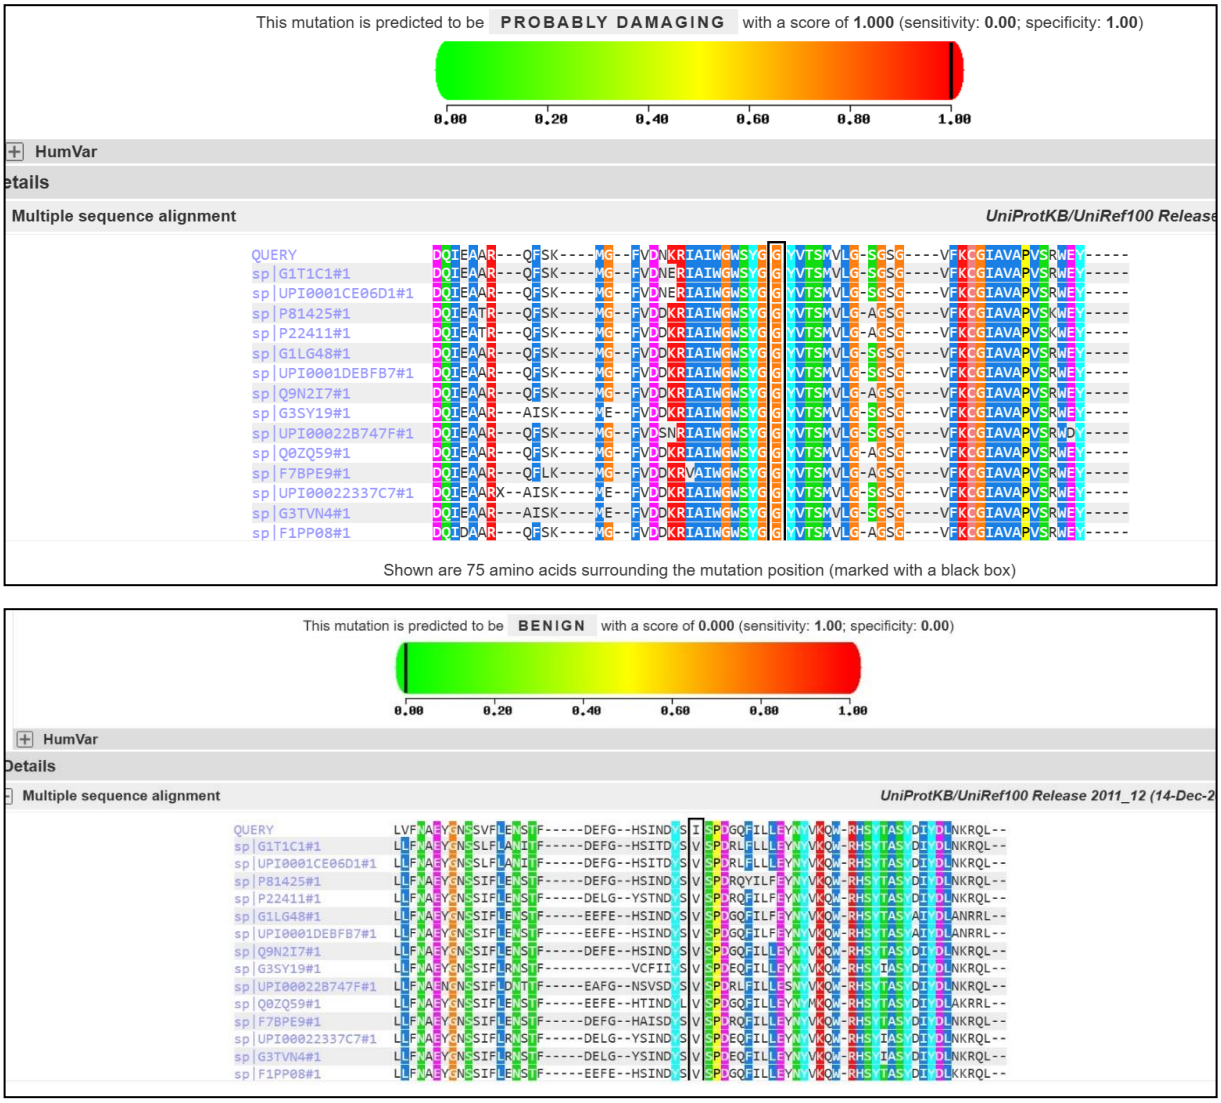


Ayrıca, *DPP4* geninde tanımlanan aminoasit değişimlerinin olası yapısal ve fonksiyonel etkilerini değerlendirmek amacıyla HOPE yazılımı kullanılmıştır. Bu analiz, mutasyonun proteinin üç boyutlu yapısındaki konumu, aminoasit özelliklerindeki değişiklikler ve olası yapısal bozunumlar açısından değerlendirilmesini sağlamıştır (Venselaar ve ark., 2010).

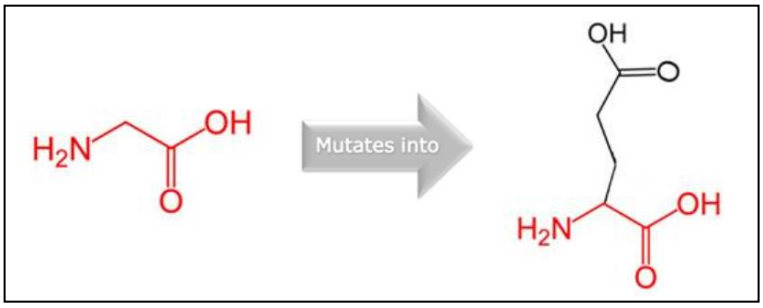
BULGULAR ve TARTIŞMA

Bu çalışmada, *DPP4* geninin AML patogenezindeki olası rolünü değerlendirmek amacıyla in silico yaklaşımlar kullanılarak genin ekspresyon düzeyleri ve mutasyon profilleri belirlenmiştir. Ayrıca, saptanan varyantların proteinin yapısal kararlılığı ve biyolojik fonksiyonu üzerindeki olası etkileri hesaplamalı yöntemlerle analiz edilmiştir.

Analiz sonuçlarına göre *DPP4* geninde iki missense mutasyon tanımlanmıştır (Şekil 1).



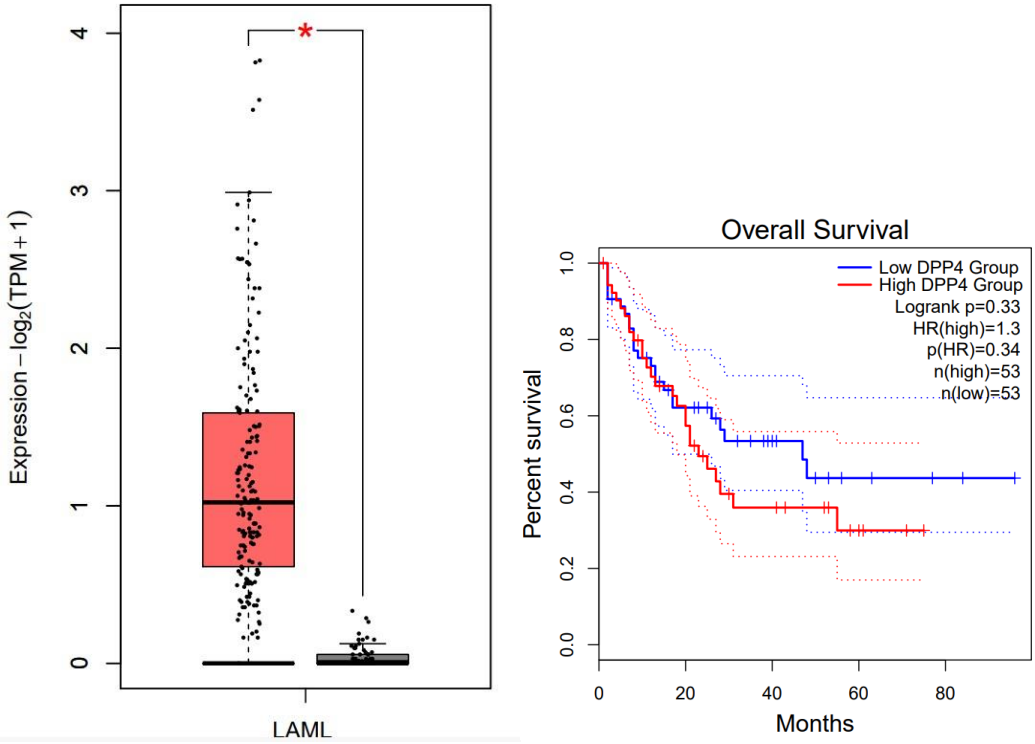
Sample ID	Protein Change	Annotation	Mutation Type	Copy #	Allele Freq (T)	# Mut in Sample
TCGA-AB-2808-03	*G633E*		Missense	Diploid	0.08	782
TCGA-AB-2828-03	*I107L*		Missense	Diploid	0.08	753



Şekil 1. DPP4'ün domain yapısının şematik gösterimi

G633E mutasyonu, PolyPhen-2 analizi sonucunda "probably damaging" olarak değerlendirilmiş olup, proteinin yapısal stabilitesi ve fonksiyonel bütünlüğü üzerinde olumsuz etki potansiyeline sahip olduğu öngörülmüştür. Buna karşın, I107L mutasyonu "benign" olarak sınıflandırılmış ve proteinin yapısal veya fonksiyonel özelliklerini anlamlı düzeyde etkilemediği tahmin edilmiştir. (Şekil 2).

I-Mutant analizi, G633E mutasyonunun DPP4 proteininin termodinamik stabilitesini azalttığını ortaya koymuştur. Bu bulgu, DynaMut2 analizinden elde edilen sonuçlarla da desteklenmiş olup, söz konusu mutasyonun *DPP4'ün* kararlılığında belirgin bir azalmaya yol açtığı doğrulanmıştır ($\Delta\Delta G$ = -1.05 kcal/mol; destabilizing). HOPE analizine göre *DPP4* genindeki G633E (Glycine→Glutamic acid) mutasyonu, proteinin yapısal ve biyokimyasal özelliklerini olumsuz etkilemektedir (Şekil 3). Küçük ve nötr bir amino asit olan glisinin yerine daha büyük ve negatif yüklü bir glutamik asidin geçmesi, sterik engellere ve elektrostatik dengenin bozulmasına yol açmaktadır. Ayrıca, mutasyon sonrası artan hidrofiliklik, hidrofobik çekirdek stabilitesini zayıflatabilir. Bu değişiklikler, DPP4 proteininin konformasyonel kararlılığında azalmaya neden olabileceğini göstermektedir. Bulgular, DynaMut2 ve I-Mutant analizlerinde gözlenen destabilizasyon eğilimi ile uyumludur.



Şekil 2. DPP4 genindeki missense mutasyonların olası fonksiyonel etkilerinin PolyPhen-2 programı ile tahmin edilmesi

Şekil 3. G633E missense mutasyon için wild-type (sol) ve mutant (sağ) amino asit modellemesi

GEPIA analizi sonuçlarına göre, *DPP4* geninin ekspresyon düzeyi, LAML örneklerinde normal kontrollere kıyasla anlamlı düzeyde artış göstermiştir ($p < 0.05$). Bu bulgu, *DPP4* geninin AML patogenezinde önemli bir biyolojik role sahip olabileceğini ve hastalığa özgü potansiyel bir terapötik hedef olarak değerlendirilebileceğini göstermektedir. Yapılan sağkalım analizinde, *DPP4* gen ekspresyon düzeyleri ile AML hastalarının genel sağkalım süreleri arasında belirgin bir ilişki eğilimi gözlenmiştir. Ancak bu farklılık istatistiksel olarak anlamlı düzeyde

bulunmamıştır (p = 0.33). Bu bulgu, *DPP4* ekspresyonunun hastalık seyrine olası etkilerinin daha geniş örneklemlerle desteklenmesi gerektiğini düşündürmektedir (Şekil 4).

Şekil 4. AML hastalarında DPP4 ekspresyon düzeyi ile sağkalım analizi

TARTIŞMA

Bu çalışmada, *DPP4* geninin AML patogenezindeki potansiyel rolü in silico yaklaşımlar ile değerlendirilmiştir. GEPIA verileri, *DPP4* ekspresyonunun AML örneklerinde normal kemik iliği dokularına kıyasla anlamlı biçimde artmış olduğunu göstermiştir. Bu durum, DPP4'ün AML hücrelerinde biyolojik olarak aktif olabileceğini ve lösemik hücre davranışlarını etkileyebileceğini düşündürmektedir. Nitekim, Wang ve ark. (2023) tarafından yürütülen çalışmada da *DPP4'ün*, AML kök hücrelerinin yaşamı ve kök hücre benzeri özelliklerinin sürdürülmesinde kritik bir rol oynadığı bildirilmiştir. DPP4'ün Src kinaz ile etkileşerek NF-κB sinyal yolunu aktive ettiği, bu yolla AML kök hücrelerinin anti-apoptotik ve self-renewal kapasitesini koruduğu gösterilmiştir. Ayrıca, DPP4 inhibitörlerinin hem insan hem de fare AML modellerinde lösemik hücre proliferasyonunu baskıladığı ve apoptozu artırdığı rapor edilmiştir. Bu bulgular, DPP4'ün hedeflenmesinin AML tedavisinde yeniden konumlandırılabilecek farmakolojik bir strateji olabileceğini desteklemektedir.

Moleküler düzeyde yapılan varyant analizleri, *DPP4* genindeki G633E mutasyonunun PolyPhen-2 tarafından "probably damaging" olarak, I107L mutasyonunun ise "benign" olarak sınıflandırıldığını ortaya koymuştur. I-Mutant ve DynaMut2 analizleri, G633E değişiminin DPP4 proteininin termodinamik kararlılığını azalttığını (ΔΔG = −1.05 kcal/mol) göstermiştir. HOPE analizi ise Glisin'den Glutamik asit'e geçişin, artan yan zincir hacmi ve negatif yük nedeniyle lokal elektrostatik etkileşimleri ve çekirdek paketlenmesini bozabileceğini göstermiştir. Bu bulgular bir arada değerlendirildiğinde, G633E mutasyonunun DPP4'ün yapısal bütünlüğü üzerinde bozucu etkiler oluşturabileceği ve proteinin fonksiyonel stabilitesini zayıflatabileceği anlaşılmaktadır. Bu sonuçlar, Wei ve ark. (2021) tarafından bildirilen verilerle de paralellik göstermektedir. Söz konusu çalışmada, ferroptozisle ilişkili genlerden oluşan çalışmanın (*DPP4, GPX4, LPCAT3, SLC7A11 ve TFRC*) AML prognozunu anlamlı biçimde öngördüğü; özellikle *DPP4'ün* tanısal ve prognostik biyobelirteçler olarak klinik öneme sahip olduğu vurgulanmıştır.

SONUÇ

Bu çalışma, in silico analizler aracılığıyla *DPP4* geninin AML patogenezindeki olası rolünü kapsamlı biçimde ortaya koymuştur. Elde edilen bulgular, *DPP4* ekspresyonunun AML örneklerinde anlamlı düzeyde arttığını ve genin hastalığın biyolojik süreçlerinde potansiyel bir düzenleyici rol üstlenebileceğini göstermektedir. Ayrıca, G633E missense mutasyonunun proteinin yapısal stabilitesini ve fonksiyonel bütünlüğünü olumsuz etkilediği, buna karşın I107L mutasyonunun nötr bir etkiye sahip olduğu belirlenmiştir. Bu sonuçlar, *DPP4'ün* AML'de hem moleküler patogenezde hem de terapötik hedefleme stratejilerinde dikkate alınması gereken önemli bir biyobelirteç olabileceğini düşündürmektedir. Bulguların, gelecekte gerçekleştirilecek deneysel ve klinik doğrulama çalışmaları için bilimsel temel oluşturacağı öngörülmektedir.

Abstract

Alterations in lipid metabolism are closely associated with tumorigenesis and cancer progression. This study aimed to investigate the expression levels of *Stearoyl-CoA Desaturase 2 (SCD2*) and *Acyl-CoA Synthetase Long Chain Family Member 1 (ACSL1)* in colon tissue to elucidate their potential involvement in cancer progression. Quantitative PCR analysis (qPCR) revealed that *SCD2* expression decreased to approximately 0.6-fold, whereas ACSL1 expression increased to nearly 1.8-fold in tumor tissues compared with matched adjacent normal tissues, while GAPDH remained stable across both groups. However, paired-samples statistical analysis demonstrated that these expression differences were not statistically significant ($p>0.05$). Taken together, these findings suggest that SCD2 and ACSL1 may play distinct yet complementary roles in the metabolic reprogramming of colon tumor cells. Increased ACSL1 expression suggests enhanced fatty-acid activation and lipid accumulation, potentially promoting tumor cell proliferation, whereas decreased *SCD2* activity may indicate reduced desaturation capacity, affecting membrane fluidity and oncogenic signaling pathways.

Keywords: Colon Cancer, *SCD2*, *ACSL1*, Lipid Metabolism, Gene Expression, Tumor Progression

INTRODUCTION

Colon cancer (CC) is defined as a malignant tumour that occurs in the colon (large exit), which represents the final segment of the human digestive system. While it is more prevalent among the elderly, the risk of developing it at any age is present. The initial stage in the pathogenesis of CC is the formation of diminutive, initially benign polyps in the colonic mucosa. These polyps have the potential to become proliferative, resulting in growth and subsequent clinical manifestations. Consequently, the implementation of regular screening programmes is imperative for individuals deemed to be at risk. The implementation of a screening programme with the objective of detecting and removing polyps in the premalignant stage has been shown to be an effective method of preventing the development of CC. Surgery constitutes the primary treatment option, and, depending on the tumour stage, can be supported by pharmacological and oncological treatments such as radiotherapy and immunotherapy. The term “colorectal cancer” is employed when the disease has spread to the rectum, and in such cases, the probability of metastatic propagation is elevated (Ferlay et al., 2013; Aoki et al., 2017). *ACSL1* is a critical enzyme that catalyses the conversion of long-chain fatty acids to acyl-CoA derivatives (Coleman et al., 2002) and plays a role in metabolic processes associated with carcinogenesis (Mashima et al., 2009; Gaisa et al., 2013). *SCD*, a rate-limiting enzyme in the biosynthesis of monounsaturated fatty acids (FA), has been found to be associated with malignant cellular transformation, proliferation, and maintenance of tumour cell survival (Roongta et al., 2011; Mason et al., 2012; Von Roemeling et al., 2013). The lipid metabolism network, which is regulated by *ACSL* and *SCD*, has been demonstrated to enhance the migration and invasion capacity of tumour cells by inducing epithelial-mesenchymal transition (EMT). Furthermore, this network has been associated with an increased risk of recurrence in colorectal

cancer patients (Sánchez-Martínez et al., 2015). Gene expression also plays a crucial role in colorectal carcinogenesis by enhancing the expression of associated oncogenic proteins. β-catenin–mediated signalling contributes to the upregulation of oncogenes, and elevated levels of nuclear β-catenin have been widely observed in colorectal cancer cells, indicating its involvement in tumour progression (Igarashi and Guarente, 2016). Studies have demonstrated that obesity constitutes a significant risk factor for multiple malignancies at least 13 cancer types including CC. Tumour cells frequently exploit lipid metabolism to satisfy their increased energy demand required for rapid proliferation (German et al., 2016; Patel et al., 2023). Lipid biology encompasses FA metabolism as well as fat and cholesterol homeostasis, which are fundamental processes contributing to tumour progression and metastasis (Lee et al., 2019). Notably, FA accumulation is more pronounced in metastatic tumours compared to primary lesions. In lipid-rich environments such as lymph nodes, metastatic cancer cells preferentially utilize FAs as their main energy source (Ell and Kang, 2013). In ovarian cancer, adipocytes facilitate tumour development by supplying FAs to malignant cells, thereby enhancing their metastatic potential (Nieman et al., 2011). Collectively, these findings support the energy storage/production hypothesis as a critical mechanism underlying tumour metastasis.

Therefore, this study aimed to investigate the expression levels of *SCD2* and *ACSL1* in colon tissue, with the goal of elucidating their potential roles in colorectal tumour progression and their relevance as metabolic biomarkers.

MATERIALS AND METHODS

Study Population

This study included 30 patients who were diagnosed with CC at the Department of General Surgery, Sivas Cumhuriyet University Faculty of Medicine. Written informed consent was obtained from all participants prior to surgical intervention. Tumor tissues excised during surgery, along with histologically normal adjacent colon tissues serving as controls, were collected in accordance with the recommendations of the attending pathologist. Patients were enrolled only after histopathological confirmation of tumor subtype by the Department of Pathology. The study protocol was approved by the Clinical Research Ethics Committee of Sivas Cumhuriyet University (Decision No: 2025-06/64, Date: 12.06.2025) and conducted in accordance with the principles of the Declaration of Helsinki.

RNA Isolation and cDNA Synthesis

Total RNA was isolated from colon tissue samples of all patients using the RNeasy Plus Mini Kit (Qiagen), following the manufacturer's protocol. RNA concentration and purity were assessed using a NanoDrop spectrophotometer, and samples with an A260/A280 ratio between 1.8 and 2.0 were considered acceptable for downstream applications. Subsequently, complementary DNA (cDNA) was synthesized from the purified RNA using the A.B.T.™ cDNA Synthesis Kit (Cat. No: C03-01-20) according to the manufacturer's instructions.

qPCR Analysis

The transcriptional profiles of *SCD2* and *ACSL1* genes were evaluated using qPCR. Reactions were carried out with EvaGreen® qPCR Master Mix and primers designed specifically for each gene. The cDNA synthesized from previously isolated RNA served as the amplification template. For each well, a final reaction volume of 20–25 µL was prepared, consisting of Master Mix, gene-specific primers, nuclease-free water, and cDNA. To correct for potential variations in sample loading and amplification efficiency, GAPDH was employed as an internal reference gene. The amplification was initiated with a denaturation phase at 95°C, followed by 40 cycles of denaturation and annealing/extension steps, with cycling conditions optimized according to primer melting temperatures. Each biological sample was analyzed in triplicate to ensure consistency and technical reliability. After amplification, melting curve analysis was performed, and reactions displaying a single specific peak were accepted as valid. Quantification of relative gene expression was calculated based on $\Delta\Delta_{CT}$ values, comparing tumor tissues with matched adjacent non-tumorous tissues.

RESULTS

The study cohort consisted of 30 CC patients. For each participant, paired samples were obtained, including the primary tumor tissue and the matched adjacent healthy colon tissue, yielding a total of 60 biological specimens for comparative gene expression analysis. Of them, 56.7% were male and 43.3% were female. Smoking was reported in 33.3%, while only 3.3% consumed alcohol. The prevalence of comorbidities included hypertension (30.0%), diabetes mellitus (16.7%), hyperlipidemia (6.7%), and heart disease (23.3%). A family history of cancer was present in 43.3% of the participants. Nutritional habits varied, with 36.7% consuming fruit/vegetable-based diets, followed by 26.7% meat-based diets. The mean age of male participants was higher than females (63.2 vs. 57.2 years). BMI values indicated that females had a higher average BMI (28.9 vs. 25.3 kg/m²) (Table 1). Expression analysis demonstrated gene-specific regulatory alterations between colon tumor tissues and matched adjacent normal tissues. Compared to the control, *SCD2* expression decreased to approximately 0.6-fold, indicating a downward trend in its transcriptional activity. Conversely, *ACSL1* expression showed a strong upregulation to nearly 1.8-fold, while *GAPDH* remained stable across both groups (Table 2, Figure 1). However, paired-samples analysis revealed that neither *SCD2* nor *ACSL1* expression change reached statistical significance (*SCD2: $p = 0.396$*; *ACSL1: $p = 0.196$*) (Table 3, Figure 2).

Table 1. Sociodemographic and clinical characteristics of CC patients

Variable	Category / Statistics	Total (n = 30)
Gender	Female, Male	13 (43.3%), 17 (56.7%)
Age (years)	Mean ± SD Range	60.57 ± 10.70 (38–79)
Height (cm)	Mean ± SD Range	166.03 ± 10.04 (150–195)
Weight (kg)	Mean ± SD Range	74.23 ± 15.89 (40–103)
BMI (kg/m²)	Mean ± SD Range	26.91 ± 5.41 (15.63–37.83)
Alcohol consumption	Yes, No	1 (3.3%), 29 (96.7%)
Smoking status	Yes, No	10 (34.5%), 19 (65.5%)*
Hypertension	Yes, No	9 (30.0%), 21 (70.0%)
Diabetes Mellitus	Yes, No	5 (16.7%), 25 (83.3%)
Hyperlipidemia	Yes, No	2 (6.7%), 28 (93.3%)
Heart disease history	Yes, No	7 (23.3%), 23 (76.7%)
Cancer family history	Yes, No	13 (43.3%), 17 (56.7%)
Dietary habits	Balanced diet, Meat-based diet, High-pastry diet, Fruit & vegetable-based diet	4 (13.3%), 8 (26.7%), 7 (23.3%) 11 (36.7%)

Table 2. qPCR analysis of CT values, fold regulation, and statistical differences in CC patient samples

Genes	Groups	Mean CT	Fold Change	*p-value*
SCD2	Group 1	10.02	0.60	*0.44*[a]
	Control	9.29		
ACSL1	Group 1	7.23	1.88	*0.31*[a]
	Control	8.15		
GAPDH	Group 1	0	1.00	N/A
	Control	0		

Significant indicates $p>0.05$
[a]Student's t-test
GAPDH: Glyceraldehyde 3-phosphate dehydrogenase, CT: Cycle threshold.

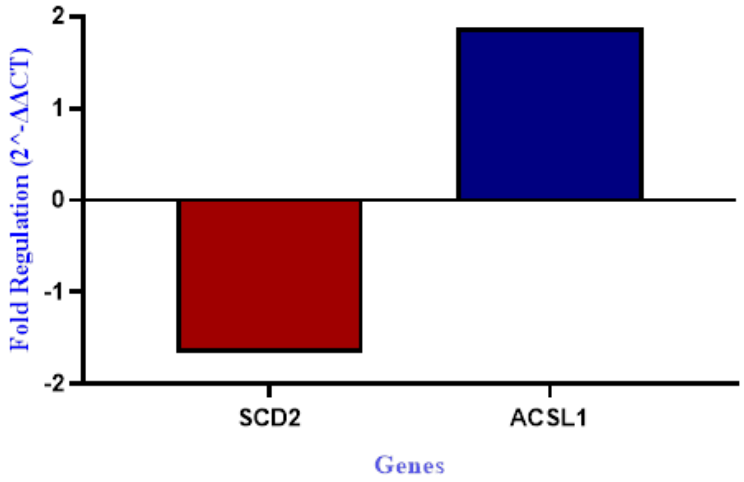

Figure 1. Differential fold regulation of *SCD2* and *ACSL1* in CC patients based on qPCR analysis.

Table 3. Paired samples t-test analysis for SCD2 and ACSL1 between CC patient conditions

Paired Comparison	Mean Difference	95% CI of Difference (Lower–Upper)	t	*p-value*
SCD2/SCD2-CT	0.606	−0.854 to 2.066	0.869	*0.396*
ACSL1/ACSL1-CT	−1.043	−2.672 to 0.587	−1.339	*0.196*

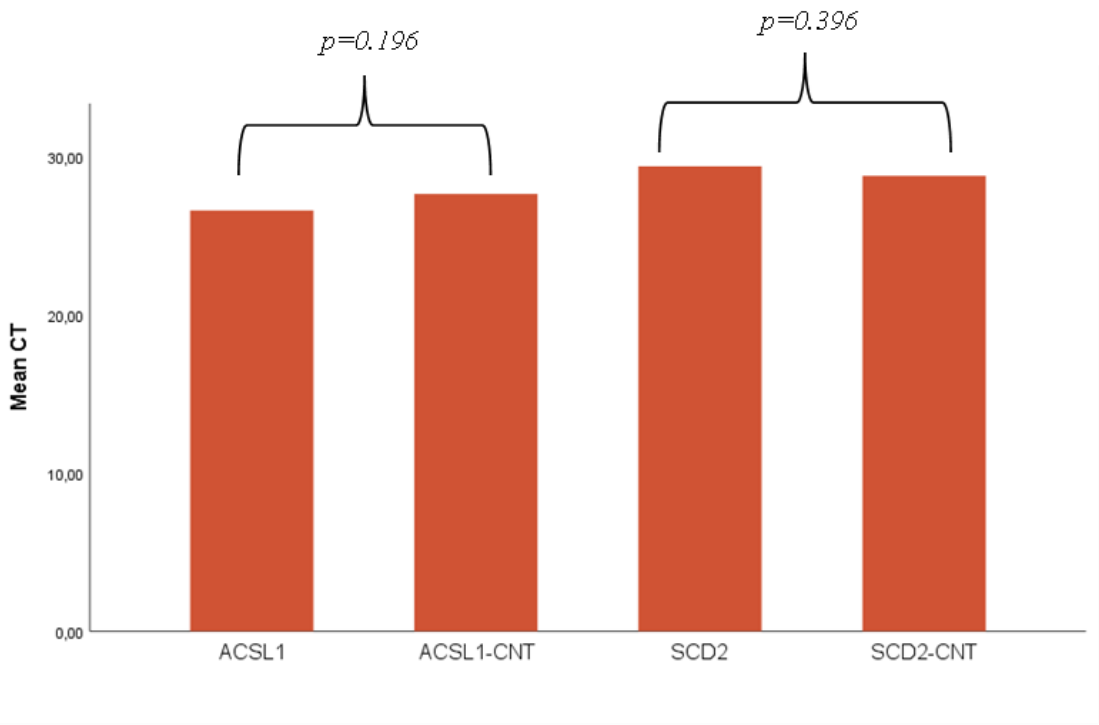

Figure 2. Paired comparison of mean CT values of ACSL1 and SCD2 between CC tissues and their matched control samples.

DISCUSSION

Colorectal tumors demonstrate profound metabolic reprogramming to sustain uncontrolled proliferation, adapt to hypoxic niches, and promote metastatic dissemination. Among these metabolic alterations, dysregulated lipid homeostasis has emerged as a critical hallmark of cancer progression. In the present study, we investigated transcriptional changes in two key lipid-regulating enzymes, *SCD2* and *ACSL1*, in matched tumor and adjacent normal colon tissues from CC patients. Although *SCD2* expression exhibited a downward trend and *ACSL1* showed an upward trend, these changes did not reach statistical significance, suggesting moderate but biologically relevant alterations. *ACSL1* functions at the intersection of lipid activation and storage, converting long-chain fatty acids into acyl-CoA derivatives that feed into lipogenesis, β-oxidation, and membrane synthesis pathways (Shen et al., 2022). Its upregulation has been linked to enhanced tumor cell proliferation, epithelial mesenchymal transition (EMT), and increased metastatic potential in multiple cancers (Chen et al., 2025). Consistent with these reports, the elevated *ACSL1* levels observed in our cohort support the hypothesis that fatty acid activation and accumulation contribute to the energetic and biosynthetic demands of colorectal tumor cells. Conversely, *SCD* family enzymes participate in monounsaturated fatty acid biosynthesis and influence membrane fluidity, signal transduction, and oncogenic survival pathways (Ascenzi et al., 2021). Unlike previous studies reporting *SCD* overexpression in aggressive cancers, our findings demonstrated a slight reduction in *SCD2* expression in tumor tissues. One possible explanation is isoform-specific compensation, where *SCD1*, a more extensively studied homolog, may remain highly active in colon tumors, masking *SCD2* downregulation. Additionally, reduced desaturation may alter membrane lipid composition, modulating stress tolerance in early-stage tumors rather than driving proliferation (Tracz-Gaszewska and Dobrzyn, 2019). Several clinical characteristics of our patient cohort, including obesity associated metrics such as BMI, strengthen mechanistic relevance. Previous studies have established obesity and excess adiposity as prevalent risk contributors for colorectal cancer, primarily through lipid driven metabolic rewiring (Ungvari et al., 2025). Although the observed changes in *SCD2* and *ACSL1* did not reach statistical significance, their expression trends indicate a potential shift in lipid metabolism in colon cancer. These findings suggest that metabolic regulation may contribute to tumor progression, even when transcript level alterations are modest.

CONCLUSION

This study demonstrated modest but biologically relevant alterations in *SCD2* and *ACSL1* expression in colon cancer tissues compared with adjacent normal tissues. The observed trends suggest a potential involvement of lipid metabolism in colorectal tumor progression. Future studies with larger cohorts and complementary functional analyses are needed to clarify the clinical relevance of these genes and to assess their utility as metabolic biomarkers or therapeutic targets in CC.

Abstract

Exosomes are nanovesicles secreted outside the cell and containing biomolecules such as proteins, lipids, mRNA, and miRNA. These vesicles reorganize cellular communication during normal physiological processes and various disease states. First observed in the 1980s during the removal of unnecessary membrane proteins during the maturation of reticulocytes, exosomes were initially considered "waste products." However, studies in the following years have demonstrated that these vesicles are part of a complex communication system within the body. Exosomes are known to play important roles in a wide variety of processes, including immune response regulation, tumour microenvironment formation, neuronal signaling, cardiovascular function, and infection. Exosomes hold great potential not only in basic biology but also in medicine, biotechnology, and the pharmaceutical industry. They are particularly used as biomarkers and therapeutic tools in cancer, neurodegenerative diseases, cardiovascular disorders, autoimmune diseases, and viral infections. Thanks to their unique biomolecular potential, exosomes can be used as biomarkers in early diagnosis and as drug carriers in targeted therapy applications. Mesenchymal stem cell-derived exosomes, in particular, offer promising results in regenerative medicine by increasing cell proliferation, suppressing apoptosis, and supporting angiogenesis and collagen synthesis. Exosomes affect synaptic plasticity by transporting proteins and RNA between brain cells. The detection of brain-derived exosomes in peripheral blood has the potential to revolutionize the early diagnosis of neurodegenerative diseases. Standardizing exosome research processes is critical for both diagnostic and therapeutic applications. New technologies and modification methods enable more effective and safe use of exosomes. In conclusion, as important components of cellular communication, exosomes are promising tools in translational medicine. Although there are currently intensive scientific studies and reports on exosomes, it is understood that further experimental and clinical research is needed on the bioactive roles of exosomes.

Keywords: Clinical trial, exosomes, experimental study, extracellular vesicles.

1. INTRODUCTION

Cell communication in living organisms is vital for sustaining life. Traditionally, it was thought that this communication was achieved through direct cell contact, secreted soluble molecules, or electrical signals. However, recently, the discovery of exosomes, a much more complex pathway for intercellular information transfer, has brought a new perspective to this field. Exosomes are nanovesicles secreted outside the cell that contain biomolecules, including micro ribonucleic acid (miRNA) and messenger RNA (mRNA), proteins, and lipids. These small vesicles reorganise cellular communication in normal physiological processes and various disease states. Exosomes were first observed in the 1980s during the process of reticulocyte maturation, when unnecessary membrane proteins were removed. Initially, they were considered 'waste products'. However, detailed studies conducted in subsequent years have revealed that these vesicles are part of a complex communication system within the organism. Exosomes play crucial roles in various molecular processes by regulating immune responses, establishing the tumor microenvironment, facilitating neuronal signaling, supporting cardiovascular function, and protecting cells against infectious agents and diseases. Exosomes have great potential not only in terms of basic biology but also in terms of medicine, biotechnology, and the pharmaceutical industry. Intense research is being conducted on their use as biomarkers and biomedical therapeutic strategies, particularly in cancer,

neurodegenerative diseases, viral infections, and tissue engineering. Their unique biomolecular properties give exosomes the ability to be used as biomarkers in early-stage disease diagnosis and as drug carriers in targeted therapy applications.

2. THE STRUCTURE OF EXOSOMES

Exosomes are small, spherical particles derived from endosomes, approximately 30-100 nm in size. These vesicles are surrounded by a double-layered phospholipid membrane, and intercellular communication is facilitated by means of the macromolecules that are contained within them, such as ribonucleic acid, deoxyribonucleic acid (DNA), proteins, and lipids. Many cell types in the organism secrete exosomes, which consist of numerous vesicles and are formed by integration with the plasma membrane. They arise as a product of the intracellular endosomal system. Almost any cell type can secrete exosomes, including epithelial/mesenchymal stem cells, neurons, tumour and immune cells (Raposo and Stoorvogel, 2013). These small vesicles exhibit important effects in cell-to-cell communication by mediating the delivery of important biomolecules in cellular activities, particularly lipids, nucleic acids, and proteins to intended cells. The release of the vesicles they contain is triggered by their fusion with the plasma membrane, a process called biogenesis (Armstrong et al., 2017).

The structure of exosomes contains cell-specific proteins and genetic material. The molecules present in the structure of exosomes are listed below.

A. Protein Content:

Tetraspanins: CD9, CD63, CD81 (exosome markers),
Tumor susceptibility gene 101 protein (TSG101), ALG-2-interacting protein X (ALIX),
HSP70, HSP90 (chaperone proteins),
MHC I and II (immune-related molecules).

B. Lipid Content:

Sphingomyelin, cholesterol, phosphatidylserine.

C. Genetic Material:

mRNA, miRNA, long non-coding RNA (lncRNA), and trace amounts of DNA.

The biogenesis of exosomes occurs in three main stages listed below (Théry et al., 2009; Yáñez-Mó et al., 2015).

A. Endocytosis: The plasmalemma invaginates to form endosomes. Subsequently, these early endosomes collect intracellular materials and signals.

B. Multivesicular Body Formation: After early endosomes complete their maturation, late endosomes are formed, resulting in the development of numerous small intraluminal vesicles.

C. Exocytosis (Secretion): Degradation by fusion with lysosomes or transport to the plasma membrane.

Exosomes are divided into different subtypes based on the cell type and the molecules they contain (Barile and Vassalli, 2017). These subtypes are listed below.

Immune system exosomes: They exhibit antigenic effects.
Tumor-derived exosomes: They influence metastasis and tumor progression.
Mesenchymal stem cell-derived exosomes: They are used in regenerative interventions

3. FUNCTIONS OF EXOSOMES

Beyond facilitating cell-to-cell interaction and participating in various cellular and molecular processes, exosomes are vital for transferring biological information and maintaining cellular homeostasis. In-depth scientific research has revealed that exosomes play pivotal roles in many processes such as immune function, inflammation, infections, and tumor growth. Both healthy individuals and patients with various diseases release exosome particles containing distinct RNA and protein profiles into the bloodstream, which could be exploited as a predictive marker (Barile and Vassalli, 2017).

3.1. Intercellular Communication

One of the primary functions of exosomes is to contribute to intercellular information transfer. They transport genetic material (mRNA, miRNA), proteins, and signaling molecules from cell to cell. This transport occurs through three different pathways, listed below (Théry et al., 2009).

1. Direct membrane fusion with the target cell.
2. Binding of ligands to receptors on the cell surface.
3. Internalization via endocytosis.

3.2. Immune System Regulation
Exosomes significantly impact both the adaptive and innate immunological responses. The T cells can be activated by antigen-presenting cells (APCs), including dendritic cells, via the secretion of exosome molecules that carry MHC-I and MHC-II. Exosomes secreted by tumor cells can cause immune suppression (Robbins and Morelli, 2014).

3.3. Tissue Regeneration and Repair
In particular, the use of mesenchymal stem cell-generated exosomes has shown great promise in the domain of regenerative medicine. The results have included increased cell proliferation, suppressed apoptosis, and supported angiogenesis and collagen synthesis (Barile & Vassalli, 2017).

4. BIOMEDICAL APPLICATIONS OF EXOSOMES
Exosomes are used in medicine for diagnostic and therapeutic approaches. In particular, the use of exosomes as biomarkers and therapeutics is relevant in neurodegenerative and cardiovascular diseases, as well as cancer. Additionally, exosomes hold potential significance in therapeutic strategies such as gene therapy and drug delivery (Barile and Vassalli, 2017). Severe acute respiratory syndrome coronavirus-2 (SARS-CoV-2) and human immunodeficiency virus (HIV) have been shown to mimic exosome-like structures to facilitate intercellular spread. Exosomes released from immune cells support host defense by carrying antiviral miRNAs (Kalluri and LeBleu, 2020). Both glial cells and neurons secrete exosomes into the central nervous system regularly. An important role is played by these vesicles in both physiological and pathological processes. Exosomes affect synaptic plasticity by transporting proteins and RNA between brain cells (Chivet et al., 2013; Kumari and Anji, 2022). Exosomes released after myocardial ischemia reduce cell death in heart muscle cells (Liu et al., 2017; Cheng et al., 2020).

The level and miRNA load of exosomes in milk samples milked for three days from cows with subclinical mastitis changed in relation to certain physiological processes, and the bta-miR-223-3p exosome expression increased and could be used as a detection marker for subclinical mastitis (Saenz-de-Juano et al., 2022). Researchers have demonstrated that mastitis modifies the composition and biological activities of exosomes present in milk. The microRNA and protein profiles of the exosomes derived from mammary alveolar cells and T cells were found to be consistent with the profiles of the exosomes found in milk. The authors emphasized the potential use of mammary alveolar cell-T cells in studies focusing on milk exosomes (Ogunnaike et al., 2021). Findings of a study examining the expression of miRNA in mastitic bovine milk exosomes caused by *Staphylococcus aureus* reported that Bta-miR-142-5p and bta-miR-223 could serve as potential biomarkers for the early detection of mastitis (Sun et al., 2015; Cai et al., 2018). A study showed that 37 miRNAs within exosomes in milk from *Staphylococcus aureus*-infected cows significantly differed from those in milk from control cows (Ma et al., 2019).

Exosomes are used as non-invasive diagnostic tools because they contain nucleic acids and cell-specific proteins, including miRNA and mRNA. Exosome content varies based on the cell type from which it is secreted, and also varies based on the pathophysiological status of the cell. Measuring exosomes secreted from brain tissue cells in peripheral blood has the promise for improving the early diagnosis of neurodegenerative disorders (Kim et al., 2021). In Alzheimer's disease, neuronal exosomes carrying tau and beta-amyloid are used as biomarkers, as are exosomes containing alpha-synuclein in Parkinson's disease. Exosomes secreted by cancer cells carry the genetic profile of the tumor and can be visualized by liquid biopsy (Kalluri, 2016). The types of cancer in which exosomes are used as biomarkers are listed below. In prostate cancer, exosomes carrying prostate-specific antigen can be detected in urine (Wei et al., 2023). For breast cancer patients, analysing cancer-derived extracellular vesicles is important for diagnosis and personalised treatment (Wilhelm et al., 2025). In brain tumors, EGFRvIII-positive exosomes can be detected in plasma (Skog et al., 2008; Ciregia et al., 2017; Gilazieva et al., 2024).

In recent years, scientists have been excited by studies and developments in the study of exosomes, which are small vesicles playing a key role in communication between cells and the transfer of biological molecules and have

beneficial effects on health, especially in the diagnosis and treatment of various diseases and disorders. Studies conducted at clinical and preclinical levels suggest that exosomes could be used to treat various diseases. The unique biological structures of exosomes and their lack of recognition by the immune system allow them to be used as drug and gene carriers or immunotherapeutic agents (El Andaloussi et al., 2013). They offer the advantages of low toxicity and targeted distribution. Doxorubicin-loaded exosomes have been shown to reduce chemotherapy side effects by providing tumor-specific targeting (Gomari et al., 2019; Wei et al., 2022). These small vesicles generated from mesenchymal stem cells have been used successfully in muscle ischemia, kidney damage, and liver cirrhosis, and accelerate tissue repair (Barile and Vassalli, 2017). The use of exosome-derived mesenchymal stem cells has been investigated as an effective treatment for liver fibrosis, with promising results. A meta-analysis has shown that mesenchymal stem cell-derived exosomes can improve liver function and aid the repair of damaged liver tissue. Furthermore, mesenchymal stem cell-exosomes combined with drugs are more effective than mesenchymal stem cell-exosomes alone (Zhou et al., 2024). Researchers reported that exosomes secreted from mesenchymal stem cells suppressed experimental fibrosis and thus improved kidney function in a mouse model of chronic kidney disease. These findings indicate that mesenchymal stem cell exosomes could be used to regenerate the kidneys (Li et al., 2025; Lv et al., 2025; Pandey et al., 2025).

Exosomes effectively cross the blood-brain barrier, slow disease progression, and clear Aβ or tau, which play key roles in Alzheimer's disease pathogenesis, and can also serve as biomarkers for early diagnosis (Gao et al., 2021; Duan et al., 2024). Exosomes generated from neural stem cells prevent abnormal protein distribution in the APP/PS1 mouse model (Li et al., 2024). It has been reported that phosphatase and tensin homolog (PTEN)-targeted miR-223-loaded mesenchymal stem cell exosomes inhibit apoptosis by activating the PI3K/Akt pathway, and may be a potential alternative therapeutic intervention for Alzheimer's disease (Wei et al., 2020). Exosome-enriched extracellular vesicles isolated from the brain tissue of tau transgenic rTg4510 mice have been shown to carry tau in different phosphorylation states, suggesting that extracellular vesicles contribute to the spread of tau pathology (Polanco et al., 2016). The exosomes derived from human adipose mesenchymal stem cells have been postulated as a potential treatment option for the treatment of Alzheimer's disease (Lee et al., 2018). Additionally, the administration of exosomes derived from iPS cells as intranasal drops has been successful in the treatment of refractory focal epilepsy (Gotoh et al., 2024). Exosomes generated from mesenchymal stem cells have improved motor function in acute spinal cord injury. Significant improvements were observed in rats treated within the first four weeks (Mou et al., 2025).

Tumor-derived exosomes are both potential biomarkers that can be targeted and therapeutic agents that can be used. Immunotherapy can be performed using exosomes carrying tumor-specific antigens (Hoshino et al., 2015). Exosomes secreted in large amounts from cancer cells are involved in reshaping the tumor microenvironment. They do this by carrying signals that facilitate metastasis, increase angiogenesis, and support the escape of immune cells (Liu et al., 2021). Exosomes generated from dendritic cells and enriched with tumour-associated peptides have been used to treat metastatic melanoma and stages III and IV non-small cell lung cancer. This treatment is safe, and tumor responses have been observed in some patients (Escudier et al., 2005; Van Delen et al., 2024). Potential applications of exosomes in areas such as gene therapy, immunotherapies, and tissue engineering are being investigated. The use of exosomes within the context of a targeted delivery system has the potential to revolutionize the development of specific therapeutic approaches (Kučuk et al., 2021).

5. CONCLUSION

In recent years, in-depth molecular studies indicate that exosomes are being used successfully in biotechnology and clinical research. New technologies and modification methods ensure that exosomes can be used more effectively and safely. Scientists predict that in the future, exosomes will be successfully used in the early diagnosis and treatment of metabolic, infectious, and cancer-related diseases, and their mechanisms will be elucidated.
Small vesicles called exosomes play a key role in intercellular communication and perform diverse biological functions, driven both by their structure and the lipids, proteins, and nucleic acids they transport. These functions range from the maintenance of physiological processes to the development of pathological events. Exosomes are not merely cellular debris, but rather highly complex and functional structures. These vesicles, which are part of a broad biological system from their formation processes to their molecular content, play a key role in understanding

and treating diseases. Their characterization and isolation are an important part of studies focusing on exosomes. These small vesicles can be isolated using techniques such as ultrasonic centrifugation, ultrasonication, and immunological methods. Characterization of these vesicles is achieved by sensitive and advanced techniques such as Western blotting, electron microscopy, and nanoparticle tracking. These techniques help in understanding the biological properties and potential applications of exosomes. Exosomes are not only involved in cellular communication but have also become promising biological tools in many areas of modern medicine. Their potential, particularly in diagnosis, treatment, and disease monitoring, takes them beyond classical biomarkers and drug delivery systems. Exosomes have significant potential in delivering drugs to target cells thanks to their natural carrier properties. Exosomes can be equipped with desired properties using methods such as genetic engineering and metabolic labeling. These modifications can increase the drug delivery capacity of exosomes and increase treatment efficacy. While there is currently a wealth of scientific research and reports on exosomes, it is clear that more experimental and clinical research is needed on the bioactive roles of exosomes.

Özet

Laktoferrin, transferrin ailesine ait çok işlevli bir demir bağlayıcı glikoproteindir ve özellikle süt olmak üzere birçok vücut sıvısında bulunmaktadır. Laktoferrin, karaciğer, böbrekler, pankreas, akciğerler, bağırsaklar, safra kesesi, prostat, sinovyal sıvı, beyin omurilik sıvısı, tükürük, bronşiyal salgılar, gözyaşı, idrar, göbek kordonu kanı, sperm, kan plazması ve bağışıklık sistemi hücreleri dahil olmak üzere çeşitli organ ve vücut sıvılarında tanımlanmıştır. Laktoferrin, nöroprotektif, antienflamatuar, antibakteriyel, antiviral ve antitümör etkilere sahiptir. Laktoferrin, kan-beyin bariyerini geçerek nöronlar, mikrogliyalar ve astrositler üzerinde önemli etkiler göstermektedir. Klinik öncesi kanıtlar, laktoferrinin gelişmekte olan beyni nöronal hasardan koruduğunu, nörotrofin üretimini artırdığını, mikrogliyal aktivasyonu baskıladığını, sinaptik plastisiteyi desteklediğini ve neonatal hipoksi-iskemi modellerinde enflamasyonu azalttığını göstermektedir. Laktoferrin, beyin gelişimi ve bilişi desteklemenin yanı sıra yaşamın ilerleyen dönemlerinde nörodejeneratif hastalıkların başlamasını önleme potansiyeline bulunmaktadır. Laktoferrin üzerine gerçekleştirilen araştırmaların büyük çoğunluğu anne sütünde laktoferrin bulunması nedeniyle yenidoğan dönemine odaklanmış olsa da yeni kanıtlar nörodejeneratif hastalıklarda faydalarını göstermektedir. Çalışmalar, laktoferrin ekspresyonunun çeşitli nörodejeneratif hastalıklarda değiştiğini göstermiştir. Laktoferrinin nörogelişimi ve nöroproteksiyonu uyardığı ve hem aktif bir terapötik ajan hem de bir ilaç nanotaşıyıcısı olarak kullanım potansiyeline sahip olduğu bildirilmiştir. Bununla birlikte, laktoferrin proteinlerinin merkezi sinir sistemi hastalıklarının başlaması, ilerlemesi ve nörogenezindeki rolleri henüz açıklığa kavuşturulamamıştır. Laktoferrinin nörodejeneratif hastalıkları önlemek için bir tedavi seçeneği olarak kullanılabilmesi için, merkezi sinir sistemindeki dağılımının, biyoyararlanımının ve moleküler hedeflerinin açıklığa kavuşturulması önem arz etmektedir. Nöro-redoks düzenleyicisi olarak mikrogliyal laktoferrinin nöronları koruma ve onarma ve sağlıklı beyin fonksiyonunu sürdürmedeki rolü kritik öneme sahiptir. Laktoferrinin, iskemik beyin hasarı, Alzheimer hastalığı ve Parkinson hastalığının deneysel modellerinde inflamasyonu hafiflettiği, oksidatif stresi engellediği ve nöronları apoptozdan koruduğu gösterilmiştir. Yenilikçi laktoferrin bazlı nanoterapiler, nörodejeneratif hastalıkların tedavisi için umut verici ve hedefli ilaç iletim stratejileri olarak araştırılmaktadır. Nöroprotektif etkileri iyi belgelenmiş çok işlevli bir glikoprotein olan laktoferrin, son yıllarda nörodejeneratif süreçlerin potansiyel bir düzenleyicisi olarak giderek artan bir ilgi görmektedir.

Anahtar Kelimeler: Deneysel model, klinik araştırma, laktoferrin, nörodejenerasyon.

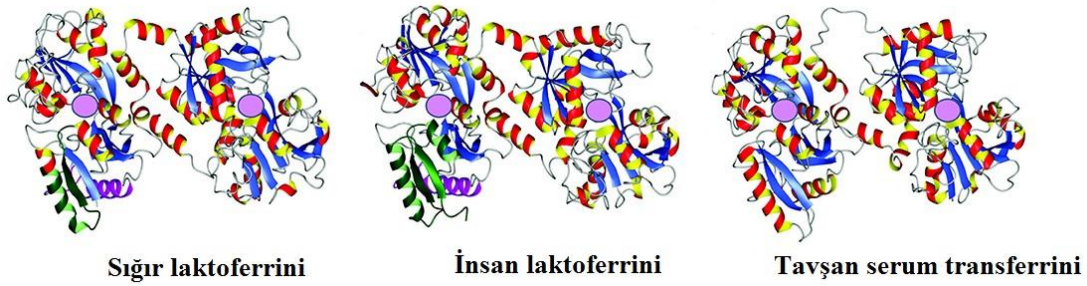
Protective role of lactoferrin in neurodegeneration: Clinical and experimental perspectives

Abstract

Lactoferrin, a multifunctional iron-binding glycoprotein of the transferrin family, is present in numerous bodily fluids, with notably high levels in milk. Lactoferrin has been identified in various organs and bodily fluids, including the liver, kidneys, pancreas, lungs, intestines, gallbladder, prostate, synovial fluid, cerebrospinal fluid, saliva, bronchial secretions, tears, urine, umbilical cord blood, sperm, blood plasma, and immune system cells. Lactoferrin has neuroprotective, anti-inflammatory, antibacterial, antiviral, and antitumor effects. Lactoferrin

crosses the blood-brain barrier and exerts significant effects on neurons, microglia, and astrocytes. Preclinical evidence suggests that lactoferrin protects the developing brain from neuronal damage, increases neurotrophin production, suppresses microglial activation, promotes synaptic plasticity, and reduces inflammation in neonatal hypoxia-ischemia models. Lactoferrin has the potential to support cognitive development and offer neuroprotective effects that reduce the risk of neurodegenerative diseases in later stages of life. Although most studies on lactoferrin have traditionally centered on its role during the neonatal stage due to its abundance in breast milk, emerging research highlights its potential therapeutic effects in neurodegenerative disorders. Studies have demonstrated that lactoferrin expression is altered in various neurodegenerative diseases. Lactoferrin has been reported to stimulate neurodevelopment and neuroprotection, with potential for use as both an active therapeutic agent and a drug nanocarrier. However, the roles of lactoferrin proteins in the initiation, progression, and neurogenesis of central nervous system diseases remain unclear. Before lactoferrin can be used as a therapeutic option to prevent neurodegenerative diseases, it is crucial to elucidate its distribution, bioavailability, and molecular targets in the central nervous system. As a neuro-redox regulator, the role of microglial lactoferrin in protecting and repairing neurons and in maintaining healthy brain function is critical. Lactoferrin has been shown to alleviate inflammation, inhibit oxidative stress, and protect neurons from apoptosis in experimental models of ischemic cerebral damage, Alzheimer's disease, and Parkinson's disease. Innovative lactoferrin-based nanotherapies are under investigation as promising and targeted drug delivery strategies for neurodegenerative disease treatment. Lactoferrin, a multifunctional glycoprotein with well-documented neuroprotective effects, has garnered increasing interest in recent years as a potential modulator of neurodegenerative processes.

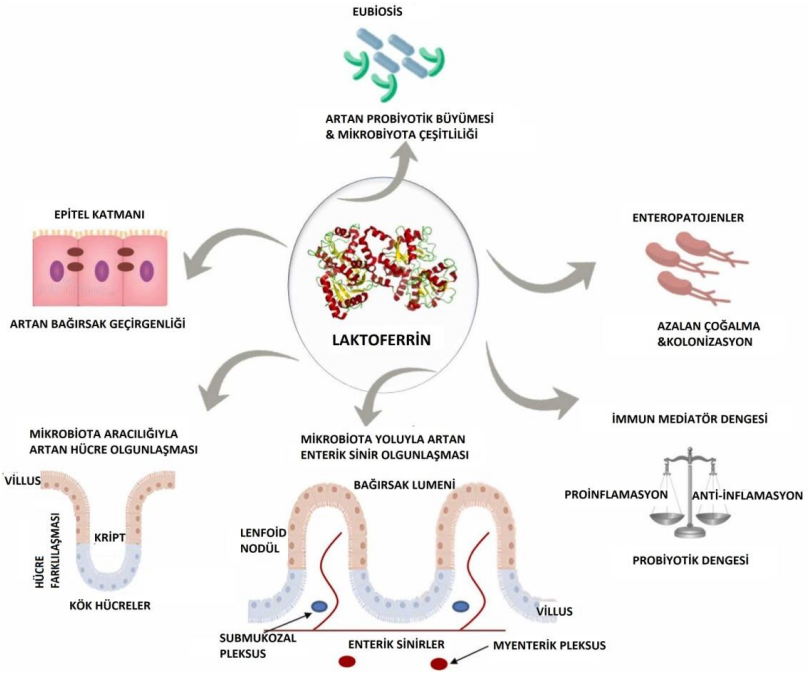
Keywords: Clinical research, experimental model, lactoferrin, neurodegeneration.



GİRİŞ

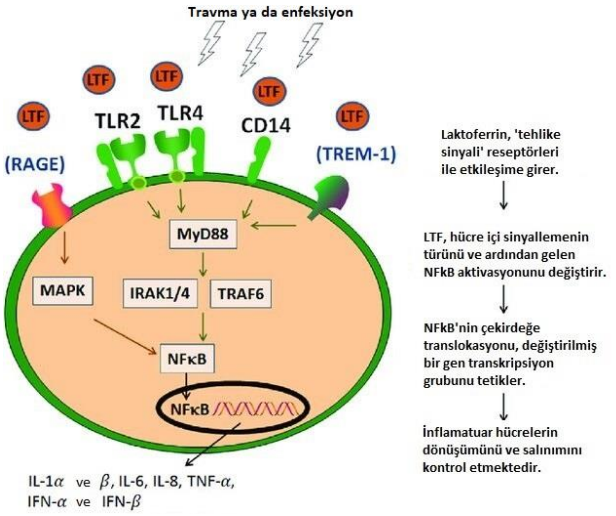
Laktoferrin, çoğu memelinin sütündeki peynir altı suyu proteininin bir bileşenidir. Sütteki laktoferrin konsantrasyonu laktasyon evresine bağlı olup kolostrumun olgun sütten yedi kat daha fazla laktoferrin içerdiği bulunmuştur. Çoğu memelinin birçok organında ve hücresinde laktoferrin bulunmaktadır. Böbreklerde, akciğerlerde, safra kesesinde, pankreasta, bağırsakta, karaciğerde, prostatta, tükürükte, sinovyal sıvıda, beyin omurilik sıvısında, bronşiyal sekresyonlarda, gözyaşında, idrarda, göbek kordon kanında, spermde, kan plazmasında ve bağışıklık sistemi hücrelerinde laktoferrin varlığı doğrulanmıştır. (Legrand ve ark., 2008; Baker ve Baker, 2012; McCarthy ve ark., 2014; Ponzini ve ark., 2020). Merkezi sinir sistemi hastalıkları dünyadaki en büyük sağlık sorunlarından biri olmaya devam etmektedir. Çoğu merkezi sinir sistemi hastalığı, yüksek oksidatif stres seviyeleri ve etkilenen dokularda yoğun inflamatuar yanıtlarla karakterizedir. Çok işlevli bir demir bağlayıcı glikoprotein olan laktoferrin antiinflamatuar, antibakteriyel, antiviral, antitümör etkiler sergilemektedir. Laktoferrinin çeşitli nörodejeneratif hastalıklarda anormal şekilde eksprese edildiği gösterilmiştir. Güncel çalışmalarda laktoferrin tarafından nörogelişimin ve nöroproteksiyonun teşviki kanıtlanmış ve laktoferrinin hem aktif bir terapötik ajan hem de ilaç nanotaşıyıcısı olarak kullanılabileceği ortaya konulmuştur (Li ve ark., 2023; Reddy ve ark., 2025). Ancak, laktoferrin proteinlerinin merkezi sinir sistemi hastalıklarının başlatılması veya ilerlemesindeki rollerine ilişkin çalışmaların, özellikle laktoferrinin nörogenezi düzenlemedeki rolüne ilişkin bilimsel kanıtların oldukça sınırlı olduğu anlaşılmaktadır.

LAKTOFERRİNİN YAPISI VE BİYOLOJİK FONKSİYONLARI



Laktoferrin, ilk kez 1939 yılında sığır sütünden demir içeren bir protein olarak izole edilmiştir (Sorensen, 1939). 1960 yılında yayınlanan bir çalışmada yapısı ve kimyasal özellikleri detaylandırılmıştır (Groves, 1960). Laktoferrinin demir bağlayan glikoproteinlerin süper ailesi olan transferrinler ile ilişkili ve serum transferrin ile % 60 amino asit sekansı özdeşliğine sahip olduğu rapor edilmiştir (Baker ve Lindley, 1992; Karav ve ark., 2017). Laktoferrin, ~80 kDa'lık büyük molekül boyutuna sahip somon pembesi renkte peynir altı suyu proteinidir. Sütte, daha küçük düzeylerde ise böbreklerde, akciğerlerde, safra kesesinde, pankreasta, bağırsakta, karaciğerde, prostatta, tükürükte, sinovyal sıvıda, beyin omurilik sıvısında, bronşiyal sekresyonlarda, gözyaşında, idrarda, göbek kordon kanında, spermde, kan plazmasında ve bağışıklık sistemi hücrelerinde bulunmaktadır (Legrand ve ark., 2008; Baker ve Baker, 2012; McCarthy ve ark., 2014). İzoelektrik noktası (pI) 8,0-8,5'tir, dolayısıyla fizyolojik pH 7,4'te pozitif yüklüdür (González-Chávez ve ark., 2009). İnsan laktoferrini bir alfa-sarmal ile

bağlanan iki küresel lob (80 kDa bi-lobal glikoprotein) halinde katlanmış 691 amino asitten oluşan katyonik glikosile edilmiş bir proteindir (Andersen ve ark., 1990; Vogel, 2012; Karav ve ark., 2017; 2018). Sığır laktoferrini 689 amino asit içermektedir (Moore ve ark., 1997). Laktoferrin ve transferrin benzer amino asit bileşimlerine, ikincil yapılara (disülfit bağlantıları dahil) ve üçüncül yapılara sahiptir, ancak biyolojik işlevler açısından farklılıklar göstermektedirler. Sığır laktoferrininin, insan laktoferrininin ve tavşan serum transferrininin kristal yapıları Şekil 1'de sunuldu.



Şekil 1. Sığır laktoferrininin, insan laktoferrininin ve tavşan serum transferrininin kristal yapıları. Pembe küreler ferrik demir (Fe^{+3}) bağlanma bölgelerini temsil etmektedir (Kell ve ark., 2020).

İnsan ve sığır laktoferrinleri yüksek sekans homolojisine sahip olup çok benzer antibakteriyel, antifungal, antiviral, antiparaziter, antiinflamatuar ve immünomodülatör aktiviteler sergilemektedirler (Togawa ve ark., 2002, Teraguchi ve ark., 2004; Rosa ve ark., 2017). Takviye olarak rekombinant insan formunu ifade etmek yerine sığır formunu sunmak daha yaygın görülmektedir. Sığır laktoferrini ayrıca Gıda ve İlaç İdaresi (FDA, ABD) tarafından "genel olarak güvenli olarak kabul edilen" bir madde olarak kabul edilmektedir ve ticari olarak büyük miktarlarda mevcuttur (Rosa ve ark., 2017). Sığır laktoferrininin oral alımından sonra pepsin ile hidrolizine ek olarak, laktoferrininin yapısını tutmaktan sorumlu amino asitlerin iyonizasyonu midenin düşük pH'sı tarafından değiştirilerek ikincil ve üçüncül yapısında değişikliklere yol açmaktadır. Daha sonra laktoferrin, ince bağırsak proteazları olan tripsin, kimotripsin, amino ve karboksil peptidaz etkisiyle tamamen parçalanmaktadır (Takeuchi ve ark., 2006; Yao, 2015). Buna karşılık, laktoferrinin yetişkin ratların ince bağırsağında bulunan enzimlere rağmen parçalanmadan kaldığı saptanmıştır (Takeuchi ve ark., 2006). Laktoferrinin bağırsaklarda yararlı bakterilerin çoğalmasını artırdığı, bağırsak geçirgenliğini güçlendirebileceği, bağışıklık medyatörlerini dengeleyebileceği ve patojenik bakterilerin çoğalmasını ve kolonizasyonunu azaltabileceği ifade edilmiştir (Abd El-Hack ve ark., 2023). Laktoferrinin bağırsak mikrobiyotasının büyümesini ve çeşitliliğini desteklemedeki etkisi Şekil 2'de sunulmuştur.

Şekil 2. Laktoferrinin bağırsak mikrobiyotasının büyümesini ve çeşitliliğini desteklemedeki etkisi (Abd El-Hack ve ark., 2023).

Laktoferrinin bilinen en iyi etkilerinin antibakteriyel (Pogoutse ve Moraes, 2017; Rosa ve ark., 2017), antiviral (Chen ve ark., 2017), antifungal (Liao ve ark., 2019), antiinflamatuar (Nakamura ve ark., 2022) ve antikanserojenik (Wang ve ark., 2019; Zhang ve ark., 2019; Li ve ark., 2023; Rodriguez-Ochoa ve ark., 2023; Kholerdi ve ark., 2024) olduğu bilinmektedir. Laktoferrin, hücre içi sinyallemenin türünü ve ardından NF-κB aktivasyonunu tanımlanmış sinyal reseptörleri [toll benzeri reseptör (TLR)2, TLR4 ve CD14] aracılığıyla değiştirmektedir. Laktoferrin ayrıca NF-κB aktivasyon yollarını kullanan RAGE veya TREM-1 gibi diğer ek sinyalleme reseptörleri aracılığıyla da etkilerini sergilemektedir (Kruzel ve ark., 2017). Laktoferrinin sinyal reseptörlerine afinitesi Şekil 3'te şematize edilmiştir (Kruzel ve ark., 2017).

Şekil 3. Laktoferrinin sinyal reseptörlerine afinitesi (Kruzel ve ark., 2017).

LAKTOFERRİNİN NÖROPROTEKTİF ETKİLERİ

Laktoferrin kolostrumda bulunan önemli bir protein olup gerek insanların gerekse hayvanların doğum sonrası gelişimi sırasında önemli bir rol oynamaktadır. Klinik öncesi kanıtlar, laktoferrinin gelişmekte olan beyni nöronal hasardan koruduğunu, nörotrofin üretimini artırdığını ve neonatal hipoksi-iskemi modellerinde inflamasyonu azalttığını göstermektedir. Bu bağlamda, laktoferrinin beyin gelişimi ve biliş için besin desteği sağlayabilme ve yaşamın ilerleyen dönemlerinde nörodejeneratif hastalıkların ortaya çıkmasını önleyebilme potansiyeli bulunmaktadır. Laktoferrin üzerine gerçekleştirilen araştırmaların büyük çoğunluğu anne sütünde laktoferrin bulunması nedeniyle yenidoğan dönemine odaklanmış olsa da yeni kanıtlar laktoferrinin nörodejeneratif hastalıklarda faydalarını ortaya koymaktadır. Laktoferrin nörodejenerasyonun potansiyel bir biyolojik belirteci olarak kabul edilmekte ve nörodejeneratif hastalıkların önlenmesi için test edilmek üzere iyi bir aday haline getirmektedir. Laktoferrin merkezi sinir sisteminde mevcuttur ve LRP1 gibi laktoferrin reseptörlerinin bir kısmı beyin endotelinde bulunduğundan periferik dolaşımdan kan-beyin bariyerini kolayca geçebilmektedir (Huang ve ark., 2010; Zhao ve ark., 2021). Bu nedenle, ilaçların hedeflenen merkezi sinir sistemine verilmesi için lipozomlarda uygulanmak üzere laktoferrinin yapısal motifleri üzerinde çalışılmaktadır ve bu reseptörler, laktoferrine bağlı ilaçların merkezi sinir sistemine girişine aracılık etmek için kullanılabilmektedir (Agrawal ve ark., 2017).

Laktoferrinin nörodejenerasyondaki rolüyle ilgili olarak, Alzheimer hastalığının başlangıcıyla güçlü bir şekilde ilişkili olan APOE ε4 aleli beyindeki demir homeostazisindeki anormallikler ve ferroptozun indüksiyonu ile ilişkilendirilmiştir (Belaidi ve ark., 2022; Stockwell, 2022). Laktoferrinin intranazal uygulanmasının nöroprotektif etkileri, Alzheimer hastalığının APPswe/PS1DE9 transgenik fare modelinde test edilmiştir. Alzheimer hastalığı modeli oluşturulmuş hayvanlarında intranazal yolla insan laktoferrini uygulaması, ERK1/2-CREB ve HIF-1α sinyal yollarının aktivasyonu ve bunun sonucunda ADAM10 ekspresyonu yoluyla beta-amiloid birikimini azaltmış ve bilişsel gerilemeyi iyileştirmiştir (Guo ve ark., 2017). Laktoferrin nörodejeneratif hastalıkların erken teşhisi için varsayılan bir biyobelirteç olarak kabul görmeye başlamıştır. Amiloidin PET görüntülenmesiyle doğrulandığı Alzheimer ve hafif bilişsel bozukluk hastalarında tükürük laktoferrin düzeyinin azaldığı ve amiloid yükü ile negatif bir ilişki gösterdiği saptanmıştır (Carro ve ark., 2017; Bermejo-Pareja ve ark., 2020; Antequera ve ark., 2021; Reseco ve ark., 2021). Tükürükteki laktoferrin ile Alzheimer hastalığı arasındaki nedensel ilişki hala bilinmemektedir; ancak, azalmış tükürük laktoferrin düzeyinin Alzheimer hastalarında yaygın olarak gözlenen bağışıklık sistemi anormalliklerini yansıtabileceği hipotezi öne sürülmüştür (Bermejo-Pareja ve ark., 2020). Azalmış tükürük laktoferrin düzeyinin Alzheimer patolojisine özgü olduğu ileri sürülmektedir (González-Sánchez ve ark., 2020). Parkinson hastalığı modellerinde MPTP uygulamasından sonra rat beyinlerinde laktoferrin düzeyindeki artışın bu hastalıkta gözlenen demir düzensizliğine karşı koruyucu bir doku tepkisi olduğu ileri sürülmüştür (Jiang ve ark., 2017). Oral insan laktoferrini uygulamasının, Parkinson hastalığı MPTP indüklü *in vivo* ve *in vitro* modellerinde nöroprotektif etkili olduğu gösterilmiştir (Xu ve ark., 2019; Liu ve ark., 2020).

Mikroglia, yüksek proinflamatuar sitokin seviyelerinde, oksidatif streste ve demir birikiminde demir şelatör molekülü laktoferrini sentezlemek üzere uyarılmaktadır. Bu bulgu laktoferrinin nöroprotektif bir ajan olarak kullanılabileceğini göstermektedir (Fillebeen ve ark., 2001). Ratlarda lipopolisakkarit indüklü hafıza bozukluğunda laktoferrin tedavisinin inflamatuar sitokin seviyelerini önemli ölçüde azalttığı ve nörotrofik faktör seviyesini normale döndürerek nöroprotektif etkili olduğu rapor edilmiştir (Madi ve El-Saka, 2018). Deferoksamin kaynaklı hipoksi oluşturulmuş farelerde insan laktoferrini apo formunun kullanımının beyin dahil çoklu organ korumasını sağladığı gözlemlenmiştir (Zakharova ve ark., 2012). Farelerde laktoferrin uygulamasının mikroglial aktivasyonu ve nöroinflamasyonu mikrobiyom-bağırsak-beyin ekseni yoluyla inhibe ederek bilişsel bozulmayı hafiflettiği saptanmıştır (He ve ark., 2023). Hipoksik iskemik beyin hasarı oluşturulan yenidoğan rat yavrularına emzirme yoluyla verilen laktoferrinin beyin metabolizması ve serebral gri ve beyaz cevher iyileşmesi üzerinde nöroprotektif etkiler gösterdiği ve bu beslenme müdahalesinin prematüre beyin nöroproteksiyonunun klinik alanı için önemli olabileceği ifade edilmiştir (Van De Looij ve ark., 2014). İntraserebroventriküler lipopolisakkarit enjekte edilen rat yavrularında emzirme süresince laktoferrin takviyesinin ventriküler dilatasyonu, hipomiyelinasyonu azaltarak ve aksonların çapını artırarak beyin hasarını hafiflettiği rapor edilmiştir (Ginet ve ark., 2016). Doğum öncesi hipoksiye maruz bırakılan rat yavrularına rekombinant insan laktoferrin uygulamasının bilişsel işlevler üzerinde koruyucu etki sergilediği saptanmıştır (Sokolov ve ark., 2022). Yenidoğan domuz yavrularında laktoferrin uygulamasının

mekansal görevlerde daha iyi performans gösterilmesini sağladığı ve bilişle ilişkili beyin kaynaklı nörotrofik faktör genlerinin ve proteinlerinin ekspresyonunu modüle ettiği bildirilmiştir (Chen ve ark., 2021).

SONUÇ

Demir bağlayıcı çok işlevli bir glikoprotein olan laktoferrinin antiinflamatuar, antibakteriyel, antiviral, antitümör etkilere sahip olduğu iyi bilinmektedir. Laktoferrinin bu önemli biyolojik etkilerinin yanında nöroprotektif etkileri de bulunmaktadır. Nörodejeneratif hastalıklarda laktoferrin ekspresyonlarının arttığı gösterilmiştir. Laktoferrinin nörogelişimi ve nöroproteksiyonu uyardığı hem aktif bir terapötik ajan hem de ilaç nanotaşıyıcısı olarak kullanım potansiyeli olduğu rapor edilmiştir. Bununla birlikte laktoferrin proteinlerinin merkezi sinir sistemi hastalıklarının başlamasında, ilerlemesinde ve nörogenezde olası katkıları henüz tam olarak açıklığa kavuşturulamamıştır. Laktoferrinin nörodejeneratif hastalıkların önlenmesinde bir tedavi seçeneği olarak kullanılmasından önce merkezi sinir sistemindeki dağılımının, biyoyararlanımının ve moleküler hedeflerinin açıklığa kavuşturulması önem arz etmektedir. Tükürük laktoferrinini bir biyobelirteç olarak değerlendiren bilimsel çalışmaların, özellikle nörodejenerasyonun bilinen biyobelirteçleri ile birlikte çalışıldığında, Alzheimer hastalığı ve diğer demanslarda laktoferrinin rolünün aydınlatılmasına yardımcı olabileceği anlaşılmaktadır. Nöro-redoks düzenleyicisi olarak mikroglial laktoferrin, nöronların korunması/onarımı ve sağlıklı beyin fonksiyonu için kritik öneme sahiptir. Demir dengesizliği ve oksidatif stres, Parkinson hastalığı, Alzheimer hastalığı, bunama, depresyon ve multipl skleroz gibi nörodejeneratif bozuklukları olan hastalarda yaygın olarak görülmektedir. Yeni laktoferrin bazlı nano-terapötikler, nörodejeneratif bozuklukların klinik yönetimi için etkili ilaç iletim sistemleri olarak geliştirilmektedir. Laktoferrinin beyinde çeşitli nöroprotektif faydalarla tanınan bir molekül olması özellikle nörodejenerasyon konusunda çalışan bilim insanlarını heyecanlandırmaktadır.

Abstract

Basil (*Ocimum basilicum* L.) is an annual medicinal and aromatic plant belonging to the Lamiaceae family. Owing to its pleasant fragrance, essential oil content, nutritional value, and distinctive flavor, it is widely utilized in various aspects of daily life. Paclobutrazol (PBZ) is an organic compound known to suppress vegetative growth while enhancing reproductive development.

This study aimed to investigate the effects of different paclobutrazol concentrations on basil (O. basilicum L.) seedlings during the vegetative stage. For this purpose, PBZ solutions at concentrations of 0 (control), 10, 20, 30, 40, and 50 ppm were applied to basil seeds sown in Petri dishes through irrigation under controlled conditions to ensure germination. At the end of the experiment, germination percentage was calculated, while root and shoot lengths as well as fresh and dry weights were measured. According to statistical analyses (ANOVA, $p<0.05$), all PBZ concentrations significantly reduced both germination percentage and -germination index compared to the control. Similarly, all concentrations markedly decreased radicle and plumule lengths along with shoot fresh weight. In contrast, shoot dry weight together with root fresh and dry weights were significantly reduced only by higher PBZ concentrations. Except for the 30 ppm treatment, no decline was observed in root and shoot water content.

Considering the protective role of paclobutrazol against stress factors, studies of this nature are expected to help determine the concentration at which plants are least affected, thereby minimizing agricultural yield losses by through its potential ameliorative effects against biotic and abiotic stresses.

Keywords: Basil, Paclobutrazol, Germination, Growth.

INTRODUCTION

Chemical growth inhibitors have been used densely in seedling cultivation, especially in fruit growing and ornamental plants recently. The reason of this choice is that they have high chemical activity and are more practical in terms of applicability. Akdemir, 2018). Although there are many advantages to using growth inhibitory chemicals, some problems can arise if not used correctly. They may cause chlorosis, disruption in growth mechanism, delay on harvest time and environmental pollution (Uslu and Özgüri 2002; Ergun et al., 2007). Although the two most well-known of these are abscisic acid (ABA) and jasmonic acid (JA), most of the studies conducted to date to provide height control by suppressing plant growth are onis Paclobutrazol (PBZ), which used as treatment agent in the present study (Rademacher, 2000; Özgül, 2021).

Paclobutrazol is one of the plant growth inhibitory chemicals used to suppress stem length in the seedling industry. It retards seedling development by showing antagonistic effect against gibberellins which take part tiller elongation without leave chemical residue or without affect harvest yield. It provides seedling length control by slowing down cell division that causes shoot elongation (Rademacher, 2000; Özgül, 2021).

Paclobutrazol [(2RS,3RS)-1-(4-chlorophenyl)-4,4-dimethyl-2-(1,2,4-triazol-1-yl)pentan-3-ol], is a gibberellin inhibitor that belongs to triazole family (Davis and Curry,1991: Baninasab, 2009Kaynak and Ersoy 1997, Kumlay et al. 2011). It is absorbed by plants from the roots and the shoots (Hazar and Bora 2018). It was discovered that PBZ protects lots of crops from the abiotic stress factors like cold, heat and UV radiation Orabi et al., 2010; Duman and Nas, 2024).

The plant material of the present research, Ocimum basilicum L. is a member of Lamiaceae family and it has for about 65 species from annual and perennial (Ekren et al.,2009; Paton et al., 1999; Karaca, 2017). Its seeds are

generally small and black coloured. The basil flowers are clustered, white, purple, lilac or dark green coloured. Although its tolerance to cold weather is low, the heat tolerance is quiet high (Arabacı ve Bayram, 2004; Baydar, 2013).

Basil is pretty liked and used in a lot of areas in Turkey, which is highly rich about medicinal and aromatic plants. Its production and consumptions are also common in worldwide (Dumanoğlu ve Mokhtarzadeh, 2021),, according to the researches its homeland is South Asia, India and Iran as well(Razavi et al., 2009). In some regions especially east provinces of Turkey, purple coloured species are more common and named 'reyhan' (Telci et al., 2005).

The basil essential oils are used in different areas like perfumery, cosmetic, medicine, hygiene, food and drink industries (Javanmardi et al, 2003; Oxenham et al., 2005; Hussain et al., 2008; Bassolé et al., 2010; Günay and Telci, 2017; Poonkodi, 2016). The extracts that obtained from basil contain amounts of phenolics, caffeic, p-coumaric, ferulic, camphor and some acids (Marki and Kinitzios, 2008; Baydar, 2013). In addition to these, it is used in traditional medicine as carminative, urinary tract antiseptic, analgesic, expectorant, antitussive, diarrhea and chronic dysentery, cardiovascular diseases, Alzheimer's and various cancers treatment (Baytop, 1999).

The wide area of use that mentioned above requires more researches about basil. So, the scope of the present study is to research the effects of the PBZ applications on basil seeds' germination stage.

MATERIALS AND METHODS

Plant Material an Laboratory Conditions

Ocimum basilicum L. seeds were obtained from a commercial firm and used as plant material .The study was conducted in Cukurova University Biology Department Plant Physiology Labaratory. The laboratory's controllled conditions were provided with Arçelik marked air conditioner and fluorescent lambs.

Chemicals and Treatment

Paclobutrazol, active ingredient of the study was obtained from Sigma firm. The PBZ concentrations were 0-(only distilled water as control)-10-20-30-40 and 50 ppm, prepared by diluting 50 ppm PBZ solution.

The basil seeds were disinfected with %5 commercial sodium hypochloride. They put in Petri dishes between the filter papers and watered with PBZ solutions. Each petri had 20 seeds (Figure 1) and each application had five replicates. The Petri dishes were put in controlled climate room for germination (24/18±2 ^{0}C, firstly dark but 16/8 light/dark photoperiod after plumule emergence, and 350 µmol/m^2 s light intensity,%60±5 humidity) completely randomise design. The Petri dishes were watered with PBZ solutions as needed until the end of the experiment. The germinated seeds were counted for seven days. At least 2 mm radicle emergence was accepted as the germination criterion (Scott et al., 1984; Soltani et al., 2012; Özyazıcı, 2023).

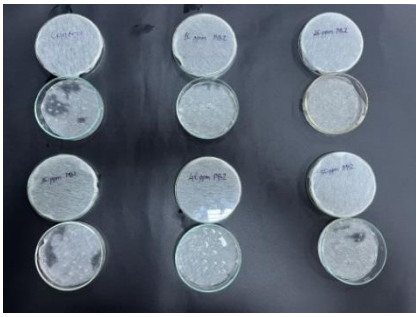

Figure 1. The first day of the basil seeds that applicated with increasing PBZ solutions

Measurements and Statistics

At the end of the experiment, random five germinated plantlet were selected from each Petri dish and their radicle-plumul lengths and fresh weights were recordedi and dried dried at 65 °C in an oven to record dry weights.Germination rate, germination index and water contents were calculated according to following formulas.

Germination percentage = (number of germinated seeds on the final day/number of tested seeds) × 100 (Ikić et al., 2012)

Germination indeks= ∑Germination seeds at a given day/Day number (Wang et al.,2004)

Water content=[(Fresh weight-dry weight)/Fresh Weight]*100

To determine the effects of PBZ treatments on basil, statistical analyses were performed using IBM SPSS Statistics 22 (ANOVA, $p<0.05$). The significant differences ($p < 0.05$).with between control and PBZ applications were shown with * in the tables.

RESULTS and DISCUSSION

The Effects of the Paclobutrazol Applications on Basil Germination Parameters

Table 1 shows the effects of the paclobutrazol applications on basil germination parameters**.** Paclobutrazol had negative effect on the Basil seeds'germination significantly($p < 0.05$). Increasing PBZ concentrations caused the germination index and germination rate of the Basil seeds. The highest germination rate and index values were recorded at Control application, while the lowest values measured at the highest PBZ concentration.

Table 1. The effects of Paclobutrazol applications on Basil seedlings' germination parameters

PBZ Concentration (ppm)	Germination Index (%)		Germination Rate (%)	
	Mean	Std. Deviation	Mean	Std. Deviation
Control (0)	53,29	± 1,53	100,00	± 0,00
10	*21,71	± 7,10	*50,00	± 17,32
20	*16,02	± 4,76	*39,00	± 13,42
30	*16,86	± 4,54	*41,00	± 8,94
40	*15,92	± 4,13	*44,00	± 8,22
50	*12,46	± 4,71	*38,00	± 9,75
LSD	6,91		15,96	

Gibberellin is known to stimulate germination in plants, such as quinoa (Altuner et al.,2020). Triazols, inhibits gibberellin synthesis by inhibiting monooxygenases that oxidize ent-kauren to ent-kaurenoic acid in the pathway's first steps (Hedden and Kamiya, 1997, Shahrohki et al., 2011). This explanation may be a comment to decline in germination parameter of basil against increasing PBZ applications.

The Effects of the Paclobutrazol Applications on Basil seedlings' Growth at Germination Period

Table 2 states the effects of the paclobutrazol applications on basil seedlings' radicle and plumule lengths. All PBZ applications affected Basil elongation negatively ($p < 0.05$). The highest length values were measured at Control application, too.

Table 2. The effects of Paclobutrazol applications on Basil seedlings' radicle and plumule lengths

PBZ Concentration (ppm)	Radicle Length (mm)		Plumule Length (mm)	
	Mean	Std. Deviation	Mean	Std. Deviation
Control (0)	50,00	± 12,69	27,67	± 4,220
10	*28,93	± 9,26	*4,07	± ,704
20	*18,13	± 4,10	*3,40	± ,737
30	*13,93	± 2,89	*2,40	± ,910
40	*14,8	± 3,93	*3,13	± ,834
50	*11,73	± 2,25	*3,47	± ,743
LSD	5,23		1,40	

The effects of the paclobutrazol applications on basil seedlings' radicle and plumule weights are shown in Table 3. All PBZ applications decreased plumule fresh weight negatively ($p < 0.05$). At the highest PBZ concentration, radicle-plumule fresh and dry weights' declines were found significantly.

Table 3. The effects of Paclobutrazol applicaTions on Basil seedlings' radicle and plumule weights

PBZ Concentration (ppm)	Radicle fresh weight (mg)		Radicle dry weight (mg)		Plumule fresh weight (mg)		Plumule dry weight (mg)	
	Mean	Std. Deviation	Mean	Std. Deviation	Mean	Std. Deviation	Mean	Std. Deviation
Control (0)	4,67	± 0,38	0,34	± 0,12	14,77	± 1,63	0,82	± 0,18
10	*5,99	± 0,95	0,34	± 0,02	*6,67	± 0,78	0,57	± 0,10
20	5,06	± 0,80	*0,53	± 0,13	*6,24	± 0,41	0,81	± 0,07
30	4,47	± 0,73	*0,55	± 0,09	*5,96	± 0,73	1,19	± 0,65
40	*3,69	± 0,55	0,38	± 0,11	*6,01	± 1,09	0,68	± 0,21
50	*2,81	± 0,11	*0,06	± 0,06	*6,10	± 0,63	*0,23	± 0,10
LSD	0,95		0,15		1,40		0,43	

Paclobutrazol organized the plant growth by arranging the regulators that contains gibberellin, abscisic acid and cytokinins (Fletcher and Hofstra, 1990). It repressed growth elongation by blocking cell division and enlargement mechanism because of its antigibberellin activity (Grossman,1988, Soumya et al.,2017). As a result of these mechanisms, the decreases in radicle-plumule length and weight in the present study may be associated with.

The Effects of the Paclobutrazol Applications on Basil seedlings' Water Contents

The effects of the paclobutrazol applications on basil seedlings' radicle and plumule water contents are presented in Table 4. While 30 ppm PBZ decreased the water contents of two diferent tisues ($p < 0.05$), the highest PBZ concentration, increased radicle and plumule water content.

Table 4. The effects of Paclobutrazol applications on Basil seedlings' radicle and plumule water contents

PBZ Concentration (ppm)	Radicle water content (%)		Plumule water content (%)	
	Mean	Std. Deviation	Mean	Std. Deviation
Control (0)	92,75	± 2,43	94,35	± 1,59
10	95,14	± 2,57	91,42	± 1,00
20	89,58	± 2,01	86,90	± 1,75
30	*87,54	± 1,55	*79,73	± 11,54
40	89,28	± 4,21	88,36	± 4,34
50	*97,84	± 2,20	96,28	± 1,72
LSD	3,82		7,55	

Paclobutrazol was stated to ameliorate leaf water potential (Watson, 2001) and decrease transpiration under drought stress (Still and Pill, 2004), induce stomatal closure (Srethar, 1991) and increase water use efficiency (Driessche, 1996; Soumya et al.,2017). In the present study, the highest water content in radicle and plumule against the highest PBZ concentration may be clarified with these.

CONCLUSION

Paclobutrazol, which is a synthetic plant growth regulator from the triazole family, decreased germination rate and index, radicle and plumule weights and lengths, but increased water content in basil plantlets. This pret-reatment may be developed to the generative stages to understand the other effects of triazole on basil.
Afterwards PBZ may be used to ameliorate stress factors or control plant growth to obtain a higher herb yield.

Özet

Hugo Schiff, 150 yılı aşkın bir süredir kapsamlı araştırmaların konusu olan ve inorganik bilimcileri büyülemeye devam eden Schiff bazının mucididir. Schiff bazları, birincil aminlerin karbonil bileşikleri ile yoğunlaşmasıyla oluşur. Çeşitli metal iyonları ile kararlı metal kompleksleri oluşturabilirler ve bu en önemli özelliklerinden biridir. Schiff bazları ve komplekslerinin birçok kullanım alanından bazıları elektrokimya, ilaç, sensör, mantar ilacı, zirai kimya, katalitik, boya ve analitik reaktif endüstrileridir. Son yıllarda, karışık ligand komplekslerine olan ilgi önemli ölçüde artmıştır. Bunun nedeni, çoğunlukla sentezlerinin basit olması, işleme tekniklerinin temel düzeyde olması, yüksek verim sağlamaları ve geniş bir uygulama alanına sahip olmalarıdır.
Bu çalışmada, 2-hidroksi-5-nitrobenzaldehit ve 4-bromoanilinin kondenzasyonundan türeyen Schiff baz ligandı sentezlenmiştir. Elde edilen Schiff bazı ve 1,10-fenantrolin ligandı ile Fe(II) ve Cu(II) metal tuzlarından karışık ligand kompleks bileşikleri sentezlenmiştir. Sentezlenen karışık ligand metal kompleks bileşiklerinin yapıları NMR (ligand için), UV-Vis ve FT-IR gibi spektroskopik yöntemlerin yanı sıra elementel analiz ve elektrolitik iletkenlik gibi ölçümlerle aydınlatılmıştır.

Anahtar Kelimeler: Schiff baz, karışık ligand metal kompleks, sentez, karakterizasyon

Şekil 1. Sentezlenen kompleks bileşiklerin yapısı

Synthesis and characterization of Schiff base and 1,10-phenanthroline derived mixed-ligand Cu(II) and Fe(II) complexes

Abstract

The Schiff base, which has been the focus of intensive research for more than 150 years and continues to amaze inorganic scientists, was first conceived of and developed by Hugo Schiff. Schiff bases are generated by the condensation of primary amines with carbonyl compounds. They may form stable metal complexes with various metal ions, which is among their most significant characteristics.Some of the many uses for Schiff bases and complexes include those in the electrochemical, pharmaceutical, sensor, fungicidal, agrochemical, catalytic, dye, and analytical reagent industries. In recent years, there has been a significant increase in interest in mixed ligand complexes. This is mostly due to the fact that they are simple to synthesize, their work-up technique is basic, they give a high yield, and they have a wide range of applications.
In this study, a Schiff base ligand derived from the condensation of 2-hydroxy-5-nitrobenzaldehyde and 4-bromoaniline was synthesised. Mixed ligand complex compounds were synthesised from Fe(II) and Cu(II) metal salts using the obtained Schiff base and 1,10-phenanthroline ligand. The structures of the synthesised mixed-ligand metal complex compounds were elucidated using spectroscopic methods such as NMR (for the ligand), UV-Vis and FT-IR, as well as measurements such as elemental analysis and electrolytic conductivity.

Keywords: Schiff base, mixed ligand metal complex, synthesis, characterization

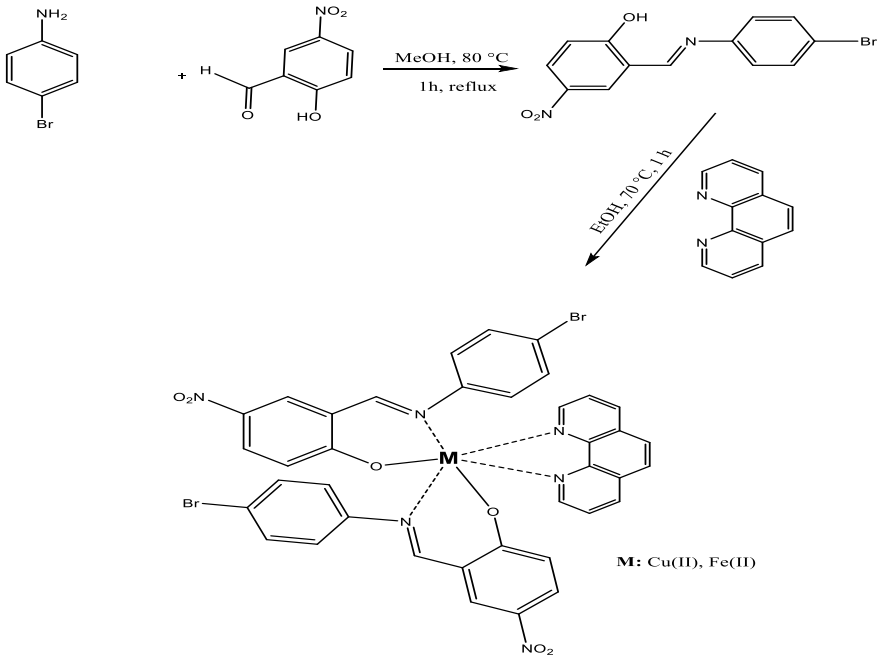
GİRİŞ

Organik bileşik sınıflarından biri olan Schiff bazları, birçok uygulama alanına sahip oldukları için halen incelenmeye devam edilmektedir (Goswami ve ark., 2024). Schiff bazları yapısındaki azometin grubu sayesinde Lewis bazı olarak hareket edip ligand görevini üstlenirler(Thakur ve ark., 2024). Schiff bazları yapılarında oksijen, azot, fosfor ve kükürt gibi çeşitli donör atomlarını içerebilir ve çeşitli metal iyonlarıyla kararlı koordinasyon bileşiklerini oluşturabilir (Sogukomerogullari ve ark., 2026). Yaklaşık 150 yıl boyunca araştırılan Schiff baz ligandları ve metal komplekslerinin sentez ve karakterizasyonu günümüzde de büyük ilgi görmektedir .(Schiff, 1864; Shah ve ark., 2024). Öyle ki Schiff bazları çok işlevli moleküler platformların stratejik tasarımını ve sentezini oluşturur ve tek bir kimyasal ile sinerjik faydalar sunar. Dahası Schiff baz ligandlarının kolay sentezlenebilir olması, elektronik özelliklerinin ayarlanabilir olması ve yapısal çok yönlülükleri nedeniyle bir çok alanda işlevsellik sağlar. (Ceramella ve ark., 2022)Schiff bazlarının geçiş metal kompleksleri biyolojik açıdan önem arz etmekte ve hem terapötik hem de farmasötik olarak incelenmektedir. Schiff baz metal komplekslerinin biyolojik uygulamaları arasında antibakteriyel, antiviral, antioksidan, antikanser ve antifungal çalışmalar yer almaktadır(Goswami ve Barman, 2026; Sagunthala Devi ve ark., 2025; Sogukomerogullari ve ark., 2025; Sogukomerogullari, ve ark., 2025; Sogukomerogullari ve ark., 2026) Schiff baz metal komplekslerinin, kolay sentezlenebilir olması, yapı ve elektronik özelliklerinin ayarlanabilmesi ve ekonomik olması katalitik ve fotokatalitik çalışmalarda da etkili rol oynamasını sağlamaktadır. (Juyal ve ark., 2023; Kiruthika, 2012; Wise ve ark., 2015)
Schiff bazları koordinasyon kimyasında önemli bir sınıfı oluşturmakta ve yaygın kullanımı, biyolojik ve katalitik alanlardaki kayda değer sonuçların olması nedeniyle yeni kompleksler tasarlanmaya devam etmektedir. Birinci sıra geçiş metalleri arasında bulunan Cu(II) ve Fe(II) metallerinin, biyolojik öneme sahip oldukları ve koordinasyon yoluyla ligand aktivitesini yönlendirdikleri bilinmektedir. (Elaaraj ve ark., 2026; Sogukomerogullari ve ark., 2025). Buna ilaveten en az iki farklı ligandın yapıya girerek oluşturdukları karışık ligand kompleksleri ise son zamanlarda dikkatleri üzerine çekmektedir. Bunun nedeni bu komplekslerin kolay sentezlenmeleri, basit işleme tekniklerinin olması, yüksek verimleri ve çeşitli uygulama alanlarının olması olarak görülmektedir (Sogukomerogullari, ve ark., 2025). Schiff bazları, piridin, fosfin, etilendiamin, bipiridin ve 1,10-fenantrolin içeren Fe (II) ve Cu (II) kompleksleri, antifungal, antibakteriyel, kimyasal algılama, antiviral ve katalitik gibi alanlarda sayısız uygulamaları nedeniyle dikkat çekmektedir (Abdelgawad ve ark., 2016; Gómez-Coca ve ark., 2001; Loginova ve ark., 2008; Sogukomerogullari, ve ark., 2025; Valentini ve ark., 2007).
Bu çalışmada 4-bromoanilin ve 2-hidroksi-5-nitrobenzaldehitten türeyen Schiff baz ligandı (L_1) sentezlenmiştir. Karışık ligand metal kompleksleri hazırlamak için co-ligand olarak 1,10-fenantrolin (L) kullanılmıştır. Bu

ligandların varlığında Fe(II) ve Cu(II) karışık ligand metal komplesleri sentezlenmiş ve FT-IR, UV-Vis, kütle, elemental analiz, manyetik duyarlılık gibi yöntemlerle karakterize edilmiştir.

2. MATERYAL ve METOT

2.1. Schiff Baz Ligandının Sentezi (L_1)



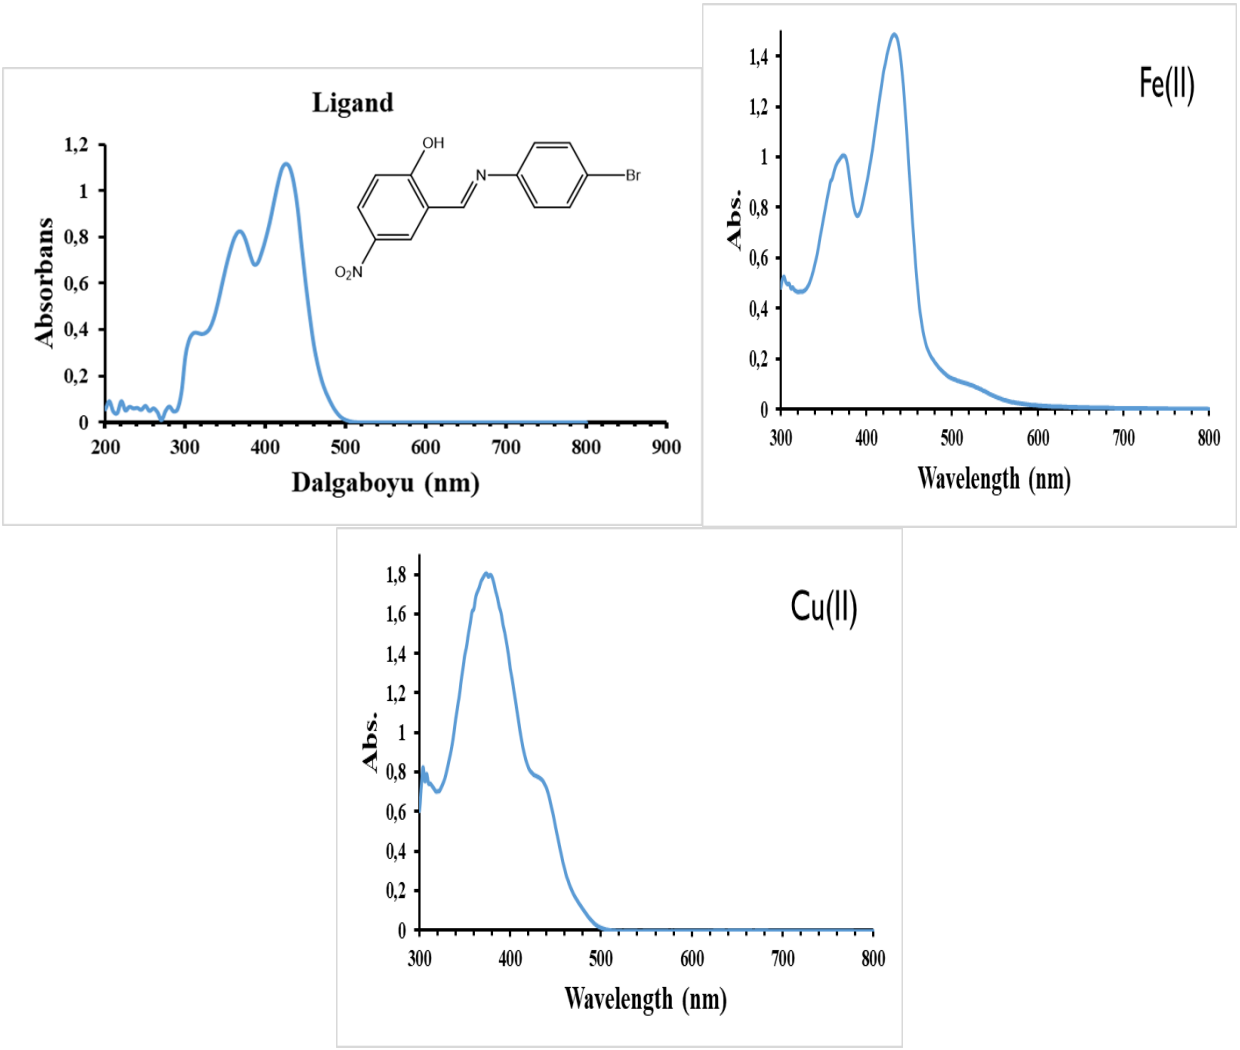
Bu çalışmada 2-hidroksi-5-nitrobenzaldehit ve 4-bromoanilin bileşiklerinden Schiff bazı ligandı (L_1) 2-(((4-bromofenil)imino)metil)-4-nitrofenol sentezlendi(van Dyk ve ark., 2023). Verim = 76 %, E.N. = 181–183 °C. UV–Vis (DMF) λmax (Abs): 430 (1.101), 370 (0.822), 310 (0.386); IR ν ATR (cm^{-1}): ν(Ar-CH) 3084, ν(N–O) 1330 & 1298, ν(C=N) 1618. ^{1}H NMR (400 MHz, aseton-d_6): δ 14.22 (s, 1H, OH), 9.19 (s, 1H, HC=N), 8.63 (s, 1H, Ar), 8.32 (s, 1H, Ar), 7.70 (s, 2H, Ar), 7.52 (s, 2H, Ar), 7.17 (s, 1H, Ar). ^{13}C NMR (600 MHz, aseton-d_6): δ 167.54, 164.32, 147.45, 133.62, 129.95, 129.35, 124.56, 121.84, 119.52, 119.01. Kapalı Formül: $C_{13}H_9BrN_2O_3$; Ma: 321,13 g/mol; Teorik $C_{13}H_9BrN_2O_3$ (%): Hesaplanan: C: %48.62, H: %2.83, N: %8.72 Bulunan: C: %48.61, H: %2. 66, N: %8.36.

2.2. Karışık Ligand Metal Komplekslerinin Sentezi

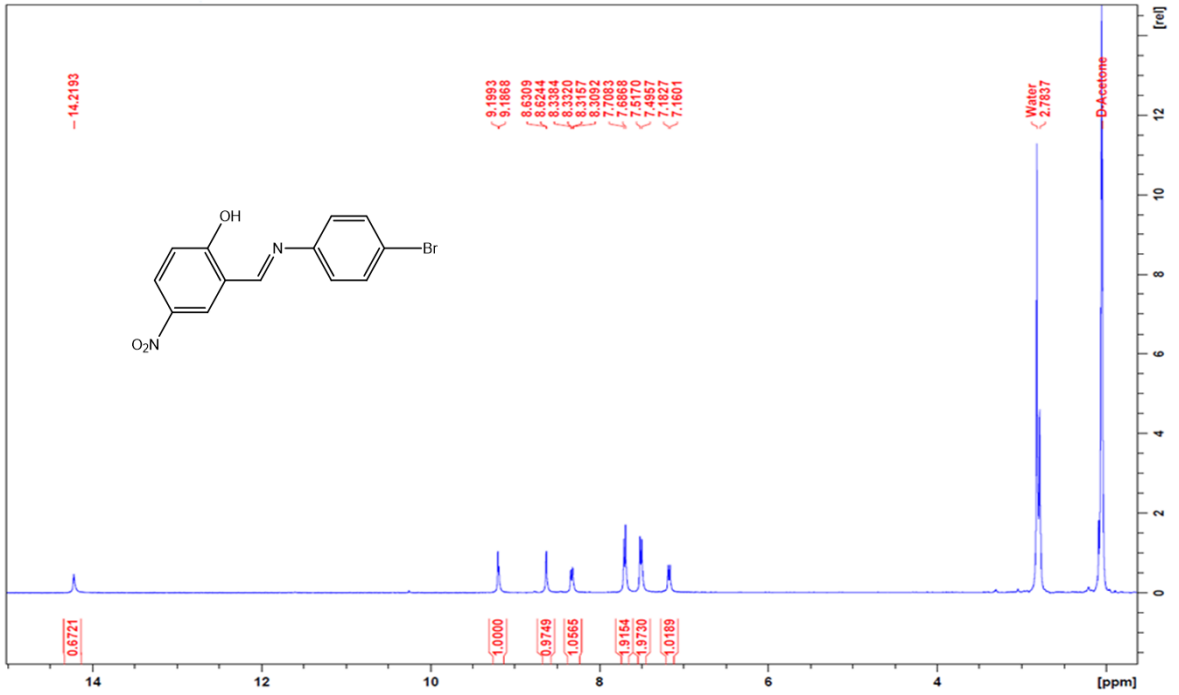
Schiff baz ligand (L_1) (1 mmol) ve 1,10-fenantrolin (0.5 mmol) ligandları 25 mL etanolde çözüldü üzerine metal tuzlarından (Cu(II) ve Fe(II)) (0.5 mmol) eklenerek 70 ºC de 1 saat karıştırıldı. Çöken madde süzüldü, dietileter ve saf su ile yıkandı. Elde edilen ürün desikatörde kurutuldu.

$[Cu(L_1)_2L].5H_2O$: Verim = 75 %, E.N. = 300 °C dekompoze. UV–Vis (DMF) λmax (Abs): 468 (0.202), 438 (0.740), 380 (1.789), 356 (1.555); IR (ATR, cm^{-1}): ν(O-H) 3406, ν(Ar-CH) 3074, ν(N–O) 1338 & 1253, ν(C=N) 1612. Ma: 974 LC-MS/MS(m/z): 884 $[M(L_1)_2(L)–5H_2O]^+$. Hesaplanan: C:%46.86, H: %3.52, N: %8.63 Bulunan: C: %46.75, H: %3.29, N: %8.55

$[Fe(L_1)_2L].5H_2O$: Verim = 67 %, E.N. = 315 °C dekompoze. UV–Vis (DMF) λmax (Abs): 534 (0.078), 434 (1.481), 374 (1.004), 356 (0.864); IR ν ATR (cm^{-1}): ν(O-H) 3367, ν(Ar-CH) 3086, ν(N–O) 1330 & 1226, ν(C=N) 1616; Ma: 966, LC-MS/MS(m/z): 876 $[M(L_1)_2(L)–5H_2O]^+$. Hesaplanan: C: %47.23, H: %3.55, N: %8.70 Bulunan: C: %47.29, H: %3.52, N: %8.64.

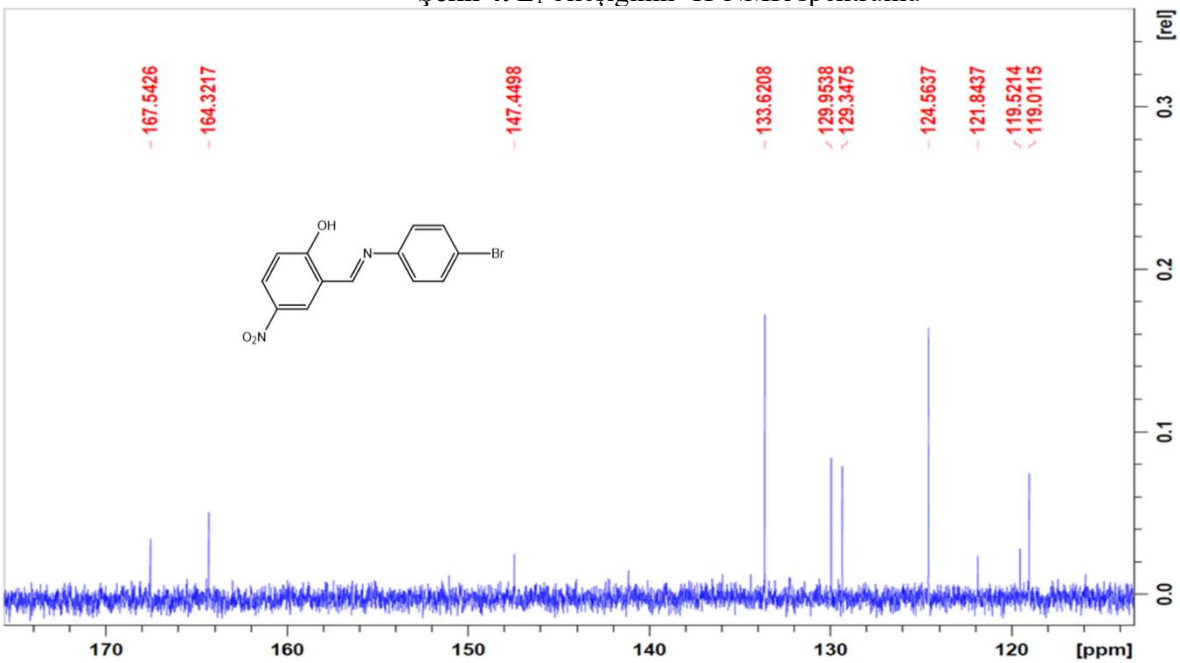


Şekil 2. Sentez şeması



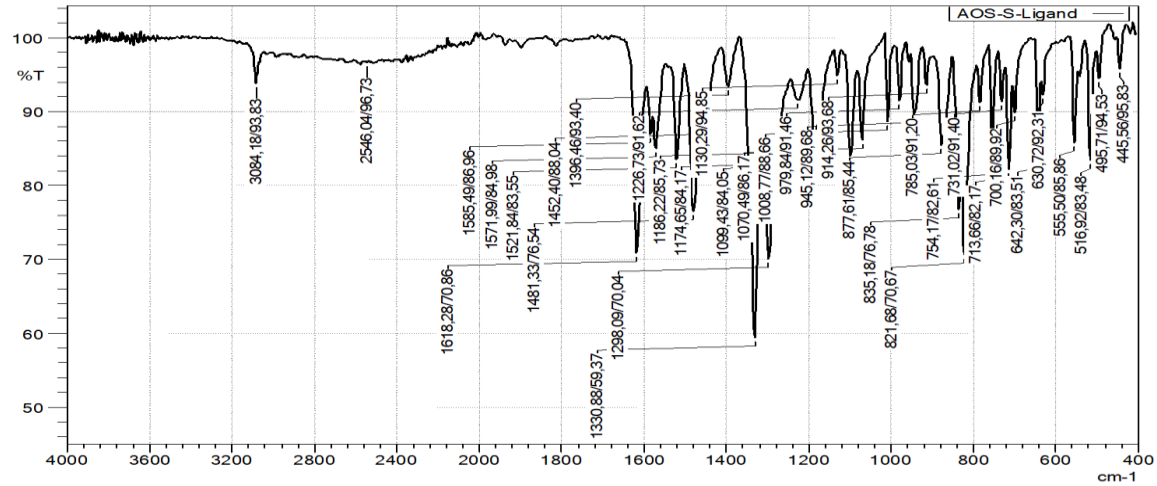
BULGULAR ve TARTIŞMA

Bu çalışmada sentezlenmiş olan Schiff baz ligand ve karışık ligand komplekslerinin tümünün UV-Vis spektrumlarına ait veriler; bu bileşiklerin DMF içerisinde çözünmesi gerçekleşerek 190-800 nm aralığında spekturumu incelenmiştir. 310, 370 ve 430 nm'deki ligandın en yüksek pikleri, sırasıyla π-π* ve n-π* geçişlerine karşılık gelmektedir. $[Cu(L_1)_2L].5H_2O$ ve $[Fe(L_1)_2L].5H_2O$ için en büyük pikler sırasıyla 356, 380, 438, 468 ve

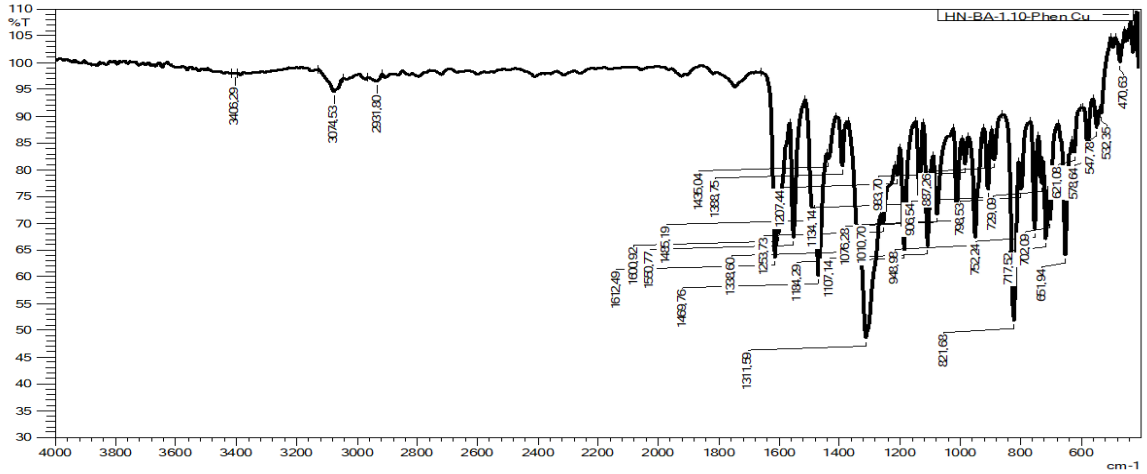


356, 374, 434, 534 nm'de kaydedilmiştir. π-π* ve n-π* geçişlerinin varlığı nedeniyle, $[Cu(L_1)_2L].5H_2O$ ve $[Fe(L_1)_2L].5H_2O$ kompleksinin absorbansının küçük bir kırmızıya kayma sergilediği keşfedilmiştir (Şekil 3). Ayrıca 468 ve 534 nm'deki piklerin yük transfer ve d-d geçişlerine ait olduğu düşünülmektedir. Bu da kompleksleşmenin olduğunu göstermektedir. Ligandın (L_1) ^{1}H-NMR ve ^{13}C-NMR spektrumları, döterolanmış bir çözücü olan aseton içinde kaydedilmiştir. L_1 'ın ^{1}H-NMR spektrumu, δ 14.22 ppm (1H) değerinde bir singlet fenolik proton, δ 9,19 ppm (1H) değerinde bir singlet azometin grubu (CH=N) protonu, δ 8.63–7.17 ppm (7H) değerinde bir çoklu aromatik proton sinyallerini göstermektedir. L_1'nin ^{13}C-NMR spektrumları, 167.54 ppm'de C-O karbon, 164.32 ppm'de azometin karbon (CH=N), 147.45–119.52 ppm'de aromatik karbonlara ait sinyaller sergilemektedir (Şekil 4 ve 5).

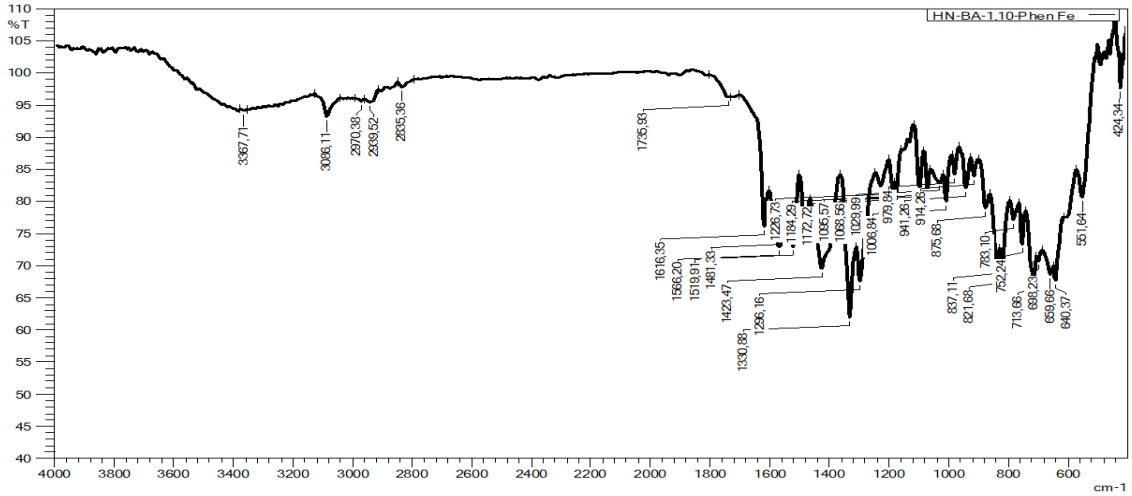
Şekil 3. Bileşiklerin UV-Vis spektrumları



Şekil 4. L_1 bileşiğinin ^{1}H-NMR spektrumu

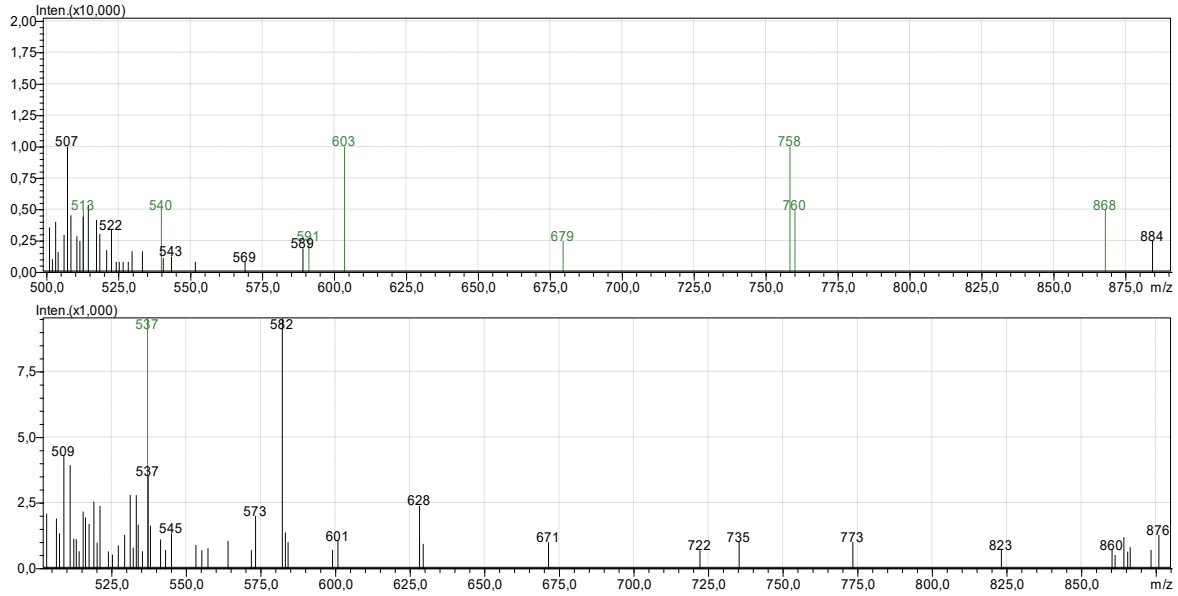


Şekil 5. L_1 bileşiğinin ^{13}C-NMR spektrumu



Ligandın (L_1) ve $[Cu(L_1)_2L].5H_2O$ ve $[Fe(L_1)_2L].5H_2O$ metal kompleksleri, FT-IR spektrumları karşılaştırılarak incelenmiştir. Ligand ve karışık ligand Cu(II) ve Fe(II) kompleksleri için sırasıyla 3084, 3074, ve 3086 cm^{-1} frekanslarında aromatik karbon ν(C-H) adsorpsiyonu için bir bant görülmüştür. Ligand ve komplekslerin azometin ν(C=N) gerilme bandı sırasıyla 1618, 1612, ve 1616 cm^{-1} frekanslarında tanımlanmıştır. (Şekil 6-8)

Şekil 6. L_1 bileşiğinin FT-IR spektrumu



Şekil 7. $[Cu(L_1)_2L_2].5H_2O$ bileşiğinin FT-IR spektrumu

Şekil 8. $[Fe(L_1)_2L_2].5H_2O$ bileşiğinin FT-IR spektrumu

Schiff baz karışık ligand metal komplekslerinin kütle spektrumları incelendiğinde, moleküler iyon pikinin (m/z): 884 $[Cu(L_1)_2L–5H_2O]^+$ ve (m/z): 876 $[Fe(L_1)_2L–5H_2O]^+$ olduğu görülmektedir. Bu formül ağırlığıyla uyumludur ve yapının kimliğini desteklemektedir. (Şekil 9)

Şekil 9. Sentezlenen bileşiklerin kütle spektrumu

4. SONUÇ

Bu çalışmada elde edilen sonuçlar 'N' ve 'O' tipi donör atom taşıyan ligandlara ait karışık ligand metal kompleksleri ile ilgili literatüre katkı sağlamıştır. Bu çalışmada 4-bromoanilin ve 2-hidroksi-5-nitrobenzaldehitin reaksiyonundan Schiff baz ligand olan 2-(((4-bromofenil)imino)metil)-4-nitrofenol (L_1) elde edildi (van Dyk ve ark., 2023). Sentezlenen ligand (L_1) ve 1,10-fenantrolin (L) ile Cu(II) ve Fe(II) asetat tuzları ile (L_1:L:M) 2:1:1 stokiyometrik oranda karışık ligand metal kompleksleri sentezlendi. Bu kompleksler oksijen ve azot atomlarının metal merkezine koordine olmasıyla oluşmuşlardır.

Sentezlenen ligand (L_1) literatürdeki verilere göre elde edilmiştir. Sentezlenen karışık ligand metal komplekslerinin orijinal ve literatür çalışmaları ile uyumlu olduğu görülmüştür. Ayrıca sentezlenen karışık ligand komplekslerin elektrolitik iletkenlik özelliği bulunmamaktadır. Sentezlenen metal komplekslerin manyetik duyarlılık değerleri $[Cu(L_1)_2L].5H_2O$ 1.98 B.M. ve $[Fe(L_1)_2L].5H_2O$ 5.32 B.M olarak bulunmuştur. Manyetik duyarlılık sonuçlarına göre kompleksler oktahedral geometriye sahiptir. Literatür çalışmaları incelendiğinde Schiff baz ile 1,10-fenantrolin ligandlarından elde edilen karışık ligand komplekslerinin biyolojik olarak aktif olması beklenmektedir.

Özet

Biyoinorganik kimya, biyolojik, tıbbi ve çevresel bilimlerde çeşitli uygulamalar için geçiş metali komplekslerini kullanan, yeni gelişen disiplinlerarası bir bilim dalıdır. Biyoinorganik kimya alanındaki gelişmeler, biyolojik açıdan önemli bileşikler için model görevi görebilen Schiff baz komplekslerine olan ilgiyi artırmıştır. Schiff bazları, azot, oksijen ve kükürt gibi çeşitli donör atomları içerdikleri ve metal iyonlarıyla kararlı koordinasyon bağları oluşturabilecekleri için çok ilginç bir ligand sınıfını temsil ederler. Son yıllarda, araştırmacılar Schiff baz ligandlarının ve bunların metal komplekslerinin sentezi ve karakterizasyonuna büyük önem vermişlerdir. Bu kimyasal bileşik sınıfı, kataliz, elektrokataliz, sıvı-sıvı ekstraksiyonu ve korozyon gibi birçok yaşam alanında ve ayrıca biyolojik sistemlerde, bakterisit, fungisit, antikanser, antitüberküloz, antienflamatuar, antiviral ve anti-HIV ajanları olarak kullanıldıkları ve birçok tedavi edilemez hastalığın tedavisinde geniş bir potansiyel uygulama alanına sahiptir. Son yıllarda, karışık ligand komplekslerine olan ilgi önemli ölçüde artmıştır. Bu durum, öncelikle bunların sentez kolaylığı, basit işleme prosedürleri, yüksek verim ve geniş uygulama alanlarına bağlanabilir. Bu çalışmada, 2-hidroksi-5-nitrobenzaldehit ve 4-floroanilinin kondenzasyonundan türeyen Schiff baz ligandı sentezlenmiştir. Elde edilen Schiff bazı ve 1,10-fenantrolin ligandı ile Fe(II) ve Cu(II) metal tuzlarından karışık ligand kompleks bileşikleri sentezlenmiştir. Sentezlenen karışık ligand metal kompleks bileşiklerinin yapıları NMR (ligand için), UV-Vis ve FT-IR gibi spektroskopik yöntemlerin yanı sıra elementel analiz ve elektrolitik iletkenlik gibi ölçümlerle aydınlatılmıştır.

Synthesis and characterization of mixed-ligand Fe(II) and Cu(II) complexes derived from flor substitute Schiff base and 1,10-phenanthroline

Abstract

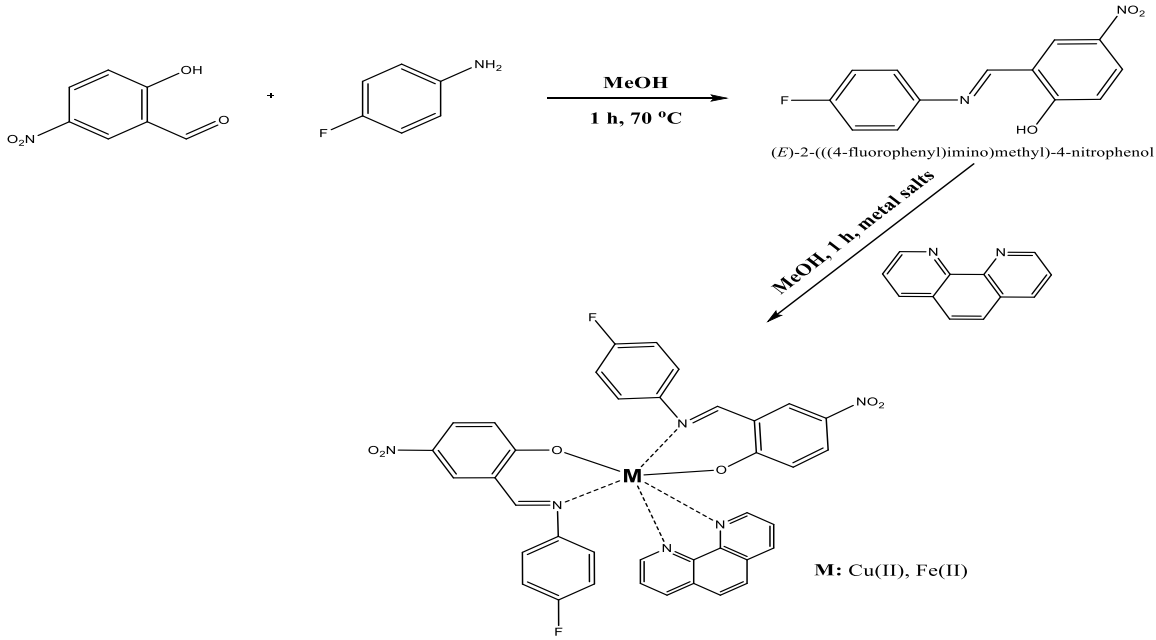
The developing discipline of bioinorganic chemistry is an interdisciplinary scientific field that makes use of transition metal complexes for a wide range of applications in the fields of biology, medicine, and environmental research. There has been a rise in interest in Schiff base complexes as a result of the emergence of the discipline of bioinorganic chemistry. Schiff base complexes have the potential to act as models for biologically significant compounds. Schiff bases are a fascinating category of ligands, as they can establish stable coordination bonds with metal ions and contain a diverse array of donor elements, including nitrogen, oxygen, and sulfur. The synthesis and characterization of Schiff base ligands and their metal complexes have been of significant importance to researchers in recent years. This category of chemical compounds possesses extensive potential applications across various domains, including catalysis, electrocatalysis, liquid-liquid extraction, and corrosion, as well as in biological systems, where they serve as bactericides, fungicides, anticancer, antituberculosis, anti-inflammatory, antiviral, and anti-HIV agents, and in the management of numerous incurable diseases. In recent years, there has been a notable rise in interest about mixed ligand complexes. This is primarily attributable to their ease of synthesis, straightforward work-up procedures, high yield, and extensive applicability. In this study, a Schiff base ligand derived from the condensation of 2-hydroxy-5-nitrobenzaldehyde and 4-floroaniline was synthesised. Mixed ligand complex compounds were synthesised from Fe(II) and Cu(II) metal salts using the obtained Schiff base and 1,10-phenanthroline ligand. The structures of the synthesised mixed-ligand metal complex compounds were elucidated using spectroscopic methods such as NMR (for the ligand), UV-Vis and FT-IR, as well as measurements such as elemental analysis and electrolytic conductivity.

Keywords: Schiff base, mixed ligand, metal complex, synthesis, characterization

GİRİŞ

Schiff bazları, sentetik erişilebilirlikleri ve esnek koordinasyon özellikleri nedeniyle bilim camiasında büyük ilgi görmüştür. Bunlar, birincil aminlerin karbonil bileşikleri ile yoğunlaşmasıyla sentezlenen azometin (C=N) gruplarına sahip kimyasal bileşiklerdir. Bu bileşikler, oksijen, nitrojen veya kükürt gibi hetero donör atomlar aracılığıyla koordinasyon sağlayan çok dişli ligandlar olarak işlev görür ve geçiş metalleri için olağanüstü bir afiniteye sahiptir (Raj ve ark., 2013). Schiff bazları birçok farklı kimyasal sentezlerde önemli ara maddeler olarak işlev görürler ve çok sayıda uygulamalarıyla tanınırlar. Bu maddelerin biyolojik etkileri arasında antitümör, antikanser, antitüberkülar, antibakteriyel, antifungal, antifertilite, antioksidan, herbisidal, antiproliferatif ve antifungal özellikler bulunur (Divya Mohan ve ark., 2026; Elaaraj ve ark., 2026; Sogukomerogullari ve ark., 2023, 2025, 2026).

Schiff baz ligandlarına metallerin dahil edilerek komplekslerinin oluşturulması, Schiff bazlarının biyolojik uygulamalarını da geliştirir (Shahraki ve Heydari, 2017). Schiff bazlarının çeşitli metallerle koordinasyon kurma konusundaki geniş kapsamlı yeteneği, onları daha da çekici hale getirmektedir (Abu-Dief ve Mohamed, 2015). Schiff baz ligandları, çeşitli donör atomları (O, N, S) ve dişlilikleri (monodentat, bidentat, tridentat vb.) ile uyarlanabilir, bu da çok çeşitli komplekslerin sentezine olanak tanır (Shah ve ark., 2024). Örneğin, multidentat ligandlar, metal etrafında belirli geometrileri uygulayan şelatlar oluşturur. Bu yapısal esneklik, kompleksin redoks davranışının ve stabilitesinin ince ayarını mümkün kılar, bu da biyolojik aktiviteyi etkiler. Basit aromatik aldehitlerden makrosikliklere ve polimerik çerçevelere kadar çok çeşitli Schiff baz ligantları araştırılmıştır. Her ligant sistemi, metal merkezinin etrafında farklı elektron bağışlayıcı özellikler ve sterik ortamlar sağlayarak, kompleksin serbest radikalleri ne kadar etkili bir şekilde nötralize edebileceğini veya oksidanları ne kadar etkili bir şekilde azaltabileceğini etkiler (Divya Mohan ve ark., 2026). Schiff bazları metal iyonlarına karşı güçlü bir kenetleme özelliği gösterir, bu da metal toksisitesini azaltmakla kalmaz, aynı zamanda metal komplekslerinde ligand olarak koordine edildiğinde işlevselliklerini de artırır (Fahmi ve ark., 2021). Schiff bazları, bir veya daha fazla donör atomla birleştiğinde makrosikller oluşturan kararlı metal kompleksleme ajanlarıdır ve metallerin yüksek oksidasyon durumlarını stabilize etmede çok önemlidir (Nworie ve ark., 2016). Bu bileşikler kolay ve ekonomik bir şekilde sentezlenebilir ve endüstriyel açıdan büyük öneme sahiptir. Ayrıca, bazı metaller için birkaç bağlanma bölgesi boş olduğundan çok dişlidirler ve boş bölgeler olası enzimatik reaksiyonlar için cazip yerlerdir



(Rohmawati ve ark., 2026; Sogukomerogullari ve ark., 2026). Modern inorganik kimyanın temel bir alanı olan koordinasyon kimyası, geçiş metali iyonları ve ligandlar arasında oluşan kompleksleri inceler. Bu komplekslerde, kısmen dolu d-orbitalleri çeşitli bağlar, karmaşık geometriler ve benzersiz elektronik özellikler sağlar. Koordinasyon sayısı, ligand türü ve uzamsal düzenleme, fizikokimyasal ve biyolojik davranışı belirler ve kataliz, malzeme bilimi ve tıbbi kimya alanlarında uygulamaları vardır (Kolhe ve ark., 2026).

Bu çalışmada 4-floroanilin ve 2-hidroksi-5-nitrobenzaldehitten türeyen Schiff baz ligandı (L_1) sentezlenmiştir. Karışık ligand metal kompleksleri hazırlamak için co-ligand olarak 1,10-fenantrolin (L) kullanılmıştır. Bu ligandların varlığında Fe(II) ve Cu(II) karışık ligand metal komplesleri sentezlenmiş ve FT-IR, UV-Vis, kütle, elemental analiz, manyetik duyarlılık gibi yöntemlerle karakterize edilmiştir.

2. MATERYAL ve METOT

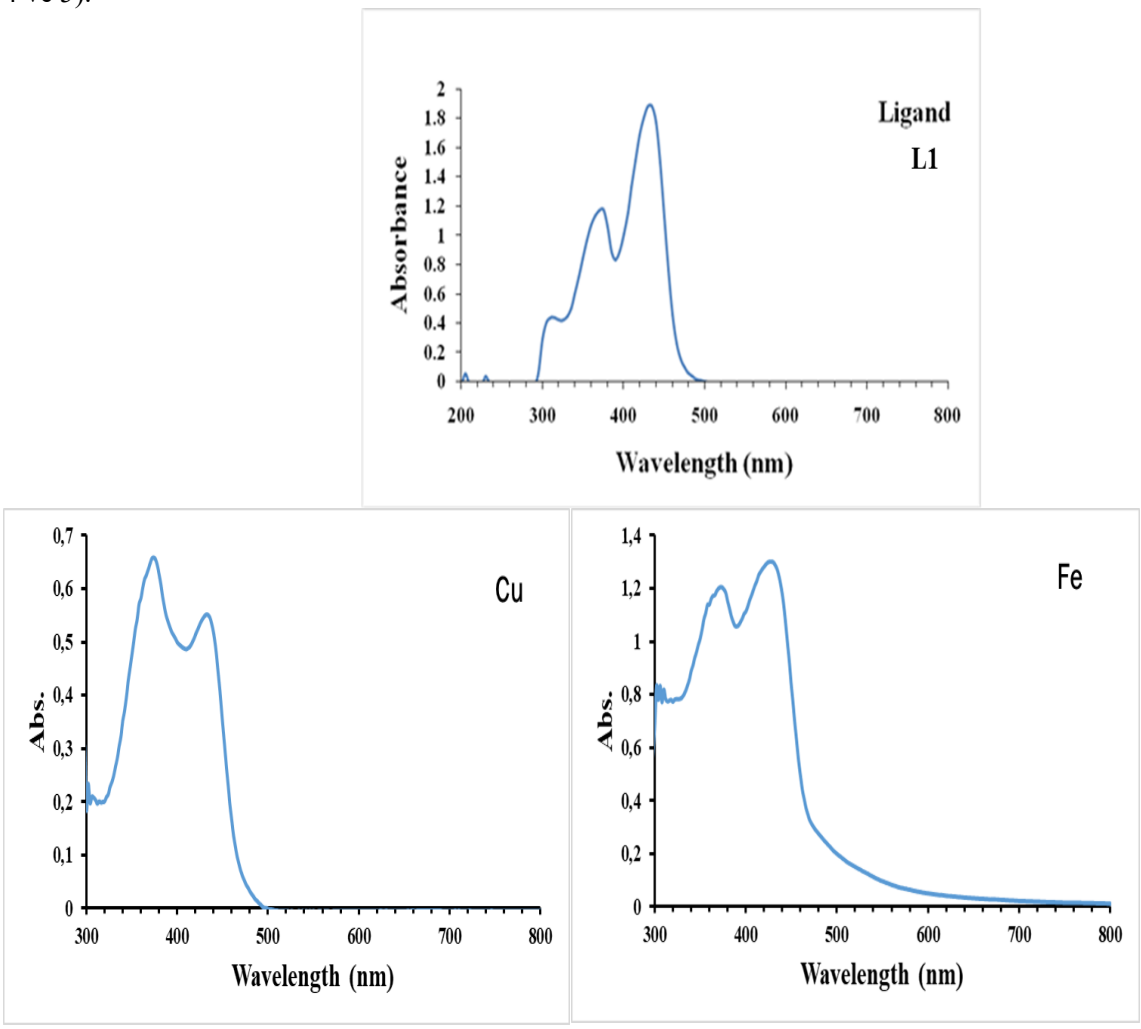
2.1. Schiff Baz Ligandının Sentezi (L_1)

2-hidroksi-5-nitrobenzaldehit (167.2 mg, 1 mmol) ve 4-floroanilin (94.8 µL, 1 mmol) 25 mL metanol içinde 70 °C'de bir saat geri soğutucu altında karıştırıldı (Qiu ve ark., 2019; van Dyk ve ark., 2023). Sarı renkli ligand çöktükten sonra süzüldü, metanol ve dietileter ile yıkandı ve tam bir gün boyunca vakumda kurumaya bırakıldı. M.A.: 260.22 g/mol; Verim = 69 %, E. N. = 173-175 °C. Elementel Analiz, $C_{13}H_9FN_2O_3$(%); Hesaplanan: C, 60.00; H, 3.49; F, 7.30; N, 10.77 Bulunan (%): C, 59.73; H, 3.30; N, 10.29. IR ν ATR (cm^{-1}): 3066 (C-H), 2924 $(C\text{-}H)_{alf.}$, 1620 (C=N), 1521 $(NO_2)_{asim}$, 1336 $(NO_2)_{sim}$. ^{1}H-NMR (400 MHz, DMSO-d_6) δ: 14.15 (s, 1H, –OH), 9.14 (s, 1H, –CH=N), 8.67 (s, 1H, H-7), 8.27 (dd, 1H, H-5, 4, 8 Hz), 7.14 (d, 1H, H-4, 8 Hz), 7.57-7.54 (m, 2H, H-9), 7.37-7.32 (m, 2H, H-10); ^{13}C-NMR (400 MHz, DMSO-d_6) δ: 166.74, 163.04, 161.80, 160.61, 143.68, 139.71, 128.78, 28.61, 123.96, 119.20,118.57, 116.90, 116.68; UV–Vis λmax (nm) in DMF: 430 (1.882), 370 (1.174), 340 (0.597), 310 (0.438).

Şekil 2. Sentez şeması

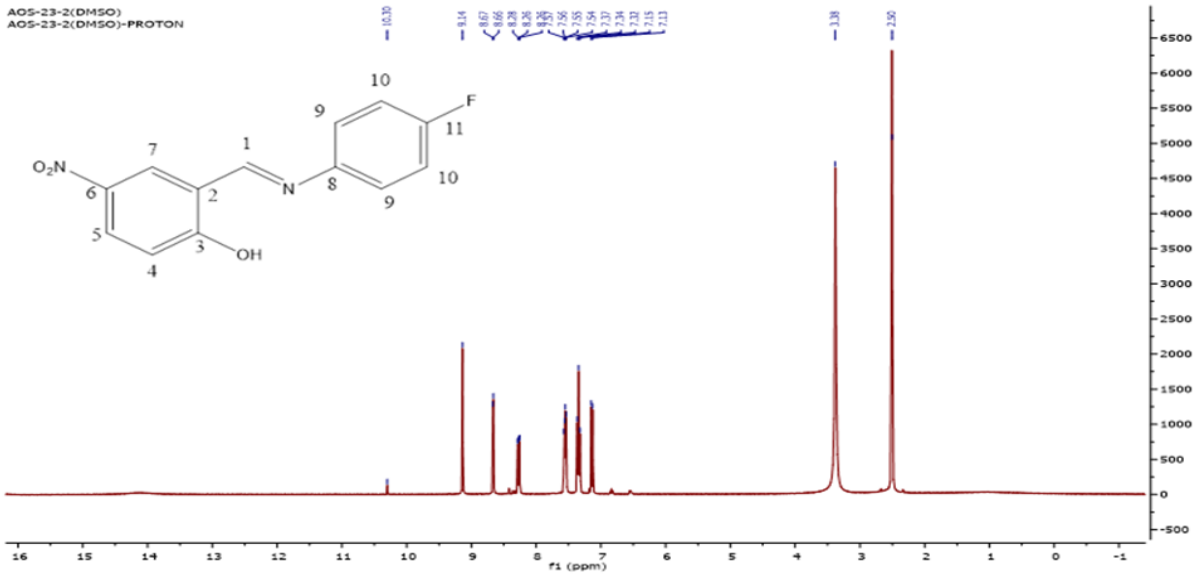
2.2. Karışık Ligand Metal Komplekslerinin Sentezi

Schiff baz ligand (L_1) (1 mmol) ve 1,10-fenantrolin (0.5 mmol) ligandları 25 mL metanolde çözüldü üzerine metal tuzlarından (Cu(II) ve Fe(II)) (0.5 mmol) eklenerek 70 ºC de 1 saat karıştırıldı. Çöken madde süzüldü, dietileter ve saf su ile yıkandı. Elde edilen ürün desikatörde kurutuldu.



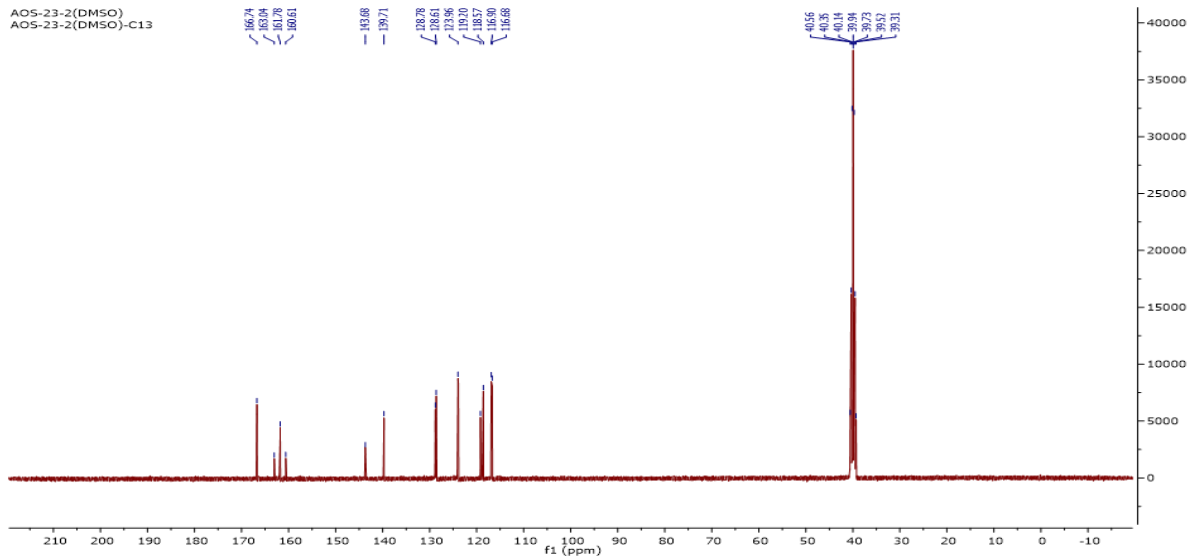
$[Cu(L_1)_2L].H_2O$: Verim = 82 %, E.N. = 312 °C dekompoze. UV–Vis (DMF) λmax (Abs): 470 (0.07), 436 (0.546), 374 (0.659), 340 (0.352); IR (ATR, cm^{-1}): ν(O-H) 3116, ν(Ar-CH) 3074, ν(N–O) 1338 & 1234, ν(C=N) 1604. Ma: 780.2, LC-MS/MS(m/z): 763 $[Cu(L_1)_2L+H\text{-}H_2O]^+$. Hesaplanan (%): C, 58.50; H, 3.36; N, 10.77. Bulunan (%): C: 58.49, H: 3.10, N: 10.30.

$[Fe(L_1)_2L].2H_2O$: Verim = 73 %, E.N. = 329 °C dekompoze. UV–Vis (DMF) λmax (Abs): 476 (0.29), 432 (1.288), 376 (1.195), 338 (0.855); IR ν ATR (cm^{-1}): ν(O-H) 3387, ν(Ar-CH) 3066, ν(N–O) 1338 & 1226, ν(C=N) 1620;



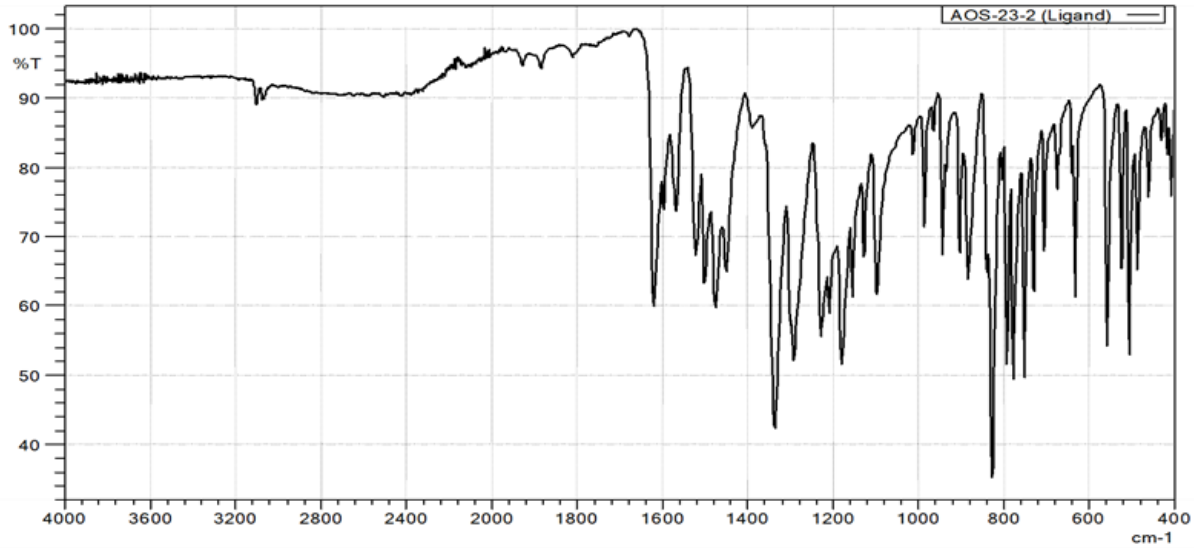
Ma: 790.52, LC-MS/MS(m/z): 813 $[Fe(L_1)_2L+2H_2O+Na]^+$. Hesaplanan: C: %57.74, H: %3.57, N: %10.63. Bulunan: C: %57.60, H: %3.66, N: %10.51.

3.BULGULAR ve TARTIŞMA

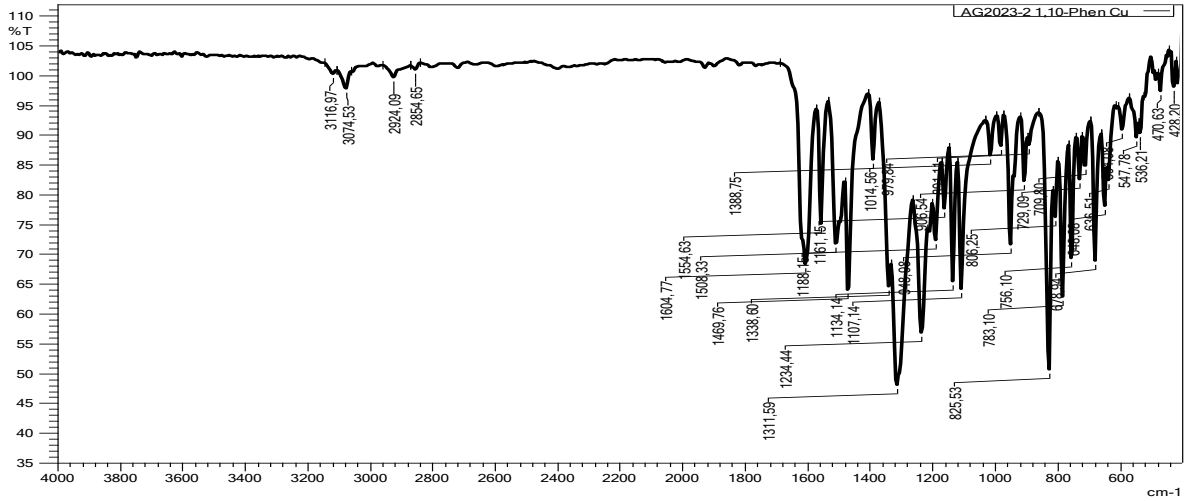


Bu çalışmada sentezlenmiş olan Schiff baz ligand ve karışık ligand komplekslerinin tümünün UV-Vis spektrumlarına ait veriler; bu bileşiklerin DMF içerisinde çözünmesi gerçekleşerek 190-800 nm aralığında spekturumu incelenmiştir. 310, 340, 370 ve 430 nm'deki ligandın en yüksek pikleri, sırasıyla π-π* ve n-π* geçişlerine karşılık gelmektedir. $[Cu(L_1)_2L].H_2O$ ve $[Fe(L_1)_2L].2H_2O$ için en büyük pikler sırasıyla 340, 374, 436, 470 ve 338, 376, 432, 476 nm'de kaydedilmiştir. π-π* ve n-π* geçişlerinin varlığı nedeniyle, $[Cu(L_1)_2L].H_2O$ ve $[Fe(L_1)_2L].2H_2O$ kompleksinin absorbansının küçük bir kırmızıya kayma sergilediği keşfedilmiştir (Şekil 3). Ayrıca 470 ve 476 nm'deki piklerin yük transfer geçişlerine ait olduğu düşünülmektedir. Bu da kompleksleşmenin olduğunu göstermektedir. Ligandın (L_1) ^{1}H-NMR ve ^{13}C-NMR spektrumları, döterolanmış bir çözücü olan aseton içinde kaydedilmiştir. L_1 'ın ^{1}H-NMR spektrumu, δ 14.15 ppm (1H) değerinde bir singlet fenolik proton, δ 9.14 ppm (1H) değerinde bir singlet azometin grubu (CH=N) protonu, δ 8.67–7.32 ppm (7H) değerinde bir çoklu aromatik proton sinyallerini göstermektedir. L_1'nin ^{13}C-NMR spektrumları, 166.74 ppm'de C-O karbon, 163.04 ppm'de azometin karbon (CH=N), 161.80–116.68 ppm'de aromatik karbonlara ait sinyaller sergilemektedir (Şekil 4 ve 5).

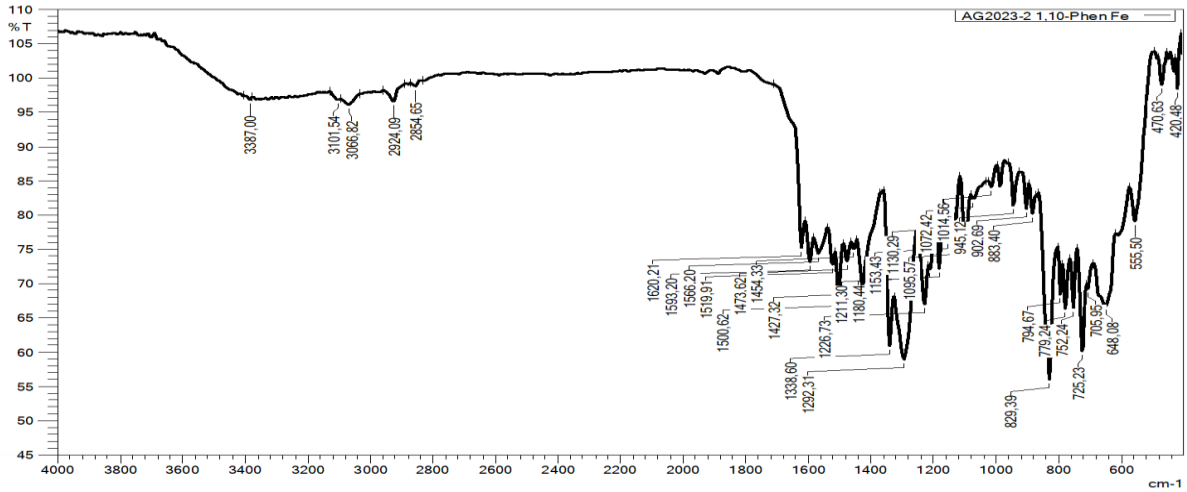
Şekil 3. Bileşiklerin UV-Vis spektrumları



Şekil 4. L_1 bileşiğinin ^{1}H-NMR spektrumu

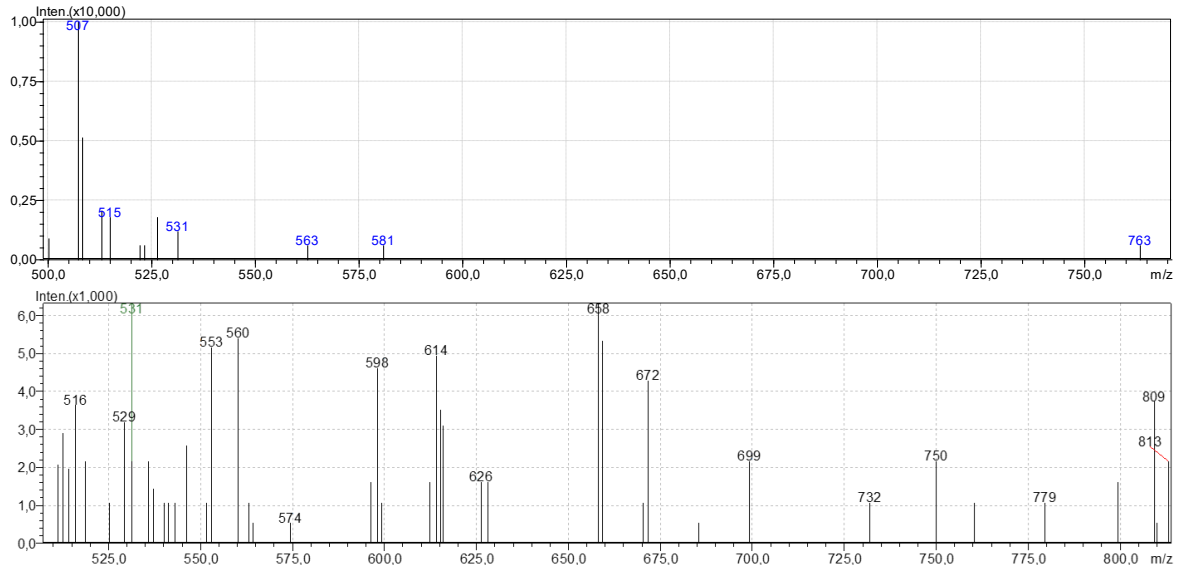


Şekil 5. L_1 bileşiğinin ^{13}C-NMR spektrumu



Ligandın (L_1) ve $[Cu(L_1)_2L].H_2O$ ve $[Fe(L_1)_2L].2H_2O$ metal kompleksleri, FT-IR spektrumları karşılaştırılarak incelenmiştir. Ligand ve karışık ligand Cu(II) ve Fe(II) kompleksleri için sırasıyla 3066, 3074, ve 3066 cm^{-1} frekanslarında aromatik karbon ν(C-H) adsorpsiyonu için bir bant görülmüştür. Ligand ve komplekslerin azometin ν(C=N) gerilme bandı sırasıyla 1620, 1604, ve 1620 cm^{-1} frekanslarında tanımlanmıştır. (Şekil 6-8)

Şekil 6. L_1 bileşiğinin FT-IR spektrumu



Şekil 7. $[Cu(L_1)_2L].H_2O$ bileşiğinin FT-IR spektrumu

Şekil 8. $[Fe(L_1)_2L].2H_2O$ bileşiğinin FT-IR spektrumu

Schiff baz karışık ligand metal komplekslerinin kütle spektrumları incelendiğinde, moleküler iyon pikinin (m/z): 763 $[Cu(L_1)_2L+H-H_2O]^+$ ve (m/z): 813 $[Fe(L_1)_2L+2H_2O+Na]^+$ olduğu görülmektedir. Bu formül ağırlığıyla uyumludur ve yapının kimliğini desteklemektedir. (Şekil 9)

Şekil 9. Sentezlenen bileşiklerin kütle spektrumu

4. SONUÇ

Bu çalışmada elde edilen sonuçlar 'N' ve 'O' tipi donör atom taşıyan ligandlara ait karışık ligand metal kompleksleri ile ilgili literatüre katkı sağlamıştır. Bu çalışmada 4-floroanilin ve 2-hidroksi-5-nitrobenzaldehitin reaksiyonundan Schiff baz ligand olan 2-(((4-florofenil)imino)metil)-4-nitrofenol (L_1) elde edildi. Sentezlenen ligand (L_1) ve 1,10-fenantrolin (L) ile Cu(II) ve Fe(II) asetat tuzları ile (L_1:L:M) 2:1:1 stokiyometrik oranda karışık ligand metal kompleksleri sentezlendi. Bu kompleksler oksijen ve azot atomlarının metal merkezine koordine olmasıyla oluşmuşlardır.

Sentezlenen ligand (L_1) literatürdeki verilere göre elde edilmiştir. Sentezlenen karışık ligand metal komplekslerinin orijinal ve literatür çalışmaları ile uyumlu olduğu görülmüştür. Ayrıca sentezlenen karışık ligand komplekslerin elektrolitik iletkenlik özelliği bulunmamaktadır. Sentezlenen metal komplekslerin manyetik duyarlılık değerleri $[Cu(L_1)_2L].H_2O$ 1.86 B.M. ve $[Fe(L_1)_2L].2H_2O$ 5.03 B.M olarak bulunmuştur. Manyetik duyarlılık sonuçlarına göre kompleksler oktahedral geometriye sahiptir. Literatür çalışmaları incelendiğinde Schiff baz ile 1,10-fenantrolin ligandlarından elde edilen karışık ligand komplekslerinin biyolojik olarak aktif olması beklenmektedir.

Özet

Bu çalışma Nisan 2023 ile Ekim 2024 tarihleri arasında Türkiye'nin Güneydoğu Anadolu Bölgesi'nde yer alan Mardin ilinde gerçekleştirilmiştir. Daha önce yapılan araştırmalar incelendiğinde Mardin ilinde Diplura'nın tespiti ile ilgili olarak sadece üç çalışma yapıldığı anlaşılmaktadır. Yapılan bu araştırma sonucunda Mardin merkeze bağlı üç farklı lokaliteden toplam 20 örnek toplanmış ve tanımlanmıştır. Teşhisi yapılan örneklerden *Campodea (Dicampa) sprovierii* (Silvestri, 1933) Mardin ili için yeni kayıttır. Çalışmanın amacı ülkemiz (Türkiye) ve özellikle Mardin ili Diplura faunasına katkıda bulunmaktır.

Anahtar Kelimeler: Diplura, Hexapoda, Fauna, Mardin, Türkiye.

New record for the Diplura (Hexapod) fauna of Mardin province

Abstract

This study was carried out between April 2023 and October 2024 in Mardin province, located in the Southeastern Anatolian Region of Türkiye. A review of previous studies reveals that only three studies have been conducted with regard of identification of Diplura in Mardin province. As a result of this research, a total of 20 specimens were collected and identified from three different localities within the central Mardin district. Of the identified specimens, *Campodea (Dicampa) sprovierii* (Silvestri, 1933) is a new record for Mardin province. The aim of the study is to contribute to the Diplura fauna of our country (Türkiye) and especially Mardin province.

Key words: Diplura, Hexapoda, Fauna, Mardin, Türkiye.

GİRİŞ

Diplura (Çatal Kuyruklular), Apterygota (Kanatsız) sınıfına ait, yüzeysel olarak böceklere benzeyen fakat gerçek böcek olmayan, genellikle nemli ortamlarda yaşayan ilkel eklembacaklılardır (Allen, 1994). Bu canlılar; toprakta, kaya ve taşların alt yüzeyinde, ağaçların gevşek kabuklarının altında veya gevşek organik maddelerde yaşayabilen eski böceklerdir. Takımın çeşitli üyeleri, Antarktika ve birçok okyanus adası hariç, neredeyse tüm kara kütlelerinde bulunur. Vücut segmentleri değişken sayıda farklı türde kıl veya pul taşır.On abdominal segment, bileşik gözlerinin olmaması, lateral stiluslar ve kaudal cercis ile karakterize edilirler (Allen, 2002). Türkiye'de Diplura üzerine yapılan çalışmalar; Paclt, 1976; Sendra ve ark., 2006, 2010 ve 2022; Tusun, 2006, 2011; Tusun ve Satar, 2020 ye ait olup, çok az sayıdadır. Bölgemizdeki ve Ülkemizdeki Diplura tür sayısını artırmak için yeni ve kapsamlı faunistik çalışmalara ihtiyaç duyulmaktadır.

MATERYAL VE METOT

Çalışmaya konu olan böcek örnekleri Nisan 2023 ile Ekim 2024 tarihleri arasında Mardin Artuklu merkez ilçesinin üç farklı lokalitesinden toplanmıştır (Şekil 1). Çalışma yapılan ve böcek örneği alınan istasyonun koordinat ve yükselti bilgileri el GPS'i (Global Position System; Küresel Konumlama Sistemi) kullanılarak (Magellan Explorist 610) kayıt altına alınmıştır. Yumuşak fırça ile toplanan böcek örnekleri çalışma alanında %70'lik etil alkole alınıp etiketlenerek laboratuvara getirilmiştir. Laboratuvara getirilen böcek örnekleri teşhis işlemi için ince fırçalar ve ultrasonik aletler ile temizlenmiştir. Örnekler temizlendikten sonra teşhisleri yapılmıştır. Teşhisi yapılan örnekler etiketlenerek, muhafaza edilmek üzere, birinci yazarın Dicle Üniversitesi Ziya Gökalp Eğitim Fakültesinde bulunan kişisel koleksiyonunda muhafaza edilmektedir.

Şekil 1. *Campodea (Dicampa) sprovierii* örneklerinin toplandığı istasyon

BULGULAR

Tür lokalitesi: Mardin ili, Artuklu İlçesi,Türkiye. 37^{0}23'08"K, 40^{0}41'34"D, Rakım:1130 m.

Taksonomi

TARTIŞMA

Campodea (Dicampa) sprovierii Silvestri, 1933, türü Türkiye faunası için ilk kez 1967 yılında İstanbul Belgrad Ormanı'nda toplanmış, ancak ilgili kayıt 2006 yılında Sendra ve arkadaşları tarafından yayımlanmıştır. Bunu izleyen dönemlerde farklı bölgelerde yürütülen faunistik çalışmalar sonucunda türün Kırklareli, Zonguldak ve Artvin illerinde de bulunduğu ortaya konmuştur. Daha sonraki kapsamlı araştırmalarla türün varlığı yedi ilde daha doğrulanmış ve Türkiye içindeki dağılımı giderek daha iyi anlaşılmıştır. Mardin'den elde edilen yeni kayıt, *C. (D.) sprovierii*'nin yalnızca Karadeniz ve Trakya bölgeleriyle sınırlı olmadığını, aynı zamanda Güneydoğu Anadolu Bölgesi'nde de uygun habitatlar bulunabildiğini göstermektedir.

SONUÇ

Mardin kaydı ile birlikte *C. (D.) sprovierii*'nin Türkiye'de bilinen il sayısı on ikiye yükselmiştir. Bu bulgu, türün ulusal ölçekteki dağılımının hâlâ tam olarak ortaya konulamadığını ve gelecekte yürütülecek detaylı arazi çalışmalarının yeni kayıtlar sağlamaya devam edebileceğini göstermektedir.

TEŞEKKÜR

Bu çalışma, Dicle Üniversitesi Bilimsel Araştırma Projeleri Koordinatörlüğü (DÜBAP) tarafından ZGEF. 25.004 proje numarasıyla desteklenmiştir. DÜBAP yönetimine destekleri için teşekkür ederiz.

Abstract

Bone tissue is vital for providing mechanical support, mineral storage, and maintaining biological functions in the body. The treatment of bone defects resulting from trauma, tumors, or degenerative diseases continues to pose a significant clinical challenge. Therefore, hydroxyapatite (HA, $Ca_{10}(PO_4)_6(OH)_2$), which is highly similar to bone tissue in terms of chemical and structural properties, has emerged as an important ceramic phase in tissue engineering and biomaterials research. Thanks to its high biocompatibility, bioactivity, and osteoconductive properties, HA is one of the most suitable materials to support bone regeneration. Hydroxyapatite can be obtained synthetically, and studies have demonstrated that HA derived from natural sources exhibits biological performance similar to or even superior to synthetic elastics. However, the brittle nature and low mechanical strength of pure HA limit its use on its own. Therefore, in recent years, composite systems composed of natural (gelatin, chitosan, alginate, etc.) and synthetic (PLGA, PCL, PLLA, etc.) polymers have been developed. These structures have been shown to yield successful results in terms of cell adhesion, tissue integration, and controlled drug release. Furthermore, ion-doped or surface-modified HA structures are reported to enhance antibacterial, osteogenic, and piezoelectric properties. Current studies reveal the versatile potential of HA-based nanocomposites in bone tissue engineering and drug delivery systems. However, long-term biosafety, biodegradability, and performance evaluations are needed to translate the obtained preclinical findings into clinical applications.

Keywords: Hydroxyapatite, biomaterial, composite scaffold, biocompatibility

1. Introduction

Bone tissue is vital for providing mechanical support, mineral storage, and maintaining biological functions in the body. The treatment of bone defects resulting from trauma, tumors, or degenerative diseases continues to pose a significant clinical challenge. Therefore, hydroxyapatite $Ca_{10}(PO_4)_6(OH)_2$ which is highly similar to bone tissue in terms of chemical and structural properties, has emerged as an important ceramic phase in tissue engineering.

Bone consists of organic and inorganic phases, a nanocomposite structure where the organic phase is largely composed of collagen and the inorganic phase is largely composed of hydroxyapatite. Bone is a mineralized tissue strengthened by the accumulation of calcium and phosphate crystals; in other words, it is a natural composite material. As with other organs and structures, bone tissue also has a hierarchical order ranging from macro to nano scales.

1.1. Hydroxyapatite: Synthesis and Composites

HA is one of the most suitable materials to support bone regeneration due to its high biocompatibility, bioactivity, and osteoconductive properties.

1.1.1. Synthesis Methods

HA can be obtained synthetically or from natural sources. The choice of method depends on the intended application and desired properties.

- Chemical precipitation: A commonly used method where calcium and phosphate ions are mixed in an aqueous solution.
- Sol-gel synthesis: Utilizes a precursor solution that forms a gel through hydrolysis and condensation.

- Hydrothermal synthesis: Uses high pressure and temperature to produce a crystalline material.
- Natural Sources: These include animal bones (chicken/beef), fish scales, eggshells, and plant extracts. Natural HA exhibits biological performance similar to or even superior to synthetic versions.

2.1.2. HA-Polymer Composites

The brittle nature and low mechanical strength of pure HA limit its use on its own. Therefore, composite systems composed of natural and synthetic polymers have been developed.

- Synthetic Polymers: PLA, PCL, PLGA, PEEK, and PMMA are used. PLA/PCL + nano HA combinations show osteogenic properties.
- Natural Polymers: Chitosan, collagen, alginate, and gelatin are advantageous in terms of biological solubility and cell interaction. Composites such as chitosan-HA and collagen-HA enhance cellular adhesion.

2.1.3. Characterization Techniques

Many methods are used in the characterization of hydroxyapatite to determine its structural and chemical properties.

- X-ray Diffraction (XRD): Provides information about the crystal structure, phase purity, and crystal size. Crystal size is often calculated using the Scherrer Equation.
- Fourier Transform Infrared Spectroscopy (FTIR): Determines the chemical structure by examining the interaction of infrared radiation with the substance. It detects characteristic vibrations of phosphate (PO_4^{3-}) and hydroxyl (OH^-) groups.
- Scanning Electron Microscopy (SEM): Surface morphology is imaged at high resolution to determine grain size, porosity, and surface regularity.
- Thermal Analysis (TGA/DSC): Examines the mass changes with temperature to investigate thermal stability and organic component content.

3. Hydroxyapatite Applications

3.1. Synthesis, Characterization and Material Development Studies

Synthesis methods and material characterization are key factors determining the performance of HA-based structures. Daldiken (2024) demonstrated increased crystallinity by synthesizing clinoptilolite-reinforced HA compounds using the sol-gel method. Toktaş et al. (2022) revealed an inverse relationship between porosity and mechanical strength by producing microporous HAp beads. Jaiswal et al. (2020) found that Mg addition increased hardness and corrosion resistance. Dokgöz (2019) synthesized dexamethasone-loaded GELMA/nanosilica nanocomposites and demonstrated that these structures offered successful mechanical strength and drug delivery.

Bang et al. (2014) reported that carbonate-modified HA was absorbed more quickly by osteoclasts, thus accelerating bone growth. Metin (2013) showed that bovine bone-derived HA powders yielded high-quality products under appropriate particle size and sintering conditions. Lee et al. (2008) reported that carbonate addition increased the solubility of HA and decreased its crystallinity, while Cengiz (2007) optimized the production of biocompatible nHA by investigating the effect of different synthesis parameters on nanoparticle morphology. This group generally emphasizes the decisive effect of synthesis parameters and additives on the structural properties of HA.

3.2.Natural and Biopolymer-Based Composites

HA structures supported by natural polymers have great potential in terms of biocompatibility and biodegradability. Alpan et al. (2022) showed that bacterial cellulose–HA nanocomposite supported new bone formation in rats. Souto Lopes et al. (2024) reported that chitosan-based nHA bioaerogel increased both in vitro cell proliferation and in vivo bone regeneration. Özcan (2017) accelerated mineralization by functionalizing fibroin and PLLA mixed scaffolds with OSN peptide. In addition, gelatin–PVA–alginate-based structures of Bahrawy et al. (2025) and gelatin/chitosan-reinforced composites of Aydın (2018) also belong to this group, demonstrating that natural polymers offer ideal matrices that combine mechanical flexibility with biocompatibility.

3.3. Drug Delivery and Delivery Systems

Hydroxyapatite (HA)-based structures stand out as highly effective carrier systems in drug delivery and bone tissue repair. Han et al. (2025) developed a nanocomposite with a core-shell structure coated with cationic starch and HA and zirconia cores to reduce the side effects of zoledronic acid and showed that this structure provides controlled release with high drug loading capacity. Similarly, Bahrawy et al. (2025) prepared multifunctional bone scaffolds loaded with ceftazidim and 5-fluorouracil by adding hydroxyapatite nanoparticles to a gelatin-PVA-alginate matrix; it was determined that these structures released drugs for up to 28 days and enhanced bone regeneration. Aydın (2018) reported that by loading 5-fluorouracil onto HA-gelatin and HA-chitosan composites, the cross-linking ratio determined the release rate, and controlled release was obtained at higher GA ratios. In his study, Öztürk (2018) combined boron-doped nHA with PLGA nanoparticles loaded with the anticancer drug salinomycin; in this hybrid system, release lasting up to 59 days and synergistic antibacterial effect were observed. Kahraman (2016) also investigated the release of 5-fluorouracil in HA-gelatin composites and emphasized that a lower gelatin ratio provided more controlled release. Overall, these studies demonstrate that HA-based systems offer promising carrier structures for both bone regeneration and targeted drug delivery.

3.4. Structures Produced with 3D Printing and Their Mechanical Properties

Three-dimensional printing technology is frequently preferred in the production of biomimetic scaffolds in bone tissue engineering. Chen et al. (2025) developed a ceramic scaffold system with antibacterial and piezoelectric properties and produced it using DLP 3D printing technique; they reported that ZnO addition increased the antibacterial effect. Yan et al. (2025) showed that integrating adipose tissue-derived mesenchymal stem cells (ADMSC) into 3D-printed PLGA/nHA scaffolds increased osteogenic differentiation in both in vitro and in vivo environments. Eldokmak et al. (2025) significantly increased cell adhesion, biocompatibility, and mechanical strength of 3D-printed PLA scaffolds by coating them with nano-HA and polydopamine. Similarly, Tut et al. (2022) and Gündüz et al. (2022) produced 3D-printed scaffolds containing PVA/WPI/HA/GEN and reported that gentamicin addition reduced pore size but maintained biocompatibility. The common conclusion of these studies is that 3D printing technology offers significant advantages in bone engineering in terms of controlled pore structure, mechanical stability, and biocompatibility.

3.5. Coating and Surface Modification Works

Vangölü et al. (2025) conducted 18-week implantation tests in New Zealand rabbits by coating Ti6Al4V screws with HA and Ca-P layers, and stated that HA-coated samples showed the best performance in terms of osteogenesis and biocompatibility. Eldokmak et al. (2025) found that polydopamine/nano-HA coatings increased cell adhesion in PLA scaffolds. Koç (2019), on the other hand, modified the surface of PRP-supported HAp/PLLA nanofiber grafts with NaOH and showed that this process accelerated osteogenic differentiation through PRP activation. These studies demonstrate that coating and surface modification methods strengthen biomaterial-cell interaction and increase implant success.

3.6. Studies Focusing on Antibacterial and Osteogenic Effects

Many studies have aimed to enhance the antibacterial and osteogenic effects of HA through modification. Li et al. (2025) reported that linezolid-loaded mHAP composites enriched with Sr were effective against MRSA and increased osteogenic potential. Zhao et al. (2024) synthesized micro/nano HA bioceramics functionalized with tea polyphenols, showing that these structures suppress osteoclast activity while supporting osteogenic differentiation. Shaikh et al. (2024) produced nHA without chemical additives using laser energy and reported that these structures increased bone formation when supported by collagen and gelatin. Santos et al. (2025), in a literature review, emphasized that HA is the most frequently preferred calcium-based material in tooth and bone regeneration. These findings highlight the importance of HA-based materials as both biocompatible and antimicrobial tissue regeneration agents.

4. Conclusion and Discussion

This study examines research on hydroxyapatite (HA), a biomaterial notable for its high degree of similarity to bone tissue, in bone tissue therapy. HA has been shown to be an important biomaterial in terms of biocompatibility and supporting bone regeneration due to its structure similar to natural bone. To overcome its brittle structure and mechanical limitations, HA has been enriched with various inorganic, polymeric, and biological additives.

The studies examined showed that nanotechnology-supported research was particularly prominent. Controlled release of potent drugs like zoledronic acid via HA-zirconia core and cationic starch-coated nanocomposite carriers increased osteogenic differentiation in bone cells and also allowed for a reduction in side effects. These types of core-shell structured systems have been shown to offer significant advantages in chemotherapy, osteoporosis, and local drug applications.

Skeletal systems containing HA, barium titanate, and ZnO, produced using DLP 3D printing technology, have offered significant approaches in the treatment of infected bone defects by combining antibacterial and osteogenic properties. 3D-printed biomaterials have shown significant advancements in skeletal technology.

In conclusion, hydroxyapatite and its derivatives are among the most powerful and promising materials in bone tissue engineering due to their structure mimicking natural bone tissue, high integration capability with functional additives, and multifaceted biological effects. When combined with evolving production techniques, next-generation modification strategies, and multidisciplinary approaches, it is predicted that HA-based systems will be used more widely in clinical applications in the future. However, it should be noted that more systematic clinical-level validations, biosafety analyses, and long-term performance tests are needed to fully realize this potential.

Abstract

Belief propagation (BP) is a message-passing algorithm commonly used for inference in graphical models, particularly, probabilistic graphical models such as Bayesian networks and Markov random fields. It works by passing messages between nodes in a graph to estimate the probability of variables given evidence, efficiently handling uncertainty in complex systems. Belief propagation (BP) is a term with meanings in different fields, but it most commonly refers to an algorithm in computer science and machine learning. Furthermore, BP has been successfully applied to a range of machine learning tasks, including clustering, classification, and probabilistic inference in Bayesian network models, thereby, facilitating efficient learning and decision-making in complex systems. "Biological networks" is a broad term that can refer to various interconnected systems in biology, often modeled as graphs or networks to understand complex interactions.These networks provide a valuable framework for understanding the complex processes that underlie biological functions and systems. However, inference in high-dimensional biological networks is often computationally demanding. To address this difficulties, we propose integrating conformal prediction with belief propagation for biological network analysis. In addition, alternative multiple testing procedures for high-throughput biological data have gained increasing attention in recent years. As a complementary approach, we introduce the use of *e-value* within belief propagation for biological networks, especially, in scenarios where the number of parameters exceeds the number of observations.

Keywords: 3-6 words. (Use commas to separate words.)

INTRODUCTION

Graphical models have been extensively studied in the literature, with important contributions by Jordan (2003), Wainwright and Jordan (2008), and Koller (2009). The message-passing algorithm, central to inference in these models, was proposed by Donoho (2008) and further developed by Fan (2022). Moreover, comprehensive overview of message passing algorithm is provided by Fang et al. (2022). Applications of message passing to biological networks were highlighted by Newman (2023). Message passing in the context of Wigner matrices has been investigated by Çakmak et al. (2014), Deshpande and Montanari (2014), Wein et al. (2019), and Stephan (2021). Furthermore, message passing alorithm with biological networks is studied by Bayati et al. (2013) and Chang et al. (2013). Graphical belief propogation and wavelet on graphs are suggested by Jia et al. (2021) and Hy and Kondor (2022), respectively. El-Hay et al. (2010) have proposed continuous belief propagation. Moreover, graphical learning for long run dependencies in protein structures is proposed by Hariri and Vandergheynst (2024). More specifically, message-passing algorithms for protein–protein interaction networks were proposed by Iqbal et al. (2008), Weigt et al. (2009), and Bailly-Bechet et al. (2011). In the area of machine learning, message passing and neural networks were studied by Gilmer et al. (2020), while the integration of belief propagation with deep neural networks was discussed by Lucibello et al. (2022).

In parallel, conformal prediction was originally introduced by Shafer and Vovk (2008). It has since been applied in various contexts, including outlier detection by Kaygusuz and Purutçuoğlu (2025), and message-passing frameworks by Clarte and Zdeberova (2024) and Wen et al. (2025). Conformal prediction with clusetring is proposed by Jung et al. (2021). For instance, one of initial study for multiple testing procedure for wavalet is studied by Abramovich and Benjamini (1996). On the other hand, Kunisky et al. (2019) have showed computational

difficulties of hypotheses testing with likelihood ratio test. More reently, Danadel et al. (2024) have proposed knockoff multiple testing procedure to avoid over clustering for single cell data. Furthermore, e-value for multiple testing was proposed by Vovk and Wang (2020), with subsequent detailed investigations by Wang and Ramdas (2022) and Xu and Ramdas (2024).

Building on these foundations, we focus on belief propagation, a message-passing algorithm commonly used for inference in probabilistic graphical models such as Bayesian networks and Markov random fields. BP provides an elegant and efficient framework for computing marginal distributions and making predictions from observed data, and it has been successfully applied in machine learning tasks such as clustering, classification, and probabilistic inference in Bayesian networks, enabling efficient learning and decision-making in complex systems.

Biological networks, which represent the interactions among genes, proteins, and cells, provide a powerful framework for understanding the intricate processes underlying biological functions. However, performing inference in high-dimensional biological networks remains computationally demanding. To address these challenges, we propose the integration of conformal prediction with belief propagation for the analysis of biological networks with clustered data, offering assumption-free prediction in such settings. Moreover, in light of recent interest in alternative multiple testing procedures for high-throughput biological data, we introduce the use of e-value within belief propagation, particularly, in scenarios where the number of parameters exceeds the number of observations.

MATERIALS AND METHODS

THEORY AND METHOD

Belief propagation on biological networks

Traditionally, belief propagation (BP) is an algorithm used to perform inference on graphical models, particularly probabilistic graphical models such as Bayesian networks and Markov random fields. BP is a message-passing algorithm that enables the computation of marginal distributions of random variables in a network.

Graphical models represent the relationships between random variables using graphs. More specifically, nodes correspond to random variables, and edges represent dependencies between them. There are two main types of graphical models:

Directed acyclic graphs (Bayesian networks): edges represent conditional dependencies.

Markov random fields (undirected graphs): edges represent direct dependencies.

In belief propagation, nodes iteratively exchange messages with their neighbors. A message from node A to node B encodes information about the probability distribution of A as it relates to B. These messages are computed using both local evidence and the messages received from neighboring nodes. The belief of a node is the current estimate of the probability distribution of the variable which it represents, given the incoming messages. Beliefs are updated iteratively until convergence.

The BP algorithm can be summarized in the following steps:

Initialization: Assign initial beliefs for each node, typically based on prior or uniform distributions.

Message passing: Iteratively pass messages between neighboring nodes until convergence or until a maximum number of iterations is reached.

Belief update: Update each node's belief based on the messages which it has received.

Marginal computation: After convergence, compute the marginal distributions for the desired nodes.

For a better representation, we can consider a simple Bayesian network with three variables A, B, and C, where A influences both B and C. To compute the marginal distribution of B, belief propagation would proceed as follows: We initialize beliefs for B based on prior knowledge. Then, the messages are passed from A to B and from C to B. Later, we update the belief for B using the received messages. Finally, we repeat the process until the belief for B stabilizes.

As a results, belief propagation is a powerful and efficient algorithm for inference in graphical models. Its ability to capture complex dependencies and provide approximate solutions even in loopy graphs makes it a valuable tool across a wide range of applications and domains.

Conformal prediction for belief propagation

Conformal prediction is a statistical methodology designed to quantify the uncertainty of predictions generated by machine learning models. Instead of providing a single point estimate, it produces prediction sets or intervals that contain the true outcome with a specified probability, under certain assumptions. For example, a conformal predictor may output a set of possible values that includes the true outcome with 95% confidence.

A central concept in conformal prediction is the ***nonconformity measure***, which evaluates how "strange" or "nonconforming" a new observation is relative to the training data. This measure determines whether a particular prediction should be included in the prediction set. To ensure statistical validity, conformal prediction relies on a ***calibration set***, a subset of the training data used to assess nonconformity and maintain the desired coverage probability.

One of the main advantages of conformal prediction is that it provides valid prediction sets under minimal assumptions. The coverage probability, which refers to the proportion of times the true outcome is contained within the prediction set, is guaranteed to meet or exceed the specified level (e.g., 95%) as long as the data points are exchangeable. Because of this, conformal prediction has been successfully applied across diverse fields such as bioinformatics, machine learning, and other domains where uncertainty quantification is critical.

More recently, conformal prediction has been integrated with ***message passing algorithms***. In this context, conformal prediction enhances the efficiency of computing prediction intervals while ensuring that true outcomes are captured within the specified confidence levels. When applied to clustered data, however, the integration of conformal prediction with message passing presents additional challenges. Nevertheless, in settings where models must aggregate information from neighboring nodes, this combination accelerates the computation of prediction sets and improves overall predictive performance.

Belief propagation with conformal prediction for Wigner matrix

In the 1950s, Wigner introduced a simple model of random matrices to approximate generic self-adjoint operators. Hereby, consider a family of independent, zero-mean, real or complex-valued random variables $\{Z_{i,j}\}_{\{1 \le i < j\}}$ independent from a family of i.i.d. centered real-valued random variables $\{Y_i\}_{\{1 \le i\}}$. Then, we define the (N × N)-dimensioanl real-symmetric or Hermitian random matrix X_N with entries:

$$X_{\{N(i,j)\}} = Z_{\{i,j\}},\ i < j;\ \{Z_{\{j,i\}}\}, i > j;\ Y_i;\ i = j. \quad (1)$$

Such a matrix is called a Wigner matrix. If the random variables $Z_{\{i,j\}}$ and Y_i are Gaussian, then X_N is referred to as a Gaussian Wigner matrix. A particularly important case arises when $E[Y_1^2] = 2\ and\ E[|Z_{\{1,2\}}^2|] = 1$. In this setting, the law of X_N is invariant under the action of the orthogonal group (when entries are real).

On the other hand, the basic goal of conformal prediction is to construct valid predictive sets with guaranteed coverage. Hence, let $(X_i, Y_i) \sim P,\ i = 1, \ldots, n$ be i.i.d. feature–response pairs from some distribution P on (X × Y). For concreteness, we may take X = R^d and Y = R, though more general cases are possible. Also, let α ∈ (0,1) be a nominal error level. Accordingly, the goal is to construct a prediction set $\hat{C}_n: X \to \{subsets\ of\ Y\}$ such that for a new i.i.d. pair $(X_{n+1}, Y_{n+1}) \sim P$.

$$P(Y_{n+1} \in \hat{C}_n(X_{n+1})) \geq 1 - \alpha. \quad (2)$$

At first glance, achieving Equation 1 without assumptions on P and without asymptotics seems difficult. Yet a trivial construction works as

$$\hat{C}_n(X_{n+1}) = \{Y\ with\ prob\ 1 - \alpha;\ \emptyset\ with\ prob\ \alpha\}. \quad (3)$$

Equation 3 guarantees exact coverage at level (1-α), thereby, satisfying Equation 2. However, this solution is not informative. The real question is whether we can construct nontrivial sets that also achieve Equation 2 in finite

samples without assumptions on P. Ideally, our strategy is to adapt to the difficulty of prediction: the more predictable Y_{n+1} is from X_{n+1}, the smaller we want $\widehat{C}_n(X_{n+1})$ to be.

On conclusion, although Wigner matrices and conformal prediction arise from very different traditions from random matrix theory in mathematical physics and distribution-free predictive inference in statistics, there is a conceptual link. Both frameworks deal with uncertainty in high-dimensional systems. But Wigner matrices provide tractable models for understanding the spectral behavior of large random operators, while conformal prediction offers rigorous ways to quantify predictive uncertainty in complex data. In modern applications, particularly in high-dimensional biological or network models, insights from random matrix theory can inform the stability and calibration of conformal prediction methods. More details about random matrix theory can be found on the book of Tao (2012).

E-value multiple testing procedure for belief propagation on biological networks

E-value, introduced by Vovk in 2019, provides an alternative to p-values in multiple testing scenarios. It is nonnegative test statistics that quantifies evidence against the null hypothesis and is closely related to betting scores and likelihood ratios. Unlike p-value, e-value allows for inference by making it especially powerful in sequential or adaptive experimental settings.

Accordingly, one of the key advantages of e-value is its ability to handle optional continuation. Specifically, e-value from subsequent experiments can simply be multiplied, producing a new "product e-value" that represents the combined evidence across all experiments. This property holds even when later experiments are decided adaptively by depending in unknown ways on earlier results or when the total number of trials is not predetermined. Importantly, the resulting product e-value continues to control Type-I error by ensuring valid inference. This property motivates the notion of the *e-process*, the sequential extension of e-value, which serves as a fundamental building block for anytime-valid statistical methods.

Another strength of e-value is its robustness under dependence. Any weighted average of e-value remains an e-value, even if the individual components are arbitrarily dependent. This flexibility makes them useful for combining evidence across diverse sources.

E-value admits several complementary interpretations as listed below.

Rescaling of tests**:** It can be seen as presenting evidence on a scale that naturally facilitates aggregation.

Relationship to p-value: The reciprocal of an e-value corresponds to a special p-value that retains a generalized Type-I error guarantee.

Connection to likelihood ratios: E-value generalizes likelihood ratios and, while related to Bayes factors, remains conceptually distinct.

Betting scores**:** It can be viewed as bets in a sequential gambling framework.

Supermartingale increments**:** In sequential contexts, it corresponds to increments of nonnegative supermartingales.

Since 2019, interest in e-value has grown rapidly, with several research groups producing breakthrough results. Formally, an e-variable is a nonnegative random variable whose expectation under the null hypothesis is at most one, and an e-value is a realized outcome of such a variable. Whereas p-value is defined in terms of probabilities, e-value is defined in terms of expectations.

Finally, under the assumption of independence, the product of e-value is itself an e-value, yielding a particularly rich domination structure. Even without full independence, this assumption can often be relaxed to the weaker condition of sequentiality, preserving the validity of e-values in adaptive settings.

Numerical examples

We began by generating data from a Wigner matrix with 1,000 observations. Following this, we applied conformal prediction based on belief propagation to identify the strongest clustered signal within the data.

Next, four Erdos–Rényi graphs were generated and assembled into a block-diagonal matrix, representing a modular network with four clusters. As expected, the nearest-neighbor spacing distribution (NNSD, shown at left side of Figure 1) is exponential, reflecting the modular structure of the matrix. Using the clusters command of the *igraph* package, we were able to clearly reveal this clustered structure.

When validating the new noisy matrix, we found that it behaves like a completely random matrix: its NNSD is Wigner-like (shown at right side of Figure 1). The modular structure disappears, and the entire matrix appears as a single large cluster. However, spurious matrix elements emerge, artificially connecting the true clusters.

Gaussian density of the eigenvalue spectrum; another method is based on fitting spline function to the cumulative empirical eigenvalue distribution. The latter is determined by the parameter unfold method. For each threshold, a distance between the empirical eigenvalue spacing distribution (NNSD) and both limiting distributions (Wigner-Dyson distribution and Exponential distribution, respectively) are estimated. Threshold and loglikelihood values per eigenvalue with exponential and Wigner distribution are obtained in Figure 1. In this figure, it is seen that exponential fits better than Wigner since the spacing decreases monotonically which may imply uncorrelated levels. On the other side, the Wigner distribution rises to a peak near spacing equal to 1, but, it has a Gaussian tail which may represent correlated levels. Hereby, the former indicates that there is a strong localization which is built from many independent spacing. The latter presents strong short-range correlations.

For conformal prediction with belief propagation on biological networks, we again used 1,000 observations. In the case without outliers, conformal prediction revealed two clusters, with 356 and 644 observations, respectively. When outliers were present, three clusters were detected, containing 198, 701, and 101 observations.

Finally, under the same setting of 1,000 observations, we applied a log-likelihood ratio e-value multiple testing procedure. This method selected five variables, with corresponding values (interpretable as transformed test statistics) of **2.969, 3.7010, 3.923, 4.551, and 5.975.**

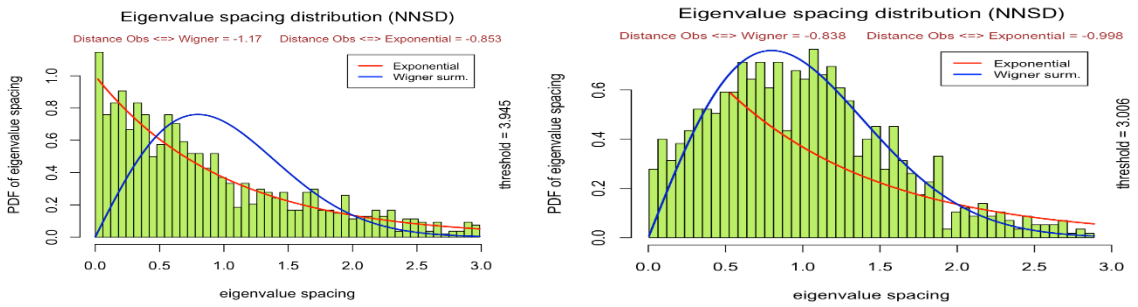

Fig.1. Eigenvalue spacing distributions (Exponential and Wigner) for biological networks (Erdös-Renyi) with different Wigner matrix parameter

CONCLUSIONS

In this study, we applied belief propagation to biological networks using Wigner matrices. However, this approach can be computationally demanding. As an alternative, we employed conformal prediction combined with belief propagation to analyze clustered biological network data.

In recent years, e-value–based multiple testing procedures have gained popularity for model selection in high-dimensional settings. Motivated by this, we proposed a framework that integrates belief propagation on biological networks with conformal prediction.

Future studies may extend this work by applying the method to other types of data, such as protein–protein interaction networks, or by incorporating spline functions with the Kullback–Leibler information criterion for model evaluation.

Abstract

Double machine learning (DML) is a statistical framework designed to estimate causal effects while effectively controlling for confounding variables. By integrating machine learning techniques with principles of causal inference, DML yields unbiased treatment effect estimates and supports robust analysis across disciplines such as economics, epidemiology, and statistical machine learning. Its utility becomes particularly evident in high-dimensional settings, where traditional estimation methods often fail due to complex interdependencies among variables. DML leverages cross-fitting procedures to mitigate overfitting, thereby, enhancing generalizability. Beyond causal inference, DML can be extended to unsupervised learning tasks such as clustering, where it facilitates the identification of meaningful data groupings while adjusting for potential confounders. In this context, we propose an innovative methodology that incorporates e-value, which is a nonnegative test statistics from likelihood ratio-based multiple testing frameworks, as a means of quantifying statistical evidence and controlling false discoveries. This approach is especially pertinent when the number of parameters exceeds the number of observations, a common scenario in modern high-dimensional data analysis. Furthermore, recent developments in multiple testing procedures for graphical models have highlighted the need for more flexible and interpretable tools. In response, we introduce a novel framework that integrates e-value within the DML paradigm to improve inference and clustering accuracy in structured, high-dimensional datasets. Our method provides a promising direction for future research in both causal inference and high-dimensional unsupervised learning.

Keywords: double machine learning, clustered data, multiway clustering, multiple testing procedure.

INTRODUCTION

Traditionally, double machine learning (DML) is a statistical methodology which is designed for causal inference that improves the estimation of the effect of a treatment or intervention while controlling for confounding variables. It combines machine learning models with a technique called orthogonalization to remove biases from regularization and overfitting, enabling unbiased and efficient estimation of causal effects even in complex, high-dimensional settings. Furthermore, the key idea is to use two separate machine learning models: one to predict the treatment and another to predict the outcome, then combine these predictions in a way that "orthogonalizes" the estimation of the treatment effect, making it robust to errors in the nuisance parameter estimation. Cross-fitting, where data is splitted and models are trained on different folds, further reduces overfitting bias. This approach provides for reliable inference about causal relationships by using flexible machine learning tools without sacrificing statistical validity.

Beyond causal inference, DML can be extended to unsupervised learning tasks such as clustering, where it facilitates the identification of meaningful data groupings while adjusting for potential confounders. clustering for instrumental variables (IV) refers to adjusting the standard errors of IV estimators to account for correlation in the error terms along multiple clustering dimensions simultaneously. In instrumental variable regression, we use instruments to address endogeneity in explanatory variables. Like in ordinary least squares (OLS), valid inference requires correctly estimating the variance-covariance matrix of the IV estimator. If the error terms are correlated within clusters (e.g., firms, regions, time periods), failing to account for this clustering can lead to underestimated standard errors and invalid inference. IV regressions often use panel or grouped data where errors may be

correlated within multiple dimensions. For example, in a dataset of firms observed over time and across regions, errors might be correlated within firms and within regions. Moreover, ignoring one or more clustering dimensions can bias standard errors downward, increasing the risk of false positives. It adjusts the variance-covariance matrix of the IV estimator to reflect clustering along all relevant dimensions simultaneously. The multiway clustered variance estimator for IV is conceptually similar to that in OLS.

In the literature, instrumental variable based on correlated with error term is introduced by Wright (1928) and Imbens (2014) has provided econometrician perspective for instrumental variables. More specifically, instrumental variables estimation for nonparametric models is proposed by Newey and Powell (2003). Hansen et al. (2008) have studied estimation procedure with many instrumantal variable. Furthermore, nonparametric additive instrumental variable estimator is proposed by Fan and Zhang (2018). Alternatively, instrumental variable in survival context is studied by Tchetgen et al. (2015). Also, instrumental variables estimation for additive hazard models is suggested by Brueckner et al. (2019). For example, insturmental variables to estimate a Cox's proportional hazards regression subject provided by Li et al. (2015).

On the other hand, double machine learning is suggested by Chernuzkov (2016,2018). R package for double machine learning is provided by Bach et al. (2024). Angrist and Pische (2009) have investigated identification properties of causal effects by using instrumental variables. More recently, double machine learning algorithm for cluster data is proposed by Chiang et al. (2022). Fingerhut et al. (2022) have proposed coordinated double machine learnig methedology. Moreover, Klyne and Shah (2023) have suggested average partial estimation with double machine learning methods. Furthermore, Duan et al. (2024) and Niu et al. (2024) have studied conditional indepedence testing procedure for double machine learning data.

Finally, e-value is introduced by Vovk and Wang (2021). Later, Xu and Ramdas (2024) an Xu et al. (2025) have proposed e-value multiple testing procedure for different models. Wang et al. Ramdas (2024) and Geoman et al. (2025) have combined false discovery rate control and e-value multiple testing procedure.

As a result, in this context, we have suggested an novel and popular methodology that incorporates e-value, which is a nonnegative test statistics from likelihood ratio-based multiple testing frameworks, as a means of quantifying statistical evidence and controlling false discoveries. This approach is especially pertinent when the number of parameters exceeds the number of observations, a common scenario in modern high-dimensional data analysis. Furthermore, recent developments in multiple testing procedures for graphical models have highlighted the need for more flexible and interpretable tools. In response, we introduce a novel framework that integrates e-values within the DML paradigm to improve inference and clustering accuracy in structured, high-dimensional datasets.

THEORY and METHOD

Double Machine Learning for Estimation of a Causal Parameter

A key element of double machine learning (DML) models is the score functions identifying the estimates for the target parameter. These functions play an essential role for valid inference with machine learning methods because of the fact that they have to satisfy a property, called Neyman orthogonality. With the score functions as key elements, we implements DML in a very general way by using object orientation.

With more mathematical details, let we assume that we have a sample $(W_{ij}; i = 1,..,N; j = 1,...,M)$ which has a double indexed of observation size as NM and modeled as i.i.d. copies of W = (Y, D, Z, X). Let P denote the probability law of $\{W_{ij}\}_{ij}$ and let E_p be the expectation of P via

$$E_p\left[\psi(W_{11;}\theta_{0,}\eta_{0})\right] = 0. \quad (1)$$

where we call ψ the score function, W = (Y, D, X, Z), $\theta_{0,}$is the parameter of interest, and η denotes nuisance functions with population value η_{0}. Therefore, we define a probability measure P and assume that N is divisible by K in order to simplify the notation.

On the other side, linear IV model can be used for multiway cluster sample. For instance, we consider a practical example of the partially linear IV model adapted to the multiway cluster sample data as below.

$$Y_{ij} = D_{ij}\theta_0 + g(X_{ij}) + q_{ij} \text{ while } E(q_{ij}|X_{ij}, Z_{ij}) = 0 \quad (2)$$
$$Z_{ij} = m(X_{ij}) + v_{ij} \text{ while } E(v_{ij}|X_{ij}) = 0$$

where Y_{ij} is the outcome variable and Z_{ij} is the policy variable of interest. The high-dimensional vector X_{ij} = ($X_{1j}, \ldots, X_{ij}$) consists of other confounding covariates, and ζ and V are stochastic errors. Equation 2 is our major expression and θ_0 is the main regression coefficient that we would like to infer. Moreover, if Z_{ij} is conditionally exogenous, θ_0 has the interpretation of a structural or causal parameter. The second equation represents confounding variable, more specfically, the dependence of Z_{ij} on covariates. The characteristics X affect the policy variable Z_{ij} via the function $m(X_{ij})$ and the outcome variable via the function $g(X_{ij})$.

One may want to observe the random variables Y_{ij}, D_{ij}, X_{ij}, and Z_{ij}, which are typically interpreted as the outcome, endogenous regressor, exogenous regressors, and instrumental variable, respectively. Moreover, the low-dimensional parameter vector θ_0 refers to an object of interest. Accordingly, a Neyman orthogonal score ψ for such model is given by

$$\psi(w;\theta, \eta) = (y - g_1(x) - \theta (d - g_2(x)))(z - m(x)) \quad (3)$$

while w = (y, d, x, z), η = (g_1, g_2, m) and g_1, g_2, m ∈ L_2 (P). Furthermore, it is straightforward to verify that this score satisfies both the moment restriction in equation (3), EP [ψ(w_{11} ; θ_0, η_0)] = 0, and the Neyman orthogonality condition (1), ∂_ηEP ψ(w_{11} ; θ_0, η_0)[η − η_0] = 0 for all η ∈ T_n)[at η_0 = (g_{10}, g_{20}, m_0), where g_{10} (X) = EP [Y |X], g_{20} (X) = EP [D|X], and m_0 (X) = EP [Z|X].

Multiway clustering for double machine learning data

Here, we suggested a novel K^2-fold multiway cross fitting procedure for estimation of θ_0. For any r ∈ N, we use the notation [r] = {1, ..., r}. With a fixed positive integer K, randomly partition [N] into K parts $\{I_1, \ldots, I_K\}$ and [M] into K parts $\{J_1, \ldots, J_K\}$. Thus, for each (k, l) ∈ [K] we obtain an estimate. Accordingly, we provided the partially linear IV model formula which is introduced in Section 2.1. Therefore, we would like to express in more details on the following high-dimensional linear representations for multiway clustering data,

$$Y_{ij} = D_{ij}\theta_0 + X_{ij}(\zeta_0) + q_{ij},$$
$$D_{ij} = Z_{ij}\pi_{10} + X_{ij}(\pi_{20}) + v_{ij},$$
$$Z_{ij} = X_{ij}(\xi_0) + V_{ij},$$

where the parameter values are set to $\theta_0 = \pi_{10} = 1.0$ and $\zeta_0 = \pi_{20} = \xi_0 = (0.5, 0.5^2, \ldots, 0.5^{\dim(X)})$ for some large dim(X). Also, the primitive random vector $(X_{ij}, q_{ij}, v_{ij}, V_{ij})'$ is constructed by

$$X_{ij} = (1 - w_1^X - w_2^X)\alpha X_{ij} + w_1^X \text{ Xα} + w_2^X \text{ Xj},$$
$$q_{ij} = (1 - w_1^q - w_2^q)\alpha q_{ij} + w_1^q q_i + w_2^q q_{ij},$$
$$v_{ij} = (1 - w_1^v - w_2^v)\alpha v_{ij} + w_1^v v_i + w_2^v v_j,$$

and

$$V_{ij} = (1 - w_1^v - w_2^v)\alpha V_{ij} + w_1^v V_i + w_2^v V_j$$

with two-way clustering weights (w_1^X, w_2^X), (w_1^q, w_2^q), (w_1^v, w_2^v), and (w_1^v, w_2^v), where α_{ij}^X, α_i^X and α_j^X are independently generated and $(\alpha_{ij}^\varepsilon, \alpha_{ij}^v)'$, $(\alpha_i^\varepsilon, \alpha_i^v)'$, $(\alpha_j^\varepsilon, \alpha_j^v)'$ are independently generated by,

$$\begin{pmatrix}\alpha_{ij}^q \\ \alpha_{ij}^v\end{pmatrix}, \begin{pmatrix}\alpha_i^q \\ \alpha_i^v\end{pmatrix}, \begin{pmatrix}\alpha_j^q \\ \alpha_j^v\end{pmatrix} \sim N\left(0, \begin{pmatrix}1 & s_{qv} \\ s_{qv} & 1\end{pmatrix}\right) \quad (5)$$

and α_{ij}^V, α_i^V, *and* α_j^V are independently generated via

$$\alpha_{ij}^V, \alpha_i^V, \text{and } \alpha_j^V \sim N(0,1). \quad (6)$$

Therefore, the weights (w_1^X, w_2^X), (w_1^q, w_2^q), (w_1^v, w_2^v), and (w_1^v, w_2^v), specify the extent of dependence in two-way clustering in $X_{ij}, q_{ij}, v_{ij}, V_{ij}$, respectively. The parameter s_X specifies the extent of collinearity among the high-dimensional regressors X_{ij}. The parameter s_{qv} specifies the extent of endogeneity. Finally, it is taken the values of these parameters (due to we have four specific points therefore, 1/4=0.25) to (w_1^X, w_2^X), (w_1^q, w_2^q), (w_1^v, w_2^v), and (w_1^v, w_2^v), =(0.25,0.25) and $s_X = s_{qv} = 0.25$ as we have four specific points.

E-value multiple testing procedure for double machine learning with clustered data

E-value, introduced by Vovk in 2019, serves as an alternative to p-value in multiple testing scenarios. It is a nonnegative test statistics that provides evidence against the null hypothesis, closely related to concepts like betting scores and likelihood ratios, allowing for more flexible statistical inference with the property that under the null hypothesis its expected value is at most 1.
This contrasts with p-value, which represents tail probabilities under the null. Traditional multiple testing procedures (like Bonferroni or Benjamini-Hochberg) control error rates based on p-value. Hence, e-value provides an alternative framework that can be more flexible and robust, especially in sequential or adaptive testing. It allows for combining evidence across tests and can be used to control error rates such as the family-wise error rate (FWER) or false discovery rate (FDR). So, we can compute e-value for each hypothesis test. Then, we can combine or adjust these e-values by using specific rules or algorithms designed to control the desired error rate. We can also reject hypotheses where the combined or adjusted e-value exceeds a certain threshold. Lastly, the e-value multiple testing procedure is a framework for controlling error rates in multiple hypothesis testing by using e-values by random variables with expected value ≤ 1 under the null, instead of p-values. As a result, this approach offers flexibility, robustness, and potential advantages in sequential and adaptive testing scenarios.

On the other hand, the e-value log-likelihood multiple testing procedure, as an extention of the above e-value testing procedure, is a method in statistical hypothesis testing that uses e-value derived from likelihood ratios (or log-likelihood ratios) to perform multiple hypothesis tests while controlling error rates. This spefic extention is called *e-value from Log-Likelihood ratio.* In this approach, an e-value can be constructed from the likelihood ratio statistic, which compares the likelihood of the observed data under the alternative hypothesis and under the null hypothesis. In the decision part, if the likelihood ratio has an expected value under the null hypothesis less than or equal to 1, it can qualify as an e-value. Furthermore, similar to above explanation, multiple testing with e-value when testing multiple hypotheses simultaneously, we can compute an e-value for each test based on the log-likelihood ratio. These e-values serve as the evidence measures against each null hypothesis. Lastly, to control error rates (like family-wise error rate or false discovery rate) across multiple tests, e-value can be combined or adjusted by using procedures analogous to those for p-value, but tailored for e-values.

As the advantages of using log-likelihood e-values is presented as follows. It is naturally interpretable as evidence ratios. It allows for anytime-valid inference, meaning that we can stop testing at any point without inflating error rates. Moreover, it can be more powerful and flexible than traditional p-value based methods, especially, in

sequential and adaptive testing contexts. Consequently, the e-value log-likelihood multiple testing procedure uses e-value derived from likelihood ratio as measure of evidence against null hypotheses in multiple testing scenarios. By leveraging the properties of e-value, this procedure controls error rates while allowing flexible, robust, and potentially more powerful inference compared to classical p-value based methods.

Numerical examples

We have conducted Monte Carlo simulations to examine proposed double machine learning methedology with 1000 iterations for each clustered data set. Table 1 indicates simulation and covariate dimension dim(X). The next column in the same table shows the integer K for K^2-fold cross fitting method. For this reason, we have proposed K = 2 and 3 in the simulations for the following results in Table 1, since 2^2 (≈ 5) and 3^2 (≈ 10) are close to the common numbers of folds used in cross fitting. The next column indicates the machine learning method for estimation of η where η shows nuisance parameter. Moreover, we have used the ridge methedology for double machine learning with clustered data. The other three columns of the table indicate Monte Carlo simulation statistics, involves the bias, standard deviation and root mean square error. For the purpose of the underlying effect of clustering assumptions. Furthermore, the number $K^2 = 4$ of folds of cross fitting is used for the zero- and one-way cluster robust DML, while the number $K^2 = 4$ of folds of two-way cross fitting is used for the two-way cluster robust DML. For each covariate dimension dim(X) ∈ {100,200}, for each choice K ∈ {2,3} for the number K^2 of multiway cross fitting, and for each of the three machine learning methods. According to simulation analysis when sample size increases, bias approximates to zero and standard deviation has the lowest value at optimal sample size where n=50 and p=100.

	Dim(X)	**Bias**	**Deviation**	**RMSE**	**Selected number of parameters by FDR**	**Selected number of variables by e-value**
n=50, p=50	100	0.0810	0.0800	0.0810	2	2
n=100, p=50	100	0.0970	0.0820	0.0780	3	3
n=50, p=100	100	0.0780	0.0580	0.0680	3	4
n=100, p=100	200	0.0912	0.0610	0.0510	3	4

Table 1: The bias, standard deviation and root means square error (RMSE) for double machine learning with multiway clustering with different number of observations (N) and the number of parameters (p) with ridge regression methodology under dimension of X (Dim(X)) to 100 and 200.

On the other side in Table 2 we have presented changes in bias standard deviation,RMSE under different N and p while ridge regression and lasso methedolody are implemented for double machine learning with clustered data.Hence,from compertaive analyses it is seen that the proposal strategy via DML with lasso methodology reduce standard error more than ridge models.

	Dim(X)	Bias	Deviation	RMSE	Selected number of parameters by FDR	Selected number of variables by e-value
n=50, p=50	100	0.0410	0.0400	0.0710	2	2
n=100, p=50	100	0.0570	0.0420	0.0680	2	3
n=50, p=100	100	0.0680	0.0380	0.0480	3	3
n=100, p=100	200	0.0812	0.0410	0.0410	3	4

Table 2: The bias, standard deviation and root means square error (RMSE) for double machine learning with multiway clustering with different number of observations (N) and the number of parameters (p) with lasso methodology under dimension of X (Dim(X)) to 100 and 200.

Hereby, we have applied e-value loglikelihood multiple testing procedure for double machine learning with multiway clustering. In the interpretation of Table 1, for illustration, it is seen that when the number of parameter is 50 and the number of observation is 50, e-value multiple testing procedure has selected two variables with associated e-values 1.89 and 3.78. Furthermore, when the number of parameters is 50 and the number of observations is 100, e-value multiple testing procedure has selected three variables with the following e-values: 1.66, 3.76 and 5.56. when the number of parameters is 100 and the number of observations is 50, e-value multiple testing procedure has selected three variables with the following e-values: 1.89, 2.79 and 4.34. Moreover, while the number of observations is 100 and the number of parameters is 100, e-value multiple testing procedure has selected four variables with the e-values 1.89, 2.56, 3.78 and 4.67.

CONCLUSION

In this work, we have suggested double machine learning procedure based on clustered data. Originally, this task can be computationally difficult. As an alternatibe solution of this problem, we have used double machine learning procedure with multiway clustering in the presence of multiway cluster sampled data, which is commonly used with real data sets. According to our small simulation analysis, we have seen that the proposed procedure has promising results to reduce standard error for finite sample performance under various multiway cluster sampling particularly for lasso methedology. Therefore, we have proposed e-value loglihood multiple testing procedure as alternative model selection procedure for double machine learning with clustered data while we have different number of obervations and number of parameters. The results have shown reduced standard error and reduced root mean square error, resulting in promising solution for the underlying challenge.

Özet

Romatoid artrit (RA) patogenezinde kilit rol üstlenen *STAT4* geni, bağışıklık hücrelerinin aktivasyonu ve diferansiyasyonunda görev yapan temel bir transkripsiyon faktörüdür. Bu çalışma, *STAT4* geninde missense varyantların olası yapısal ve fonksiyonel sonuçlarını hesaplamalı biyoinformatik yöntemlerle değerlendirmeyi amaçlamıştır. *NCBI dbSNP* veritabanından elde edilen varyantlar, *SIFT, PolyPhen-2, I-Mutant, Project HOPE* ve *ConSurf* yazılımlarıyla analiz edilmiştir. Analizlerde altı missense varyantın (Ile115Val, Glu128Val, Thr446Ile, Ile244Met, Gln282His ve Ile80Met) zararlı etki potansiyeli taşıdığı öngörülmüştür. Evrimsel korunum analizine göre özellikle Ile115Val ve Thr446Ile değişimlerinin yüksek derecede korunmuş bölgelerde yer aldığı ve bu değişimlerin STAT4 proteininin stabilitesini olumsuz yönde etkileyebilecek yapısal değişikliklere neden olabileceği tahmin edilmiştir. Aynı zamanda GeneMANIA analizi, *STAT4*'ün *STAT1, STAT3, IL12RB2* ve *IFNGR1* genleriyle güçlü etkileşimler sergilediğini ve bu genlerin *JAK-STAT* sinyal yoluna bağlı biyolojik süreçlerde birlikte görev aldığını ortaya koymuştur. Elde edilen bulgular, *STAT4* varyantlarının protein fonksiyonu ve bağışıklık yanıtı üzerinde etkili olabileceğini göstermekte olup, gelecekteki deneysel araştırmalar için önemli ön bilgiler sunmaktadır.

Anahtar Kelimeler *STAT4*, Romatoid artrit, Tek nükleotid polimorfizmi, Biyoinformatik analiz

Bioinformatic analysis of the potential effects of missense variants in the *STAT4* gene on rheumatoid arthritis

Abstract

The *STAT4* gene, which plays a key role in the pathogenesis of rheumatoid arthritis (RA), is a key transcription factor involved in the activation and differentiation of immune cells. This study aimed to evaluate the potential structural and functional consequences of missense variants in *STAT4* using computational bioinformatics methods. Variants obtained from the *NCBI dbSNP* database were analyzed using *SIFT, PolyPhen-2, I-Mutant, Project HOPE,* and *ConSurf* software. Six missense variants (Ile115Val, Glu128Val, Thr446Ile, Ile244Met, Gln282His, and Ile80Met) were predicted to have deleterious effects. Evolutionary conservation analysis revealed that the Ile115Val and Thr446Ile substitutions, in particular, are located in highly conserved regions and are predicted to cause structural changes that could negatively affect the stability of the STAT4 protein. GeneMANIA analysis also revealed that *STAT4* exhibits strong interactions with *STAT1, STAT3, IL12RB2*, and *IFNGR1* genes, and that these genes are involved in biological processes related to the *JAK-STAT* signaling pathway. These findings suggest that *STAT4* variants may impact protein function and immune responses, providing important preliminary information for future experimental studies.

Keywords *STAT4*, Rheumatoid arthritis, Single nucleotide polymorphism, Bioinformatic analysis

GİRİŞ

Romatoid artrit (RA), ilerleyici sinovit ile karakterize olan otoimmün kökenli, kronik inflamatuvar bir eklem hastalığıdır. Bu süreç zamanla geri dönüşü olmayan kıkırdak ve kemik erozyonuna yol açarak eklem deformiteleri

ve fonksiyonel kayıplarla sonuçlanır (Jahid ve ark., 2023). Hastalığın gelişiminde genetik yatkınlık (özellikle *HLA-DRB1*) ve çevresel faktörlerin etkileşimi belirleyicidir. Genom çapında ilişkilendirme çalışmaları, RA patogenezinde *JAK/STAT*, NF-κB ve *MAPK* yollarının kritik rollerini ortaya koymuştur (Okada ve ark., 2014; Smolen ve ark., 2018).

RA patogenezinin temel özelliği, sinovyal hücreler tarafından TNF, IL-1 ve IL-6 gibi proinflamatuvar sitokinlerin aşırı üretimidir. Birçok çalışma, bu sitokinlerin *JAK-STAT* sinyal yolunu aktive ederek hastalığın sürekliliğini ve kronik inflamasyonu sürdürdüğünü göstermiştir (Xue ve ark., 2023). Bu sinyal yolunun önemli üyelerinden biri olan Signal Transducer and Activator of Transcription 4 (*STAT4),* özellikle *IL-12-STAT4* ekseni üzerinden bağışıklık yanıtının düzenlenmesinde kritik rol oynar. STAT4 aktivasyonu, Th1 ve Th17 hücre polarizasyonu, IFN-γ üretimi ve immün yanıtın amplifikasyonu süreçlerini destekler. Bu nedenle STAT4, RA patogenezinde inflamatuvar sitokin dengesizliğinin ve otoimmün yanıtın moleküler merkezinde yer almaktadır (Xia ve ark., 2024).

RA'da *STAT4* gen varyantlarının, özellikle IL-12 aracılı *JAK/STAT* sinyallemesinde rol oynayan mekanizmalar üzerindeki etkilerinin daha iyi anlaşılması, hastalığın genetik temellerinin aydınlatılmasına katkı sağlayabilir. Bu bağlamda, bu çalışmada *STAT4* genindeki amino asit değişimine yol açan tek nükleotid polimorfizm (SNP)'lerin, proteinin yapısal stabilitesi ve fonksiyonel bütünlüğü üzerindeki potansiyel etkilerinin biyoinformatik analizlerle değerlendirilmesi ve elde edilen bulguların romatoid artrit patogeneziyle olası ilişkilerinin incelenmesi amaçlanmıştır.

MATERYAL VE METOT

Bu çalışmada *STAT4* genine ait SNP, *NCBI dbSNP* (National Center for Biotechnology Information Single Nucleotide Polymorphism Database) veritabanından elde edilmiştir. Her bir varyanta ait amino asit değişimi, genetik konum ve mutasyon tipi kaydedilmiştir. İn silico analizlerin yürütülmesi için insan STAT4 proteininin FASTA formatındaki amino asit dizisi ve UniProtKB erişim numarası, ilgili UniProt veritabanından temin edilmiştir.

SNP'lerin proteinin yapısı ve işlevi üzerindeki olası etkilerini değerlendirmek için, açık erişimli biyoinformatik analiz platformları kullanılmıştır. *SIFT* ve *PolyPhen-2* programları, amino asit değişimlerinin proteinin fonksiyonel bütünlüğü üzerindeki olası etkilerini tahmin etmek için kullanılmıştır (Ng ve ark., 2003; Adzhubei ve ark., 2013). *I-Mutant* yazılımı, mutasyonların protein stabilitesi üzerindeki artırıcı veya azaltıcı etkilerini değerlendirmek üzere uygulanmıştır. Ayrıca, elde edilen varyantların üç boyutlu yapısal etkilerinin yorumlanması için *Project HOPE* aracı kullanılmış (Venselaar ve ark., 2010) ve mutasyon bölgelerinin evrimsel korunma düzeyleri *ConSurf web* sunucusu aracılığıyla analiz edilmiştir (Ashkenazy ve ark., 2016). Bunun yanı sıra, *STAT4* geninin diğer genlerle olan etkileşim ağlarını belirlemek amacıyla *GeneMANIA* yazılım aracı kullanılmıştır (Warde-Farley ve ark., 2010).

BULGULAR VE TARTIŞMA

STAT4 proteininin (UniProtKB: Q14765) kodlandığı *STAT4* geni (Gene ID: 6775) üzerinde yapılan veri tabanı taramalarında, toplam 82.160 varyant bulunduğu belirlenmiştir. Bu varyantların 742 tanesi amino asit değişimine neden olan missense tiptedir.

Bu varyantların protein yapısı ve fonksiyonu üzerindeki olası etkilerini değerlendirmek amacıyla *SIFT, PolyPhen-2, I-Mutant, Project HOPE* ve *ConSurf* yazılım araçları kullanılmıştır. Analizler sonucunda, tüm araçlar tarafından zararlı olarak tahmin edilen altı missense SNP belirlenmiştir: rs3024839 (Ile115Val), rs140675301 (Glu128Val), rs141331848 (Thr446Ile), rs557179689 (Ile244Met), rs755772067 (Gln282His) ve rs957846209 (Ile80Met) (Tablo 1).

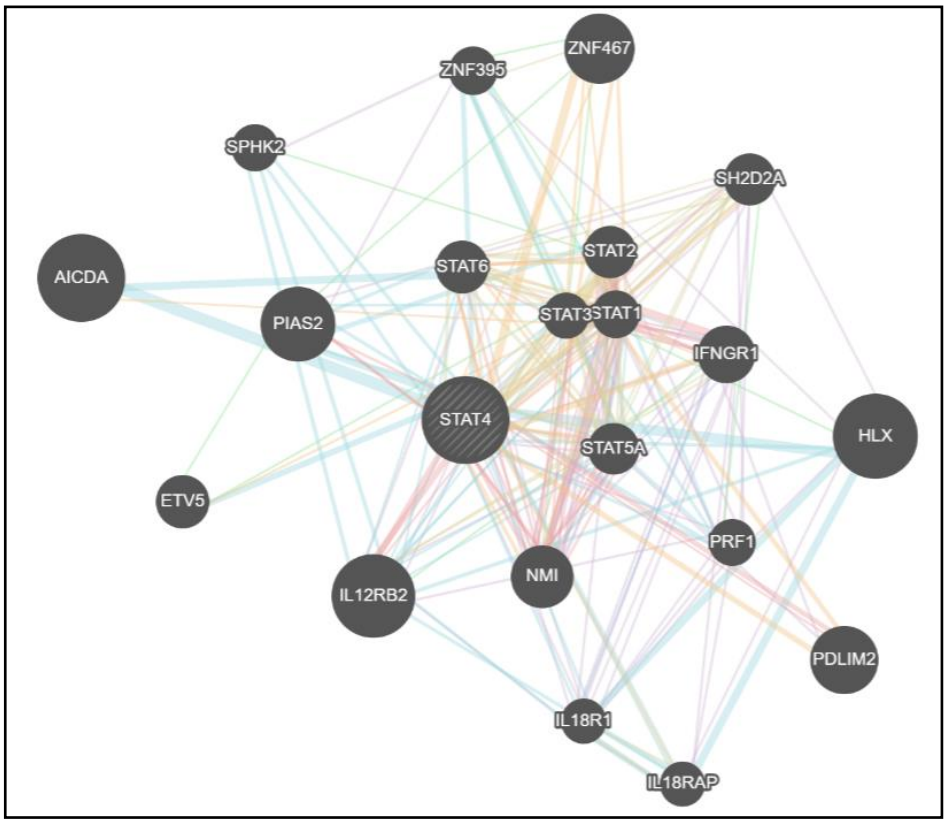
Tablo 1. *STAT4* genindeki missense varyantların olası zararlı etkilerinin biyoinformatik analiz sonuçları

SNP ID	Amino Asit Değişimi	SIFT	PolyPhen-2	I-Mutant	RI
rs3024839	Ile115Val	Deleterious	Possibly damaging	Decrease	8
rs140675301	Glu128Val	Deleterious	Possibly damaging	Decrease	4
rs141331848	Thr446Ile	Deleterious	Probably damaging	Decrease	9
rs557179689	Ile244Met	Deleterious	Probably damaging	Decrease	5
rs755772067	Gln282His	Deleterious	Possibly damaging	Decrease	8
rs957846209	Ile80Met	Deleterious	Possibly damaging	Decrease	6

HOPE analizi sonucunda incelenen altı missense varyantın proteininin lokal konformasyonu, hidrofobik etkileşimleri ve domain yapısı üzerinde farklı düzeylerde değişimlere yol açtığı belirlenmiştir. Değişimlerin büyük kısmı, amino asit yan zincir hacmi ve polarite farklılıklarına bağlı olarak lokal stabilite azalması, hidrojen bağı bozulması veya dimerizasyon yüzeyinde yapısal uyumsuzluk ile ilişkilendirilmiştir (Tablo 2).

Tablo 2. *Project HOPE* analiziyle amino asit değişimlerinin değerlendirilmesi

SNP	Amino Asit Değişimi	Domain	Analiz Sonucu
rs3024839	Ile115Val	coiled-coil	Mutant kalıntı, orijinal kalıntıdan daha küçük olup proteinin hidrofobik çekirdeğinde boşluk oluşumuna neden olabilir. Bu kalıntı, protein aktivitesi açısından önemli bir domain içerisinde yer almaktadır.
rs140675301	Glu128Val	N-terminal coiled-coil	Glutamatın valin ile yer değiştirmesi negatif yük kaybına ve hidrofobikliğin artmasına yol açmaktadır. Bu değişim, çevredeki elektrostatik etkileşimleri etkileyebilir. Kalıntı, fonksiyonel öneme sahip bir domain içerisinde bulunmaktadır.
rs141331848	Thr446Ile	SH2 geçiş bölgesi	Treoninin izolösin ile yer değiştirmesi sonucu polar grubun kaybı meydana gelmiştir. Mutant kalıntı daha büyük ve hidrofobik olup, yakın temaslardaki etkileşimleri bozma potansiyeli taşımaktadır.
rs557179689	Ile244Met	DNA bağlanma domaini	İzolösin yerine daha büyük metiyonin kalıntısının geçmesi, yerel paketlenme yoğunluğunu etkileyebilir. Bu kalıntı, protein fonksiyonu açısından kritik bir bölge içerisinde yer almaktadır.
rs755772067	Gln282His	Linker domaini	Nötr bir kalıntı olan glutaminin, zayıf bazik özellikteki histidin ile değişimi yük dağılımında değişikliğe neden olmaktadır. İlgili kalıntı, diğer domainlerle temas hâlinde bulunan bir bölgededir.
rs957846209	Ile80Met	N-terminal	Metiyonin kalıntısı izolösinden daha büyük olup, yan zincir hacmindeki artış lokal esnekliği etkileyebilir. Bu kalıntı, aktiviteyle ilişkili bir domain içerisinde yer almaktadır.



ConSurf analizine göre STAT4 proteininin Ile115Val ve Thr446Ile varyantları yüksek derecede korunum gösteren bölgelerde yer almaktadır. Bu bölgelerde meydana gelen amino asit değişimleri, proteinin yapısal ve fonksiyonel bütünlüğü açısından kritik öneme sahiptir. Ile115Val mutasyonu, coiled-coil domaininde yer alan hidrofobik çekirdek yapısında izolösinin daha küçük hacimli valinle yer değiştirmesi sonucu lokal hidrofobik etkileşimlerin zayıflamasına ve protein stabilitesinde azalmaya yol açabilir. Thr446Ile değişimi ise SH2 domainine yakın bölgede

gerçekleşmekte olup, treoninin hidroksil grubunun kaybı hidrojen bağı ağını zayıflatabilir ve bölgesel konformasyonel uyumsuzluklara neden olabilir. Bu nedenle her iki varyantın da STAT4 proteininin stabilitesi ve sinyal iletim etkinliği üzerinde olumsuz etkiler oluşturma potansiyeline sahip olduğu düşünülmektedir.

Şekil 1. STAT4 proteininin amino asit düzeyinde evrimsel korunum haritası

GeneMANIA yazılım aracı kullanılarak *STAT4* geninin fonksiyonel etkileşim ağı oluşturulmuştur. Analiz sonucunda *STAT4* geninin 20 farklı genle etkileşim içinde olduğu ve ağda toplam 21 gen ile 278 bağlantı bulunduğu belirlenmiştir. Bu ilişkilerin büyük çoğunluğunu fiziksel etkileşimler ve ko-ekspresyon temelli bağlantılar oluşturmaktadır. Ağın merkezinde *STAT4* yer almakta olup, *STAT1, STAT3, STAT5A, IL12RB2, IFNGR1, SH2D2A, PIAS2, HLX, IL18R1, IL18RAP, STAT2, STAT6, NMI, PRF1, AICDA, PDLIM2, ETV5, SPHK2, ZNF395* ve *ZNF467* genleriyle güçlü bağlantılar göstermektedir. Bu etkileşimler, *STAT4*'ün bağışıklık yanıtı ve sitokin aracılı sinyal süreçlerinde düzenleyici rol üstlenebileceğini düşündürmektedir.

Şekil 2. *GeneMANIA* tarafından oluşturulan *STAT4* gen-gen etkileşim ağı

SONUÇ

Bu çalışma, *STAT4* geninde amino asit değişimine yol açan varyantların proteinin yapısal stabilitesi ve fonksiyonel bütünlüğü üzerindeki potansiyel etkilerini hesaplamalı biyoinformatik yaklaşımlar kullanarak değerlendirmiştir. Yapılan analizler sonucunda, altı missense varyantın (rs3024839, rs140675301, rs141331848, rs557179689, rs755772067 ve rs957846209) STAT4 proteininin lokal konformasyonu, hidrofobik etkileşimleri ve domain organizasyonunu farklı düzeylerde etkileyebileceği öngörülmüştür. Özellikle yüksek korunum gösteren bölgelerde bulunan Ile115Val ve Thr446Ile değişimlerinin, protein stabilitesinde azalmaya ve sinyal iletim etkinliğinde zayıflamaya neden olabileceği tahmin edilmiştir.

GeneMANIA analizi, *STAT4*'ün *STAT1, STAT3, STAT5A, IL12RB2* ve *IFNGR1* genleriyle güçlü etkileşimler sergilediğini göstermiştir. Bu etkileşimler, *IL-12/IL-23/IFN-γ* aracılı *JAK-STAT* sinyal ağında *STAT4*'ün merkezi bir düzenleyici rol oynadığını desteklemektedir.

Elde edilen bulgular, *STAT4* genindeki yapısal varyasyonların bağışıklık yanıtının düzenlenmesi ve romatoid artrit patogenezinde rol oynayabilecek moleküler mekanizmalar hakkında ön bilgi sağlamaktadır. Bu sonuçlar, gelecekte yapılacak deneysel ve klinik doğrulama çalışmalarına yön verebilecek niteliktedir.

Özet

Aspergillus flavus, gıda ve yemlerde aflatoksin kontaminasyonuna yol açan başlıca mikotoksijenik türlerden biridir. Geniş ekolojik adaptasyon kapasitesi ve yüksek toksijenik potansiyeli nedeniyle tropikal ve subtropikal bölgelerde halk sağlığı ve ekonomi açısından önemli bir risk oluşturmaktadır. Bu çalışmada, çeşitli gıda ürünlerinden izole edilen *A. flavus* suşlarının morfolojik ve moleküler karakterizasyonu ile aflatoksin üretim potansiyelleri değerlendirilmiştir. Toplam 100 gıda örneği beş farklı seçici besiyerinde [Potato Dextrose Agar (PDA), Chloramphenicol Glucose Agar (CGA), Dichloran Rose Bengal Chloramphenicol Agar (DRBC), Dichloran Glycerol Agar (DG18) ve Symphony Agar] kültüre edilmiştir. Bu besiyerlerinin birlikte kullanımı, türün morfolojik varyasyonlarını, sporulasyon yoğunluğu ve pigmentasyon gibi karakteristik özelliklerini gözlemleyerek izolasyon başarısını artırmayı hedeflemiştir. Çalışılan gıda örneklerinden (tahin helvası, kuru hurma, nohut unu ve mısır) izole edilen şüpheli beş *A. flavus* izolatının tür tayini ve filogenetik analizi için ITS ve β-tubulin gen bölgeleri amplifiye edilmiştir. Şüpheli *A. flavus* izolatlarının tür doğrulaması, ITS bölgesinin PCR ile çoğaltılmasının ardından *HhaI* restriksiyon enzimi kullanılarak gerçekleştirilen RFLP analiziyle desteklenmiştir. *A. flavus* izolatlarının ITS ve β-tubulin gen dizileri sekanslanmış, elde edilen diziler BLAST analiziyle GenBank veri tabanındaki referans *A. flavus* suşlarıyla karşılaştırılmış ve %99-100 oranında nükleotid benzerliği göstermiştir. Filogenetik ilişkiler, MEGA 12 yazılımı kullanılarak Maximum Likelihood yöntemi (1000 bootstrap) ile değerlendirilmiştir. Toksijenik potansiyelin belirlenmesi amacıyla *aflR*, *aflQ*, *aflO*, *aflP* ve *aflD* aflatoksin biyosentez genlerinin varlığı multiplex-PCR ile analiz edilmiştir. Tahin helvasından izole edilen *A. flavus*'ta düzenleyici gen olan *aflR* geni, kuru hurma ve nohut unundan izole edilen izolatlarda ise geç yol geni olan *aflQ* geni saptanmamıştır. Mısırdan izole edilen *A. flavus* izolatı ise tüm genler bakımından pozitif bulunmuş ve ELISA analizinde yalnızca bu izolatın aflatoksin B_1 (62,05 ppb) ürettiği tespit edilmiştir. Bulgular, farklı gıdalardan elde edilen *A. flavus* izolatlarının genetik ve toksijenik çeşitlilik gösterdiğini ve bölgesel gıda zincirlerinde aflatoksin riski açısından heterojen bir dağılım sergilediğini ortaya koymaktadır.

Anahtar Kelimeler: *Aspergillus flavus*, aflatoksin, PCR, ELISA, gıda güvenliği

Genetic and Toxigenic Profiling of *A. flavus* Isolates Obtained from Different Food Sources

Abstract

Aspergillus flavus is one of the major mycotoxigenic species responsible for aflatoxin contamination in food and feed. Due to its wide ecological adaptability and high toxigenic potential, it poses a significant risk to public health and the economy, particularly in tropical and subtropical regions. In this study, the morphological and molecular characterization of *A. flavus* strains isolated from various food products, as well as their aflatoxin production potentials, were evaluated. A total of 100 food samples were cultured on five different selective media [Potato Dextrose Agar (PDA), Chloramphenicol Glucose Agar (CGA), Dichloran Rose Bengal Chloramphenicol Agar (DRBC), Dichloran Glycerol Agar (DG18), and Symphony Agar]. The use of multiple culture media aimed to enhance isolation efficiency by observing morphological variations, sporulation density, and pigmentation

characteristics of the species. From the analyzed samples (tahin halva, dried date, chickpea flour, and maize), five presumptive *A. flavus* isolates were obtained. For species identification and phylogenetic analysis, the ITS and β-tubulin gene regions were amplified. The identification of *A. flavus* isolates was further confirmed by RFLP analysis, performed on the ITS region amplified by PCR using the *HhaI* restriction enzyme. The ITS and β-tubulin gene sequences of the isolates were sequenced, and BLAST analysis revealed 99-100% nucleotide similarity with reference *A. flavus* strains in the GenBank database. Phylogenetic relationships were evaluated using the Maximum Likelihood method (1000 bootstrap) implemented in the MEGA 12 software. To determine the toxigenic potential, the presence of the *aflR*, *aflQ*, *aflO*, *aflP*, and *aflD* genes involved in aflatoxin biosynthesis was analyzed by multiplex PCR. The regulatory gene *aflR* was not detected in the isolate obtained from tahin halva, while the late-pathway gene *aflQ* was absent in isolates from dried date and chickpea flour. The maize-derived isolate was positive for all targeted genes and was the only one found to produce aflatoxin B_1 (62,05 ppb) according to ELISA results. The findings indicate that *A. flavus* isolates obtained from different food sources exhibit genetic and toxigenic diversity, highlighting a heterogeneous distribution of aflatoxin risk across regional food chains.

Keywords: *Aspergillus flavus*, aflatoxin, PCR, ELISA, food safety

GİRİŞ

Funguslar doğada yaygın olarak bulunmakla birlikte, gıda üretim zincirinde kontaminant hâline geldiklerinde ciddi kalite ve güvenlik sorunlarına yol açmaktadır. Uygun koşullarda hızla çoğalarak gıdanın duyusal ve besinsel özelliklerini bozmakta ve mikotoksin oluşumuna neden olabilmektedirler (Maggon vd., 1977; Var ve Kabak, 2004). *Aspergillus* section *Flavi* üyelerinin (*A. flavus*, *A. parasiticus*, *A. nomius*, *A. niger*) trofofazdan idiyofaza geçişte üretilen ikincil metabolitler olup yüksek sıcaklık ve düşük su aktivitesine karşı dirençleri nedeniyle gıda güvenliği açısından büyük risk taşımaktadır (Bordin vd., 2014; Kale ve Bennet, 1992). Bu grup içerisinde yer alan aflatoksinler, *A. flavus*, *A. parasiticus* ve *A. nomius* gibi türler tarafından üretilen poliketid türevi toksinlerdir ve hepatokarsinojenik etkileri nedeniyle en tehlikeli mikotoksin gruplarından biri kabul edilmektedir (Benkerroum, 2019). Bu toksinlerin en bilinen analogları AFB_1, AFB_2, AFG_1 ve AFG_2'dir; bunlar arasında AFB_1, Uluslararası Kanser Araştırmaları Ajansı (IARC) tarafından Grup 1 karsinojen olarak sınıflandırılmıştır (IARC, 1993). Aflatoksin oluşumu, özellikle mısır, yer fıstığı, antepfıstığı, ayçiçeği, badem gibi yüksek yağ içeren ürünlerde daha sık gözlenmektedir (Bordin vd., 2014).

Aflatoksin üretimi, substrat bileşimi, sıcaklık, pH ve su aktivitesi gibi çevresel faktörlerden önemli ölçüde etkilenmektedir. *A. flavus*'un optimum gelişme sıcaklığının 28-30 °C, toksin üretim aralığının ise 24-35 °C arasında olduğu; ayrıca minimum su aktivitesi gereksiniminin 0.71-0.74, optimumun ise 0.98 a_w olduğu bildirilmektedir (Milani, 2013; Sanchis ve Magan, 2004). Türkiye'nin Akdeniz Bölgesi sıcak ve nemli iklimi, *Aspergillus* türlerinin gelişimi ve aflatoksin üretimi için elverişlidir. Adana ve çevresinde mısır, buğday ve yer fıstığı yoğun yetiştirilmektedir ve tahin helvası gibi yağlı tohum ürünlerinde *A. flavus* ve AFB_1 kontaminasyonu rapor edilmiştir (Var vd., 2007; Var vd., 2020).

Küf-maya sayımı ve izolasyonu, bakteriyel analizlere kıyasla daha uzun inkübasyon süreleri gerektirdiğinden gıda endüstrisinde hızlı ve güvenilir yöntemlere ihtiyaç duyulmaktadır (Taniwaki vd., 2001). *Aspergillus* türleri morfolojik özellikleriyle tanımlanabilse de (Klich, 2002), birçok türün fenotipik olarak birbirine son derece benzer olması tanımlamayı güçleştirmekte ve bu nedenle farklı besiyerlerinde izolasyon ve alt-kültürleme yapılması önerilmektedir. Literatürde *Aspergillus* ve diğer gıda kaynaklı küflerin ayrıntılı morfolojik tanımlamasında Czapek Yeast Extract Agar (CYA), Malt Extract Agar (MEA), Yeast Extract Sucrose (YES) Agar, Oatmeal Agar (OA), Potato Dextrose Agar (PDA) ve Dichloran Glycerol Agar (DG18) gibi birden fazla besiyerinin eş zamanlı kullanılmasının önerildiği birçok çalışma bulunmaktadır (Samson vd., 2005; Pitt ve Hocking, 2009; Samson vd., 2014). Farklı besiyerlerinin kullanılmasının bilimsel temeli, ortamların karbon/nitrojen oranı, su aktivitesi, ozmotik basınç, mineral bileşimi ve inhibitör maddeler açısından farklılık göstermesidir. Bu değişkenler, koloni rengi, doku yapısı, konidiasyon paterni, pigment oluşumu ve büyüme hızı gibi ayırt edici fenomenlerin her ortamda farklı şekillerde ortaya çıkmasına neden olmaktadır (Frisvad vd., 2007). Bu çok boyutlu yaklaşım, gıda matrislerinden izole edilen küflerin doğru şekilde tanımlanmasını sağlamakta; aynı zamanda potansiyel mikotoksijenik risklerin daha güvenilir biçimde değerlendirilmesine katkıda bulunmaktadır. Ayrıca uluslararası bir mikrobiyolojik standart olan ISO 21527-1:2008 ve ISO 21527-2:2008, gıdalarda küf-maya izolasyonunda ürünün su aktivitesine bağlı

olarak farklı besiyerlerinin kullanılmasını metodolojik bir gereklilik olarak tanımlamakta; bu yönüyle çoklu besiyeri yaklaşımının uygulamada da desteklendiğini göstermektedir (Anonim, 2008a; Anonim, 2008b).

Aspergillus'ların tür düzeyinde doğru tanımlamaları için moleküler DNA analizleri yaygın olarak kullanılmaktadır (Godet ve Munaut, 2010). Bu analizlerde; *Aspergillus* türlerinin Polimoreraz Zincir Reaksiyonu (PCR) ve Restriksiyon Parça Uzunluğu Polimorfizmi (RFLP) tabanlı tanımlamaları genellikle ITS, β-tubulin, 18S rDNA veya mitokondriyal DNA gibi bölgeler üzerine kuruludur (Rodrigues vd., 2007). Aflatoksin biyosentezi, *A. flavus* genomunda yaklaşık 75 kb'lik bir gen kümesi tarafından kodlanmaktadır ve bu kümede erken, orta ve geç yol genleri (örneğin *aflD*, *aflM*, *aflP*, *aflR*, *aflS*) yer almaktadır (Yu vd., 2004; Zeng vd., 2020). Aflatoksin biyosentez genlerini hedefleyen PCR yaklaşımları, özellikle toksijenik ve atoksijenik suşların ayrımında etkin bir strateji sunmaktadır (Somashekar vd., 2004; González-Salgado vd., 2008).

Bu çalışmada, Adana ve çevresinden temin edilen çeşitli gıda örnekleri küf izolasyonu için kullanılması önerilen beş farklı besiyeri (Potato Dextrose Agar, Sypmhony Agar, Dichloran Rose Bengal Chloramphenicol Glucose Agar, Dichloran Glycerol %18 Agar ve Chloramphenicol Glucose Agar) kullanılarak izolasyon performansları, izolat sayısı ve izolasyon süresi bakımından değerlendirilmiştir. Ardından PDA besiyerine ekilen gıdalardan izole edilen *Aspergillus flavus* üyelerinin morfolojik ve moleküler tanımlamaları yapılmış; ayrıca aflatoksin biyosentez genlerinin varlığı ve AFB_1 üretimi incelenmiştir. Böylece, bölgesel gıda ürünlerinde *A. flavus* kaynaklı aflatoksin kontaminasyon potansiyeli ortaya konulmuş ve aflatoksijenik-apatojenik izolat ayrımında genetik ve immünokimyasal düzeyde bir değerlendirme yapılmıştır.

MATERYAL VE YÖNTEM

MATERYAL

Bu çalışmada, Adana ve çevresinden rastgele örnekleme yöntemiyle temin edilen çeşitli gıda ürünleri (mısır, nohut unu, tahin helvası, kuru hurma, buğday unu, arpa, yulaf, çavdar, irmik, pirinç ve mısır gevreği) materyal olarak kullanılmıştır. Bu ürünlerden *Aspergillus flavus* izolatlarının elde edilmesi, moleküler karakterizasyonlarının yapılması ve izolatların aflatoksin üretim potansiyellerinin değerlendirilmesi amaçlanmıştır.

YÖNTEM

Gıdalardan Küf İzolasyonu

Küf izolasyonu için ISO 21527-1:2008 standardı temel alınmış ve özellikle düşük su aktivitesine sahip gıdalarda kullanılmaya uygun yöntemler tercih edilmiştir. Analize alınan her örnekten 10 g alınarak 90 ml steril peptonlu fizyolojik tuz çözeltisi (%0,1 pepton + %0,85 NaCl) ile karıştırılmış ve stomacher cihazında 2 dakika boyunca homojenize edilmiştir. Hazırlanan süspansiyondan uygun seri dilüsyonlar yapılarak, her dilüsyondan 0,1 ml örnek aşağıdaki beş farklı besiyerine (Dichloran Rose Bengal Chloramphenicol Agar (DRBC), Dichloran Glycerol 18% Agar (DG18), Potato Dextrose Agar (PDA), Chloramphenicol Glucose Agar (CGA), Symphony Agar (SA) yayma yöntemiyle ekilmiştir. Besiyerleri 25 ± 1 °C'de 5-7 gün inkübe edilmiştir. İnkübasyon süresi sonunda oluşan koloniler, koloni ve hücre morfolojisine göre tanımlanmıştır (Anonim, 2008a; Anonim, 2008b).

Küf İzolatlarının Morfolojik Olarak Tanımlanması

Küf izolasyonu yapılan örneklerden elde edilen izolatların tanımlanmasında kültürel ve morfolojik özellikler dikkate alınmıştır. Bu amaçla izolatlar Czapek Agar ve Malt Ekstrakt Agar (MEA) besiyerlerinde geliştirilmiş, koloni rengi, yapısı ve çapı, kolonin ters yüzeyindeki renk, konidiyal başlığın şekli, çapı ve rengi, konidyofor yapısı ile sterigmanın uniseriate veya biseriate dizilişi ve sklerot varlığı değerlendirilmiştir. İzolatlar, steril petrilere dökülen 15-20 ml Czapek Agar üzerinde tek spor izolasyonu şeklinde ekilmiş ve 25 °C'de 10-12 gün süreyle inkübe edilmiştir. Koloni büyüme hızı, 4. günden başlayarak 12. güne kadar ölçülmüştür. Miselyumun rengi ve yapısı ile kolonin ters yüzeyinde oluşan renk kaydedilmiş; konidiyal başlık, konidyofor ve sterigmanın morfolojisi mikroskobik inceleme ile değerlendirilmiştir. Ayrıca, sklerot varlığı veya yokluğu not edilmiştir. Tür tanımlamalarında Raper ve Fennell (1977), Samson ve Pitt (1990), Ruiqian vd. (2004), Rodrigues vd. (2007) ile Varga vd. (2011) tarafından önerilen tanı anahtarları esas alınmıştır.

Aspergillus İzolatlarının Moleküler Olarak Tanımlanması

Şüpheli beş *A. flavus* suşunun moleküler tanımlaması için ilk olarak, Fungi/Yeast Genomic DNA Isolation Kit (Norgen Biotek Corp.) kullanılarak DNA izolasyonu gerçekleştirilmiştir. Öncelikle, tek spor izolasyonu yapılarak her izolat PDA (Potato Dextrose Agar) besiyerine ekilmiş ve 25 °C'de 7 gün inkübe edilmiştir. Küf kolonisinden elde edilen miselyum ve sporlar steril şartlarda 1,5 mL eppendorf tüplerine aktarılmıştır. Pellet, kitin sağladığı liziz buffer ile çözündürülmüş ve boncuklar içeren filtre tüplerine aktarılmıştır. Örnekler maksimum hızda vortekslenip 65 °C'de ısıtıcı blokta inkübe edilerek hücre duvarının parçalanması sağlanmıştır. Boncuklar kısa bir spin ile dibe çöktürülmüş ve üstteki süpernatant yeni bir mikrosantrifüj tüpüne aktarılmıştır. Üst faza eş hacimde %96-100 etanol eklenip vortekslenmiş, ardından kitin bağlanma ve yıkama solüsyonlarıyla (wash solution A ve solution BX) işlem tekrarlanmıştır. Son aşamada DNA, elution buffer B kullanılarak filtre tüplerinden elüsyonla elde edilmiş ve -20 °C'de saklanmıştır. İzole edilen DNA, konsantrasyon ve saflık açısından NanoDrop spektrofotometre ile doğrulanmıştır.

PCR ile Şüpheli A. flavus Suşlarının Hedef Gen Bölgelerinin Çoğaltılması

Tür tanımlaması amacıyla ITS ve β-tubulin gen bölgeleri PCR ile çoğaltılmıştır. ITS bölgesi için ITS1/ITS4 (600 bp) (White vd., 1990), β-tubulin bölgesi için Tub-F/R (340 bp) (El Khoury vd., 2011) primerleri kullanılmıştır. Ayrıca aflatoksijenik özelliklerin değerlendirilmesi amacıyla *aflR* (999 bp), *aflQ* (1088 bp), *aflO* (1333 bp), *aflP* (1490 bp) ve *aflD* (990 bp) aflatoksin biyosentez genleri (Scherm vd., 2005) multiplex-PCR yöntemiyle incelenmiştir. Her PCR reaksiyonu 25 µL hacimde hazırlanmış, 1 µL genomik DNA, 12,5 µL Master Mix, 1 µL forward ve 1 µL reverse primer ile 9,5 µL ddH_2O içermiştir. PCR cihazında literatüre göre belirlenen döngü programları uygulanmış ve ürünler %1,5 agaroz jel elektroforezi ile doğrulanmıştır. Agaroz jel hazırlanırken 1,5 g agar 100 mL TBE tamponunda çözülmüş, 60 °C'ye soğutulduktan sonra 5 µL DNA boyası eklenmiştir. PCR ürünleri jele yüklenmiş ve 90 voltta 60 dakika elektroforez uygulanmıştır.

Şüpheli A. flavus Suşlarının RFLP Yöntemiyle Tanımlanması

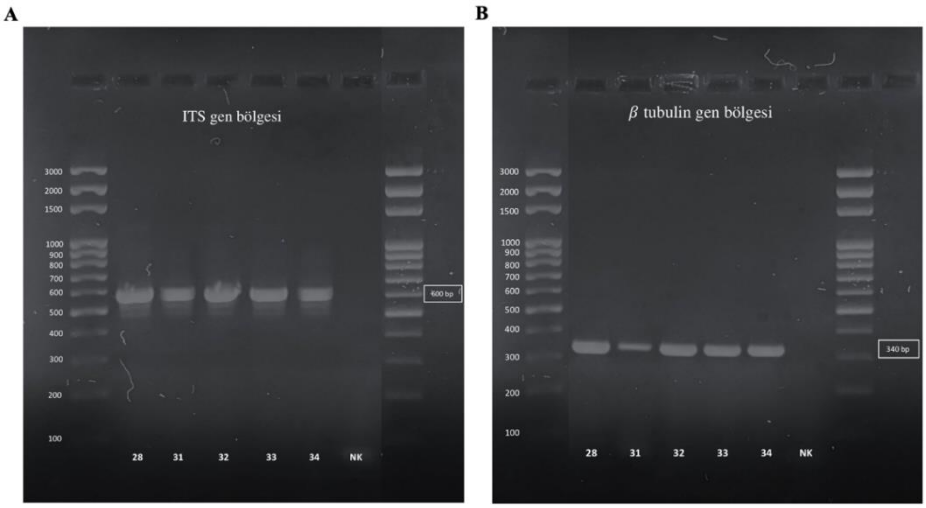
Tür doğrulamasını desteklemek amacıyla ITS PCR ürünleri *HhaI* restriksiyon enzimi ile kesilmiştir (Krulj vd., 2020). Kesim reaksiyonu, 10 µL PCR ürünü, 2 µL 10x Fast Digest tampon, 2 µL Fast Digest enzimi ve 16 µL nuclease-free su ile hazırlanmış ve 37 °C'de 10 dakika inkübe edilmiştir. Oluşan restriksiyon fragmanları %2 agaroz jel elektroforezi ile görselleştirilmiştir.

Şüpheli A. flavus Hedef Gen Bölgelerinin Doğrulanması ve Filogenetik Çalışmalar

ITS ve β-tubulin PCR ürünleri Sanger sekanslama yöntemi ile özel bir firma tarafından dizilenmiştir. Her örnek için ileri ve geri yönlü diziler elde edilmiş, düşük kaliteli uç bölgeler manuel olarak çıkarılmış ve konsensüs diziler oluşturulmuştur. Konsensüs diziler CLUSTAL X (Chenna vd., 2003) programı ile çoklu hizalamaya tabi tutulmuş ve GenBank referans dizileriyle BLAST algoritması aracılığıyla karşılaştırılmıştır. Tür tanımlaması, %100 nükleotid benzerliğine sahip referans dizilere dayanarak yapılmıştır. *A. flavus* olarak tanımlanan izolatların β-tubulin ve ITS bölgesine ait DNA dizileri CLUSTAL X programı (Chenna vd., 2003) kullanılarak hizalanmış, ardından NCBI veri tabanından yüksek benzerlik gösteren beş *A. flavus*'un DNA dizileri ile Kimura 2-parameter (K2P) modeli kullanarak 1000 bootstrap tekrarıyla Maximum Likelihood yöntemi (Felsenstein, 1981) uygulanarak MEGA 12 yazılımı aracılığıyla filogenetik ağaçlar oluşturulmuştur.

Aflatoksin B_1 Üretiminin ELISA ile Değerlendirilmesi

Aflatoksijenik potansiyelin belirlenmesi amacıyla izolatlar MEA+S besiyerinde kültüre alınmıştır (Abbas vd., 2011). Katı besiyeri 22,5 g Malt Ekstrakt Agar ve %15 D-sükroz ile hazırlanmış, 121 °C'de sterilize edildikten sonra 50 mg/L kanamisin eklenmiştir. Ön kültür için izolatlar 3 mL MEA+S sıvı besiyerinde 25 °C'de bir gece inkübe edilmiş, ardından yaklaşık 15 mL katı besiyerine yayma yöntemiyle ekilmiş ve 25 °C'de 10 gün inkübe edilmiştir. Gelişen misel yapıları toplanıp tartılmış, biyokütleye orantılı olarak %70 metanol eklenmiş ve 4000 rpm'de 10 dakika santrifüj edilmiştir. Üst faz homojenize edilip Elabscience® Aflatoxin B_1 (AFB_1) ELISA kitine uygun şekilde analiz edilmiştir.



BULGULAR ve TARTIŞMA

Morfolojik Bulgular

Mısır, nohut unu, tahin helvası ve kuru hurma örneklerinden izole edilen *Aspergillus* izolatları, kültürel ve morfolojik özellikleri dikkate alınarak tür spesifik tanımlama anahtarları kullanılmış ve değerlendirilmiştir. Konidiyal başlık yapılarının, sterigma diziliminin, konidiyofor özelliklerinin ve sklerot varlığının tüm izolatlarda *A. flavus*'a özgü karakteristiklerle yüksek oranda örtüşmesi ile bu izolatlar *A. flavus* olarak tanımlanmıştır. *A. flavus* türü; genellikle yeşilimsi tonlarda, küresel veya yarı küresel yapıda konidiyal başlıklara (20-50 µm), biseriate (çift sıra) sterigma dizilimine, pürüzlü yüzeyli konidiyoforlara ve koyu renkli düzensiz sklerotlara sahip olmasıyla karakterize edilmektedir (Klich, 2002; Samson vd., 2014). Çalışmada incelenen beş izolatta bu özelliklerin tamamı tutarlı biçimde gözlenmiş ve izolatların koloni rengi, doku yapısı ve hava hifi oluşumu gibi kültürel özelliklerinin kullanılan besiyerine bağlı olarak değişiklik gösterdiği belirlenmiştir. Farklı besiyerlerinde (PDA, DRBC, DG18, CGA ve SA) gözlenen bu varyasyonlar, *A. flavus*'un besiyeri bileşimine duyarlı fenotipik çeşitliliğiyle uyumludur. Çalışma sonucunda, PDA ve CGA'da kahverengi-zeytin yeşili merkez ve çevresinde yoğun hava hifi oluşumu gözlenirken, DG18'de daha sarımsı bir merkez rengi dikkat çekmiştir.

Moleküler Bulgular

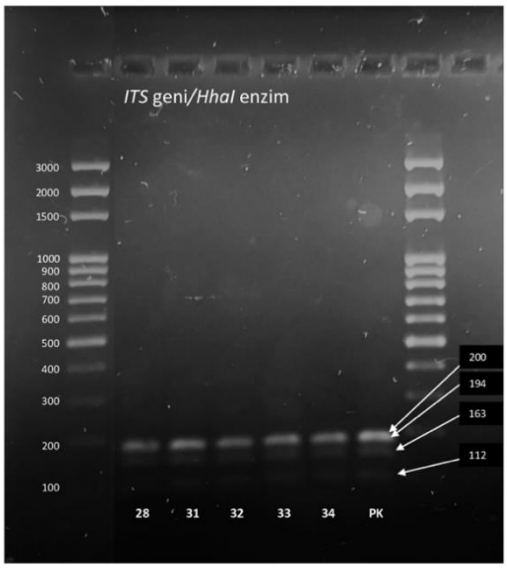
Bu çalışmada, şüpheli *A. flavus* izolatlarının tür düzeyinde tanımlanması amacıyla ITS ve β-tubulin gen bölgeleri PCR yöntemiyle çoğaltılmıştır. ITS (600 bp) bölgesi, fungus türlerinin moleküler tanımlamasında yaygın olarak kullanılan, evrimsel olarak korunmuş bir bölge olup (White vd., 1990); çalışmadaki 5 izolatın tamamında tek bir bant amplifiye edilmiştir. Tub gen bölgesi (340 bp), türler arası varyasyonu yansıttığı için filogenetik analizlerde önemli bir belirteç olarak değerlendirilmektedir (Glass ve Donaldson, 1995); bu çalışmada tüm izolatlarda başarılı amplifikasyon elde edilmiştir (Şekil 1).

Şekil 1. DNA izolasyonları yapılan 5 şüpheli *A. flavus* izolatının hedeflenen genleri olan A) ITS (600 bp), B) β-tubulin (340 bp) gen bölgelerinin PCR ürünlerinin DNA jel elektroforezi sonuçları (NK: negatif kontrol).

Toplamda beş *Aspergillus flavus* izolatı için hem ITS hem de β-tubulin gen bölgelerine ait yaklaşık 600 bp ve 340 bp uzunluğunda bantlar gözlemlenmiştir. Bu sonuçlar, amplifikasyon işleminin başarıyla gerçekleştiğini ve her iki gen bölgesinin tüm izolatlarda korunduğunu göstermektedir. Elde edilen bu veriler, mısır, nohut unu, kuru hurma ve tahin helvası örneklerinden izole edilen bu izolatların tür düzeyinde doğru şekilde tanımlandığını ve genetik olarak *A. flavus* ile yüksek oranda benzerlik gösterdiğini desteklemektedir. Ayrıca bu durum, kullanılan primer çiftlerinin *A. flavus* türünün spesifik bölgelerini hedeflemede etkin olduğunu ve ilerleyen filogenetik analizler için uygun bir temel oluşturduğunu ortaya koymaktadır. Samson vd. (2007) da ITS dizilerinin *Aspergillus* türlerinin hızlı ve doğru tanımlanmasında temel belirteç olarak kullanılabileceğini bildirmiştir.

A. flavus izolatlarının aflatoksijenik potansiyelini belirlemek amacıyla gerçekleştirilen multiplex-PCR analizlerinde *aflR*, *aflQ*, *aflO*, *aflP* ve *aflD* genlerinin varlığı izolatlara göre değişiklik göstermiştir (Tablo 1). Tahin helvası örneğinden elde edilen İzolat 28'de *aflR* geni saptanmamış olup diğer dört gen pozitif bulunmuştur. Kuru

hurmadan elde edilen İzolat 31 ile nohut unu kaynaklı İzolat 32 ve İzolat 33'te *aflQ* geni dışındaki tüm genler amplifiye edilmiştir. Mısır örneğinden izole edilen İzolat 34 ise beş genin tamamının pozitifliği ile dikkat çekmiş ve genetik olarak tam aflatoksijenik profil göstermiştir. Bu sonuçlar, çalışmada yer alan izolatların büyük çoğunluğunun aflatoksin biyosentez yolunda yer alan temel genleri taşıdığını ve potansiyel olarak AFB_1 üretme kapasitesine sahip olabileceğini göstermektedir.



Tablo 1. *A. flavus* izolatlarının kaynak/bölge bilgileri ve bu izolatların aflatoksin biyosentez genlerinin (*aflR*, *aflD*, *aflP*, *aflO*, *aflQ*) klasik PCR sonuçları

Şüpheli A. flavus İzolatlarının RFLP Analiziyle Tanımlanması

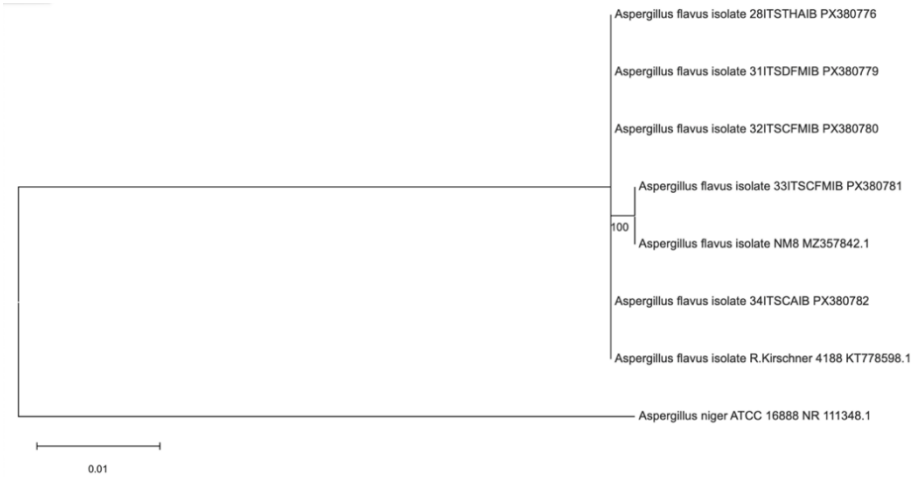
ITS1/ITS4 primerleriyle çoğaltılan beş PCR ürününe *HhaI* restriksiyon enzimiyle PCR ürünlerinin belirli bölgelerinden kesim işlemi gerçekleştirilmiştir. ITS1/ITS4 primerleri ile çoğaltılan beş PCR ürününe uygulanan *HhaI* restriksiyon enzimi kesimi sonrası elde edilen DNA fragmanlarının %2'lik agaroz jel elektroforez görüntüleri Şekil 2'de gösterilmiştir.

Şekil 2. ITS1/ITS4 primerleri ile çoğaltılan beş PCR ürününe *HhaI* restriksiyon enzimiyle kesim sonuçlarının %2 agaroz jel elektroforez görüntüsü (PK: pozitif kontrol).

ITS gen bölgesinin *HhaI* restriksiyon endonükleazı ile kesilmesi, *Aspergillus* türleri arasında tür düzeyinde ayırt edici fragman desenlerinin oluşmasına olanak sağlamaktadır. Literatürde, *A. flavus* izolatlarının *ITS* bölgesinin *HhaI* enzimiyle sindirimi sonucunda yaklaşık 200 bp, 194 bp, 163 bp ve 112 bp uzunluklarında dört fragman elde edildiği bildirilmektedir (Krulj vd., 2020). Bu çalışmada da *ITS1/ITS4* primerleriyle çoğaltılan beş PCR ürününün *HhaI* enzimiyle kesimi sonucu benzer fragmentasyon profilleri gözlenmiştir (Şekil 2). Elde edilen bu bant desenleri, kesimin hedeflenen bölgelerde başarıyla gerçekleştiğini ve izolatların *A. flavus* türüne özgü karakteristik bir restriksiyon paterni sergilediğini göstermektedir. Bu bulgu, PCR-RFLP yönteminin morfolojik tanımlamayı destekleyen güvenilir bir moleküler doğrulama aracı olduğunu ortaya koymaktadır.

Literatürde yer alan verilerle karşılaştırıldığında, bu tez kapsamında elde edilen sonuçlar Krulj vd. (2020) tarafından bildirilen bulgularla yüksek oranda uyumluluk göstermiştir. Söz konusu çalışmada, farklı gıda kaynaklarından izole edilen *A. flavus* suşlarının *ITS* bölgesi PCR-RFLP yöntemiyle analiz edilmiş ve *HhaI* enzimiyle yapılan kesim sonrasında yaklaşık 200 bp, 194 bp, 163 bp ve 112 bp uzunluklarında dört belirgin fragmanın oluştuğu belirtilmiştir. Araştırmacılar, bu fragmentasyon modelinin *A. flavus* için karakteristik olduğunu ve yöntemin tür düzeyinde güvenilir bir şekilde ayırt edici olduğunu vurgulamıştır.

A. flavus İzolatlarının ITS ve β-tubulin Gen Bölgelerine Ait Dizileme ve Filogenetik Analiz Sonuçları



ITS ve β-tubulin gen bölgelerinde amplifikasyon gösteren beş *A. flavus* izolatı üzerinde özel bir firma tarafından dizileme analizleri gerçekleştirilmiştir. Hedeflenen gen bölgelerinin dizilenmesi, her bölgeye özgü ileri (forward) ve geri (reverse) primerler kullanılarak Sanger sekanslama yöntemiyle yapılmıştır. Elde edilen diziler Chromas yazılımı ile kontrol edilerek düşük kaliteli uç kısımlar temizlenmiş ve FASTA formatında kaydedilmiştir. Her örnek için elde edilen ileri ve geri yönlü diziler NCBI BLASTn aracı kullanılarak hizalanmış ve bu hizalamalardan konsensüs diziler oluşturulmuştur. Konsensüs diziler daha sonra CLUSTAL X (Chenna vd., 2003) programı kullanılarak çoklu hizalamaya tabi tutulmuş ve GenBank veri tabanındaki referans dizilerle karşılaştırılmıştır. Karşılaştırmalar sonucunda, izolatların tamamının %100 oranında benzerlik gösterdiği belirlenmiş ve bu değerler tür düzeyinde tanımlamada referans alınmıştır. Elde edilen sonuçlara göre, tüm diziler NCBI GenBank veri tabanına kaydedilerek erişim numaraları alınmıştır. BLAST analizinden elde edilen benzerlik oranları Tablo 2'de verilmiştir.

Tablo 2. *A. flavus* izolatlarına ait ITS gen bölgelerinin GenBank veri tabanında çıkan benzerlik oranları.

33TUBCFMIB	β-tubulin	PX418189	*A.flavus* beta-tubulin gene, complete cds	100	M38265.1
34TUBCAIB	β-tubulin	PX418190	*A.flavus* beta-tubulin gene, complete cds	100	M38265.1

Bu çalışmada, beş *A. flavus* izolatın moleküler tanımlanmasında, ITS ve β-tubulin gen bölgelerine yönelik dizileme yapılmış ve bu izolatlar NCBI veri tabanındaki referans dizileriyle karşılaştırılmıştır. Yapılan dizileme analizleri sonucunda *A. flavus* benzerlik oranının %100 aralığında olduğu görülmüştür. Lavkor (2019) tarafından yapılan bir

çalışmada, Adana ve Osmaniye illerinden toplanan yerfıstığı örneklerinden izole edilen *A.* section *Flavi* üyeleri üzerinde yapılan moleküler tanımlamalar, β-tubulin gen bölgesi PCR ürünlerinin BLAST analizi yapılarak GenBank veri tabanıyla karşılaştırılması sonucunda, *A. flavus* ve *A. parasiticus* türlerine ait izolatların sırasıyla %89-100 ve %96-100 oranında benzerlik gösterdiğini bildirmiştir. Bu da β-tubulin gen bölgesinin *Aspergillus* türlerinin tanımlanmasında oldukça güvenilir bir genetik işaretleyici olduğunu ortaya koymaktadır. Bu tez çalışmasında *A. flavus* türünün GenBank veri tabanıyla karşılaştırılması sonucunda %100 benzerlik göstermesi, tür içi varyasyonun sınırlı olabileceğini düşündürmektedir. Lavkor (2019) çalışmasında, *A.* section *Flavi* üyesi izolatlar arasında *A. flavus* türünün en sık tespit edilen tür olduğunu belirtmiştir ve benzer şekilde bu tez çalışmasında da yoğun olarak *A. flavus* türü tespit edilmiştir. Sonuç olarak, bu çalışma, *A. flavus* türünün moleküler tanımlamasında ITS ve β-tubulin gen bölgeleri kullanılarak elde edilen dizileme sonuçlarının güvenilir olduğunu ortaya koymaktadır. Filogenetik ağaç oluşturulurken dış grup (outgroup) olarak, ITS bölgesine dayalı analizde *Aspergillus niger* ATCC 16888 (Şekil 3), β-tubulin bölgesine dayalı analizde ise *Aspergillus neoflavipes* isolate NRRL 5504 (EU014084.1) kullanılmıştır (Şekil 4).

Şekil 3. *A. flavus* izolatlarının genetik ilişkilerini ITS dizilerine dayanarak gösteren Maximum Likelihood filogenetik ağacı.

Şekil 4. *A. flavus* izolatlarının akrabalık derecelerini β-tubulin dizileri üzerinden Maximum Likelihood analizi ile ortaya koyan filogenetik ağaç.

A. flavus İzolatlarının Aflatoksin B_1 Üretiminin ELISA Yöntemi ile Değerlendirilmesi

Beş *A. flavus* izolatında aflatoksin üretim potansiyelinin belirlenmesi amacıyla gerçekleştirilen ELISA analizleri sonucunda, yalnızca mısır kaynaklı İzolat 34'te tespit limiti olan 0,15 ppb'nin üzerinde AFB_1 üretimi gözlenmiş

ve konsantrasyonun 62,05 ppb olduğu belirlenmiştir. Diğer dört izolatta ise aflatoksin miktarı tespit limitinin altında kalmıştır. Klasik PCR sonuçlarıyla birlikte değerlendirildiğinde, İzolat 34'ün *aflR*, *aflQ*, *aflO*, *aflP* ve *aflD* genlerinin tamamını taşıdığı ve yüksek aflatoksijenik potansiyel gösterdiği görülmüştür. Buna karşılık, bir veya birden fazla aflatoksin biyosentez geninde eksiklik bulunan İzolat 28, 31, 32 ve 33'ün AFB_1 üretmediği tespit edilmiştir. Bu bulgular, çalışmadaki *A. flavus* izolatlarının genetik olarak aflatoksijenik olsalar bile toksin üretim kapasitelerinin izolata özgü değişiklik gösterebildiğini ortaya koymaktadır.

SONUÇ

Bu çalışmada, farklı gıda ürünlerinden izole edilen *A. flavus* suşlarının morfolojik ve moleküler tanımlamaları ve toksijenik özellikleri değerlendirilmiştir. Farklı besiyerlerinde gözlenen fenotipik varyasyonlara rağmen konidiyal yapı, sterigma dizilimi ve sklerot oluşumu gibi ayırt edici özelliklerin tüm izolatlarda tutarlı biçimde görülmesi, bu izolatların *A. flavus* olarak sınıflandırılmasını güçlü biçimde desteklemektedir. Ayrıca birden fazla besiyerinin kullanılması, koloni rengi, doku yapısı ve hava hifi oluşumu gibi kültürel özelliklerin daha net ortaya çıkmasını sağlayarak tür tanımlamasında önemli bir avantaj sağlamıştır. Moleküler tanımlamada ITS ve β-tubulin gen bölgelerinin dizilenmesi sonucunda tüm izolatların *A. flavus* türüyle yüksek düzeyde (%100) benzerlik gösterdiği doğrulanmıştır. Filogenetik analizler, izolatların birbirleriyle yakın akrabalık ilişkileri olmakla birlikte, farklı gıdalardan elde edilen suşlar arasında belirgin genetik çeşitlilik olabileceğini göstermiştir. Multiplex-PCR ile gerçekleştirilen aflatoksin biyosentez gen analizi, çalışılan izolatların büyük bölümünde *aflR*, *aflO*, *aflP* ve *aflD* genlerinin varlığını ortaya koymuş, ancak bazı izolatlarda düzenleyici gen (*aflR*) veya geç yol genlerinden biri (*aflQ*) bulunmamıştır. Bu durum, gıda kaynaklı *A. flavus* popülasyonlarında aflatoksijenik kapasitenin genetik düzeyde heterojen olduğunu göstermektedir.

Toksijenik özelliklerin ELISA ile değerlendirilmesi, yalnızca mısırdan izole edilen suşun tespit limiti üzerinde (62,05 ppb) aflatoksin B_1 ürettiğini ortaya koymuştur. Diğer izolatlarda ise, aflatoksin biyosentez genlerinin çoğunun pozitif olmasına rağmen toksin üretimi tespit edilememiştir. Bu durum, aflatoksin üretim kapasitesinin yalnızca gen varlığına değil, aynı zamanda çevresel koşullara, suşların fizyolojik durumuna ve olası epigenetik düzenlemelere bağlı olarak değişebileceğini göstermektedir. Genel olarak, farklı gıda ürünlerinden elde edilen *A. flavus* izolatlarının hem genetik özellikleri hem de toksin üretim profilleri arasında önemli düzeyde çeşitlilik bulunduğu belirlenmiştir. Bu çeşitlilik, bölgesel gıda zincirlerinde aflatoksin riskinin tahmin edilmesi ve kontrol stratejilerinin geliştirilmesi açısından kritik bir öneme sahiptir.

TEŞEKKÜR

Bu çalışma Çukurova Üniversitesi Bilimsel Araştırma Projeleri Birimi (BAP) tarafından FDK-2023-16038 nolu proje kapsamında desteklenmektedir.

ORAL PRESENTATION

*Capnodis tenebricosa'*nın (Olivier, 1790) (Coleoptera: Buprestidae) biyolojik mücadele ajanı olarak değerlendirilmesi

Üzeyir Çağlar[1*] (*Orcid: https://orcid.org/0000-0002-8401-0155*)

[*1] Gazi Üniversitesi Sağlık Hizmetleri Meslek Yüksekokulu, Ankara, Türkiye

*Sorumlu yazar e-mail: ucaglar@gazi.edu.tr

Özet

Buprestidae familyasına ait *Capnodis* cinsinin bazı türlerinin larvaları canlı dokularda gelişerek kültürü yapılan pek çok ağaçta, orman ve süs bitkisi ağaç ve ağaççıklarında önemli zararlar yapmaktadırlar. *Capnodis* türleri meyve ve bağ zararlısı olarak bilinir.

Tarımsal üretim alanlarında kültür bitkilerinin dışında doğal olarak kendiliğinden yetişen tüm bitkilere tarla yabancı otları adı verilmektedir. Bu bitkiler, tarımı yapılan bitkilerin, kalitesine ve ürün miktarına olumsuz etki eden en önemli faktörlerden biri olarak kabul edilir. Yabancı otlar, tarım bitkilerinin ekolojik gereksinimleri olan ışığına, besin elementlerine ve suyuna ortak olmaktadır. Bu durum tarımı yapılan bitkilerin gelişimi olumsuz etkiler ve ürünün kalitesi ile ürün miktarı düşer.

Durum biyoçeşitlilik açısından ele alındığında ise tarla yabancı otları ülkelerin biyolojik zenginlikleridir. Bu bitkilerden gereğince yararlanılması ve zararlarından korunabilmesi için bunların her türlü sistematik, morfolojik ve üreme özellikleri gibi biyolojik özelliklerinin bilinmesi gereklidir.

Biyolojik mücadelenin amacı, yabancı otların eradikasyonu değil, ancak populasyon ekolojisi prensiplerine dayanarak, yabancı ot yoğunluğunu hoşgörü eşiği altında tutmaktır.

Yabancı otların kontrolünde son yıllarda yaşanan direnç problemleri, araştırmacıların doğal ve sürdürülebilirliği olan biyolojik mücadele gibi alternatif yöntemlere olan ilgisini artırmıştır.

Rumex crispus L. (Kıvırcık kuzukulağı) (Polygonaceae), tohum ve kazık kökün en üst kısmındaki tomurcuklardan gelişen sürgünlerle çoğalan çok yıllık bir bitkidir; Ülkemizde şeker pancarı ve ayçiçeği de dahil olmak üzere birçok ürünü istila eder. Hasat sırasında tohumları buğday tohumlarını kirleterek tane kalitesini düşürür.

Avrupa ülkeleri ve İtalya'da yapılan çalışmalarda *Rumex* bitkisi üzerinde yaklaşık 200 böcek türü gözlenmiştir. Gözlenen bazı böcek türlerinin *Rumex*'in biyolojik kontrolünde kullanılabilme potansiyeline sahip oldukları belirlenmiştir.

2025 yılında arazi çalışmalarında Buprestidae familyasından *Capnodis* cinsine ait *Capnodis tenebricosa* türünün ergin bireyleri *Rumex crispus* L. (Kıvırcık kuzukulağı) bitkisi üzerinde dinlenme ve beslenme faaliyetlerini yaparken gözlenmiştir. *Rumex crispus* bitkisinin gövdesi içinde yaprak sürgününün olduğu kısımda *Capnodis tenebricosa* larvalarına rastlanmıştır.

Capnodis türleri; ormancılık ve zirai açıdan ağaçlarda zararlı türler olarak kabul edilmektedir. Yapılmış olan çok sayıdaki bilimsel çalışmalarda bu durum açıkça ifade edilmektedir. Bu durumun aksine Buprestidae familyasından bazı türler biyolojik mücadelede ajan olarak kullanılmaktadır. Bu çalışmada *Capnodis tenebricosa* türü tarımsal alanlarda istilacı tür olarak bilinen *Rumex crispus* için Biyolojik mücadele ajanı olarak düşünülmektedir.

Keywords: Buprestidae, *Capnodis tenebricosa,* biyolojik kontrol ajanı, *Rumex crispus*

GİRİŞ

Türkiye, bulunduğu konumu ve farklı ekosistemlere sahip olması nedeniyle biyolojik çeşitlilik açısından son derece zengindir (Önen & Özcan, 2010). Buprestidae familyası tür sayısı bakımından Coleoptera takımının en büyük 8 familyasından birisidir ve Dünya'da 15 000 civarında türü bilinmektedir (Muskovits ve Hegyessy, 2002; Booth ve ark., 1990). *Capnodis* cinsinin Dünyada 18 türü, (Obenberger, 1926), Palearktik bölgede 15 türü vardır (Löbl ve Smetana, 2006). Türkiye'de ise bu cinsin 10 türü bulunmaktadır (Lodos ve Tezcan, 1992; Löbl ve Smetana, 2006).

Capnodis türleri genellikle 20 °C'nin altındaki ve 40 °C'nin üzerindeki sıcaklıklarda hareketsiz ya da çok az hareketlidirler (Akman ve San, 1975; Erdem ve Çanakçıoğlu, 1977; Bily, 1982; Donald ve ark., 1989; Booth ve ark., 1990; Lodos ve Tezcan, 1995; Kaya, 1999; Muskovits ve Hegyessy, 2002; Kaygın, 2007).

Buprestidae familyasına ait *Capnodis* cinsinin bazı türlerinin larvaları canlı dokularda gelişerek kültürü yapılan pek çok ağaçta, orman ve süs bitkisi ağaç ve ağaççıklarında önemli zararlar yapmaktadırlar (Tezcan, 1990; Lodos ve Tezcan, 1995). *Capnodis* türleri meyve ve bağ zararlısı olarak bilinir (Yaşar 1996).

Capnodis miliaris türü çeşitli kavak ve söğüt türlerinde zararlıdır (Kaygın, 2007). Kiraz yetiştirilen alanlarda ise *Capnodis tenebrionis* ve *Capnodis carbonaria* türlerinin zararlarından bahsedilmektedir (Tezcan, 1990).

Capnodis tenebrionis türü taş çekirdekli meyve bahçelerinde önemli bir zararlıdır. Bu türün erginleri yumurtalarını ağacın çeşitli bölgelerine bırakır. Yumurtadan çıkan larvalar özellikle köklerde ve ağaç gövdelerinde galeriler oluşturarak ağaçların ölümüne ve verim kaybına neden olabilir. Bu zararlının İspanya, İtalya, Türkiye, İran, Suriye, Kuzey Afrika, İsrail, Fransa ve Filistin'de görüldüğü bildirilmiştir (David'yan, 2003; Abu Jbara, 2005; Booth ve ark., 1990; Bonsignore ve ark., 2008; Şahin ve Gözel, 2017; Tüzün, 1975; Grasselly ve Crossa-Rayaud, 1980; Zobar ve ark., 2019; Marannino ve de Lillo, 2005).

Tarımsal üretim alanlarında kültür bitkilerinin dışında doğal olarak kendiliğinden yetişen tüm bitkilere tarla yabancı otları adı verilmektedir (Türe ve Köse, 2000). Yabancı otlar tarımı yapılan bitkilerin kalitesine ve ürün miktarına olumsuz etki eden en önemli faktörlerden biri olarak kabul edilir (Türe ve Köse, 2000).

Yabancı otlar, tarım bitkilerinin ekolojik gereksinimleri olan ışığına, besin elementlerine ve suyuna ortak olmaktadır. Bu durum tarımı yapılan bitkilerin gelişimi olumsuz etkiler ve ürünün kalitesi ile ürün miktarı düşer. (Türe ve Köse, 2000; Uluğ ve ark., 1993; Özer, 1993). Türkiye'de yabancı otlardan meydana gelen verim kaybı %20 ile %50 arasında değişmektedir (Uluğ ve ark., 1993; Özer, 1993).

Durum biyoçeşitlilik açısından ele alındığında ise tarla yabancı otları ülkelerin biyolojik zenginlikleridir (Söker ve ark., 2012). Ülkemiz sahip olduğu coğrafik konum ve elverişli iklim sayesinde biyololik çeşitlilik açısından çok zengin bir flora ve faunaya sahiptir. Bu çeşitlilik bitkisel üretim alanlarında önemli bir sorun olan yabancı otları da kapsamaktadır (Uygur ve Uygur, 2010). Bu bitkilerden gereğince yararlanılması ve zararlarından korunabilmesi için bunların her türlü sistematik, morfolojik ve üreme özellikleri gibi biyolojik özelliklerinin bilinmesi gereklidir (Söker ve ark., 2012).

Yabancı otların kontrolünde son yıllarda yaşanan problemler, araştırmacıların doğal ve sürdürülebilir olan biyolojik mücadele gibi alternatif yöntemlere olan ilgisini artırmıştır (Sırrı ve Özaslan, 2024). Yabancı otlarla biyolojik mücadele; genellikle potansiyel doğal düşman olabilen eklem bacaklılar (böcekler ve akarlar), bitki patojenleri (mantarlar, bakteriler, virüsler ve nematodlar), balıklar, kuşlar ve diğer hayvan türleri kullanılarak, yabancı ot popülasyon ve yoğunluğunu kontrol altına alınması veya baskılanması şeklinde tanımlanmaktadır (Uygur ve Uygur, 2010).

Rumex crispus L. (Kıvırcık kuzukulağı) (Polygonaceae) tohum ve kazık kökün en üst kısmındaki tomurcuklardan gelişen sürgünlerle çoğalan çok yıllık bir bitkidir. Türkiye'de, Erzurum'da şeker pancarı ve ayçiçeği de dahil olmak üzere birçok ürünü istila eder (Zengin,1996; Tozlu ve Zengin, 1997). Hasat sırasında tohumları buğday tohumlarını kirleterek tane kalitesini düşürür. Bu saf olmayan tohum partileri, ekim sırasında yabancı otun diğer tarlalara yayılmasını kolaylaştırır (Zengin, 1999).

Ülkemizde Bayburt, Erzurum ve Kars illerinde *Rumex crispus* L. bitkisi üzerinde tespit edilen *Lixus bardanae* (F.) (Coleoptera: Curculionidae)'nin biyolojisi üzerine yapılan çalışmada bitkinin yaprakları ile beslendiği, dişi böceklerin yumurtalarını bitki gövdesine bıraktığı ve yumurtadan çıkan larvaların bitki gövdesinde galeriler açtığı gözlenmiştir. Pupadan çıkan ergin böceklerin Eylül ayı sonlarında toprağa geçip bitki kökü etrafında dik pozisyonda kış mevsimini geçirdikleri tespit edilmiştir. Bu çalışma kapsamında *Lixus bardanae* böcek türünün tarla bitkileri için istilacı ve kaliteyi düşürücü rolü olan *Rumex crispus* (kıvırcık kuzukulağı) türü için popülasyonunu kontrol altında tutacak biyolojik ajan olduğu kanısına varılmıştır (Gültekin ve ark., 2004)

Avrupa ülkeleri ve İtalya'da yapılan çalışmalarda *Rumex* türleri üzerinde yaklaşık 200 böcek türü gözlenmiştir. Curculionidae familyasına ait 3 böcek türünün *Rumex*'in biyolojik kontrolünde kullanılabilme potansiyeline sahip

oldukları belirlenmiştir. Aynı çalışma kapsamında *Capnodis tenebricosa* larvalarının *Rumex crispus* köklerinde oldukça yaygın olduğu ve fide köklerini tamamen öldürebildiği gözlenmiştir (Spencer ve Hostettler, 1979).

MATERYAL VE METOT

Bu çalışma 2025 yılı, Temmuz ayında gerçekleştirilen entomofaunistik çalışmalarında elde edilen verilere dayanmaktadır. Arazi çalışmaları, Eskişehir ili, Mihallıççık ilçesinde gerçekleştirilmiştir. Bölgede yapılan arazi çalışmaları esnasında Buprestidae familyasından *Capnodis* cinsine ait *Capnodis tenebricosa* türüne ait ergin bireyler *Rumex crispus* L. (Kıvırcık kuzukulağı) bitkisi üzerinde dinlenme ve beslenme faaliyetlerini yaparken gözlenmiştir.

Ergin böcek bireyleri bir süre gözlendikten sonra *Rumex crispus* bitkisinin gövdesi bir çakı ile boyuna olarak iki bölüme ayrılmıştır. Bitki gövdesi içinde yaprak sürgününün olduğu kısımlarda *Capnodis tenebricosa* larvalarına rastlanmıştır.

Arazi çalışması esnasında gözlenen ergin böceklerden birkaç tanesi tür teşhislerinin doğrulanması amacıyla % 70'lik etil alkol kavanozlarına konulmuştur. Böceklerin toplandığı bölgenin lokalite bilgileri kaydedilmiştir. Laboratuvara getirilen böcekler müze materyali haline getirildikten sonra teşhis işlemleri yapılmış ve böcek kasalarına yerleştirilmiştir.

SONUÇLAR VE TARTIŞMA

Bu çalışmadaki veriler 2025 yılı, Temmuz ayında Eskişehir ili Mihallıççık ilçesinde yapılan arazi çalışmaları sonucunda elde edilmiştir. Arazi çalışmaları esnasında Buprestidae familyasından *Capnodis* cinsine ait *Capnodis tenebricosa* türünün ergin bireyleri *Rumex crispus* L. (Kıvırcık kuzukulağı) bitkisi üzerinde dinlenme ve beslenme faaliyetlerini yaparken gözlenmiştir.

Ergin *Capnodis tenebricosa* bireylerinin bitki üzerinde görülmesinin ardından tarımsal açıdan zararlı olarak bilinen *Rumex crispus* bitkisinin gövdesi çakı yardımıyla boyuna iki parçaya ayrılmıştır. Bitki gövdesi içerisinde ise *Capnodis tenebricosa* türünün larvalarına rastlanmıştır.

Yabancı otların tarımsal açıdan parazit etkileri, toprağı işlemede ve hasat yapmada sebep oldukları zorluklar, zehirli ve zararlı yönleri ele alıdığında yabancı ot mücadelesi kaçınılmazdır. (Önen, 2020). Bu mücadele başarılı bir şekilde yapılmazsa tarımsal üretimin sürdürülebilirliği mümkün değildir (Önen, 2021).

Yabancı otların mücadelesinde herbisitlerin (kimyasallar) çevreyi kirletmesi ve insan sağlığına olumsuz etkisi, yabancı otlarda dayanıklılığın ortaya çıkması gibi olumsuz etkilerinden dolayı günümüzde yabancı otlarla biyolojik kontrol yöntemi oldukça önem kazanmıştır (Zengin, 2013).

Yabancı ot kontrolünde biyolojik ajan olarak fitofag veya fitopatojenik doğal düşmanlar kullanılmaktadır (DeBach, 1964). Biyolojik ajanların yabancı ot kontrolünde kullanılmasındaki amaç, popülasyon ekolojisi prensiplerine dayanarak, yabancı ot yoğunluğunu hoşgörü eşiği altında tutmaktır. Pratikte biyolojik kontrol, faydalı bitki türlerine zarar vermeden, üzerinde bulunduğu konukçu bitkilerine direkt veya indirekt olarak zarar veren ya da zayıflatan doğal düşmanların kullanılması ile gerçekleşir (Zengin, 2013).

Yabancı otların biyolojik mücadelesinde potansiyel öneme sahip bazı böcek türlerinin yapılan gözlemlerde konukçu yabancı otlar üzerinde yoğun şekilde beslendiği, biyolojik dönemlerini geçirdiği ve konukçularının yaprak/sürgünlerinde deformasyona ve kurumalara yol açabildikleri görülmüştür (Sırrı ve Özaslan, 2024).

Bu böceklerin konukçu yabancı otların tohum tablası, gövde ve yan dallara yumurta bırakmak için delikler açtıkları ve çıkan genç bireylerin beslenme sonucu bitkinin iletim demetlerinde/çiçek tablalarında hasar oluşturarak kurumalara neden olabildikleri saptanmıştır. Özellikle yumurta bırakılan bölgelerde (gövde, yan dal, tohum tablası) çıkan larvaların beslenmesi sonucu konukçu bitkinin gövdesi neredeyse tamamen deforme olabilmekte, gövde, dal ve çiçek tablaları kırılabilmekte, larvaların tohumlarla beslenmesi sonucu konukçu yabancı otun tohum miktarı azalabilmektedir (Sırrı ve Özaslan, 2024).

Dolayısıyla bazı böcek türlerinin konukçu yabancı ot türlerinin popülasyon yoğunluğunun azalmasında (bitkinin büyümesi, gelişimi, tohum oluşması) oldukça etkili olabildiği gözlemlenmiştir (Sırrı ve Özaslan, 2024).

Capnodis türleri; ormancılık ve zirai açıdan ağaçlarda zararlı türler olarak kabul edilmektedir. Yapılmış olan çok sayıdaki bilimsel çalışmalarda bu durum açıkça ifade edilmektedir. Ancak Buprestidae familyasından bazı türler biyolojik mücadelede ajan olarak kullanılmaktadır. Bu çalışmada *Capnodis tenebricosa* türü tarımsal alanlarda istilacı tür olarak bilinen *Rumex crispus* için Biyolojik mücadele ajanı olarak düşünülmektedir.

*Sorumlu yazar e-mail: yceylan@bartin.edu.tr

Özet

Melissa officinalis ve *Thymbra spicata,* içeriklerindeki fenolik bileşikler, uçucu yağlar ve çeşitli fitokimyasallar nedeniyle antibakteriyel ve antikanser etkilere sahip tıbbi ve aromatik bitkilerdir. Bu bitkilerden elde edilen ekstraktların biyolojik aktiviteleri, kullanılan çözücü türüne göre değişiklik gösterebilmektedir. Bu nedenle çalışmada, bitkilerin etanol, kloroform ve bu çözücülerin karışımı kullanılarak hazırlanan ekstraktlarının antibakteriyel ve antikanser özellikleri değerlendirilmiştir. Bitkilerin özütlerinin *Staphylococcus aureus* ve *Escherichia coli* suşları üzerine antibakteriyel etkileri incelenmiştir. Elde edilen bulgular, hem *M. officinalis* hem de *T. spicata* ekstraktlarının farklı çözücülerde değişen düzeylerde antibakteriyel aktivite gösterdiğini ortaya koymuştur. *T. spicata'*nın en iyi antibakteriyel aktivitesi etanol ekstraktında görülmüş olup, her iki bakteri için MİK 15.625 µg/mL ve MBK 31.25 µg/mL değerleriyle çalışmadaki en düşük konsantrasyonları vermiştir. *M. officinalis'*in en etkili sonucu ise kloroform ekstraktında elde edilmiş ve her iki bakteri için MİK 93.75 µg/mL ile MBK 187.5 µg/mL değerleri kaydedilmiştir. Çalışmanın bir diğer aşamasında, elde edilen ekstraktların HeLa serviks kanseri hücre hattı üzerindeki sitotoksik etkileri değerlendirilmiştir. Uygulanan bitki özütlerinin, doza bağlı olarak hücre canlılığını azalttığı ve özellikle kloroform ekstraktlarının daha belirgin antiproliferatif etki gösterdiği gözlenmiştir. Bu çalışmada en etkili sitotoksik sonuçlar *T. spicata*'nın kloroform ekstraktında (IC_{50} = 52,59 µg/mL) elde edilirken, *M. officinalis*'te en iyi etki kloroform ekstraktında (IC_{50} = 69,24 µg/mL) görülmüş ve genel olarak *T. spicata*'nın *M. officinalis*'e kıyasla daha güçlü antiproliferatif aktivite gösterdiği belirlenmiştir. Sonuçlar, *M. officinalis* ve *T. spicata* bitkilerinin doğal antimikrobiyal ve antikanser ajanlar olarak potansiyel taşıdığını ve biyolojik etkinin kullanılan çözücü türüne göre önemli ölçüde farklılaştığını ortaya koymuştur.

Anahtar Kelimeler: Antibakteriyel, Antikanser, *Melissa officinalis*, *Thymbra spicata*

Melissa officinalis and *Thymbra spicata* as phytotherapeutic agents: An investigation of their antibacterial and anticancer activities

Abstract

Melissa officinalis and *Thymbra spicata* are medicinal and aromatic plants with antibacterial and anticancer properties owing to their phenolic compounds, essential oils, and various phytochemicals. The biological activities of the extracts obtained from these plants may vary depending on the type of used solvent. Therefore, the antibacterial and anticancer properties of extracts prepared using ethanol, chloroform, and a mixture of these solvents were evaluated in this paper. The antibacterial effects of the plant extracts were investigated against *Staphylococcus aureus* and *Escherichia coli* strains. The findings revealed that both *M. officinalis* and *T. spicata* extracts exhibited varying levels of antibacterial activity depending on the solvent type. The highest antibacterial activity of *T. spicata* was observed in the ethanol extract, which exhibited the lowest concentrations in the study with MIC and MBC values of 15.625 µg/mL and 31.25 µg/mL, respectively, for both bacterial strains. The most effective result for *M. officinalis* was obtained from the chloroform extract, recording MIC and MBC values of 93.75 µg/mL and 187.5 µg/mL, respectively, against both bacteria.

The cytotoxic effects of the obtained extracts were evaluated on the HeLa cervical cancer cell line in another part of the study. The applied plant extracts decreased cell viability in a dose-dependent manner, and particularly the

chloroform extracts exhibited a more pronounced antiproliferative effect. The most potent cytotoxic result in this study was obtained from the chloroform extract of *T. spicata* (IC_{50} = 52.59 µg/mL), while in *M. officinalis*, the best effect was also observed in the chloroform extract (IC_{50} = 69.24 µg/mL). Overall, *T. spicata* demonstrated stronger antiproliferative activity compared to *M. officinalis*. The results indicate that *M. officinalis* and *T. spicata* possess potential as natural antimicrobial and anticancer agents and that the biological efficacy varies significantly depending on the used solvent type.

Keywords: Antibacterial, Anticancer, *Melissa officinalis*, *Thymbra spicata*

GİRİŞ

Bitkilerin tedavide kullanımları insanlık tarihiyle birlikte başlamıştır. Binlerce yıl önce insan, bitkilerin tedavi edici gücünü tanımış ve sağlıklı yaşayabilmek için ondan yararlanmıştır (Faydaoğlu ve Sürücüoğlu, 2011). Tıbbi ve aromatik bitkiler, hastalıkları önlemek, sağlığı sürdürmek veya hastalıkları iyileştirmek için ilaç olarak kullanılan bitkilerdir (Kızıloğlu ve ark., 2017). Ülkemiz zengin florasıyla çok sayıda tıbbi ve aromatik bitkiyi bünyesinde bulundurmaktadır. Ayrıca Anadolu, tedavi gücü yüksek aromatik bitkilerin varlığı konusunda çok önemli bir potansiyele sahiptir (Dönmez, 2016). Araştırmamız da yer alan, tıbbi ve aromatik bitkilerden olan zahter (*Thymbra spicata)* acımsı tadı ve keskin kokusuyla bilinen *Lamiaceae* (Ballıbabagiller) familyasına ait bir bitkidir (Çınar ve ark., 2018). Türkiye'de özellikle Akdeniz ve Güneydoğu Anadolu bölgelerinde yaygın olarak bulunmaktadır. Zahter, başta Hatay olmak üzere, Gaziantep, Kilis ve ülkemizin Akdeniz iklim kuşağında doğal olarak yetişmekte ve genellikle baharat olarak kullanılmaktadır (Koçer, 2021). Zahter bitkisinden elde edilen ana bileşenler, simen (%7.17), c-terpinen (%12.30), o-simen (%10.05), ve karvakrol (%65.15) olarak tespit edilmiştir (Koçer, 2021). Karvakrolun analjezik, antiinflamatuvar, antikanserojen, antibakteriyel, antifungal, yara iyileşmesini ve hücre çoğalmasını hızlandırıcı etkileri olduğunu gösteren birçok çalışma bulunmaktadır (Canbek, 2008). Bunların yanı sıra bitkinin özünde fenolik bileşikler ağır basarken öne çıkan rosmarinik asittir. Biberiye, kekik, gibi bitkilerde bulunan, doğal antioksidan olan rosmarinik asit (RA) antimikrobiyal etkiye sahiptir (Önal ve Erden, 2011). Rosmarinik asitin *in vitro* çalışmalarda anti-HIV-1, antibakteriyel, antioksidan, anti-kanserojen ve anti-alerjik aktiviteler, antiviral özellikler gibi bazı biyolojik faaliyetleri olduğu bildirilmiştir. *In vivo* çalışmalar da rosmarinik asitin antikanserojenik özellikler sergilediğini göstermiştir (Bulduk ve Gökçe, 2017). Benzen halkası içeren organik maddeler genel olarak fenolik bileşikler olarak adlandırılmakta olup bunlar bitkiler aleminde bulunan ikincil metabolitlerdir (Uylaşer ve İnce, 2008). Bu bilgiler kapsamında, fenololik bileşiklerin antikarsinojen, antimutajen ve antimikrobiyal aktivite göstermeleri bakımından insan sağlığı üzerinde olumlu etkileri olduğuna ulaşılmıştır. (Korcan ve ark., 2018).

Zahterle ortak kimyasal bileşenlere sahip bitkiler arasında yer alan *Melissa officinalis* (limon otu) zengin kimyasal bileşimi ve biyolojik olarak aktif bileşenleri sayesinde tanınmış olan tıbbi bir bitkidir (Düvenci, 2024). *M. officinalis* , son on yılda araştırmaların odak noktası olmuştur (Draginic ve ark., 2022). *M. officinalis'*in başlıca aktif bileşenleri uçucu bileşikler (geranial, neral, sitronelal ve geraniol), triterpenler (ursolik asit ve oleanolik asit), fenolik asitler (rosmarinik asit, kafeik asit ve klorojenik asit) ve flavonoidlerdir (kuersetin, ramnositrin ve luteolin) (Petrisor ve ark., 2022). Bu bileşenler, bitkinin antioksidan, antimikrobiyal ve anti-inflamatuar özellikler sağlayıp; bitkiyi modern bitkisel tıpta değerli bir kaynak haline getirmektedir (Düvenci, 2024). Biyolojik çalışmalara göre, *Melissa officinalis'in* uçucu yağı ve özleri , potansiyel tıbbi kullanımları olan birçok farmakolojik etkiyi belirleyen aktif bileşiklere sahiptir (Petrisor ve ark., 2022). *M. officinalis* ülkemizde Akdeniz Bölgesi'nde yetişmektedir. *M. officinalis* arı otu, bal otu olarak da bilinen çok yıllık bir bitkidir ve Lamiaceae (nane) familyasının bir üyesidir (Miraj ve ark., 2016). *M. officinalis* bitkisinin en bilinen özellikleri; antiviral, antifungal, antikanser, antibakteriyel ve antioksidan etkiler göstermesidir. *M. officinalis* eczacılık, parfümeri, kozmetik ve gıda sanayinde çok sayıda kullanım alanına sahiptir (Topdemir, 2018). Köklü bir geçmişe sahip olan, tıbbi özellikleri ile insanoğlunun hayatında yer tutmuş ve tarih boyunca önemini korumuş olan *M. officinalis* günümüzde de birçok hastalığın tedavisinde fitoterapik amaçlar ile kullanılmaktadır (Başkal ve ark., 2017). Gastrointestinal sistem rahatsızlıklarından sinir sistemi rahatsızlıklarına, kalp ve damar hastalıklarından astıma kadar birçok hastalığın tedavisinde kullanılan *M. officinalis* gerek modern tıpta standardize ekstreleri şeklinde gerekse halk hekimliğinde yaygın olarak kullanıla gelen bir bitkidir (Başkal ve ark., 2017). Çalışmalar kapsamında *M. officinalis* ekstraktlarının patojenlere karşı önemli derecede antibakteriyel ve antifungal etkinlik gösterdiğini ortaya koymuştur (Düvenci, 2024).

Kanser büyüme özellikleri bozulmuş hücrelerin klonal yayılımıdır ve somatik genetik hastalıkların en sık, en yaygın ve aynı zamanda en komplike olanıdır (Yokuş ve Çakır, 2012). Tek bir organı etkileyebildiği gibi uzaktaki organlara da yayılarak etkisini gösterebilmektedir. Her ne kadar bazı standartlar belirlenmiş olsa da her kanser türüne özgü olarak farklı yaklaşımlar ve tedaviler uygulanmaktadır (Baykara, 2016). Günümüzde bitki ekstraktlarının antikanserojenik etkileri bulunmuş ve antikanserojenik ilaçların %63'ünün bitkilerden elde edildiği, ayrıca bu ilaçların yan etkilerinin az olduğu ve tedavide başarı oranının yüksek olduğu tespit edilmiştir (Saraç ve ark., 2018). Kanser tedavisinde bitkisel kaynaklı ürünlerin kullanımı nispeten oluşabilecek sağlık sorunlarının önüne geçebilir. Bu yüzden son yıllarda antikanser ajan olarak kullanılan çeşitli bitki kaynaklarının kimyasal bileşenleriyle ilgili çalışmalar artmıştır (Desai ve ark., 2008). Meme ve serviks kanseri kadınlarda en çok görülen iki kanser türü olarak tanımlanmıştır (Maraşlı ve Öztürk, 2021). Serviks kanseri, dünyada her iki dakikada bir kadın ölümüne neden olan ve kadınlarda meme kanserinden sonra en sık görülen ikinci kanserdir (Aydoğdu ve Özsoy, 2018). Araştırmada, HeLa hücre hattı olan rahim ağzı kanseri (serviks adinokarsinom) üzerinde durulmuştur.Bitki ekstrelerinin antikanser özellikleri üzerinde çalışmalar yapılmakta olup, *M. officinalis* ve *T. spicata* bitkileri de meme kanseri başta olmak üzere rahim ağzı (HeLa) kanserine de antikanser etki göstermektedirler.

Akne vulgaris, halk arasında bilinenin aksine, kıl folikülü, kıl şaftı ve yağ bezinden oluşan pilosebase ünitenin kronik inflamatuar bir hastalığıdır ve dünya çapında en sık görülen dermatolojik rahatsızlıklar arasındadır (Tuchayi ve ark., 2015). Bakteriler, toprak ve suda yaygın olarak bulunan ve diğer organizmaların simbiyontları olarak yaşayan prokaryotlara ait tek hücreli canlı organizmaların önemli bir grubudur (Vijayaraghavan ve Yun, 2008). Akneye sebep olan bakteri çeşitleri arasında *Propionibacterium acnes* bakterisinin yanı sıra *Escherichia coli*, *Staphylococcus aureus* bakterileri de bulunmaktadır. Araştırma da kullanılan bakteriler; gram negatif özellikte olan *Escherichia coli* ve gram pozitif özelliğe sahip olan *Staphylococcus aureus* bakterileridir.

Araştırmamızın içeriklerinden olan *M. officinalis* ve *T. spicata* bitkilerinin antibakteriyel ve antikanser etkilerine değinilmiştir. Araştırma da temelini *M. officinalis* ve *T. spicata* bitkilerinin oluşturduğu, akne üzerindeki antibakteriyel etkileri ve HeLa hücre hattı üzerindeki antikanser etkilerinin incelenmesi amaçlanmış ve hangi oranlarda etki ettiğine bakılmıştır.

MATERYAL VE METOT

1.Bitki Materyali ve Ekstrakt Hazırlanması

Çalışmada kullanılan *M. officinalis* ve *T. spicata* bitkileri gölgede kurutulduktan sonra elektrikli değirmende öğütülerek toz haline getirilmiştir. Her iki bitki grubu hem etanol hem de klorofom çözücülerinde ekstre edilmiştir. Ekstraksiyon işlemi sonrasında karışımlar filtre kâğıdı yardımıyla süzülmüş, ardından çözücüler evaporatör cihazı kullanılarak uzaklaştırılmıştır. Elde edilen özütler 37°C'de 24 saat inkübe edilmiştir. Son olarak özütler +4°C'de analiz aşamasına kadar muhafaza edilmiştir.

2.Antibakteriyel Aktivite Testi

Bitki ekstraktlarının ekstraksiyon işlemi sonrasında elde edilerek hazırlanmasının ardından antibakteriyel aktivitelerinin araştırılması amacıyla, *Staphylococcus aureus* (Gram pozitif) ve *Escherichia coli* (Gram negatif) kullanılmış ve stok olan suşlar Luria-Bertani (LB) sıvı besiyerinde aktive edilmiştir. Tüm bakteriler Mueller Hinton sıvı besiyerine inoküle edilmiş ve bakteri büyümeleri 0,5 McFarland standardı bulanıklığına ($1,5\times10^8$ CFU/mL) göre standardize edilmiştir. Aynı hacimde büyüme ortamı ve çözeltisi, 96 kuyucuklu mikroplaka sisteminin ilk kuyucuğuna eklenmiş ve karışım 37 °C'de inkübe edilmiştir. Bakteri suşlarının gelişimi ve minimum bakterisidal konsantrasyon (MBC) tayini için Nutrient Agar (NA) ortamı kullanılmıştır.

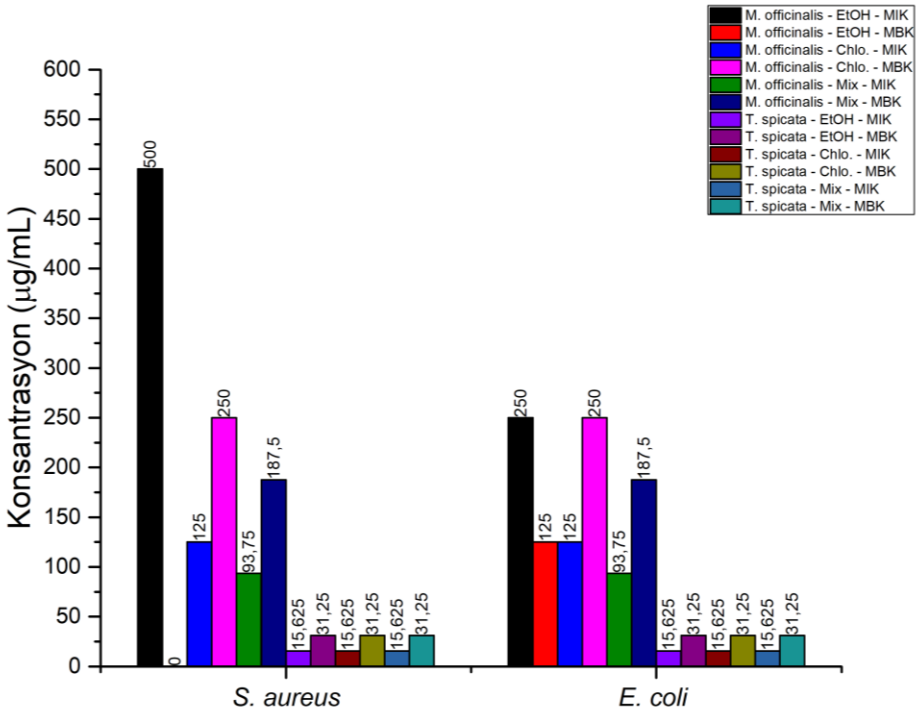
3. Antikanser Özelliklerinin Belirlenmesi

3.1. Hücre Kültürü

İnsan serviks karsinomu hücreleri (HeLa hücre hattı) Amerikan Tip Kültür Koleksiyonu'ndan (ATCC, Manassas, VA, ABD) temin edildi. HeLa hücre hattı, %10 fetal sığır serumu (FBS) ve %1 penisilin-streptomisin ile takviye edilmiş yüksek glikoz içeren Dulbecco's Modified Eagle Medium (DMEM) besiyerinde, %5 CO_2 içeren nemli ortamda ve 37 °C sıcaklıkta inkübatörde kültüre edilmiştir. Hücreler %80 doluluğa ulaştıktan sonra deneysel uygulamalara geçilmiştir.

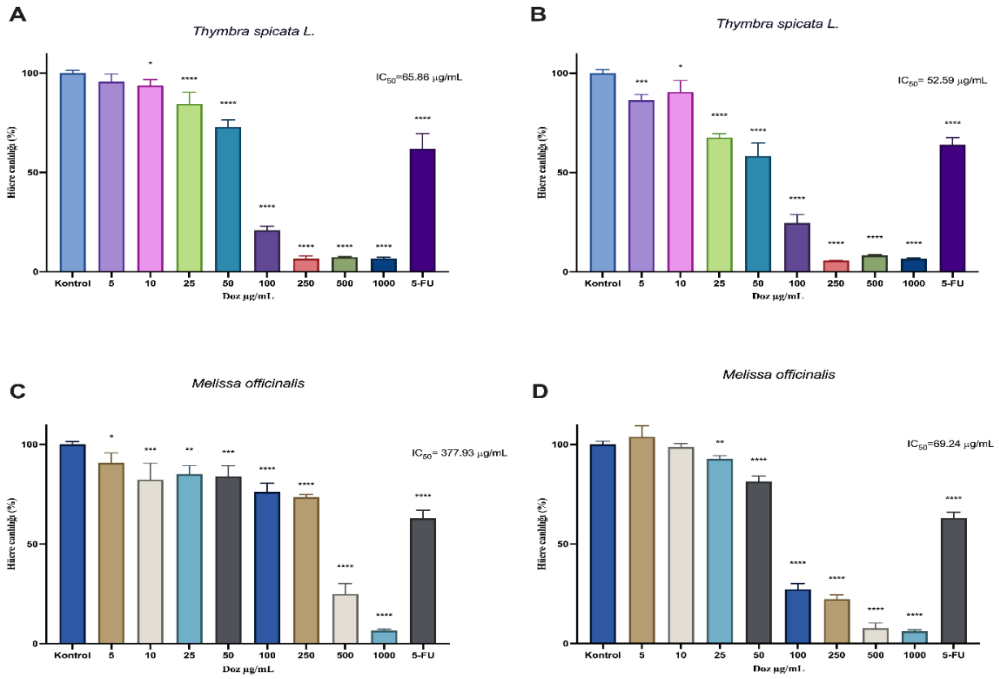
3.2. Hücre sitotoksisite analizi (MTT analizi)

Bitki ekstraktlarının HeLa hücre hattı üzerindeki sitotoksisite düzeyinin belirlenmesi için MTT (3-(4,5-dimetiltiazol-2-il)-2,5-difenil tetrazolyum bromür) analizi yapılmıştır. 96 kuyucuklu plakaya her bir kuyucukta yaklaşık 7500 hücre olacak şekilde hücre ekimi yapılmış ve bir gece 5 CO_2 içeren nemli ortamda ve 37 °C sıcaklıkta inkübe edilmiştir. Süre sonunda besiyeri çekilmiştir ve taze besiyeri içerisinde bitki ekstraktları 5-1000 ug/mL konsantrasyon aralığında hücrelere 48 saat boyunca uygulanmıştır. Bitki ekstraktları hazırlanırken kullanılan kloroform ve etil alkol çözücüleri, hücre canlılığına toksik etki oluşturmamak amacıyla seyreltilmiş ve nihai uygulamalarda çözücü konsantrasyonu %0.1'i geçmeyecek biçimde ayarlanmıştır. Pozitif kontrol olarak 200 uM 5-Florourasil kullanılmıştır. Süre sonunda tüm besiyeri uzaklaştırılmış, ardından PBS içerisinde hazırlanmış 0.5 mg/mL MTT çözeltisinden 20 µL her bir kuyucuğa eklenmiştir. Hücreler 3 saat süreyle inkübatörde bekletildikten sonra, MTT içeren ortam uzaklaştırılmış ve her kuyucuğa 100 µL DMSO eklenmiştir. Oluşan formazan kristallerinin çözünmesi için 30 dakika beklenmiş, ardından absorbans değerleri 570 nm dalga boyunda mikroplaka okuyucu (Thermo Scientific Multiscan GO, ABD) ile ölçülmüştür. Elde edilen absorbans değerleri kontrol grubuna göre normalize edilerek hücre canlılığı (%) hesaplanmış, IC_{50} değerleri GraphPad Prism 10.3.1 yazılımı kullanılarak grafikler çizilmiştir. Deneyler üç tekrarlı olarak yürütülmüştür. Hücre hatlarındaki IC_{50} değerleri https://www.aatbio.com/tools/ic50-calculator çevrim içi aracı kullanılarak hesaplanmıştır.



BULGULAR ve TARTIŞMA

Yapılan MİK (Minimum inhibitör konsantrasyon) ve MBK (Minimum bakterisidal konsantrasyon) testleri sonucunda, *M. officinalis* ve *T. spicata* ekstraktlarının hem *S. aureus* hem de *E. coli* bakterileri üzerinde farklı düzeylerde antibakteriyel aktivite gösterdiği belirlenmiştir (Şekil 1). *T. spicata* ekstraktları, etanol, kloroform ve etanol-kloroform karışımı çözücülerde en düşük MİK değerlerine sahiptir, bu da en yüksek antibakteriyel etkiyi göstermektedir. Örneğin, *T. spicata* ekstraktlarının MİK değeri 15,625 µg/mL olarak ölçülmüştür. Bu sonuç, *T. spicata* bitkisinin içerdiği karvakrol ve timol gibi fenolik bileşiklerin bakteriyel üremeyi güçlü bir şekilde inhibe ettiğini ve bakterisidal etki sağladığını göstermektedir. *M. officinalis* ekstraktları, *E. coli* üzerinde orta düzeyde inhibitör etki göstermişlerdir. *T. spicata* da etanol-kloroform çözücüleri birlikte kullanıldığında, ayrı ayrı çözücülerde ekstre edildiklerindeki gibi yüksek etkinlik göstermeye devam etmiş, aynı şekilde *M. officinalis* de etanol-kloroform çözücüleri birlikte kullanıldığında ise ayrı ayrı çözücülerde ekstre edildiklerinde çıkan sonuçlardan daha iyidir. Her iki bitki ekstraktı da Gram pozitif (*S. aureus*) ve Gram negatif (*E. coli*) bakterilere karşı etkili olmuştur, bu durum ekstraktların geniş spektrumlu antimikrobiyal potansiyele sahip olduğunu ortaya koymaktadır. *M. officinalis* bitkisinin orta düzeyde etkisi ise, rosmarinik asit ve flavonoid içerikleriyle açıklanabilir.



Çalışma kapsamında *T. spicata* ve *M. officinalis* bitkilerinden elde edilen kloroform ve etil alkol ekstraktlarının HeLa hücre hattı üzerindeki sitotoksik etkileri değerlendirilmiştir (Şekil 2). Elde edilen sonuçlar, her iki bitkinin de özellikle kloroform çözücüsü ile hazırlanan ekstraktının hücre canlılığını anlamlı düzeyde azalttığı tespit edilmiştir. Pozitif kontrol olarak HeLa hücre hattına uygulanan 5-fluorourasil (5-FU), 200 µM konsantrasyonda hücre canlılığını yaklaşık %65 seviyesine düşürmüştür. Daha önceden yapılmış bir çalışmada *M. officinalis* bitkisinin sudaki ekstraktının 48 saat boyunca kolon kanseri hücrelerine uygulanmasının IC_{50} değeri 264,4 µg/mL olarak tespit edilmiştir. Buna ek olarak *M. officinalis* özütünün hücre döngüsünü G2/M fazında durdurulmasını indüklediği, apoptozu tetiklediği ve hücre göçünü baskıladığı belirlenmiştir (Kuo ve ark., 2020). Bir başka çalışmada ise *M. officinalis*'in etanol kullanılarak elde edilen ekstraktın akciğer, meme, prostat ve yumurtalık kanseri hücre hatlarında 72 saat boyunca uygulanmasının tüm hücre hatlarında yüksek antiproliferetif etki gösterdiği belirlenmiştir (Jahanban-Esfahlan ve ark., 2015). 2018 yılında yapılan bir çalışmada, *M. officinalis* bitkisinin etanolik ekstraktının akciğer kanseri hücrelerine 48 saat uygulanması sonucunda IC_{50} değeri 100,9 µg/mL olarak belirlenmiştir (Magalhães ve ark., 2018). Yaptığımız çalışmada *M. officinalis* bitkisinin insan serviks karsinomu hücre hattında (HeLa) özellikle kloroformdaki ekstraktının 48 saat boyunca uygulanması sonucunda IC_{50} değeri 69,24 µg/mL olarak tespit edilmiştir. Bu bulgular, *M. officinalis bitkisinin* antiproliferatif aktivitesinin çözücü tipine bağlı olarak değişkenlik gösterebildiğini ancak genel olarak bitkinin içeriğindeki polifenolik bileşenler sayesinde farklı kanser türlerinde güçlü bir fitoterapötik potansiyele sahip olabileceğini desteklemektedir. *T. spicata'*nın farklı kanser türleri üzerindeki antiproliferatif etkileri daha önce çeşitli çalışmalarda araştırılmıştır. *T. spicata'*nın sulu ve etil alkollü ekstraktlarının kolon, meme ve melanoma üzerindeki anti proliferatif etkilerinin değerlendirilmesi için yapılan bir çalışmada sulu ekstraktta önemli bir sitotoksik etki

gözlenmezken, etil alkoldeki ekstraktlarında konsantrasyona bağlı olarak hücre canlılığının azaldığı gözlemlenmiştir. *T. spicata'*nın etil alkol ekstraktının IC_{50} değerleri meme kanseri, kolon kanseri ve melanoma hücre hatlarında sırasıyla 58,447, 110,238, 31,443 µg/mL olarak tespit edilmiştir (Diab ve ark., 2022). Yaptığımız çalışmada ise *T. spicata* bitkisinin insan serviks karsinomunda etil alkol ekstraktının 48 saat boyunca uygulanması sonucunda IC_{50} değeri 65,86 µg/mL,kloroform ekstraktı içinse 52,59 µg/mL olarak hesaplanmıştır. Bu bulgular *M. officinalis* ve *T. spicata* bitkilerinin içerdiği bileşikler ile kanser tedavisinde destekleyici ajanlar olarak kullanılabileceğini göstermektedir. Gelecekteki çalışmalarda bu bitkilerin aktif bileşenlerinin moleküler etki mekanizmalarının, hücre ölüm yolakları üzerindeki rollerinin ve potansiyel terapötik etkilerinin araştırılması, kanser tedavisi için yeni stratejilerin geliştirilmesine önemli katkı sunabilir.

Bitki içerikli ilaçların kanser tedavisinde kullanıldığı bilinmektedir. Daha önce yapılan araştırmalarda MCF-7 hücreleri üzerinde *M. officinalis* ekstraktlarının antikanser özelliklere bakılmıştır ve araştırma sonucu ekstraktların sitotoksik etki (hücreyi öldüren) gösterdiği görülmüştür (Öğüt ve ark., 2022). Elde edilen bulgular daha önce yapılan bu araştırmaları desteklemekte olup, *M. offcinalis* bitkisinin kanserin çoğalmasını engelleyen nitelikte olduğu kanısına varılmıştır. *T. spicata* bitkisinde yoğun oranda bulunan karvakrolun antikansarojen etkileri bulunmaktadır. Son yıllarda akciğer kanseri içindeki oranı artan adenokarsinomda karvakrolun, kanserli hücrelerin sayısını azalttığı, hücrelerin morfolojisini bozduğu ve total protein oranını azalttığı gösterilmiştir (Koparal ve Zeytinoğlu, 2003). Yapılan çalışmada elde edilen sonuca göre de, zahterin HeLa kanser hattı üzerinde antikanser etkisinin oranının yüksek olduğu görülmektedir.

Şekil 1. *M. officinalis* ve *T. spicata* bitkilerinin MİK ve MBK sonuçları (X: özütler) µg/mL

Şekil 2. *Thymbra spicata* (A) etil alkol (B) kloroform ve *Melissa officinalis* (C) etil alkol (D) kloroformda çözünen bitki ekstraktlarının HeLa hücre hattı üzerindeki 48 saatlik sitotoksik etkileri (****: $p < 0.0001$; ***: $p < 0.001$; **: $p < 0.01$; *: $p < 0.05$)

SONUÇ

Çalışmada *M. officinalis* ve *T. spicata* bitkilerinin farklı çözücülerle hazırlanan ekstraktlarının *S. aureus* ve *E. coli* bakterileri üzerinde antimikrobiyal etkinlikleri, Minimum İnhibitör Konsantrasyon (MİK) ve Minimum Bakterisidal Konsantrasyon (MBK) testleriyle değerlendirildiğinde, elde edilen sonuçlar, zahter ekstraktlarının, özellikle etanol, kloroform ve karışım çözücüleri ile hazırlanmış olanlarının, her iki bakteri türüne karşı *M. officinalis* ekstraktlarına kıyasla daha düşük MİK ve MBK değerleri sergileyerek daha yüksek antimikrobiyal potansiyele sahip olduğunu göstermiştir. Buna karşılık, *M. officinalis* ekstraktlarının kloroform ve karışım çözücü ile hazırlanan formları etanol ekstraktına göre daha etkili bulunmakla birlikte, bu ekstraktların MİK ve MBK değerleri *T. spicata* ekstraktlarına göre yüksek olup, dolayısıyla antibakteriyel etkinlikleri daha sınırlı kalmıştır. Bu bulgular doğrultusunda, *T. spicata* ekstraktlarının hem Gram (+) hem de Gram(-) bakterilere karşı güçlü bir antimikrobiyal ajan olarak potansiyel taşıdığı, *M. officinalis* ekstraktlarının ise özellikle kloroform ve karışım ekstraktifleri aracılığıyla destekleyici antibakteriyel rol üstlenebileceği söylenebilir.

T. spicata ve *M. officinalis* rahim ağzı kanseri hücrelerinin çoğalmasını baskılar. Bu çalışmada *T. spicata.* ve *M. officinalis* bitkilerinden elde edilen etanol ve kloroform ekstraktlarının HeLa hücre hattı üzerindeki sitotoksik etkileri MTT analizi ile değerlendirilmiştir. *T. spicata* ve *M. officinalis* bitki özütlerinin 48 saatlik HeLa hücre hatlarına uygulanması, kanser hücrelerin canlılığında doza bağlı bir azalmaya neden olmuştur. Etanol ekstraktı için IC_{50} değeri 65,86 µg/mL,kloroform ekstraktı için 52,59 µg/mL olarak belirlenmiştir. Bitki özütünün kloroform içerisinde çözünmesinin etanol çözeltisine göre daha yüksek sitotoksik etki gösterdiği saptanmıştır. Etanol ekstraktı için IC_{50} değeri 377,93 µg/mL, kloroform ekstraktı için 69,24 µg/mL olarak hesaplanmıştır. Etanol ekstraktı daha düşük toksisiteye sahipken, kloroform ekstraktı belirgin antiproliferatif etki oluşturmuştur. Elde edilen veriler, *T. spicata* ekstraktlarının *M. officinalis* ekstraktlarına kıyasla daha güçlü antiproliferatif etki gösterdiğini ortaya koymuştur.

ORAL PRESENTATION

Evaluation of the cytotoxic effects of Hydroxy Methyl Butyrate (HMB) used as an ergogenic Aid

S. Kara-Ertekin,[1*] (*https://orcid.org/0000-0002-7976-7057*)

Abstract

Hydroxy Methyl Butyrate (HMB), a leucine-derived metabolite, is widely used as an ergogenic aid to support and increase muscle mass. While its performance-enhancing effects have been demonstrated, data on its toxicological profile at the cellular level remain limited. This study aimed to evaluate the cytotoxic effects of HMB on various normal and cancerous cell lines to assess its tissue-specific toxicity. Cytotoxicity was assessed in seven cell lines, including normal (L929, HOB, HEK) and cancerous (MCF-7, A549, U87MG, Ishikawa) cells. Cells were exposed to HMB concentrations ranging from 10 µM to 2000 µM for 24 hours. Cell viability was measured using the MTT assay. HMB did not show significant cytotoxic effects on HEK and HOB cells at any concentration. However, L929 cells exhibited a substantial decrease in viability (up to 80%) at higher concentrations. Among the cancer cell lines, MCF-7 and U87MG were sensitive to HMB, showing a 75–80% reduction in viability at concentrations ≥1000 µM, while A549 and Ishikawa cells showed minimal response. Cytotoxic effects were primarily observed at concentrations exceeding typical plasma levels achieved through oral supplementation. HMB demonstrated selective cytotoxicity depending on cell type and concentration. Although HMB appears to be safe at recommended doses, tissue-specific adverse effects may occur if exposure levels exceed physiological norms. These findings provide baseline data to support future molecular studies on the safety profile of HMB.

Keywords: Ergogenic aid, Hydroxy Methyl Butyrate, cytotoxicity, sports supplement

INTRODUCTION

In sports science, dietary ergogenic aids are defined as substances or procedures used to enhance performance and accelerate recovery processes. Although the term 'ergogenic aids' is the most common in the scientific literature for performance-enhancing substances, these products are also known as nutritional or sports supplements. The use of ergogenic aids for both professional and recreational purposes is becoming increasingly common (Lopez-Samanes et al., 2015). Substances used as ergogenic aids include anabolic-androgenic steroids, protein powders, branched-chain amino acids (BCAAs), hydroxy methyl butyrate (HMB), colostrum, glutamine, creatine, carnitine, ginseng, taurine, caffeine, chitosan, and ephedrine (Bayram & Öztürkcan, 2020; Dhar et al., 2005).

Beta-hydroxy beta-methylbutyrate (HMB) is a naturally occurring metabolite of leucine, a well-known anticatabolic amino acid, and it can be produced endogenously in humans and animals. Leucine is a crucial amino acid that plays a regulatory role in muscle metabolism. It acts as a precursor for protein synthesis and energy metabolism. The first step in leucine metabolism is its transformation into α-ketoisocaproate (KIC) through transamination. HMB can then be produced from KIC with the help of a cytosolic enzyme called KIC-dioxygenase. Most of the KIC is broken down by KIC-dehydrogenase, an enzyme found only in mitochondria. Roughly 80% of leucine is typically used for protein synthesis, with the remaining portion being converted to α-KIC. Only a small percentage (about 5%) of leucine is changed into HMB (Baxter et al., 2005; Molfino et al., 2013; Pitchford et al., 2018). The formation of HMB through this pathway relies heavily on hepatic KIC dioxygenase. Following this

pathway, cytosolic HMB is initially converted to cytosolic β-hydroxy-β-methylglutaryl-CoA (HMG-CoA), which can then be directed towards cholesterol synthesis. Another pathway involves the production of isovaleryl-CoA by the enzymatic action of branched-chain ketoacid dehydrogenase (BCKD) on α-KIC in the liver after transamination, followed by the production of HMG-CoA via the HMG-CoA synthase enzyme (Zanchi et al., 2011). Numerous biochemical studies have provided evidence that HMB is primarily converted to HMG-CoA, a cholesterol precursor, in the liver and muscles. Therefore, HMB may serve as a precursor for cellular cholesterol synthesis, particularly in tissues like muscle that rely on de novo cholesterol synthesis (Nissen et al., 2000). The possible role of HMB in protecting against muscle damage caused by contraction activity may be related to increased stability of the muscle plasma membrane and enhanced metabolic efficiency. HMB, converted to hydroxy methylglutaryl-CoA (HMG-CoA) for cholesterol synthesis, affects the electrical properties of the skeletal muscle fiber membrane Additionally, Nissen et al. (Nissen et al., 2000) suggested that HMB might act as a precursor to the structural components of cell membranes by enhancing the repair of the sarcolemma after contraction activity. The effect of HMB supplementation on acute muscle fatigue may also involve an increase in acetyl-CoA content, likely through the conversion of HMG-CoA to acetoacetyl-CoA by HMG-CoA synthase within mitochondria. It has also been shown that HMB supplementation leads to increased ATP and glycogen content in the gastrocnemius muscle. HMB may enhance the tricarboxylic acid (TCA) cycle, increase ATP content, activate the malate-aspartate shuttle, and provide a carbon skeleton for glycogen synthesis. In vitro data also suggest that HMB may support an increase in the oxidation of free fatty acids (FFA) in skeletal muscle. Additionally, HMB supplementation may support an increase in lipid availability due to the enhanced lipolysis. Studies have shown that HMB supplementation for 28 days in rats results in decreased epididymal fat tissue content and is also associated with increased plasma FFA concentrations and enhanced gene and protein expression of hormone-sensitive lipase (HSL) in white adipose tissue. This effect may be attributed to an increase in growth hormone (GH) in response to HMB supplementation, as GH stimulates lipolytic enzymes such as HSL (Pinheiro et al., 2013).

Pharmacokinetic data for HMB indicate that its plasma half-life is approximately 2.5 hours. Around 9 hours after intake, HMB levels in the plasma return to baseline. While some HMB is excreted in the urine, 70-85% is retained in the body for further metabolic processes (Pinheiro et al., 2013). The concentration of HMB in the blood following oral administration depends on the dose and whether it is consumed with other foods (Wilson et al., 2013). The pharmacokinetic data for HMB are provided in Table 1.

Table 1. Pharmacokinetic data of HMB (Pinheiro et al., 2013).

Parameter	1g HMB	3g HMB	3g HMB+ 75 g Glucose
Peak plasma concentration	115nmol/L	~480 nmol/L	~350 nmol/L
Time to peak plasma concentration	2.0 h	1.0 h	1.9 h
Plasma half-time	2.37 h	2.38 h	2.69 h
Accumulation in urine	14 %	29%	27%

Given that the endogenous production of HMB is minimal, a 70 kg individual synthesizes only about 0.2 to 0.4 grams of HMB daily from dietary leucine. HMB is found in foods such as citrus fruits, some fish, and breast milk. However, it is very difficult and impractical to obtain the quantities of HMB used in studies that inhibit proteolysis and promote muscle mass gains through diet alone. Although the liver is the primary site of HMB production and shows high dioxygenase activity, studies have shown that muscles and other tissues also produce small amounts of HMB (Pinheiro et al., 2013). It is thought that stressed or damaged muscle cells may not produce sufficient HMG-CoA to support the cholesterol synthesis needed. Supplemented HMB could serve as an adequate source of HMG-CoA production in such muscle cells to maintain proper cholesterol synthesis and support membrane function and structural integrity. As evidenced by a reduction in the leakage of creatine phosphokinase (CK) from muscle cells after intense exercise, it has been observed that supplemented HMB can significantly reduce muscle damage (Baxter et al., 2005). This feature is an option that can be used not only in athletes but also in pathological conditions where muscle loss occurs. It has been adopted as an alternative supplement by individuals under extreme muscle stress, elderly individuals and patients with diseases associated with muscle loss syndromes such as cachexia

(Pinheiro et al., 2013; Zanchi et al., 2011). The mechanisms by which HMB promotes increases in strength and muscle hypertrophy are thought to include the upregulation of IGF-I gene expression in skeletal muscles, stimulation of protein synthesis via the mTOR signaling pathway, and suppression of proteolysis through inhibition of the ubiquitin-proteasome system (Zanchi et al., 2011). This supplement suppresses protein breakdown during the post-workout recovery phase, allowing only carbohydrates and fats to be burned for energy, which results in an increase in lean body mass (Tokish et al., 2004). Additionally, a critical analysis of HMB conducted by the International Society of Sports Nutrition concluded that chronic HMB consumption is safe for both young and elderly populations (Wilson et al., 2013). Studies support that taking 3g of HMB daily as an ergogenic aid is effective in enhancing recovery, lean body mass, strength, power, and aerobic performance (Pinheiro et al., 2013; Wilson et al., 2013). In a study conducted in accordance with FDA Good Laboratory Practices, rats consuming a diet containing up to 5% HMB-CA for 91 days showed no adverse effects in clinical observations, hematology, clinical chemistry, or organ weights. The study reported observed no-adverse-effect levels (NOAEL) of 3.49 g/kg for male rats and 4.16 g/kg for female rats (Baxter et al., 2005; Wilson et al., 2013). Based on the body surface area correction factors recommended by the United States Food and Drug Administration, these levels correspond to approximately 0.5 g/kg in humans. For a 70 kg individual, this equates to more than 30 g/day, which is over 10 times the recommended dose (Pitchford et al., 2018). In humans, consuming up to 6 g of CaHMB per day has not caused any changes in kidney function, liver function, or hematology. Although these data are compelling and support the safe use of HMB, some aspects of HMB's safety profile have not been published to date (Pitchford et al., 2018). However, there has been very little research on the hematologic, hepatic, renal, or cardiac side effects of HMB. This lack of research raises discussions about the safety of HMB use (Dhar et al., 2005).
This study aims to determine the cytotoxic effects of HMB, an ergogenic aid, on various cell lines including L929 (mouse fibroblast cell line), HOB (human osteoblast cell line), HEK (human embryonic kidney cell line), MCF-7 (human breast cancer cell line), A549 (human lung adenocarcinoma cell line), U87MG (human glioblastoma cell line), and Ishikawa (human endometrial cancer cell line). The data obtained will provide a basis for future molecular studies and help in dose selection related to HMB use.

MATERİALS AND METHODS

Chemicals

3-Hydroxy-3-methylbutyric acid (Cas no. 625-08-1) were purchased from Alfa Aesar (Thermo Scientific). Phosphate-buffered saline (PBS), cell culture medium, and all other supplements were obtained from Multicell Wisent Bio Products (Saint-Bruno, Quebec, Canada) and sterile plastic materials were purchased from NEST (Science Co., Ltd., China).

Cell culture and treatment

To determine the cytotoxic effects of HMB, cell lines L929 (mouse fibroblast), HOB (human osteoblast), HEK (human embryonic kidney cell line), MCF-7 (human breast cancer), A549 (human lung adenocarcinoma), U87MG (human glioblastoma), and Ishikawa (human endometrial cancer) were used, and the cells were obtained from ATCC (American Type Culture Collection, Rockville, MD, USA). The cells were incubated in DMEM containing 10% fetal bovine serum and 1% penicillin-streptomycin, with 5% CO2 at 37°C. Stock solutions of 3-Hydroxy-3-methylbutyric acid (HMB) were prepared in PBS at a concentration of 10 mM, and the cells were exposed to concentrations of 10, 100, 200, 400, 600, 1000, and 2000 µM for 24 hours. The solutions were filtered through 0.22 µm filters.
In pharmacokinetic studies, it was reported that the peak plasma concentration of HMB in its free acid form was approximately 487 µM after a 3 g intake, with 28% of this concentration excreted in the urine. Additionally, plasma concentrations may vary depending on whether it is taken with glucose (Vukovich et al., 2001; Wilson et al., 2013). Based on this, and considering that the recommended daily intake is 1, 3, or 6 g, the dose range used in this study was selected to be between 10 µM and 2000 µM.

Cell viability assay

For the MTT (3- (4,5-dimethylthiazol-2-yl)-2,5-diphenyltetrazolium bromide) assay, cells were seeded at a density of 5 × 104 cells per well in 96-well plates and allowed to adhere overnight. The cells were then exposed to six different concentrations of HMB (10-2000 µM). At the end of the exposure period, 10 µl of MTT solution (5 mg/ml in PBS) was added to each well and incubated in the dark for 4 hours. After the formazan crystals formed by viable

cells were dissolved in DMSO, their absorbance was measured at 570 nm using ELISA multi-well plate reader (Thermo Scientific Multiskan GO), and cell viability was calculated relative to the control.

Statistical analysis

Data from the experimental groups and standard errors of the means (SEM) were evaluated using GraphPad Prism 9.5.1 software (StatSoft Inc.). For statistical analysis, One-Way ANOVA was performed followed by Dunnett's multiple comparisons test. A significance level of $p<0.01$ and $p<0.05$ was used for the evaluation of results.

RESULTS

Effects of HMB on cytotoxicity

The effect of different concentrations of HMB on the survival of three normal cells and four cancer cell measured via MTT assay is shown in Figure 2 and 3. After a 24-hour incubation with six different concentrations of HMB (10-2000 µM), cell viability in normal cells did not exhibit a significant difference in HEK and HOB cell lines compared to untreated cells. However, in L929 cells, there was a significant decrease in cell viability, with a reduction of up to approximately 80% (Figure 2).

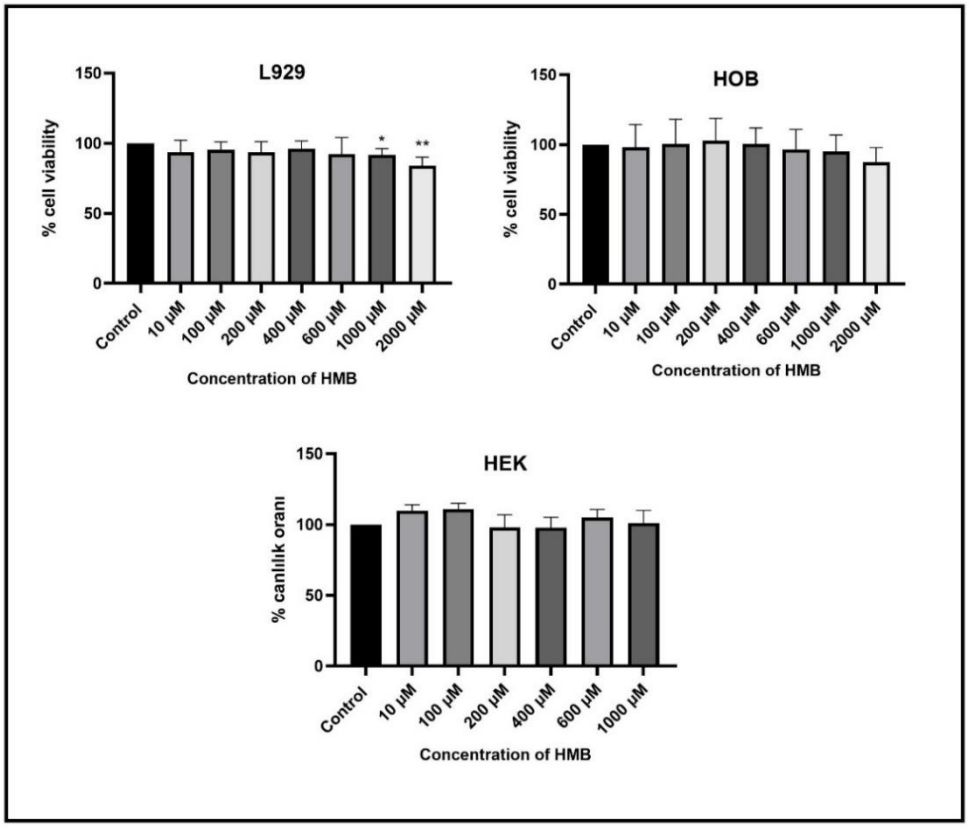

Figure 2. The cytotoxic effect of HMB on L929 (mouse fibroblast), HOB (human osteoblast) and HEK (human embryonic kidney) cells. Each bar denotes the mean (±SEM). HMB indicates β-hydroxy-β-methylbutyrate. Significance at *$p<0.05$, **$p<0.01$, compared with control.

Similarly, the effect of HMB on cell viability in cancer cells was assessed after 24 hours of exposure. A significant decrease in viability, around 75-80%, was observed at 1000 µM concentrations in MCF-7 breast cancer cells and U87MG glioblastoma cells. However, no significant difference was observed in the other investigated cells, including A549 lung adenocarcinoma cells and Ishikawa endometrial adenocarcinoma cells (Figure 3).

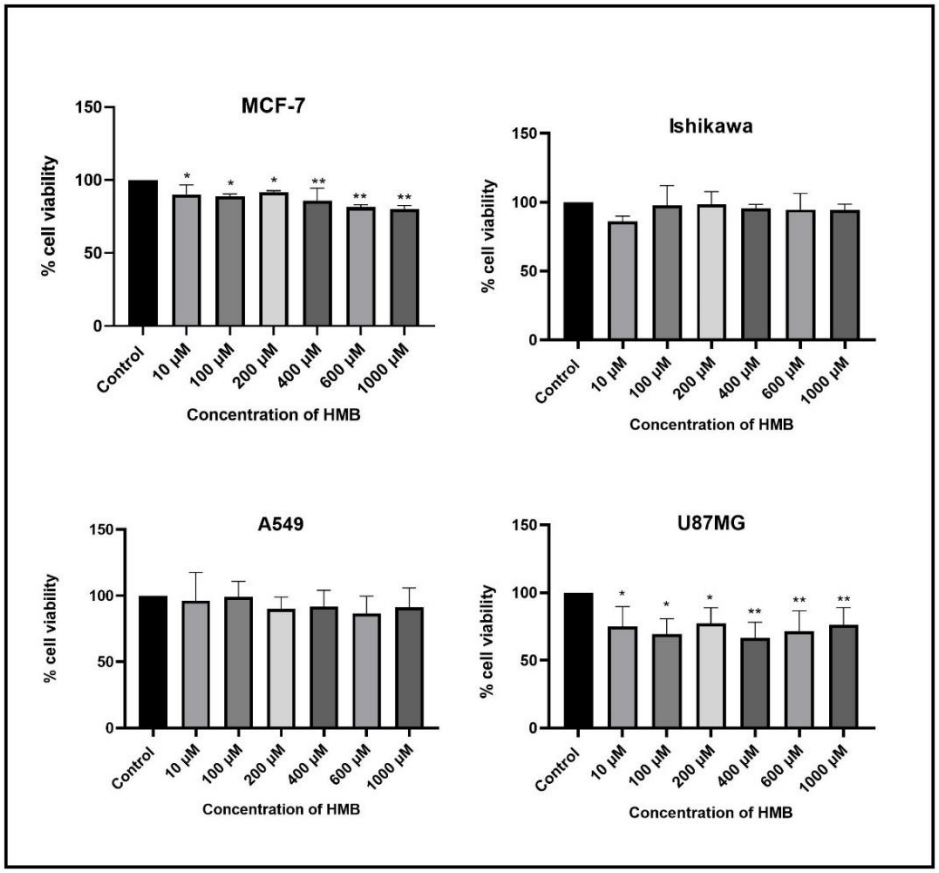

Figure 3. The cancer cells cytotoxicity of HMB. MCF-7 (human breast cancer), A549 (human lung adenocarcinoma), U87MG (human glioblastoma), and Ishikawa (human endometrial cancer) cells were treated with HMB for 24 h. Each bar denotes the mean (±SEM). HMB indicates β-hydroxy-β-methylbutyrate. Significance at *p<0.05, **p<0.01, compared with control.

DISCUSSION

In this study, the cytotoxic effects of Hydroxy Methyl Butyrate (HMB), a widely used ergogenic aid, were evaluated in normal and cancer cell lines using the MTT assay. The data obtained revealed that HMB caused dose-dependent and cell type-specific cytotoxicity, especially at high concentrations. In normal cell lines, HEK (human embryonic kidney) and HOB (human osteoblast) cells maintained high viability at all concentrations after HMB exposure, suggesting that HMB did not cause significant toxicity in these epithelial and bone-derived cells. In contrast, L929 cells (mouse connective tissue cells) showed significant sensitivity with a decrease in viability of up to 80% at higher doses. This discrepancy may be due to both species differences between cells and the higher proliferative activity or metabolic sensitivity of fibroblasts compared to more specialized cells such as osteoblasts (Xia et al., 2008). In the cancer cell group, MCF-7 (breast epithelial adenocarcinoma) and U87MG (glioblastoma) cells were sensitive to HMB and showed a decrease in viability up to 75-80%, while A549 (lung adenocarcinoma) and Ishikawa (endometrial adenocarcinoma) cells showed more resistance. When the results were evaluated according to the tissue origin of the cells; cells of mesenchymal origin (L929) and some epithelial cancer cells (MCF-7) and U87MG cells of nervous system origin appeared to be more sensitive to HMB-induced cytotoxicity. In contrast, cells of renal, pulmonary and osteoblastic origin were found to be relatively resistant.

These findings suggest that tissue-specific metabolic features, such as differences in mitochondrial activity or membrane composition, may influence the cellular response to HMB. The observed sensitivity of U87MG and MCF-7 cells may reflect their higher metabolic demands or unregulated proliferation, making them more vulnerable to metabolic modulators such as HMB.

Importantly, cytotoxic effects were observed at concentrations of 1000 µM and above, while the typical oral dose of HMB of 3 grams per day resulted in the highest plasma concentrations (~487 µM) that were not cytotoxic in any of the human cell lines tested. This finding supports the idea that recommended daily doses of HMB are within safe physiological limits, especially for healthy individuals or athletes using supplements (Vukovich et al., 2001; Wilson et al., 2013). In terms of sports health, the data support the idea that HMB is unlikely to pose a cytotoxic risk at standard supplementation levels, particularly to tissues of kidney, bone, or lung origin. However, the effects observed in certain cancer lines highlight the potential for selective cytotoxicity that could be investigated in future therapeutic repurposing studies.

In conclusion, this study provides a detailed view of the cytotoxic profile of HMB by including a variety of cell types from different tissue origins and highlights the importance of both dose and cellular context in assessing the safety and potential applications of ergogenic supplements.

Abstract

The World Health Organization defines health emergencies as medical events requiring immediate intervention. Hospitals located in tourist areas face increased workload during the tourist season due to the influx of domestic and foreign visitors. This study focuses on the management of health emergencies during the tourist season in a Regional Hospital in Albania, which experiences exceptionally high patient inflows every summer. The aim of the study is to identify effective management challenges, assess existing capacities, and propose improvements in organizational and nursing services during peak tourist periods (Alsomali et al. 2024). The research question guiding this study is: How does the high patient influx affect the quality and effectiveness of health emergency management during the tourist season? A qualitative methodological approach was applied, using a structured questionnaire administered to emergency department staff to collect data on their experiences, perceptions, and needs. The results suggest the necessity for concrete measures, including mandatory staff training, enhanced inter-institutional cooperation, improved emergency protocols, and investments in infrastructure. These actions are essential to ensure a rapid, safe, and efficient response to emergencies during periods of high patient load. In conclusion, the study highlights the urgent need for a clear emergency management strategy during the tourist season, increased staffing levels, improved infrastructure, and the development of specialized protocols. The findings aim to contribute to the improvement of health emergency management in tourist cities and serve as a basis for strategic health policy planning at both local and national levels.

Keywords: emergency management, tourist season, nursing care, patient influx, healthcare system

INTRODUCTION

Coastal and tourist areas face unique challenges in managing health emergencies. Although these regions attract a large number of visitors during the tourist season, they often operate with limited healthcare resources and infrastructure. Consequently, hospitals in such areas are frequently required to handle a sudden and significant increase in emergency cases, including trauma, infectious diseases, cardiac events, gastrointestinal disorders, and incidents related to environmental or weather conditions. (Turcato et al. 2023)

Regional coastal hospitals, situated in high-tourism zones, experience a notable rise in emergency admissions during the summer months. This seasonal surge affects resource management, staff organization, and the ability to deliver timely and effective patient care. In this context, the present study seeks to examine and analyze the existing practices of health emergency management (HEM) in a regional coastal hospital and to identify opportunities for improvement. The primary aim of this study is to assess how health emergencies are managed during the tourist season and to identify methods and practices that can enhance the efficiency and quality of emergency medical services. It further evaluates the challenges

faced by nurses and physicians, with the goal of developing recommendations that can strengthen emergency management and optimize healthcare delivery during peak tourist periods.
The study focuses on three main objectives: (1) to analyze the impact of the tourist season on the management of health emergencies; (2) to identify strategies for improving emergency management during the tourist season; and (3) to review current policies and practices related to emergency care. (Hitzek et al. 2022)
This research is significant for several reasons. First, it provides an opportunity to evaluate and improve how health emergencies are managed in coastal hospitals where patient influx is highly seasonal. Second, it offers practical insights for healthcare professionals—particularly nurses and physicians—by identifying the main challenges they encounter and proposing ways to enhance their working conditions and reduce occupational stress. Finally, the findings of this study have implications for local and national health policy, as they can inform the development of more effective emergency management strategies and resource allocation plans. Ultimately, this research aims to contribute to improving the quality and responsiveness of healthcare services for both local communities and tourists during high-demand periods

MATERIALS AND METHODS:

Methodological Approach

This research employs a mixed-method approach, combining both quantitative and qualitative data collection and analysis. Such a design enables a comprehensive understanding of the factors influencing emergency management and allows for triangulation between statistical evidence and staff perceptions. (Lewis et al. 2023)
The study is empirical, descriptive, and comparative in nature, grounded in both theoretical frameworks of health management and practical data collected from hospital records and staff surveys. The analysis focuses on identifying trends in emergency case frequency, workload variation, and service organization during the tourist season compared to other period*s.*

Study Setting and Period

The research was conducted at a Regional Hospital located in a coastal area of Albania, chosen intentionally for its distinct seasonal fluctuations in patient volume. This hospital serves as a regional referral center, providing emergency services not only to the local urban population but also to surrounding rural communities and a large number of domestic and international tourists during summer. Data collection took place between March and May 2025, using structured questionnaires distributed electronically to the hospital's medical and nursing staff.

Data Collection Instrument

The main research instrument was a structured questionnaire, specifically designed for this study and divided into two sections.
The first section (Questions 1–4) collected demographic data about participants.
The second section (Questions 5–12) focused on issues related to emergency management, including patient waiting times, infrastructure adequacy, workload, and operational challenges during the tourist season.
All questions were closed-ended, using a five-point Likert scale (1–5) to measure participants' perceptions and experiences. The questionnaire was distributed electronically to ensure accessibility, data accuracy, and participant anonymity. This digital approach also facilitated efficient data collection and real-time monitoring of responses.

Data Analysis

Data obtained from the questionnaires were analyzed using descriptive statistical methods with Microsoft Excel. The analysis included calculations of frequencies, percentages, and mean scores, and the results were presented through tables and charts. This allowed for a clear interpretation of the staff's perceptions regarding waiting times, workload intensity, and the overall effectiveness of institutional and organizational management during the tourist season.

Ethics and Confidentiality

In accordance with ethical standards for scientific research, special attention was given to protecting participants' rights and ensuring the confidentiality of collected data. All participating physicians and nurses were clearly informed about the study's purpose, significance, and the use of their responses. Participation was voluntary, and informed consent was obtained electronically from each respondent. No personally identifiable information was collected, ensuring full anonymity and privacy. All responses were used solely for research purposes and analyzed in aggregate form to maintain confidentiality

RESULTS

Table 1: Dermografic datas, age and gender of nursing and medical staff

Age Group	Female (n, %)	Male (n, %)	Total (n, %)
Under 25 years	1 (3.6%)	0 (0%)	1 (3.6%)
25–35 years	6 (21.4%)	5 (17.9%)	11 (39.3%)

Statement	**Strongly Disagree**	**Disagree**	**Neutral**	**Agree**	**Strongly Agree**	**Total**
The hospital provides training for managing emergencies during high patient load periods	1 (3.6%)	2 (7.1%)	12 (42.9%)	13 (46.4%)	0 (0%)	28 (100%)
There are procedures for managing non-resident or foreign patients	2 (7.1%)	1 (3.6%)	3 (10.7%)	20 (71.4%)	2 (7.1%)	28 (100%)
The increase in tourists creates challenges in communication and rapid diagnosis	1 (3.6%)	5 (17.9%)	4 (14.3%)	9 (32.1%)	9 (32.1%)	28 (100%)

CONCLUSIONS AND RECOMMENDATIONS

The study shows that the Regional Hospital effectively maintains the quality of emergency services despite a substantial increase in patient flow during the tourist season. The majority of staff positively evaluated the department's infrastructure, the existence of protocols, and response times, indicating a well-organized and functional system. Nevertheless, certain gaps were identified, particularly the lack of structured training programs for managing high patient volumes and challenges in communication and rapid diagnosis with non-resident and foreign patients. These findings highlight that while the hospital operates reliably under peak conditions, targeted improvements in technical resources, staff training, and patient communication strategies are essential to enhance overall emergency care performance during periods of high tourist activity.

The study recommends developing a seasonal operational plan to ensure adequate staffing, equipment, and flexible shifts during peak tourist months, complemented by regular training for managing high patient volumes and high-risk emergencies. (Walker et al. 2016) Strengthening triage systems, providing multilingual support for foreign patients, and investing in medical infrastructure are essential. Enhancing inter-institutional coordination, promoting community awareness, supporting staff wellbeing, and conducting post-season evaluations will further improve the quality and efficiency of emergency care during the tourist season.

Özet

Bu çalışma, koç testislerinin üç boyutlu (3B) modellenmesinde yüzey matlaştırma işleminin model kalitesi üzerindeki etkisini değerlendirmek amacıyla yürütülmüştür. Mezbahadan temin edilen altı çift testis laboratuvara getirilmiş, serum fizyolojik ile temizlenmiş ve morfometrik ölçümleri yapılmıştır. Örnekler rastgele iki gruba ayrılmıştır: Grup 1'deki testisler herhangi bir yüzey işlemi uygulanmadan, Grup 2'deki testisler ise tüm yüzeylerine matlaştırıcı sprey (3D Mat) uygulanarak taranmıştır. Tüm örnekler optik tarayıcı (Structure Sensor, Occipital Inc.) kullanılarak 0,5 mm çözünürlükte 360° taranmış ve elde edilen .obj dosyaları 3D Builder yazılımında işlenmiştir. Modeller Autodesk Meshmixer yazılımında poligon sayısı, yüzey hatası ve artefakt varlığı açısından analiz edilmiştir. Sonuçlar her iki grup arasında morfometrik ölçümler açısından anlamlı fark olmadığını ($p>0.05$) göstermiştir. Hata sayısı matlaştırıcı uygulanan grupta (6.5 ± 0.2), doğal yüzeyli gruba (7.1 ± 0.7) göre düşük olmakla birlikte fark istatistiksel olarak anlamlı bulunmamıştır ($p>0.05$). Görsel değerlendirmede matlaştırılmış modellerin yüzey yansımalarının azaldığı ve tarama bütünlüğünün daha kararlı olduğu gözlenmiştir. Elde edilen bulgular, yüzey matlaştırma uygulamasının organların 3B modellenmesinde optik yansıma kaynaklı hataları azaltma potansiyeline sahip olduğunu, ancak etkinin istatistiksel olarak anlamlı düzeyde olmadığını göstermektedir. Bu durum, yüzey işlemlerinin karmaşık dokularda daha belirgin fayda sağlayabileceğini düşündürmektedir.

The effect of surface matting on model parameters in 3D modelling of ram testes

Abstract

This study was conducted to evaluate the effect of surface matting on the quality of three-dimensional (3D) models of ram testes. Six pairs of testes obtained from a slaughterhouse were brought to the laboratory, cleaned with physiological saline, and subjected to morphometric measurements. The samples were randomly divided into two groups: Group 1 testes were scanned without any surface treatment, while Group 2 testes were coated with a matte spray (3D Mat) covering the entire surface before scanning. All samples were scanned using an optical scanner (Structure Sensor, Occipital Inc.) at 0.5 mm resolution with 360° rotation, and the obtained .obj files were processed using 3D Builder software. The models were analysed in Autodesk Meshmixer software in terms of polygon count, surface errors, and artifact presence. The results showed no significant difference between the groups in morphometric measurements ($p > 0.05$). The number of surface errors was lower in the matte-coated group (6.5 ± 0.2) compared to the untreated group (7.1 ± 0.7), but the difference was not statistically significant ($p > 0.05$). Visual assessment revealed that the matte-coated models exhibited reduced surface reflections and more stable scanning integrity. These findings indicate that surface matting has the potential to reduce optical reflection-related

errors in the 3D modelling of biological organs, although the effect was not statistically significant. This suggests that surface treatment may provide more evident benefits when applied to complex tissues.

GİRİŞ

Veteriner hekimliği eğitimi, öğrencilerin karmaşık anatomik yapıları üç boyutlu (3B) olarak kavrayabilmelerini gerektiren uygulamalı bir disiplindir. Ancak, geleneksel kadavra temelli eğitim materyalleri; etik kaygılar, biyogüvenlik gereksinimleri, sınırlı örnek erişimi ve uzun vadede doku bozulması gibi çeşitli kısıtlarla karşı karşıyadır (McMenamin ve ark., 2018). Bu nedenlerle son yıllarda, sanal anatomi uygulamaları, 3B biyomodeller gibi alternatif eğitim araçları giderek önem kazanmıştır (Kocyigit ve ark., 2023a). Bu araçlar hem öğrencilerin öğrenme deneyimlerini zenginleştirmekte hem de sürdürülebilir ve etik açıdan uygun eğitim materyalleri sağlamaktadır (Seymour ve ark., 2020; Kocyigit ve ark., 2023b).

Veteriner anatomi eğitiminde testis biyomodelleri, erkek üreme sisteminin morfolojik özelliklerinin anlaşılmasında önemli bir rol oynamaktadır. Gerçek dokuya morfolojik olarak yüksek benzerlik gösteren modeller, testis-epididimis ayrımı, epididimisin kısımları, spermin izlediği yol gibi karmaşık anatomik detayların öğretiminde yüksek görsel doğruluk sağlamaktadır (Kocyigit ve ark., 2021; ve ark., 2013). Bu doğruluk, öğrencilerin topografik anatomi kavrayışını güçlendirerek klinik uygulamalarda palpasyon ve cerrahi beceri gelişimini desteklemektedir.

Organların 3B modellenmesinde çeşitli yöntemler kullanılmaktadır. Bunlar arasında bilgisayarlı tomografi (BT), manyetik rezonans görüntüleme (MRG), optik ve lazer temelli tarama sistemleri öne çıkmaktadır (Li ve ark., 2021). Her yöntemin uzamsal çözünürlük, renk doğruluğu, maliyet ve işlem süresi açısından avantaj ve sınırlılıkları vardır. Özellikle optik tarama yöntemleri, organların dış yüzey morfolojisini yüksek detayda yakalayabilme potansiyeli nedeniyle anatomik modellemelerde yaygınlaşmaktadır. Ancak, bu yöntemlerde parlak veya ıslak yüzeylerin yüksek yansıtıcılığı, sensörlerin doğru derinlik algısını bozarak geometri hatalarına neden olmaktadır (Zheng ve ark., 2022).

Bu sorunun giderilmesi için son dönemde yüzey matlaştırma teknikleri geliştirilmiştir. Organ yüzeylerine uygulanan matlaştırıcı sprey veya pudra tabakaları, yansıma kaynaklı optik hataları azaltmakta ve tarayıcının ışık geri yansımasını homojenleştirerek nokta bulutu kalitesini artırmaktadır (Rebner ve ark., 2020). Bu yaklaşım, özellikle nemli ve düzensiz yüzeyli biyolojik dokuların taranmasında model bütünlüğünü koruma açısından kritik öneme sahiptir.

Bu çalışmanın amacı, koç testis dokularının 3B modellenmesinde yüzey matlaştırma işleminin model kalitesi üzerindeki etkisini değerlendirmektir. Çalışmanın hipotezi, organ yüzeylerine uygulanan 3D Mat gibi matlaştırıcı ajanların, ıslak doku yüzeylerine kıyasla yansımaları azaltarak optik tarama kalitesini ve buna bağlı olarak elde edilen 3B modelin geometrik doğruluğunu artırdığı yönündedir. Bu hipotezin test edilmesi, veteriner anatomi eğitiminde kullanılacak biyomodellerin üretiminde standartlaştırılmış tarama protokollerinin geliştirilmesine katkı sağlayacaktır.

MATERYAL VE METOT

Testislerin Hazırlanması ve Deneme Gruplarına Ayrılması

Bu çalışmada, toplam altı çift koç (Ovis aries) testisi, mezbahada kesim sonrasında elde edilmiştir. Testisler, kesimi takiben en fazla 30 dakika içinde laboratuvara getirilmiştir. Numuneler oda sıcaklığında tutulmuş, serum fizyolojik (0,9% NaCl) ile nazikçe yıkanarak yüzeydeki kan, pıhtı ve sekresyon kalıntılarından arındırılmıştır. Daha sonra, testisi çevreleyen tunika vajinalis tabakası makas yardımıyla uzaklaştırılmıştır. Her testis için morfometrik ölçümler (uzunluk, genişlik ve çevre) dijital kumpas (±0,01 mm hassasiyet) kullanılarak gerçekleştirilmiştir.

Morfometrik ölçümlerin ardından testisler rastgele yöntemle iki deneme grubuna ayrılmıştır. Birinci grupta yer alan testislere (n = 6) modelleme öncesinde herhangi bir yüzey işlemi uygulanmamış, doğrudan tarama sehpasına yerleştirilmiştir. İkinci grup testislere (n = 6) ise optik tarama öncesinde, organın tüm yüzeyini eşit şekilde kaplayacak biçimde matlaştırıcı sprey (3D Mat, Aesub®) uygulanmıştır. Uygulama, homojen kaplama sağlamak amacıyla 20–25 cm mesafeden, 10 saniyelik püskürtme aralıklarıyla gerçekleştirilmiştir.

Testislerin 3B Modellenmesi

Her bir testisin üç boyutlu (3B) hacimsel verileri optik tarayıcı (Structure Sensor; Occipital Inc., San Francisco, ABD) kullanılarak elde edilmiştir. Tarama işlemleri, sabit bir platform üzerinde 360° döndürme yöntemiyle yapılmış; 0,5 mm çözünürlükte veri setleri elde edilmiştir. Elde edilen yüzey verileri, Object dosya formatında (.obj) kaydedilerek bilgisayar ortamına aktarılmıştır.

Model Verilerinin Analizi

Her iki grupta elde edilen 3B modeller, Autodesk Meshmixer yazılımı (Autodesk Inc., ABD) aracılığıyla analiz edilmiştir. Modeller, referans organlarla morfometrik ölçüler bakımından karşılaştırılmıştır. Ayrıca her iki gruba ait 3B modeller yüzey kalitesi, poligon sayısı ve artefakt (bozulmuş veya hatalı yüzey alanı) varlığı açısından birbirleriyle karşılaştırılmıştır. Yüzey düzgünlüğü görsel olarak incelenmiş, poligon sayısı otomatik olarak yazılım tarafından raporlanmıştır. Artefakt sayısı manuel inceleme ile belirlenmiştir.

İstatistiksel Analiz

Her iki gruba ait sayısal veriler için ortalama ve standart sapma değerleri hesaplanmıştır. Gruplar arasındaki farkın istatistiksel anlamlılığı Student t testi ile değerlendirilmiştir. İstatistiksel analizler IBM SPSS Statistics (v.25.0; IBM Corp., Armonk, NY, ABD) yazılımı kullanılarak gerçekleştirilmiş ve anlamlılık düzeyi $p < 0,05$ olarak kabul edilmiştir.

BULGULAR

Referans testislerin ortalama uzunluğu 81.37 ± 5.4 mm, genişliği ise 22.07 ± 2.8 mm olarak ölçülmüştür. Üç boyutlu modellemeye tabi tutulan gruplar arasında morfometrik ölçümler açısından anlamlı fark saptanmamıştır ($p > 0.05$). Doğal yüzeyli (matlaştırılmamış) testis modellerinde ortalama uzunluk 79.23 ± 4.4 mm, genişlik 20.12 ± 1.7 mm; matlaştırıcı uygulanan testis modellerinde ise uzunluk 80.92 ± 3.5 mm ve genişlik 21.61 ± 3.5 mm olarak belirlenmiştir.

Model kalitesi açısından değerlendirildiğinde, optik tarama sonrasında elde edilen 3B verilerde her iki grup arasında yüzey bütünlüğü bakımından sayısal fark gözlenmiş olsa da bu fark istatistiksel olarak anlamlı bulunmamıştır ($p > 0.05$). Doğal yüzeyli grupta ortalama hata (artefakt) sayısı 7.1 ± 0.7 iken, matlaştırıcı uygulanan grupta bu değer 6.5 ± 0.2 olarak kaydedilmiştir.

Tablo 1. Testis modellerinin morfometrik verileri ve hata sayıları

	nn	**Uzunluk mm**	**Genişlik mm**	
Referans testisler	112	81.37 ± 5.4	22.07 ± 2.8	Hata sayısı
Grup 1 (Natural) testis modelleri	66	79.23 ± 4.4	20.12 ± 1.7	7.1 ± 0.7
Grup 2 (Matlaştırılan) testis modelleri	6	80.92 ± 3.5	21.61 ± 3.5	6.5 ± 0.2

$p>0.05$

TARTIŞMA

Bu çalışmada, koç testislerinin üç boyutlu (3B) modellenmesinde yüzey matlaştırma işleminin tarama kalitesi üzerindeki etkisi değerlendirilmiştir. Optik tarama yöntemi, referans dokuların morfolojik özelliklerinin yüksek çözünürlükte dijitalleştirilmesine olanak tanıyan, invaziv olmayan bir tekniktir. Ancak ıslak ve parlak organ yüzeyleri, tarayıcı sensörlerde aşırı yansımalara ve buna bağlı olarak tarama eksikliklerine neden olmaktadır (Zheng ve ark., 2022). Bu nedenle yüzey matlaştırma uygulamaları, yansımayı azaltmak ve model geometrisinin bütünlüğünü korumak amacıyla önerilmektedir (Rebner ve ark., 2020).

Elde edilen sonuçlar, matlaştırıcı uygulanan testis modellerinde hata (artefakt) sayısının sayısal olarak daha düşük olduğunu, ancak bu farkın istatistiksel olarak anlamlı olmadığını göstermiştir ($p>0.05$). Bu bulgu, yüzey matlaştırma işleminin tarama sürecinde bir miktar iyileşme sağladığını ancak örnek sayısının sınırlı olması nedeniyle anlamlı düzeyde farklılık oluşturmadığını düşündürmektedir. Benzer biçimde, Furtner (2020) ve Li ve ark., (2021) tarafından yapılan çalışmalar da yüzey optik özelliklerinin tarama kalitesini etkilediğini, fakat nem oranı, doku homojenliği ve ışık açısının da sonucu önemli ölçüde belirlediğini bildirmiştir. Morfometrik ölçümler, referans testislerle modellenmiş testisler arasında anlamlı fark göstermemiştir. Bu durum, 3B tarama sisteminin temel geometrik doğruluğunu koruduğunu ve organ boyutlarının dijital modele doğru biçimde aktarıldığını ortaya koymaktadır. Diğer yandan testis dokusunun parlak yapısına rağmen 3B tarayıcı ile 0,5 mm çözünürlükte kabul edilebilir düzeyde modelleme yapılabilmiştir. Bu durum, uygun tarama mesafesi ve sabit ışık koşullarının doğru şekilde ayarlanmasının, matlaştırma uygulaması kadar belirleyici olduğunu göstermektedir. Ayrıca, matlaştırıcı ajanların doku yüzeyinde kalın tabaka oluşturması olası mikro-doku detaylarının kaybına neden olabileceğinden, uygulama miktarının standardize edilmesi önemlidir.

Elde edilen bulgular matlaştırıcı sprey kullanımının 3B modelleme sürecinde optik hataları azaltabileceğini, ancak bu etkinin belirgin düzeyde istatistiksel fark yaratmadığını ortaya koymaktadır. Bu durum, yüzey işlemlerinin özellikle karmaşık organlarda daha belirgin fayda sağlayabileceği hipotezini destekler niteliktedir.

Koç testislerinin 3B modellenmesinde yüzey matlaştırma işlemi, optik tarama sürecinde yansıma kaynaklı veri kayıplarını azaltma eğilimi göstermiştir. Matlaştırıcı uygulanan grupta hata sayısı daha düşük olmasına rağmen fark istatistiksel olarak anlamlı bulunmamıştır ($p > 0.05$). Bu bulgu, tarama kalitesinin yalnızca yüzey optik özelliklerinden değil, tarayıcı çözünürlüğü, örnek konumlandırması ve çevresel ışık koşullarından da etkilendiğini göstermektedir. Veteriner hekimliği eğitiminde kullanılacak biyomodellerin geliştirilmesinde, yüzey matlaştırma uygulamalarının organlarda tarama kalitesini artırabileceğini değerlendirmekteyiz.

Özet

Bu çalışma, Amasya ili Suluova ilçesinde 109 sütçü sığırda süt verimi ile suni tohumlama sonrası gebelik oranı arasındaki ilişkiyi incelemiştir. Gebe ineklerin süt verimi 17.9 ± 4.6 L/gün, gebe kalmayanların ise 20.3 ± 5.2 L/gün olarak bulunmuştur. Gruplar arası fark anlamlıdır ($p < 0.05$). Süt verimi ile gebelik durumu arasında negatif bir korelasyon ($r = -0.28$) saptanmıştır. Bulgular, yüksek süt veriminin döl verimini olumsuz etkileyebileceğini göstermektedir.

Anahtar Kelimeler: Süt sığırcılığı, süt verimi, suni tohumlama, gebelik

The Relationship Between Milk Yield and Post-Insemination Pregnancy Rate in Dairy Cows

Abstract

This study investigated the relationship between milk yield and post-insemination pregnancy rate in 109 dairy cows in Suluova, Amasya. Pregnant cows produced 17.9 ± 4.6 L/day of milk, while non-pregnant cows produced 20.3 ± 5.2 L/day. The difference was significant ($p < 0.05$). A negative correlation ($r = -0.28$) was found between milk yield and pregnancy status, indicating that higher milk production may adversely affect fertility.

Keywords: Dairy, milk yield, artificial insemination, pregnancy

GİRİŞ

Süt sığırcılığı, hayvancılık sektörünün ekonomik sürdürülebilirliği ve verimliliği açısından temel üretim dallarından biridir. Başarılı bir süt sığırcılığı işletmesinde hem yüksek süt verimi hem de yeterli dölverimi elde edilmesi gerekmektedir. Süt verimi, genetik potansiyel, beslenme, çevresel koşullar ve yönetim uygulamalarıyla belirlenirken; döl verimi, ineklerin yeniden gebe kalma yeteneği, buzağılama aralığı ve hizmet başına gebelik oranı gibi parametrelerle değerlendirilir (LeBlanc, 2010). Bu iki üretim parametresinin birlikte optimize edilmesi hem ekonomik hem de biyolojik açıdan büyük önem taşımaktadır.

Bununla birlikte, çok sayıda araştırma süt verimi ile döl verimi arasında genetik ve metabolik düzeyde negatif bir ilişki bulunduğunu ortaya koymuştur (Walsh ve ark., 2010; Bello ve ark., 2012). Yüksek süt verimli ineklerde laktasyonun erken döneminde belirginleşen negatif enerji dengesi, ovaryum aktivitesinin gecikmesine, östrus belirtilerinin zayıflamasına ve gebelik oranlarının azalmasına neden olmaktadır (Nebel ve ark., 1993). Bu durum, enerji dengesi bozukluğu ile ilişkili hormonal düzensizliklerin (örneğin insülin, IGF-1, LH dalgalanmaları) üreme fizyolojisini baskılamasıyla açıklanmaktadır (Walsh ve ark., 2010). Ancak bazı araştırmacılar bu ilişkinin yalnızca fizyolojik değil, aynı zamanda yönetimsel faktörlerden de etkilendiğini, özellikle yüksek verimli sürülerde östrus tespit hataları ve besleme dengesizliklerinin rol oynadığını bildirmiştir (LeBlanc, 2013).

Suni tohumlama (ST), modern süt sığırcılığı işletmelerinde genetik ilerlemeyi hızlandıran, bulaşıcı hastalık riskini azaltan ve sürü yönetimini kolaylaştıran bir üreme teknolojisidir (Cardoso Consentini ve ark., 2021). Ancak ST'nin başarısı, yalnızca sperma kalitesi veya uygulama tekniğine değil; aynı zamanda ineğin fizyolojik durumu, metabolik dengesi ve süt verim düzeyine de bağlıdır (Hamid ve ark., 2021). Özellikle yüksek süt verimli ineklerde ovulasyon zamanlamasında kaymalar, uterus ortamında pH değişimleri ve implantasyon başarısında azalmalar görülebilmektedir (Inchaisri ve ark., 2010; Rutten ve ark., 2016). Bu faktörler, hayvan başına gebelik oranlarını düşürerek suni tohumlamanın etkinliğini sınırlayabilir.

Bu nedenle saha koşullarında süt verimi ile suni tohumlama sonrası gebelik oranı arasındaki ilişkinin incelenmesi hem fizyolojik hem de yönetimsel düzeyde üretim stratejilerinin geliştirilmesi açısından önem taşımaktadır. Bu çalışmanın amacı, farklı süt verim düzeylerine sahip ineklerde suni tohumlama sonrası gebelik oranlarını karşılaştırarak, süt üretimi ile döl verimi arasındaki ilişkinin saha koşullarındaki pratik yansımalarını değerlendirmektir.

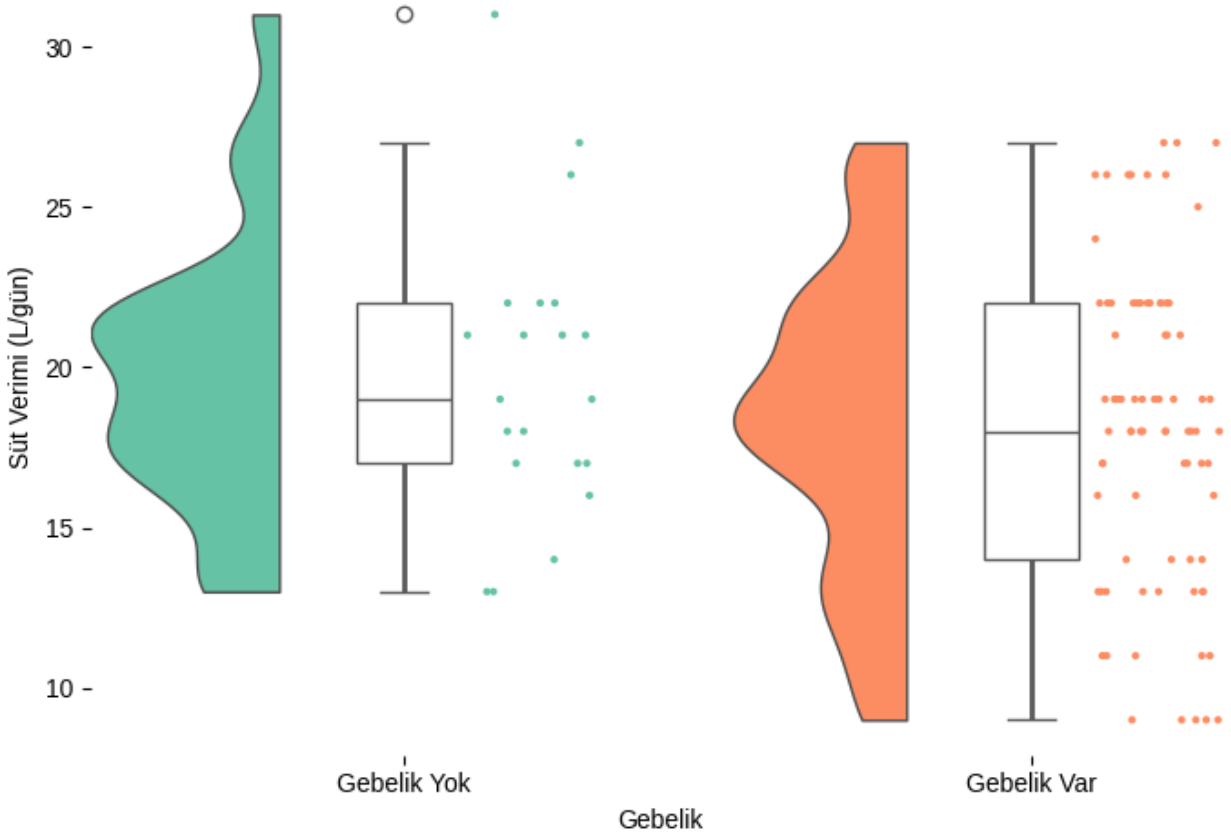
MATERYAL VE METOT

Bu araştırmada materyali, Amasya ili Suluova ilçesinde faaliyet gösteren 18 işletmede kayıtları düzenli tutulan toplam 109 baş sütçü sığıra ait suni tohumlama (ST) ve süt verimi verileri oluşturmuştur. Çalışmaya dahil edilen hayvanlar, benzer bakım, besleme ve barınak koşullarında yetiştirilmiş olup, veriler 2024 yılı üretim dönemine aittir. Araştırmada incelenen veriler Amasya Damızlık Sığır Yetiştiricileri Birliğinden temin edilmiştir.

Suni tohumlama uygulamaları, işletmede görevli veteriner hekim tarafından rektovajinal yöntemle gerçekleştirilmiş; tohumlama tarihleri, kullanılan sperma bilgileri ve gebelik sonuçları kayıt altına alınmıştır. Gebelik durumu, tohumlamadan yaklaşık 60 gün sonra yapılan rektal muayene ile belirlenmiştir. Süt verimi verileri ise günlük kayıtlar temel alınarak bireysel ortalama süt üretimi litre cinsinden hesaplanmıştır.

Elde edilen verilerin istatistiksel değerlendirmesinde parametrik test yöntemleri kullanılmıştır. Gebelik durumu (1 = gebe, 0 = boş) ile süt verimi arasındaki farkın belirlenmesinde bağımsız iki örneklem t-testi uygulanmıştır. Bu analiz, gebelik elde eden ve etmeyen gruplar arasındaki ortalama süt verimlerinin istatistiksel olarak farklı olup olmadığını belirlemek amacıyla yapılmıştır. Gruplar arası süt verimi değerleri ortalama ± standart sapma biçiminde ifade edilmiştir.

Ayrıca, gebelik durumu ile süt verimi arasındaki ilişkinin yönü ve gücünü ortaya koymak için Pearson korelasyon analizi kullanılmış, buna göre korelasyon katsayısı (r) hesaplanmıştır. Analizlerde anlamlılık düzeyi $p < 0.05$ olarak kabul edilmiştir.



Tüm istatistiksel hesaplamalar IBM SPSS Statistics 22.0 paket programı kullanılarak gerçekleştirilmiştir. Verilerin normal dağılım varsayımı Kolmogorov–Smirnov testi ile doğrulanmış, varyans homojenliği ise Levene testi ile kontrol edilmiştir.

BULGULAR

Araştırmada incelenen toplam 109 sütçü sığıra ait suni tohumlama ve süt verimi verilerinin değerlendirilmesi sonucunda, 86 hayvanda suni tohumlama sonrası gebelik tespit edilmiştir. Gebe ineklerin günlük ortalama süt verimi 17.9 ± 4.6 L/gün, gebe kalmayan ineklerin ise 20.3 ± 5.2 L/gün olarak belirlenmiştir. Genel ortalama süt verimi tüm popülasyon için 18.4 ± 4.8 L/gün olarak hesaplanmıştır.

Gruplar arası farkın istatistiksel olarak anlamlı olup olmadığını belirlemek amacıyla yapılan bağımsız iki örneklem t-testi sonucunda, süt verimi ile gebelik durumu arasında anlamlı bir fark saptanmıştır ($p < 0.05$). Buna göre, gebelik elde edemeyen ineklerin süt verimi ortalaması, gebe kalanlara göre anlamlı derecede daha yüksek bulunmuştur.

Süt verimi (sürekli değişken) ile gebelik durumu (ikili değişken) arasındaki ilişkiyi belirlemek için yapılan Pearson korelasyon analizi sonucunda r = –0.28 değeri elde edilmiştir.

Şekil 1. Sığırlarda gebelik durumu ile süt verimi arasındaki ilişki

TARTIŞMA

Bu çalışmada, Amasya ili Suluova ilçesinde bulunan sığırcılığı işletmelerinde 109 inekten elde edilen suni tohumlama ve süt verimi verileri incelenmiş, süt verimi ile gebelik oranı arasındaki ilişki değerlendirilmiştir. Bulgular, süt verimi yüksek olan ineklerde suni tohumlama sonrası gebelik oranının anlamlı derecede düşük olduğunu göstermiştir. Gebe ineklerin ortalama süt verimi (17.9 ± 4.6 L/gün), gebe kalmayanlara (20.3 ± 5.2 L/gün) kıyasla istatistiksel olarak daha düşük bulunmuş ($p = 0.0035$). Ayrıca, süt verimi ile gebelik durumu arasında negatif yönlü, zayıf düzeyde bir korelasyon ($r = –0.28$) belirlenmiştir. Bu bulgu, literatürde bildirilen süt verimi ile döl verimi arasındaki antagonistik ilişkinin saha koşullarında da gözlendiğini doğrulamaktadır.

Süt verimi ve döl verimi arasındaki negatif ilişki, uzun yıllardır süt sığırcılığı genetiği ve fizyolojisi alanında tartışılan temel bir konudur. Bu ilişkinin kökeninde çoğunlukla negatif enerji dengesi (NED), metabolik stres ve hormonal bozukluklar yer almaktadır. Laktasyonun erken döneminde, yüksek süt verimi potansiyeline sahip ineklerde enerji gereksinimi alım kapasitesini aşmakta, bu durum vücut yağ rezervlerinin mobilizasyonuna yol açmaktadır. Yüksek süt veriminde plazmada yağ asitleri (NEFA) ve β-hidroksibutirat (BHBA) düzeyleri yükselirken, insülin ve IGF-1 düzeyleri azalmakta; bu biyokimyasal

değişiklikler ovaryum fonksiyonlarını olumsuz etkilemektedir (Walsh ve ark., 2010; Bello ve ark., 2012). Özellikle folikül gelişimi ve ovulasyon süreci, negatif enerji dengesi koşullarında baskılanmakta, luteal fonksiyon zayıflamakta ve embriyonik kayıplar artmaktadır (LeBlanc, 2010).

Bulgularımız, yüksek süt veriminin üreme performansını olumsuz etkilediğini bildiren önceki araştırmalarla büyük ölçüde paralellik göstermektedir. Nebel ve ark. (1993), yüksek süt verimli Holstein ineklerde gebelik oranlarının düşük süt verimli akranlarına göre belirgin şekilde azaldığını; bununla birlikte bu ilişkinin sadece fizyolojik değil, yönetimsel etkenlerle de pekiştiğini bildirmiştir. Benzer şekilde, Inchaisri ve ark. (2010) yüksek süt veriminin ilk tohumlamada gebelik olasılığını azalttığını ve enerji dengesiyle ilişkili metabolik belirteçlerin bu süreçte önemli rol oynadığını vurgulamıştır. Rutten ve ark. (2016) ise süt verimi ile suni tohumlama başarısı arasında istatistiksel olarak anlamlı negatif korelasyon tespit etmiş, bu ilişkinin doğrusal bir modelle öngörülebilir olduğunu belirtmiştir. Bu çalışmalarla uyumlu olarak, mevcut çalışmada da yüksek süt verimi grubundaki ineklerin gebelik oranı anlamlı biçimde daha düşük bulunmuştur.

Yüksek süt verimi düzeyinin döl verimi üzerindeki olumsuz etkilerinin bir diğer açıklaması, östrus davranışlarının bastırılması ve tespit güçlüğüdür. Yüksek süt üretimi, artan metabolik hız nedeniyle steroid hormonlarının (özellikle östradiol ve progesteron) dolaşımdan daha hızlı uzaklaştırılmasına neden olur (Walsh ve ark., 2010). Bu durum östrus süresinin kısalmasına, belirti şiddetinin azalmasına ve sonuç olarak östrus tespit oranlarının düşmesine yol açar. Yanlış zamanlamayla yapılan suni tohumlamalar ise fertilizasyon başarısını düşürür (Cardoso Consentini ve ark., 2021). Çalışmamızda da gebelik oranı düşük bulunan ineklerin süt verim ortalamasının yüksek olması, bu mekanizmayı destekler niteliktedir.

Bununla birlikte, süt verimi ile üreme performansı arasındaki bu olumsuz ilişkinin mutlak olmadığı, yönetimsel faktörlerle hafifletilebileceği literatürde vurgulanmıştır. LeBlanc (2013), yüksek verimli sürülerde uygun vücut kondisyon skoru yönetimi, enerji yoğunluğu yüksek rasyonlar ve metabolik sağlık izleme protokollerinin uygulanmasının üreme verimliliğini koruyabildiğini belirtmiştir. Aynı şekilde Hamid ve ark. (2021), besleme yönetimi, tohumlama zamanı optimizasyonu ve stres faktörlerinin azaltılmasının yüksek süt verimi koşullarında döl verimini desteklediğini bildirmiştir. Bu bağlamda, mevcut çalışmanın saha koşullarında yapılmış olması, elde edilen bulguların pratik geçerliliğini artırmaktadır.

Korelasyon analizinde elde edilen r = –0.28 değeri, ilişkinin yönünün negatif, ancak gücünün zayıf düzeyde olduğunu göstermektedir. Bu durum, süt verimi tek başına gebelik başarısını belirleyen bir faktör olmadığını; enerji dengesi, hormonal profil, tohumlama zamanı, sperma kalitesi, çevresel stres ve yönetim uygulamaları gibi çok sayıda faktörün üreme başarısına katkıda bulunduğunu düşündürmektedir (Bello ve ark., 2012; Rutten ve ark., 2016). Bu nedenle, yüksek süt verimli sürülerde döl verimi düşüşünü önlemek için çok boyutlu bir yönetim stratejisinin benimsenmesi gereklidir.

Sonuç olarak, bu çalışma yüksek süt verimi ile suni tohumlama sonrası gebelik oranı arasında anlamlı düzeyde negatif bir ilişki bulunduğunu göstermektedir. Bulgular, süt verimi arttıkça üreme performansının belirli bir sınırda gerileyebileceğini, ancak bu etkinin uygun sürü yönetimiyle azaltılabileceğini ortaya koymaktadır. Enerji dengesi yönetimi, östrus tespiti doğruluğunun artırılması ve besleme stratejilerinin optimize edilmesi hem üretim hem de üreme verimliliğini birlikte koruyabilmek açısından kritik önem taşımaktadır.

TEŞEKKÜR

Araştırma verilerine sorunsuz ulaşmamıza sağlayan Amasya Damızlık Sığır Yetiştiricileri Birliği'ne ve veteriner hekim Cem Çağdaş ARKÖSE'ye teşekkür ederiz.

Özet

Doğal boyalar, tekstil endüstrisinde yenilikçi ve sürdürülebilir kaynaklar olarak giderek daha fazla önem kazanmaktadır. Bu çalışmada, Giresun Şebinkarahisar yöresinden temin edilen ceviz (*Juglans regia* L.) yaprakları, pamuklu kumaşların boyanmasında biyomordan olarak farklı konsantrasyonlarda (%5, %10 ve %20) kullanılmıştır. Boyama işlemleri, doğal boya kaynağı *Rubia tinctorium* ile üç farklı konsantrasyonda (%10, %20 ve %30) gerçekleştirilmiştir. Biyomordan ve boya konsantrasyonlarındaki değişimlerin kumaşların renk özellikleri üzerindeki etkileri sistematik olarak incelenmiştir. Numunelerin renk ölçümleri CIELAB renk uzayı (L*, a*, b*), renk doygunluğu (C*), renk tonu açısı (h°) ve renk derinliği (K/S) değerleri üzerinden değerlendirilmiştir. Ayrıca, sürtme haslığı testleri uygulanmış ve sonuçlar ISO 105-X12 standardı kapsamında değerlendirilmiştir. Elde edilen sonuçlar, hem boya hem de biyomordan konsantrasyonlarındaki değişimin renk derinliği ve ton üzerinde belirgin etkiler yarattığını göstermiştir. Artan *Rubia tinctorium* konsantrasyonu ile birlikte K/S ve C* değerlerinde artış gözlenmiş; renkler daha koyu ve doygun hale gelmiştir. Tüm numunelerde elde edilen haslık değerleri kabul edilebilir düzeydedir. Bu bulgular, ceviz yaprağı ekstraktının çevre dostu ve sürdürülebilir bir biyomordan olarak pamuklu kumaşların doğal boyanmasında etkin biçimde kullanılabileceğini ortaya koymaktadır.

Anahtar Kelimeler: Doğal Boyama, Biyomordan, sürdürülebilir tekstiller

The Use of Biomordant from *Juglans regia* L. Leaves in Sustainable Dyeing

Abstract

Natural dyes are becoming increasingly important as innovative and sustainable resources in the textile industry. In this study, walnut (Juglans regia L.) leaves sourced from the Giresun Şebinkarahisar region were used as a biomordant at different concentrations (5%, 10%, and 20%) for dyeing cotton fabrics. Dyeing processes were carried out with the natural dye source Rubia tinctorium at three concentrations (10%, 20%, and 30%). The effects of varying biomordant and dye concentrations on the colour properties of the fabrics were systematically investigated. Colour measurements of the samples were evaluated based on the CIELAB colour space (L*, a*, b*), colour saturation (C*), hue angle (h°), and colour depth (K/S) values. In addition, rubbing fastness tests were conducted, and the results were evaluated according to the ISO 105-X12 standard. The results showed that changes in both dye and biomordant concentrations had significant effects on colour depth and hue. An increase in Rubia tinctorium concentration was accompanied by an increase in K/S and C* values; the colours became darker and more saturated. The fastness values obtained for all samples were acceptable. These findings demonstrate that walnut leaf extract can be effectively used as an environmentally friendly and sustainable biomordant for the natural dyeing of cotton fabrics.

Keywords: Natural Dyeing, Biomordant, Sustainable Textiles

Introduction

The Industrial Revolution has made people's lives and livelihoods more appealing worldwide through the adoption of sustainability and the use of advanced technologies and products. Among these advanced technologies and products, textiles play an important role in national economies. People have used natural dyes in textiles since prehistoric times. Natural dyes can be obtained from the roots, stems, and leaves of plants, from insects, or from minerals. Synthetic dyes were discovered in 1856. Synthetic dyes have significant potential for industrial applications due to their ease of application and cost-effectiveness. With the increased use of synthetic dyes across various sectors, people gained easier access to products with a wide variety of colour options. However, many researchers have observed that the wastewater released during the preparation and finishing stages negatively affects water quality and soil fertility. Furthermore, a World Bank study reports that the textile dyeing industry is responsible for up to 20% of global water pollution, as 13–45% of all dyes used in dyeing or printing are released into the environment through wastewater. It has been observed that people have contracted various diseases such as cancer and asthma due to this wastewater, which contains many chemicals. In recent years, due to growing environmental awareness and increasing interest in sustainable products, the toxicity of synthetic dyes, their non-biodegradability, and the serious health risks they pose have become a global concern. In addition, the fact that natural dyes are obtained from sustainable sources, have a low chemical reaction effect, and are environmentally friendly has encouraged people to use textile products dyed with natural dyes again (Prabhu et al., 2012; Korkmaz et al., 2023; Ibrahim et al., 2025; Khatun et al., 2025).

Today, mordants are used to ensure that natural dyes bind more permanently and to enhance the colour tone. Metal salts are generally preferred as mordants. However, the use of these mordants can also pose environmental hazards. Therefore, the use of biomordants as an alternative to traditional metal mordants is increasingly popular (Kılınç et al., 2025).

Juglans regia leaves, which have a high tannin content, phenolic compounds, and antioxidant properties, are a suitable alternative for use as a biomordant. The phenolic compounds in walnut leaves interact with the hydroxyl groups on the fibre surface, facilitating easier binding of natural dyes. Therefore, it is known that walnut derivatives have the potential to be used as biomordants due to their rich tannin content (İşmal, 2017; Kılınç et al., 2025).

In this study, cotton/polyester fabrics mordanted with Juglans regia at different concentrations were dyed with Rubia tinctorium (root dye) at various concentrations, and their colour characteristics and fastness values were examined. It is thought that the use of *Juglans regia* and *Rubia tinctorium* for sustainable green technologies could be a high-potential alternative in the textile industry.

MATERIAL and METHOD

Cotton/polyester (75/25) twill woven fabric was used in the studies. Table 1 shows that the fabric properties.

Table 1. Fabric properties

Properties	Cotton/Polyester(75/25%)
Fabric construction	Plain weave 1/1
GSM (g/m²)	110
Ends per inch (cm⁻¹)	24
Picks per inch (cm⁻¹)	16
Warp count (Nm)	30
Weft count (Nm)	60

Mordanting Process

As part of the study, a pre-mordanting process was applied to woven fabrics. For the mordanting process, three concentrations of walnut leaf (*Juglans regia*) biomordant were used: 5%, 10%, and 20%. The amount of mordant was determined according to the fabric weights. The flotte ratio in the mordanting process was 1:100.

Dyeıng Process

Dye (*Rubia tinctorium*) concentrations were calculated based on fabric weight and applied at three levels during the dyeing process: 10%, 20%, and 30%. The fabrics were dyed at 100°C for 30 minutes. The dyeing was performed using pure water at a 1:30 flotte ratio. After dyeing, the fabrics were washed sequentially in cold water, boiling water, and cold water to remove any undyed dye.

Colour Measurement

Colour measurements of painted fabric samples were performed using the LS175 colorimeter. Measurements were taken under a D65 light source and 10° standard observer conditions.

The % reflectance (R) values in the visible range (400–700 nm) were obtained and converted to colour strength (K/S) values using the Kubelka–Munk equation (Equation 1).

$$K/S = (1-R)^2 / 2R \quad (1)$$

In addition to colour intensity measurements, the CIELAB colour coordinates of the samples have been determined. In this context, L* (lightness: 0 = black, 100 = white), a* (positive = red, negative = green), and b* (positive = yellow, negative = blue) values were measured; additionally, the C* (chroma, 0 = dull, 100 = vivid) parameter was used to evaluate colour saturation.

Fastness Tests

Rubbing fastness tests were performed on dyed fabrics. Fastness tests were conducted in accordance with ISO 105-X12 standards.

RESULTS and DISCUSSION

The colour values of the samples are presented in Table 2. Examination of the L* values shows that the dyeing process reduces this value. Regarding lightness, the use of mordant generally does not cause a change, except in samples containing 30% dye, where mordant reduces lightness values. The a* values indicate that the red hue in the samples increases compared to the standard fabric. The use of mordant in the sample containing 30% dye also results in an increased red hue. This value is similar at other concentrations. The b* values show an increase in the yellow hue compared to the raw fabric, and mordanting does not significantly affect the yellow hue overall. Chroma values increase compared to the raw fabric, and the use of mordant slightly increases these values in some samples, but no significant difference is observed.

Looking at the colour wheel in Figure 1, it can be seen that the raw fabric is in region 3 (orange-yellow), while the dyed samples are in region 2 (red-orange).

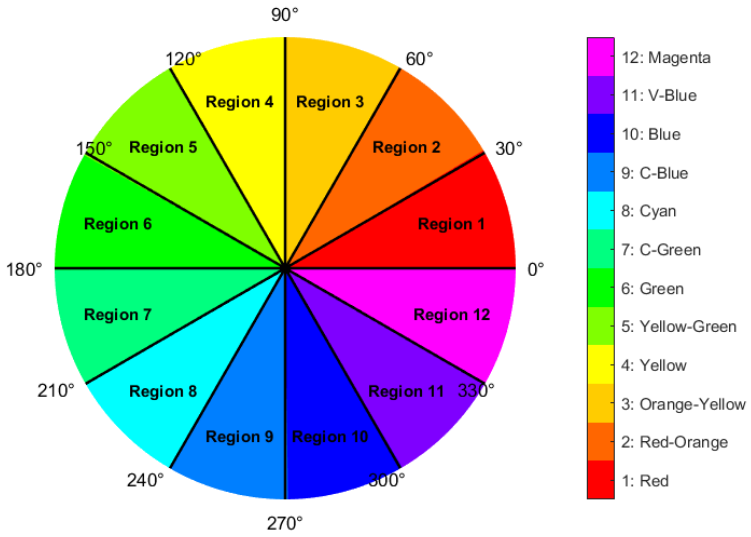

Figure 1. Colour Wheel

An increase in the K/S values of the samples is observed after dyeing. The use of mordant does not cause much change in the K/S values in general, except for samples with 30% dye used, as seen in Table 2 and Figure 2.

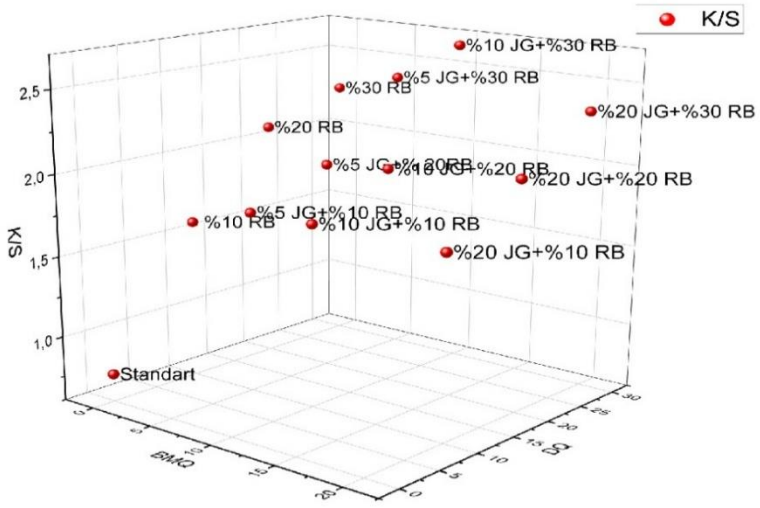

Figure 2. Relationship between K/S, biomordant quantity (BMQ) and dye quantity (DQ)

The fastness values of the samples are given in Table 3. When examining the dry rubbing fastness, it is seen that the values range between 4 and 4-5. In general, the dry rubbing fastness of the samples is similar. The wet rubbing fastness values are 1 degree lower than the dry fastness values. Wet rubbing fastness values range between 3 and 3-4. Wet rubbing fastness values also show similarity in general terms.

CONCLUSION

In sustainable textile dyeing, colouring fabrics using entirely natural resources is highly important. In this study, the positive effects of using Juglans regia as a biomordant, notable for its rich tannin and phenolic compound content, have been observed. As the concentration of *Rubia tinctorium* dye increased, colour yield and saturation also increased. The use of the biomordant contributed positively to colour depth, especially at high dye concentrations. Rubbing fastness results are acceptable. Overall, this study indicates that using *Juglans regia* as a biomordant produces successful results and that an effective natural dyeing process is achieved when combined with *Rubia tinctorium*. This study may provide scientific guidance for future research on sustainable textile dyeing using waste-based natural resources.

Abstract

Photocapacitors integrate solar energy yield and storage processes into single device, which offers a promising option for efficient and sustainable solar energy utilization. In this study, tin (II) sulfide (SnS) was synthesized via facile co-precipitation method and used as the photoelectrode active material for photoacapacitor applications. The crystal structure and surface morphology of the synthesized samples were examined by X-ray Diffraction (XRD) and scanning electron microscopy (SEM) analysis, respectively. The electrochemical energy storage performance of the photoelectrodes was then investigated both in the dark and under solar light irradiation. Photoelectrochemical measurements revealed that light irradiation provided noticeable enhancement in the specific capacitance of ITO/SnS photoelectrode. The ITO/SnS photoelectrode exhibited the specific capacitance of 10.4 mF cm^{-2} at the current density of 0.03 mA cm^{-2} under light illumination. As a result, this study presents a novel perspective for highly effective photo-responsive active materials for photocapacitors.

Keywords: tin (II) sulfide, photoelectrodes, photocapacitors, energy storage.

INTRODUCTION

The excessive fossil fuel consumption driven by rapid population growth and the requirement for worldwide economic progress has resulted in the scarcity of traditional energy sources, global warming and a great deal of crucial environmental and health problems (Kansal et al., 2023). As a vital sustainable technology, solar energy can be converted into electricity through solar cells; however, variability in solar intensity limits a consistent supply, thereby decreasing reliability. Thus, to overcome this limitation, the combination of solar cells and energy storage systems has been regarded as a practical approach that provides to enhance their effectiveness for commercial applications. Photocapacitors are newly developed devices capable of directly harvesting and storing solar energy directly (Kajana et al., 2022, Sangaraju et al., 2023). Among several metal chalcogenide materials, tin (II) sulfide (SnS) is particularly remarkable because it is composed of earth-abundant elements, is eco-friendly and offers efficient light absorption with suitable optical energy band gap (E_g) of 1.3 eV (Caoet al., 2021). Furthermore, SnS displays outstanding pseudocapacitive behavior due to the high redox activity and higher conductivity (Dar et al., 2023). Tariq et al. synthesized Cu-doped SnS thin films to evaluate their potential as solar cell materials for photovoltaic applications (Tariq et al., 2023). In the study of Thong Ho et al., the SnS thin films were prepared by the vapor transport deposition technique and they reported increase in solar cell power conversion efficiency from 0.11% to 2% (Ho et al., 2022). In addition, Dar et al. synthesized SnS structures with hydrothermal method and achieved noticeable specific capacitance (Dar et al., 2022). In another work, Ni-doped SnS electrodes were fabricated for supercapacitor applications. The achieved specific capacitance of the electrode was 47 F g^{-1} at the scan rate of 10 mV s^{-1}, indicating the superior charge storage capability (Dar et al., 2023). Considering these findings, the present study aims to

investigate the synthesis of SnS structures and examine the charge storage capacity under solar light irradiation for photocapacitor applications.

MATERIALS AND METHODS

Synthesis of SnS powder and preparation of ITO/SnS photoelectrodes

To synthesize SnS via simple precipitation method, tin (II) chloride ($SnCl_2$) and sodium sulfide nonahydrate ($Na_2S.9H_2O$) were used as tin and sulfur sources, respectively. First, 0.32 g of $SnCl_2$ was dissolved in deionized (DI) water, and the pH was adjusted to 2.5. Separately, 0.81 g of $Na_2S.9H_2O$ was dissolved in DI water, and both solutions were stirred for 30 min. After that, the $Na_2S.9H_2O$ solution was mixed with $SnCl_2$ solution and heated to 80 °C under stirring for 1h. Then, the mixture was cooled down, and the precipitate was washed with DI water and ethanol, followed by vacuum drying at 40 °C for 12 h. Prior to the drop-casting process, indium tin oxide (ITO) substrates were ultrasonically cleaned with acetone, ethanol and DI water. The synthesized SnS powder was dispersed in DI water to prepare a suspension, which was used for photoelectrode preparation. For the drop-casting method, a five-cycle deposition process was carried out. After each cycle, the photoelectrodes were dried. Finally, the fabricated photoelectrodes were annealed at 250 °C for 1 h.

Material characterization and electrochemical/photoelectrochemical measurements

X-ray diffraction (XRD) analysis of the as-fabricated samples was employed using a Siemens D5000 (2θ range from 10° to 80°). Morphology of the sample was studied using scanning electron microscopy (SEM, FEI Nova 200, 10 kV).

Electrochemical experiments were conducted in a three-electrode-cell system by Metrohm Autolab. The electrochemical cell composed of an ITO (1x1 cm^2) working electrode, a Pt counter electrode and an Ag/AgCl reference electrode. All electrodes were immersed in a 1.0 M Sodium sulfate (Na_2SO_4) aqueous electrolyte. Cyclic voltammetry (CV) tests were applied to study the reversibility of the fabricated electrodes while galvanostatic charge–discharge (GCD) analyses were employed to determine their specific capacitance (C_s). For photoelectrochemical experiments, the CV and GCD tests were further performed in the presence of solar light illumination using an Ossila Solar Simulator (1000 W m^{-2}).

The C_s of the electrode was calculated using the following equation (Budaket al., 2022):

$$C_s = \frac{(I \times \Delta t)}{(\Delta V \times A)} \quad (1)$$

where C_s states the specific capacitance (F cm^{-2}), I is the discharge current (A), Δt is the discharge time (s) and A is the area of ITO (cm^2).

RESULTS and DISCUSSION

Phase composition and morphology of as-synthesized SnS structures were characterized by XRD and SEM analyses, respectively. As presented in Fig. 1a, the XRD pattern of SnS displayed characteristic diffraction peaks corresponding to the (201), (111), (410), (511) and (512) planes, observed at 2θ values of 26.3, 31.5, 39.2, 51.2, and 64.9°, respectively. All the diffraction peaks are in good agreement with the standard JCPDS card No. 01–073-1859 (Khademalrasool et al., 2023) corresponding to orthorhombic phase of SnS. Fig. 1b illustrates a typical SEM image of the as-prepared SnS powder, which shows primary particles in the order of <100 nm, forming larger secondary particles involving plenty of interconnected nanoparticles. Agglomeration of this type is commonly observed in aqueous synthesis, where no specific surface passivating molecules, or surfactants have been used, as in this case.

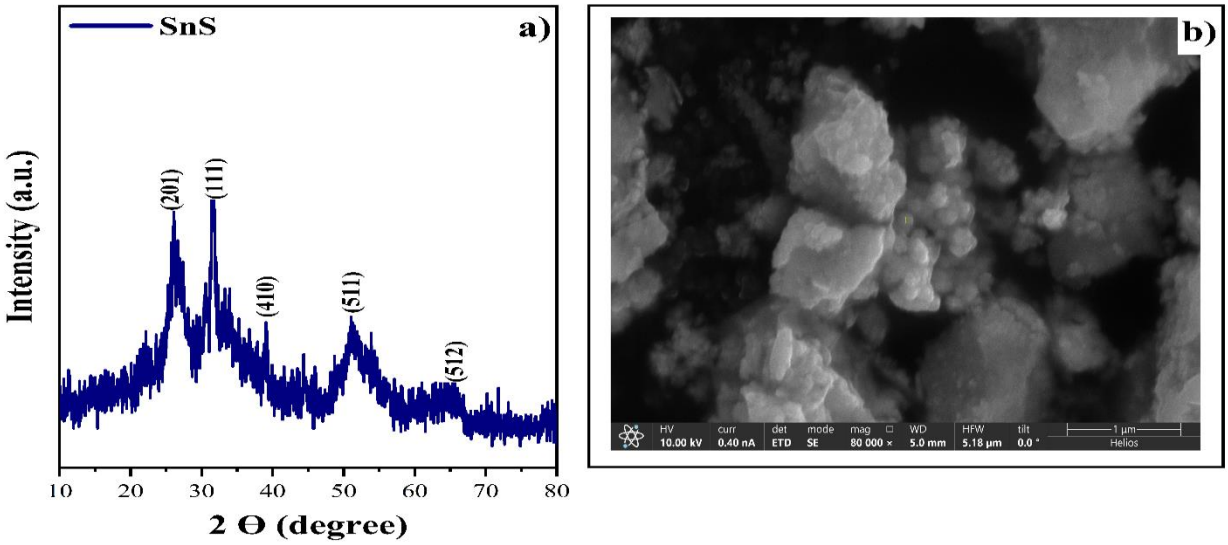

Figure 1. Characterization of as-synthesized SnS nanopowder: **a)** powder XRD pattern, and **b)** SEM micrograph.

Cyclic voltammetry (CV) and galvanostatic charge/discharge (GCD) measurements were both performed under both solar light irradiation and dark conditions in a standard three-electrode system to clarify the effect of light on capacitive behavior. The three-electrode system was constructed of an ITO/SnS working electrode, a Pt wire counter electrode and Ag/AgCl reference electrode. Photoelectrochemical properties and charge storage efficiency of the ITO/SnS photoelectrode are presented in Fig. 2. The enclosed CV area of the ITO/SnS was larger under light illumination than that of dark conditions, implying a higher specific capacitance (Fig. 2a). Under exposure to light, higher peak currents were recorded, and a more reversible redox response was clearly noticed. These results could be attributed to increased electroactivity arising from high-energy photoelectrons generated under light illumination (Huang et al., 2022). Fig. 2b depicts the CV profiles of the ITO/SnS photoelectrode at several scan rates changing from 10 to 150 mV s^{-1} within the potential window of -0.2 to 0.2 V vs. Ag/AgCl under light irradiation. As the scan rates increased, no distinct change was observed in the CV curves, suggesting good reversibility. As shown in Fig. 2c, a longer discharge time was detected under light irradiation compared to dark conditions, which supports the CV findings. The specific capacitance of the ITO/SnS reached 10.4 mF cm^{-2} at a current density of 0.03 mA cm^{-2} in the presence of light, whereas it was estimated 4.1 mF cm^{-2} in the dark. Thus, the capacitive performance was enhanced by 2.5-fold under light irradiation. In Fig. 2d, all GCD curves displayed a comparable triangular shape with increasing current density, demonstrating the characteristic capacitive charge storage mechanism. Furthermore, almost symmetric GCD plots at various current densities revealed that the ITO/SnS photoelectrode possessed favorable rate capability (Momeni et al., 2022).

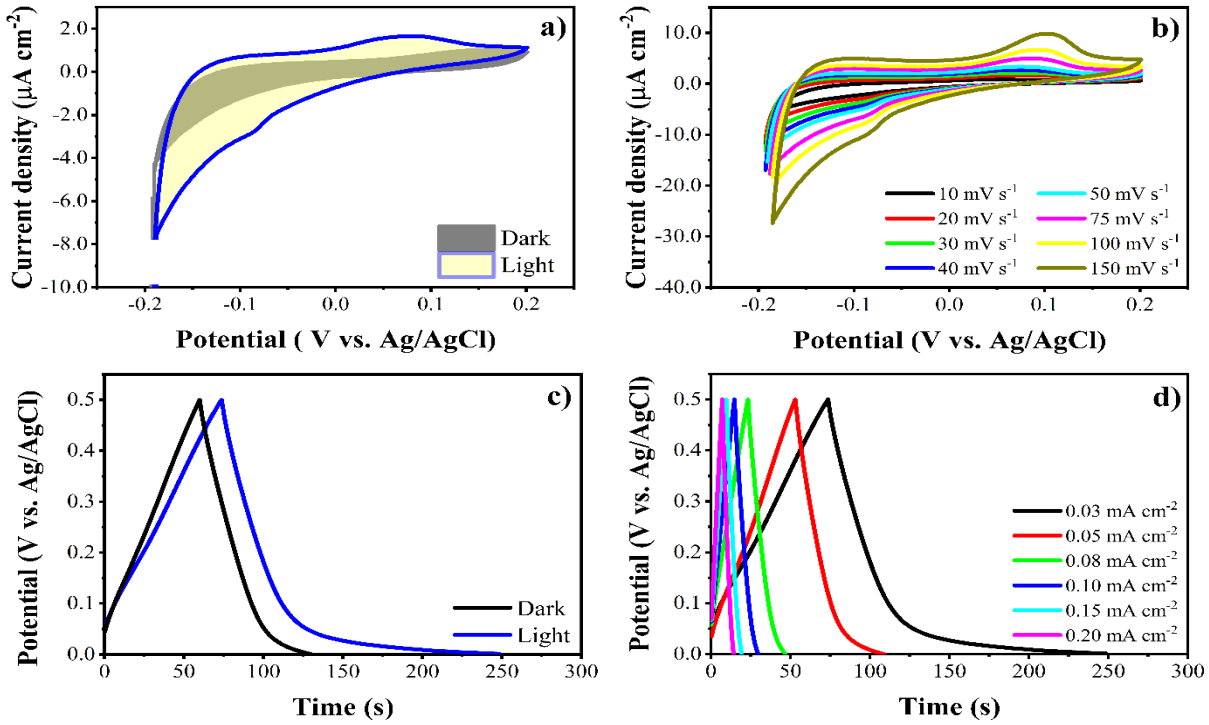

Figure 2. a) CV curves at a scan rate of 20 mV s^{-1}, **b)** CV profiles at various scan rates ranging 10 to 150 mV s^{-1} in the presence of light, **c)** GCD curves at a current density of 0.03 mA cm^{-2}, d) GCD profiles at different current densities ranging 10 to 150 mV s^{-1} in the presence of light.

CONCLUSION

In summary, SnS particles were successfully synthesized and deposited on the ITO surface using a drop casting technique followed by annealing for novel photocapacitor applications. The crystal structure and morphological properties of the synthesized SnS powder were characterized by XRD and SEM, respectively. Photoelectrochemical performance tests were conducted in 1.0 M Na_2SO_4 electrolyte solution under solar light illumination. This facilitated ion diffusion and charge transfer, leading to an increase in the photoactive behavior of the ITO/SnS photelectrode. The recorded CV profile at various scan rates showed that the SnS films exhibited redox charge storage mechanism. According to GCD tests, the ITO/SnS photoelectrode delivered an improved specific capacitance of 10.4 F g^{-1} at a current density of 0.03 mA cm^{-2} under light irradiation compared to its performance in the dark. In conclusion, this work highlights the potential of SnS as a photoactive material for future photocapacitor applications.

Abstract

Abiotic stress factors such as heat and drought are among the most detrimental environmental challenges affecting global tomato (*Solanum lycopersicum*) production. These stressors disrupt cellular homeostasis, trigger oxidative stress, and inhibit metabolic processes critical for early development. This study investigates the modulatory role of smoke-derived compound karrikin 1 (KAR1) on gene expression patterns in tomato seedlings subjected to simultaneous heat and drought stress. Four experimental treatments were applied: control (G1), KAR1 pre-treatment (G2), stress (G3), and KAR1 + stress (G4). While germination data were excluded from this version, molecular analysis revealed substantial transcriptional activation of *CAT*, *SOD*, *SlWRKY31*, *ERF84*, and *NHX1* genes under stress. KAR1 pre-treatment under stress attenuated these upregulations, suggesting a regulatory priming effect that enhances adaptability without excessive energy demand. These findings position KAR1 as a natural signaling molecule capable of fine-tuning stress responses and promoting sustainable approaches to crop resilience.

Keywords: Karrikin, abiotic stress, Solanum lycopersicum, gene expression, antioxidant response.

INTRODUCTION

Abiotic stresses such as high temperature and drought are key constraints limiting crop productivity, especially in arid and semi-arid regions. In tomato (*S. lycopersicum* L.), these stressors impair germination, root elongation, photosynthesis, and reproductive processes. The dual impact of heat and drought creates a synergistic stress condition that disrupts the antioxidant defense system and alters gene expression networks controlling stress perception and tolerance.

The increasing frequency of heat waves and prolonged droughts caused by global climate change has prompted research into environmentally friendly plant bioregulators that can enhance resilience. Karrikins (KARs) are butenolide compounds released from burning plant material that have drawn attention for their dual roles in seed germination and stress adaptation (Flematti et al., 2004; Nelson et al., 2012). KAR1, the most potent member of this family, interacts with the *KARRIKIN INSENSITIVE2* (KAI2) receptor and F-box protein MAX2, initiating a signaling cascade that overlaps with strigolactone and abscisic acid (ABA) pathways (Waters et al., 2017). These interactions result in transcriptional modulation of stress-responsive genes and improved oxidative stress management.

Recent studies demonstrate that KAR1 enhances plant tolerance to drought by increasing enzymatic antioxidant activity (e.g., superoxide dismutase, catalase, peroxidase) and osmolyte accumulation (Sun et al., 2020). Similarly, *Arabidopsis thaliana* exposed to KAR1 exhibits controlled activation of drought-inducible genes, preventing excessive metabolic cost under mild stress (Li et al., 2017). However, research focusing on combined heat and drought stress remains scarce, especially in tomato cultivars known for stress sensitivity. This study provides the first gene-level assessment of KAR1-induced modulation under simultaneous abiotic stresses, offering mechanistic insight into molecular priming effects.

MATERIALS AND METHODS

Tomato cultivar 'Celebrity' was used for its well-characterized heat and drought sensitivity. Four experimental groups were established: G1 (Control), G2 (KAR1, 10 µM), G3 (Heat + Drought Stress), and G4 (KAR1 + Stress). KAR1 was applied by soaking seeds in 10 µM solution for 12 hours before planting. Seedlings were grown in peat:vermiculitesubstrate (3:2, w/w) under 23°C/18°C (day/night), 16-hour photoperiod, and 70% relative humidity. Stress was applied at 38°C/26°C with 30% humidity for 72 hours, combined with irrigation withholding to simulate drought (Table 1).

Table 1. Experimental design of treatment groups for germination analysis

Groups	**Karrikin**	**Distilled Water**	**Heat+Drought Stress**
G1 – Control	-	5 mL	-
G2 – Karrikin	+		-
G3 – Stress	-	2,5 mL	+
G4 – Karrikin + Stress	+		+

Leaf samples were flash-frozen in liquid nitrogen and homogenized for total RNA extraction using TriZol reagent (Invitrogen, USA) and purified with Direct-zol RNA MiniPrep Kit (Zymo Research, USA). RNA integrity was confirmed by agarose gel electrophoresis and A260/A280 ratios (1.9–2.1). cDNA synthesis was performed using the High-Capacity cDNA Reverse Transcription Kit (Applied Biosystems, USA) following manufacturer's instructions.

qRT-PCR analyses targeted five genes: *CAT*, *SOD*, *SlWRKY31*, *ERF84*, and *NHX1*, with *Actin* as reference. Reactions were run in triplicate using RealQ SYBR Green Master Mix (Ampliqon, Denmark) on a Bio-Rad CFX96 system. Thermal cycling conditions were 95°C for 15 min, followed by 40 cycles at 95°C (20 s), 60°C (20 s), and 72°C (20 s). Melting curves confirmed amplicon specificity. Relative expression was calculated using the $2^{-\Delta\Delta Ct}$ method (Livak & Schmittgen, 2001). Data were analyzed by one-way ANOVA ($p < 0.05$) using Python libraries *numpy*, *scipy*, and *statsmodels*.

RESULTS and DISCUSSION

Heat and drought stress caused pronounced transcriptional activation of oxidative stress-related and regulatory genes in tomato seedlings. In the stress-only group (G3), *CAT* and *SOD* expression increased nearly 16-fold, confirming the central role of reactive oxygen species (ROS) scavenging enzymes in early stress response. *SlWRKY31* and *ERF84* were also highly upregulated, indicating strong activation of transcriptional networks involved in osmotic and heat shock signaling. Similarly, *NHX1*, responsible for vacuolar Na+/H+ antiport, exhibited a 10-fold induction, suggesting enhanced ion homeostasis and osmoprotection (Table 2).

Table 2. Relative expression levels ($2^{-\Delta\Delta Ct}$ ± SD) of selected stress-related genes in tomato seedlings under different treatment conditions. Expression was normalized to the *actin* reference gene and calculated using the ΔΔCt method, with the control group (G1) as the calibrator (relative expression = 1.00). Values represent mean ±standard deviation of three biological replicates. Treatments include control (G1), KAR1 pre-treatment without stress (G2), stress without KAR1 (G3), and KAR1 pre-treatment under stress (G4).

Gene	G1	G2	G3	G4
CAT	1.0 ± 0.1	1.23 ± 0.1	16.0 ± 0.82	4.0 ± 0.22
SOD	1.0 ± 0.09	1.15 ± 0.13	16.0 ± 1.34	4.59 ± 0.45
SlWRKY31	1.0 ± 0.07	1.15 ± 0.12	16.0 ± 1.15	4.0 ± 0.28
ERF84	1.0 ± 0.07	1.15 ± 0.1	11.31 ± 1.05	2.83 ± 0.28
NHX1	1.0 ± 0.06	1.23 ± 0.12	9.85 ± 0.76	2.46 ± 0.26

In contrast, the KAR1 + stress group (G4) exhibited moderated expression for all genes: *CAT* (4.0-fold), *SOD* (4.6-fold), *SlWRKY31* (4.0-fold), *ERF84* (2.8-fold), and *NHX1* (2.5-fold) (Fig 1). This controlled induction reflects KAR1's priming capacity—preparing cellular defense without overstimulation. KAR1 likely facilitates ROS detoxification and membrane stabilization by modulating signal transduction through the KAI2-MAX2 axis, which regulates hormonal crosstalk between ABA and gibberellin pathways (Nelson et al., 2016).

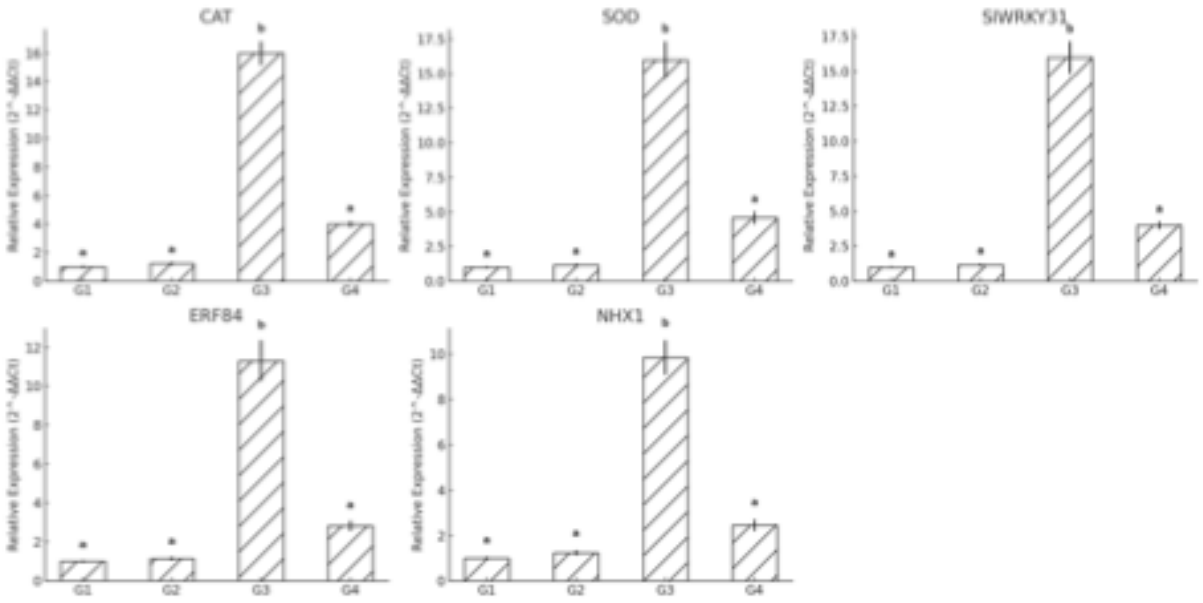

Figure 1. Relative expression levels ($2^{-\Delta\Delta Ct}$ ± SD) of selected stress-responsive genes in tomato seedlings under different treatments. The expression of five genes CAT, SOD, SlWRKY31, ERF84, and NHX1 was measured via qPCR using Actin as the reference gene and the control group (G1) as the calibrator. Treatments include G1 (control), G2 (KAR1-only), G3 (stress-only), and G4 (KAR1 + stress). Values are means ±standard deviation (n = 3). Different letters above bars indicate significant differences among treatments for each gene ($p < 0.05$, one-way ANOVA with Tukey's post hoc test). The data show strong induction under combined stress (G3), and moderated expression in KAR1-treated stressed seedlings (G4), highlighting the regulatory effect of KAR1

Comparable studies in *Avena fatua*, *Arabidopsis*, and wheat confirm that KAR1-treated plants display enhanced antioxidant enzyme activity and improved tolerance to dehydration and high temperature (Gupta et al., 2022; Saini et al., 2023). The ability of KAR1 to regulate *WRKY* and *ERF* transcription factors highlights its role in modulating stress memory and adaptive plasticity—traits critical for climate-resilient agriculture.

CONCLUSION

This study demonstrated that KAR1 acts as an effective molecular modulator of stress-responsive gene expression in tomato under combined heat and drought stress. KAR1 pre-treatment mitigated excessive gene activation, maintaining metabolic stability and promoting efficient oxidative stress management. These findings suggest that KAR1 can be developed as a sustainable biostimulant for enhancing plant resilience under multifactorial environmental stresses.

Future research should focus on identifying downstream transcriptional regulators of the KAR1 signaling cascade, exploring interactions with phytohormones such as ABA and ethylene, and evaluating field-level effects of KAR1-based treatments for tomato and other economically important crops.

Abstract

In recent years, interest in the use of naturally occurring bioactive compounds as alternatives to synthetic additives and chemical drugs has increased. Clove oil is considered a natural option in the food preservative, pharmaceutical, and cosmetic industries. GC-MS analyses have revealed the presence of various phenolic and terpenic compounds that support the therapeutic potential of clove oil. The positive effects of these compounds on human health have made clove oil an important tool for food supplements and natural therapeutic methods. In this study, Clove (Syzygium Aromaticum) was extracted using a Supercritical Extraction System (SFE). The products obtained from this SFE extraction were analyzed for their essential oil components using Gas Chromatography-Mass Spectrometry (GC-MS). Clove oil (Syzygium aromaticum) is a valuable herbal product known for its rich phenolic compound content and widely used in traditional medicine. Studies using Gas Chromatography-Mass Spectrometry (GC-MS) analyses have shown that eugenol, the primary component of clove oil, is present in high concentrations (70-90%). In addition, other bioactive compounds such as β-caryophyllene, acetyl eugenol, and humulene also contribute to the pharmacological effects of clove oil

Keywords: Supercritical Extraction System (SFE), Clove (Syzygium Aromaticum), Gas Chromatography-Mass Spectrometry (GC-MS)

INTRODUCTION

Clove (Syzygium aromaticum) is a versatile plant known as both a spice and a flower. Clove buds (Syzygium aromaticum), used as a spice, originated in Indonesia and are widely used in cuisines around the world for their strong aroma. They offer numerous health benefits. They aid digestion, alter the structure of the digestive system, have analgesic effects, and may help regulate blood sugar. The buds of Syzygium aromaticum, commonly known as cloves, have been used in traditional medicine for various purposes for many years (Khader et al., 2014). Beyond modern medical science, certain symbols and services have been maintained in traditional medicine in Far and Middle Eastern countries for many years. These include gum disease, oral diseases, digestive disorders, moderate well-being, respiratory diseases, inflammatory diseases, rheumatic pain, initiation, blood problems, and skin diseases (Arunava et al., 2018). Tincture obtained from clove buds is reported to be used in the treatment of toothaches, mouth sores, digestive problems, and generally respiratory diseases and rheumatic pain. A few drops of clove oil mixed with honey is taken internally for vomiting and indigestion, and the oil is used externally as an antiseptic and painkiller for skin diseases and wounds (Cortés-Rojas et al., 2014). Usage in Dentistry: Thanks to its eugenol content, clove oil is used to quickly relieve toothaches. Studies have shown that gels containing 20-30% clove oil relieve dental pain intermittently within 15 minutes (Markowitz et al., 1992). Regular use has been observed to reduce swelling and pain (Kim et al., 2013). Bacterial and Fungal Infections: Eugenol is effective against bacteria such as S. Aureus and E. Coli. It also prevents the dissolution of fungi such as Candida albicans (Chaieb et al., 2007). Oral Health: As a gargle, it constricts the mouth (Pinto et al., 2009). Blood Sugar Regulation: It has been observed that it lowers fasting blood sugar in patients with type 2 diabetes (Selles et al., 2020). Fights Free Radicals: It has a high ORAC value (10,700 µmol TE/g) and is effective in preventing heart damage (Prasad et al., 2005). Asthma and Bronchitis: They breathe by dilating the bronchi (Pandey et al., 2024). Stomach Ulcer and Indigestion: It balances stomach acids and prevents the proliferation of H. Pylori bacteria (Maggini et al. 2024). Effects on Alzheimer's and Memory: Clove oil has protective properties for the nerves. It can be used as a treatment in many centers as a natural healing source (Zhang et al., 2017).

MATERIALS AND METHODS

A supercritical fluid is the physical state of a substance at or above its critical temperature and pressure. In this state, the fluid combines the diffusion properties of a gas with the solvent properties of a liquid. The most commonly used supercritical fluid is carbon dioxide (CO_2) (because it is environmentally friendly, non-toxic, and inexpensive). As shown in Figure. 1, Clove (Syzygium Aromaticum) was extracted using a supercritical fluid extraction system, and an extract was obtained for analysis.

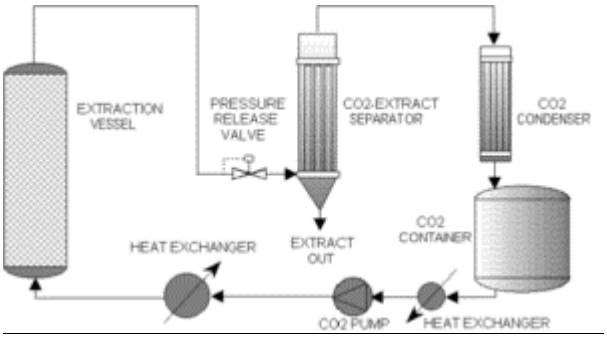

Figure1. Supercritical Fluid Extraction System

Gas Chromatography-Mass Spectrometry (GC-MS), especially for essential oils. In this method, clove oil is dissolved in acetone and injected into the gas chromatograph. Gas chromatography separates the components, while mass spectrometry determines their identity. Eugenol, the main component of clove oil, exhibits a distinct peak in this analysis. Other phenolic compounds and terpenoids present in the oil can also be detected. 0.02 g of clove oil extracted using the SFE method was placed in a tube. 2 mL of acetone was added and dissolved to create a homogeneous solution. The liquid phase of this solution was filtered through a 0.45 µm PTFE filter to remove particles, and the cleaned sample was transferred to a GC-MS vial. Finally, this sample was injected into the GC-MS instrument for chemical component analysis. For the GC-MS analysis of clove oil, the analysis conditions were prepared as shown in Table. 1; an HP-5 MS column (5% phenylmethylpolysiloxane) was used to separate volatile components. 1 µL was injected in Pulsed Split (50:1) mode, and helium (0.7 mL/min flow rate) was used as the carrier gas. The column oven temperature program was gradually increased from 50°C to 280°C, while the ion source temperature was set at 230°C and the quadrupole temperature was set at 150°C. These conditions were optimized for optimal determination of components specific to clove oil, such as eugenol.

Table 1. Gas Chromatography Mass Spectrometry Detector (GC-MS) Method Conditions

injector		carrier gas		column furnace			MS temperature	
mode	temperature	type	flow rate	°C/min	°C	minute	source	Quadro pole
1µL pulsed split(50:1)	180 °C	He	0,7 mL/min	10 20	50 200 280	2 10 7	230°C	150°C

The analysis results obtained from the GC-MS analysis of Clove (Syzygium Aromaticum) oil are given in Figure 2.

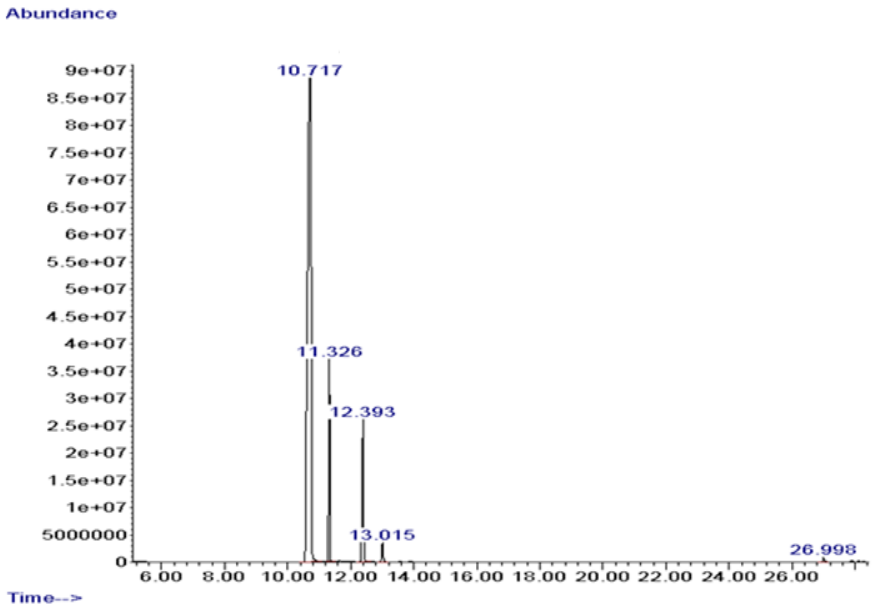

Figure 2. GC-MS Analysis Spectrum of Clove (Syzygium Aromaticum) Oil

The analysis results obtained from the GC-MS analysis of Clove (Syzygium Aromaticum) oil are given in Table 2.

Table 2. GC-MS Analysis Result of Clove (Syzygium Aromaticum) Oil

Retention time	% amount	Component Name
11,326 min	%79,170	Eugenol
12,394 min	%10,876	Caryophyllene
13,015 min	%8,636	Aceteugenol
14,012 min	%1,015	Caryophyllene oxide
15,27 min	%0,300	Phenol Derivative (Phenol, 2,2'-methylenebis[6-(1,1-dimethylethyl)-4-methyl-)

RESULTS and DISCUSSION

Clove (Syzygium Aromaticum) oil, extracted using SFE systems, is a valuable herbal product known for its rich phenolic compound content and widely used in traditional medicine. Studies using GC-MS analyses have identified a high concentration of eugenol (79.170%), the primary component of clove oil. In addition, other bioactive compounds such as β-caryophyllene (10.876%), acetyl eugenol (8.636%), and humulene also contribute to the pharmacological effects of clove oil. The high 79% eugenol content of clove (Syzygium Aromaticum) oil explains why cloves have been used as a painkiller for centuries. The presence of over 10% caryophyllene demonstrates that this oil not only relieves pain but also has anti-inflammatory properties. The approximately 8% acetyl eugenol content, responsible for the oil's milder effects, contributes to the effectiveness of clove oil.

CONCLUSION

The SFE system, unlike traditional solvent extraction, does not require heating or steaming. It is environmentally friendly, consumes little energy, is fast, does not require post-extraction purification, and requires very little time to prepare the product for extraction. The SFE extraction system has become a widely used technique for extracting certain plants with pharmacological properties. It has become a modern and powerful extraction system preferred for obtaining active ingredients. Therefore, the study has become a modern and preferred technique that not only maximizes extraction efficiency but also provides accurate results for active ingredient analysis.

Abstract

In this study, the biosorption performance of mechanically activated seashells (MAS) prepared at three different activation times (1, 2, and 3 hours) was evaluated for the removal of Methyl Violet 6B (MV6B) dye. The experiments revealed that the highest adsorption efficiency was achieved under the same conditions for all MAS samples, regardless of the activation time. These optimal conditions were found to be pH 6, 30 minutes contact time, 100 mg/L MV6B concentration, and 30°C temperature. Equilibrium biosorption data were applied to Langmuir, Freundlich, and Temkin isotherm models, and the Freundlich isotherm was determined to be the most suitable model for all MAS (1h, 2h and 3h) samples, showing heterogeneous multilayer adsorption behavior. Kinetic analyses using pseudo-first-order, pseudo-second-order, and Elovich kinetic models showed that the pseudo-second-order model best fit the biosorption process for MAS (1h, 2h and 3h). The negative values of Gibbs free energy (ΔG°), enthalpy (ΔH°), and entropy (ΔS°) in the thermodynamic parameters calculated for MAS samples confirmed that the biosorption of MV6B onto MAS is spontaneous and exothermic, and also that disorder at the solid–solution interface decreases. It was observed that MAS samples exhibit similar adsorption properties even when the activation time varies and possess strong potential as an effective biosorbent for MV6B removal.

Keywords: mechanical activation, isotherm, kinetics, thermodynamics, seashell, methyl violet 6B

INTRODUCTION

With the development of industry, there has been a significant increase in the amount of dye waste entering water sources. Cationic triphenylmethane dyes used in the textile and similar industries pose an environmental risk. One such dye, Methyl Violet 6B (MV6B), is a difficult pollutant to treat due to its high solubility and stability, and is also harmful to health (Rai et al., 2005). Therefore, effective removal of dye waste is important. While existing methods are often costly and inadequate, adsorption stands out as a low-cost and highly efficient alternative (Kausar et al., 2023).

Systems in which biomass is used as an adsorbent in the adsorption process are defined as bioadsorption. Due to their low cost, biodegradability, and easy accessibility, marine product wastes such as oyster, snail, and shrimp shells have emerged as effective bioadsorbents in recent years (Su et al., 2022; Hossain et al., 2024). Seashells, which contain approximately 95% $CaCO_3$, were preferred in this study because they exhibit strong adsorbent properties due to their porous structure and high binding capacity when properly prepared and ground (He et al., 2015; Wang, 2021).

Mechanical activation is typically achieved by high-energy ball milling of a powdered material (Baláž et al., 2003). The primary purpose of mechanical activation is to increase the surface area, thereby providing energy input to the system and increasing the reaction rate for subsequent processes (Alex et al., 2016).

In this study, the removal of the cationic dye MV6B from aqueous solutions was investigated using mechanically activated sea shells for different durations. The aim was to improve the surface properties of shell powder without chemical treatment and to increase its adsorption capacity through mechanical activation. The isothermal, kinetic, and thermodynamic behavior of the system was evaluated using the adsorbents obtained.

MATERIALS AND METHODS

Materials

In the bioadsorption study, Methyl Violet 6B (MV6B) (molecular weight: 393.96 g/mol) was used as the dye (Figure 1). The required amount of powdered dye was dissolved in deionized water to prepare a stock solution (1000 mg/L). All working solutions at the desired concentrations were prepared by diluting the stock solution. The pH of the solution was adjusted using 0.1 mol/L HCl or 0.1 mol/L NaOH solution with a HANNA/pH 211 model pH meter.

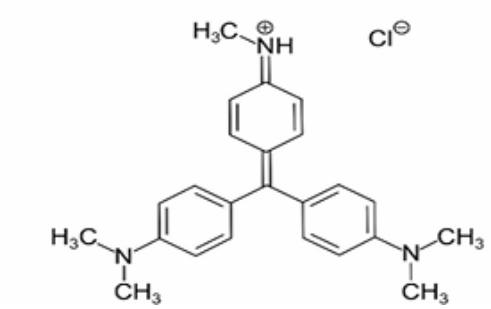

Figure 1. Methyl Violet 6B chemical structure

Preparation of seashells

The seashells were obtained from the Karabiga coast in the district of Biga (Çanakkale, Turkey). The seashells were washed with tap water and then with pure water to remove coarse dirt. The seashells washed in pure water were dried in an oven at 80 °C for 12 hours. The dried seashells were crushed with a hammer and then ground into powder using an IKA A11 mill. The mechanical activation process of the seashells was carried out in a planetary ball mill (Fritsch pulverisette) at 600 rpm for 1.2 and 3 hours.

Adsorption experiments

The bioadsorption performance of seashells (MAS) activated at different times was evaluated for the removal of MV6B from aqueous solutions. MV6B bioadsorption experiments were conducted using 50 mL falcon tubes with the batch bioadsorption method. The solutions were shaken using a Biosan Multi Rotator at 100 rpm. For bioadsorption optimization, the initial dye concentration (10-125 mg/L), adsorbent amount (0.1-0.5 g), temperature (25°C-60°C), adsorption contact time (5-60 min), and pH 2-8 conditions were investigated. The MV6B concentration in the solution was measured at the maximum dye wavelength (λ = 580 nm) using a spectrophotometer (UV-Vis) (T80 + PG device LTD).

The bioadsorption efficiency (% R) and capacity (qe) of MV6B dye on MAS were calculated according to Equations (1) and (2):

$$R\% = \frac{C_0 - C_e}{C_0} x\ 100 \quad (1)$$

$$q_e = \frac{(C_0 - C_e)}{W} xV \quad (2)$$

Here, in the %R and qe formulas, C_0 represents the initial MV6B concentration (mg/L), C_e represents the MV6B concentration at equilibrium (mg/L), q_e represents the adsorption capacity (mg/g), W represents the adsorbent amount (g), and V represents the solution volume (L).

Isotherm studies

Adsorption isotherm studies are an important factor in explaining the fundamental interaction between adsorbent and adsorbate substances and the adsorption mechanism. In this study, the Langmuir, Freundlich, and Temkin models, which are common isotherms, were used to define the adsorption equilibrium.

The Langmuir isotherm model is expressed by Equation 3:

$$\frac{C_e}{q_e} = \frac{1}{q_{max} K_L} + \frac{C_e}{q_{max}} \quad (3)$$

where q_e is the amount of dye adsorbed per unit mass of adsorbent at equilibrium (mg/g), C_e is the equilibrium concentration of the dye in solution (mg/L), qmax is the maximum monolayer adsorption capacity (mg/g), and K_L is the Langmuir adsorption constant (L/mg).

The Freundlich isotherm model is expressed by Equation 4:

$$\ln q_e = ln K_F + \frac{1}{n} ln\, C_e \quad (4)$$

where K_F is the Freundlich constant related to adsorption capacity (mg/g) and n is the heterogeneity factor. The value of 1/n indicates the adsorption intensity or surface heterogeneity.

The Temkin isotherm model is expressed by Equation 5:

$$q_e = B ln K_T + B ln C_e \quad (5)$$

where K_T is the Temkin isotherm equilibrium binding constant (L/g) and B is a constant related to the heat of sorption (J/mol).

Kinetic studies

Adsorption kinetics is described by pseudo-first-order (equation 6), pseudo-second-order (equation 7) and Elovich (equation 8) models.

$$\ln(q_e - q_t) = \ln q_e - k_1 t \quad (6)$$

Here, q_e (mg/g) and q_t (mg/g) are the amount of dye adsorbed at time t, and k_1 (min^{-1}) is the first-order adsorption rate constant.

$$\frac{t}{q_t} = \frac{1}{k_2 q_e^2} + \frac{1}{q_e} t \quad (7)$$

where k_2 is the pseudo-second-order equation constant (g/mg min^{-1}); t is the specified time constant (min); q_t is the amount of adsorbed material at the end of the t period (mg/g); q_e is the amount of adsorbed material in equilibrium (mg/g).

$$q_t = \frac{1}{\beta}\ln(\alpha\beta) + \frac{1}{\beta}\ln t \quad (8)$$

Here, q_t represents the amount of adsorbate adsorbed at time t. In this equation, α is the initial adsorption rate, reflecting how quickly adsorption begins; β is related to the activation energy for surface coverage and chemisorption, and shows how the adsorption rate decreases as the surface fills up.

Thermodynamic studies

The thermodynamic analyses were performed using the following Equations (9), (10), and (11):

$$K_D = \frac{q_e}{C_e} \quad (9)$$

$$\Delta G° = -RTlnK_D \quad (10)$$

$$\Delta G° = \Delta H° - T\Delta S° \quad (11)$$

In the equations, ΔG° is the Gibbs free energy change, ΔH° is the adsorption enthalpy change, ΔS° is the entropy change, and T is the absolute temperature; R is the gas constant (8.314 joules.mol/K).

RESULTS and DISCUSSION

Adsorption parameters effects

In this study, various optimization parameters were investigated to evaluate the bioadsorption performance of MAS samples (1 h, 2 h, and 3 h) on MV6B dye. In this context, the effects of pH (2–8), initial dye concentration (20–125 ppm), contact time (5–60 min), adsorbent amount (0.1–0.5 g), and temperature (25–60 °C) were investigated.The results obtained showed that the optimal conditions for all MAS samples were pH 6, 30 min

contact time, 100 mg/L MV6B concentration, and 30 °C temperature. Under these optimal conditions, the MV6B removal efficiency was calculated as 94.13% for 1 hour MAS, 93.09% for 2 hours MAS, and 98.55% for 3 hours MAS, demonstrating that MAS samples have a high bioadsorption capacity.

Bioadsorption Isotherms

It is a parameter that describes how adsorbate molecules are distributed between the liquid and solid phases when the adsorption process reaches equilibrium. The isotherm model results for 1, 2, and 3-hour mechanical activation times (MAS) are given in Table 1.

Table 1. Isothermal model results for 1h (a), 2h (b), and 3h (c) MAS

a)

Isotherm Model	Parameter	Value
Langmuir	R^2	0,4607
	q_{max}(mg/g)	-8,0645
	K_L(L/mg)	-0,0720
	R_L	-0,1611
Freundlich	R^2	0,9596
	K_F (mg/g)	0,3304
	1/n	1,7249
Temkin	R^2	0,9503
	K_t (L/g)	0,3995
	B	10,694

b)

Isotherm Model	Parameter	Value
Langmuir	R^2	0,4686
	q_{max}(mg/g)	-11,7233
	K_L(L/mg)	-0,0738
	R_L	-0,1566
Freundlich	R^2	0,9337
	K_F (mg/g)	0,6455
	1/n	1,565
Temkin	R^2	0,923
	K_t (L/g)	0,5362
	B	10,19

c)

Isotherm Model	Parameter	Value
Langmuir	R^2	0,4977
	q_{max}(mg/g)	-13,8504
	K_L(L/mg)	-0,0815
	R_L	-0,1398
Freundlich	R^2	0,956
	K_F (mg/g)	0,9559
	1/n	1,504
Temkin	R^2	0,934
	K_t (L/g)	0,6694
	B	9,9357

Among the applied models, the Freundlich isotherm has the highest correlation coefficient for all MAS samples. This supports the idea that the adsorbent surface has a heterogeneous structure and that adsorption occurs through a multi-layer mechanism (Sultana et al., 2022). The negative q_{max} values obtained in the Langmuir model indicate that the assumption of single-layer adsorption is not valid in the process and that this model is insufficient to explain the system. Similarly, there are studies in the literature that report negative values (Lu et al., 2018; Esfandiar et al., 2021; Ščasná et al., 2025). These findings support the notion that the applicability of the Langmuir model may be limited in some adsorption systems. The Temkin model parameters reveal that the adsorbate–adsorbent interactions change throughout the process and that the adsorption heat decreases regularly as the surface coverage increases (Kanwal et al., 2024). These findings indicate that the adsorption mechanism occurs on heterogeneous surfaces with variable energy distribution rather than on a homogeneous monolayer structure.

Bioadsorption Kinetics

Adsorption kinetics is used to determine the mechanisms by which adsorbed species attach to the adsorbent surface and the rate of these processes (Khandaker et al., 2020). The kinetic model results for 1, 2, and 3 hours of mechanical activation time (MAS) are presented in Table 2.

Table 2. Kinetic model results of 1h (a), 2h (b) and 3h (c) MAS

a)

Kinetic Model	Parameter	Value
Pseudo-first-order	R^2	0,7200
	k1 (1/min)	0,0193
	qe,cal (mg/g)	2,5609
Pseudo-second-order	R^2	0,9996
	k2 (g/mg.min)	0,0667
	$q_{e,cal}$ (mg/g)	13,6612
Elovich	R^2	0,8180
	β (g/mg)	1,2294
	α (mg/g.min)	247274,0

b)

Kinetic Model	Parameter	Value
Pseudo-first-order	R^2	0,7705
	k1 (1/min)	0,0184
	qe,cal (mg/g)	1,9169
Pseudo-second-order	R^2	0,9998
	k2 (g/mg.min)	22,2474
	$q_{e,cal}$ (mg/g)	13,6425
Elovich	R^2	0,8842
	β (g/mg)	1,8494
	α (mg/g.min)	703000751,3

c)

Kinetic Model	Parameter	Value
Pseudo-first-order	R^2	0,7142
	k1 (1/min)	0,0186
	qe,cal (mg/g)	2,2049
Pseudo-second-order	R^2	0,9995
	k2 (g/mg.min)	0,0724
	$q_{e,cal}$ (mg/g)	13,9082
Elovich	R^2	0,7310
	β (g/mg)	1,7102
	α (mg/g.min)	153784651,5

According to the table results, the pseudo-second-order (PSO) model showed the best fit among the adsorption kinetics data. This finding indicates that chemical interactions are dominant in the adsorption process and that the adsorption capacity of the adsorbate is a rate-determining factor (Singh et al., 2024). The pseudo-first-order and Elovich models provided lower fit in explaining the process, and the PSO model was seen to represent the kinetic behavior more accurately. This situation indicates that adsorption occurring on the adsorbent surface is largely carried out by chemical binding mechanisms.

Bioadsorption Thermodynamics

The primary reason for performing a thermodynamic evaluation is to determine the appropriate nature and spontaneity of this process (Balji et al., 2023). The thermodynamic model results for 1, 2, and 3-hour mechanical activation times (MAS) are presented in Table 3.

Table 3. Thermodynamic model results of 1h (a), 2h (b) and 3h (c) MAS

a)

T (°C)	ΔG°(kJ/mol)	ΔH° (kJ/mol)	ΔS° (J/(mol.K))
25	-3,028		
30	-2,211		
40	-2,212	-8,553	-19,791
50	-2,113		
60	-2,129		

b)

T (°C)	ΔG°(kJ/mol)	ΔH° (kJ/mol)	ΔS° (J/(mol.K))
25	-0,954		
30	-1,774		
40	-0,902	-12,132	-36,036
50	-0,276		
60	-0,174		

c)

T (°C)	ΔG°(kJ/mol)	ΔH° (kJ/mol)	ΔS° (J/(mol.K))
25	-4,593		
30	-5,859		
40	-4,382	-19,964	-49,554
50	-3,501		
60	-3,689		

The results of the thermodynamic analysis indicate that the values of ΔG°, ΔH°, and ΔS° are negative. A negative ΔG° value indicates that the adsorption process occurs spontaneously, while a negative ΔH° value indicates that the process is exothermic. Furthermore, the negative ΔS° value indicates that the system acquires a more ordered structure during adsorption and that entropy decreases. These results demonstrate that adsorption is thermodynamically favorable and that the process occurs exothermically.

CONCLUSION

The adsorption data showed the best fit to the Freundlich isotherm model, indicating that the adsorbent surface is heterogeneous and that adsorption occurs via a multistage mechanism. In contrast, the Langmuir isotherm proved insufficient in explaining the process due to its assumption of monolayer adsorption. Kinetic analyses showed that adsorption best fits the pseudo-second-order (PSO) model, thus indicating that the process is controlled by chemical interactions. The negative values of the thermodynamic parameters (ΔG°, ΔH°, ΔS°) indicate that adsorption occurs spontaneously, exothermically, and through a mechanism that leads to a more ordered state of the system.

Additionally, the optimal conditions for all MAS samples have been determined as pH 6, 30 minutes contact time, 100 mg/L MV6B concentration, and 30 °C. Under these conditions, the MV6B removal efficiency was calculated as 94.13% for 1-hour MAS, 93.09% for 2-hour MAS, and 98.55% for 3-hour MAS. These results demonstrate that mechanically activated seashell powders with different durations are effective biosorbents with high bioadsorption capacity and can be successfully used in MV6B removal.

Özet

$Cu_2ZnSnSe_4$ (CZTSe), güneş hücrelerinin soğurucu katmanlarının kullanımında umut vadeden malzemelerden biridir. Dünya çapında bol miktarda bulunan çinko ve kalay elementleri, yaklaşık 1,5 eV'lik optimuma yakın bir doğrudan bant aralığı ve yaklaşık 10^4 cm^{-1} gibi yüksek bir soğurma katsayısı içerir. Oleylamin (OLA) içindeki CZTSe nanokristalleri, sıcak enjeksiyon yöntemiyle başarıyla hazırlanmıştır. Yapısının, bileşiminin ve morfolojisinin karakterizasyonu taramalı elektron mikroskobu (SEM) ve parçacık boyut analizörü kullanılarak yapılmıştır. Sonuçlar, monodispers nanokristallerin 9 nm aralığında tek fazlı polikristalin olduğunu ortaya koymuştur.

Anahtar Kelimeler: CZTSe, Nanokristal, Yarı iletken

Synthesis and characterization of CZTSe nanocrystals

Abstract

$Cu_2ZnSnSe_4$ (CZTSe) is one of promising materials in the use of absorber layers of solar cells. It contains earth-abundant elements of zinc and tin, a near-optimal direct band gap of ~1.5 eV, as well as a large absorption coefficient ~10^4 cm^{-1}. The CZTSe nanocrystals in oleylamine (OLA) was successfully prepared via hot-injection method. The characterization of its structure, composition and morphology were done using scanning electron microscope (SEM), and particle size analyzer. The results revealed that the monodispersed nanocrystals were single phase polycrystalline within the range of 9 nm.

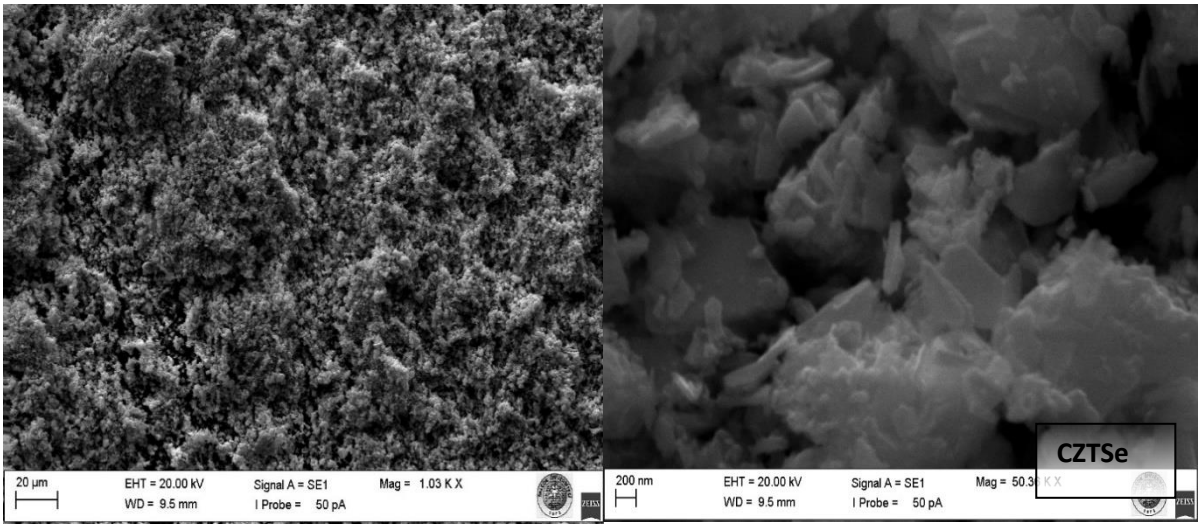
GİRİŞ

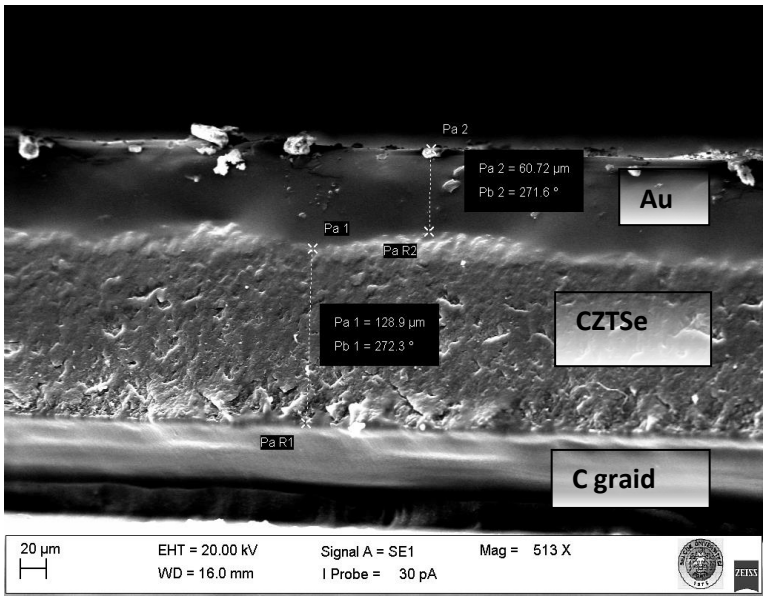
Son zamanlarda güneş hücrelerinde etkili ışık emici malzemeler olarak $Cu_2ZnSnSe_4$ (CZTSe), Cu2ZnSnS4 (CZTS) ve $Cu_2ZnGeSe_4$ gibi Cu_2-II–IV–VI4 kuaterner yarı iletkenler, kapsamlı bir şekilde araştırılmıştır. Bu sistemlerden biri olan CZTSe, 1,4–1,56 eV optik bant aralığı ve 10^4 cm^{-1}'in üzerindeki yüksek emilim katsayısı sayesinde güneş hücrelerinde uygulama için en ilgi çekici malzemelerden biri olduğunu kanıtlanmıştır (Babu ve ark. 2011; Wibowo ve ark. 2007-a). Pahalı indiyum (In) ve galyum (Ga) kullanan CdTe ve $Cu_2InGaSe_4$ (CIGS) gibi iyi bilinen güneş hücresi malzemelerinin aksine, CZTSe'deki bileşen elementler Zn ve Sn nispeten bol ve ucuzdur (Zoppi ve ark. 2009). Maliyetli, yüksek sıcaklık ve düşük verimli üretim teknikleri kullanılarak püskürtme ve termal buharlaştırma teknikleri kullanılarak CZTSe soğurucu malzemenin hazırlanmasına ilişkin birkaç rapor bulunmaktadır (Babu ve ark. 2008-2011; Long ve ark. 2009; Zoppi ve ark. 2009; Wibowo ve ark. 2007-a). Kalkopirit bazlı ince film güneş hücrelerinde kullanılan indiyumun bulunabilirliği ve pahalılığı, mevcut büyük ölçekli ince film güneş hücrelerinin yüksek üretim maliyetlerine yol açmaktadır. Bu nedenle, güneş hücresi cihazlarının üretim maliyetini düşürmek amacıyla CZTSe, yeni bir soğurucu malzeme olarak incelenmiştir. Mellikov ve ark. (2009), bir CZTSe güneş hücresinde CZTSe mono tanecikleri kullanarak %2,14'lük bir verim elde etmişlerdir. Çoğunlukla vakum biriktirme (Wibowo ve ark. (2007-b); Friedlmeier ve ark. 1997) ve selenizasyon kullanılarak yapılan çeşitli CZTSe bileşik preparatları, CZTSe filmleri için başarıyla gösterilmiştir (Babu ve ark. 2008; Volobujeva ve ark. 2009). İnce film güneş hücrelerinin düşük sıcaklıkta biriktirme tekniklerinin

geliştirilmesine yönelik büyük bir talep vardır. Yüksek sıcaklık ve basınç gerektirmeyen CZTSe güneş hücreleri için yeni bir hazırlama yöntemi, kontrollü stokiyometri ile CZTSe nanokristallerini kimyasal olarak sentezlemek ve bunları bir "mürekkep" içinde dağıtmaktır. Bu çözeltiye dayalı yaklaşım, selenyum kaybına neden olabilen selenyum atmosferinde yüksek sıcaklıkta tavlama ihtiyacını ortadan kaldıracaktır. Özellikle, $CuInS_2$, $CuInSe_2$, CIGS ve CZTS dahil olmak üzere nanokristal mürekkebe dayalı fotovoltaik cihazlar yakın zamanda bildirilmiştir (Altosaar ve ark. 2006; Guo ve ark. 2009; Steinhagen ve ark. 2009). Burada, oleylamin (OLA) içinde CZTSe nanokristallerinin sentezlenerek SEM ve DLS ile karakterizasunu gerçekleştirilmiştir.

MATERYAL VE METOT



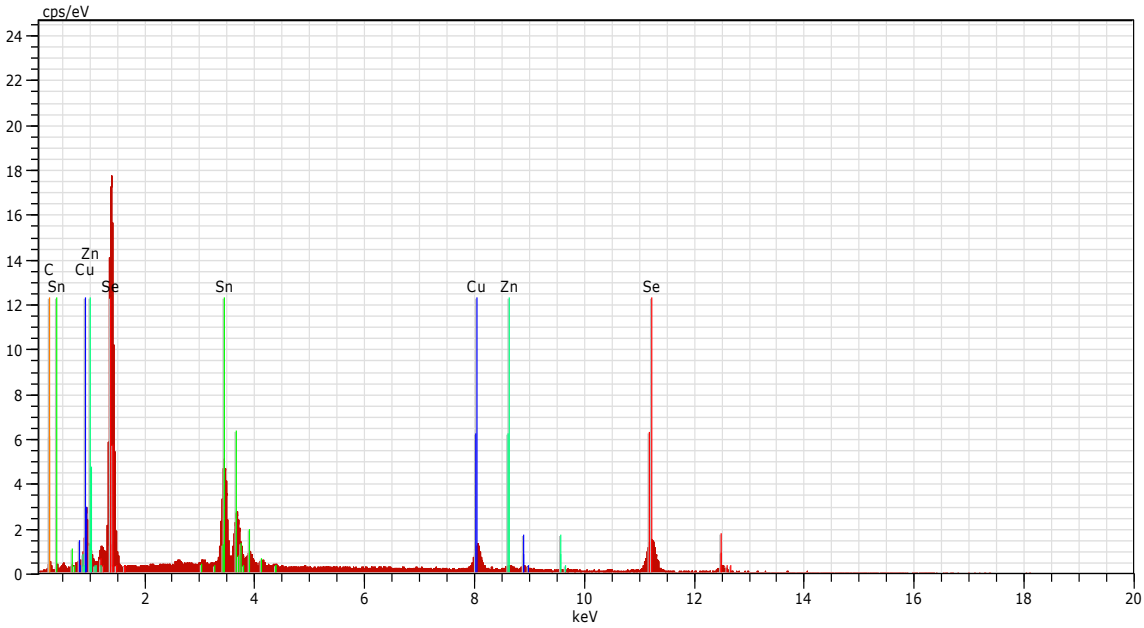
Tüm kimyasal reaktifler ve çözücüler daha fazla saflaştırma yapılmaksızın kullanıldı. CZTSe nanokristalleri sıcak enjeksiyon yöntemiyle sentezlendi. Sentez süreci aşağıdaki gibidir:



$$2CuCl_2.2H_2O + ZnCl_2 + SnCl_2 \cdot 2H_2O + 4Se \xrightarrow{OLA-\ 230°C} Cu_2ZnSnSe_4\ nanokristaller$$

12 mmol selenyum (Se, %99,98) ve 10 mL OLA (> %70 saflıkta), 100 mL üç boyunlu bir balona eklendi ve ardından N_2 atmosferi oluşturuldu. Karışım 1 saat bekletildi; 6 mmol bakır klorür dihidrat ($CuCl_2.2H_2O$, analitik saflıkta), 3 mmol çinko klorür ($ZnCl_2$, analitik saflıkta), 3 mmol kalay (II) klorür dihidrat ($SnCl_2 \cdot 2H_2O$, analitik saflıkta) ve 10 mL OLA, başka bir 100 mL başka üç boyunlu balonda karıştırıldı ve argon altında 150 °C'ye ısıtıldı. Isıtma sırasında çözelti koyu maviden kahverengi-yeşil renge döndü ve bu, Cu-, Zn- ve Sn-oleylamin komplekslerinin oluşumunu gösterdi. Karışım 100 °C'ye ısıtıldığında, hızla selenyum çözeltisine enjekte edildi. Sıcaklık 230 °C'ye çıkarıldı ve kuvvetlice karıştırılarak 2 saat tutuldu. Karışım oda sıcaklığına soğutulduktan sonra, balona 20 mL etanol eklendi, 30 dakika boyunca ultrasonik dispersiyonla işlendi ve ardından 7000 rpm'de 10 dakika santrifüj edildi. Üst faz, 1 mL OLA ve 10 mL etanol ile karıştırıldıktan sonra 8000 rpm'de 10 dakika santrifüj edildi. Çökelti, 10 mL etanolde yeniden dağıtıldı ve yüksek saflıkta CZTSe nanokristalleri elde etmek için tekrar santrifüj edildi. CZTSe nanokristalleri, kloroform ve toluen dahil olmak üzere polar olmayan organik çözücülerde dağıtılabildi gözlemlendi.

BULGULAR ve TARTIŞMA



Elde edilen CZTSe nanokristallerin karakterizasyon işlemleri SEM-EDX, Numunelerin yüzey morfolojisi ve EDX analizleri SEM (ZEISS, EVO LS10) ile incelendi ve Şekil 1'de gösterilmiştir.

Şekil 1. Karbon SEM ızgarası üzerinde desteklenen altın kaplı CZTSe nanoparçacıklarının SEM görüntüleri

Şekil 2'de görüldüğü gibi EDX analizini gerçekleştirmiş ve aşağıdaki tabloda gösterilen sonuçlar elde edilmiştir:

Şekil 2. Karbon SEM ızgarasında desteklenen CZTSe nanoparçacıklarının EDX spektrumu

Tablo 1. CZTSe nanokristallerin EDX değerleri

	EDX
Cu	8.8 %
Sn	30.2 %
Zn	2.1 %
Se	58.6 %

Böylece başlangıçta katılan Zn'nin yaklaşık %2'si ve katılan Sn'nin yaklaşık %30'u CZTSe yapısının içine girer.

Partikül boyutu tespiti analizi sonucu elde edilen sonuçlarda CZTSe ortalama 9.7 nm civarında olduğu tespit edilmiş ve Şekil 3.' de gösterilmiştir.

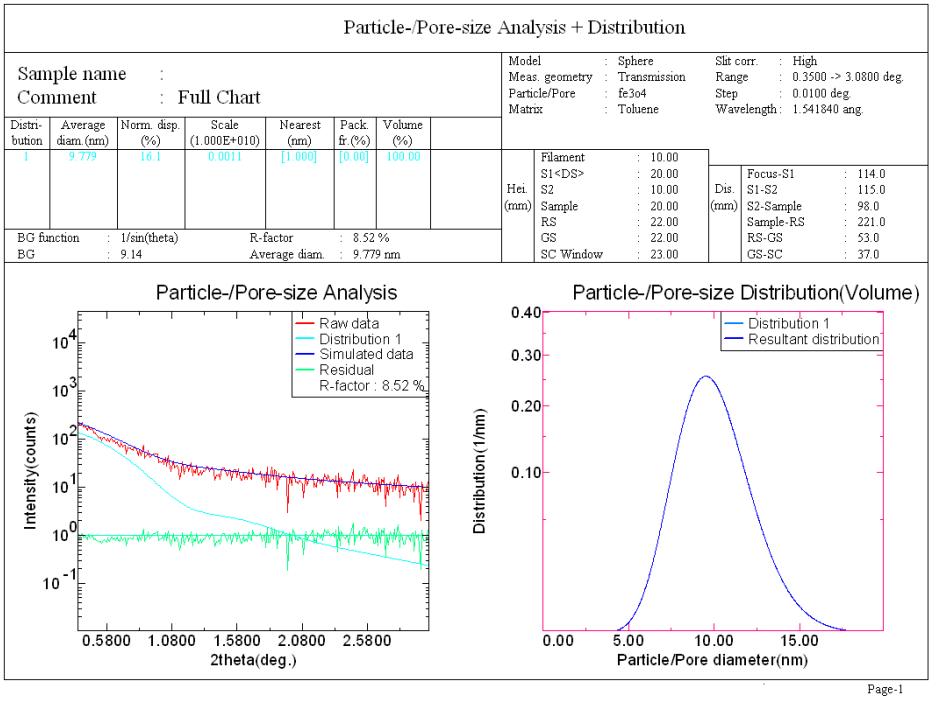


Fig. 3 Partikül boyutu analizi

SONUÇ

Yüksek emilim katsayısı sayesinde güneş hücrelerinde uygulama için en ilgi çekici malzemelerden biri olan ortalama 9 nm boyutunda CZTSe nanokristalleri oleyamin içerisinde başarılı bir şekilde sentezlenmiş ve güneş hücreleri için yüzey karakterizasyonları ve kompozisyonu SEM-EDX ile gerçekleştirilmiştir. Farklı metaller yapıya doplanarak da optik bant genişliği yükseltilerek güneş hücrelerinde daha etkin bir yapı ortaya çıkarabileceği literatüre yeni katkılar sunacağı aşikardır.

Abstract

This study evaluated the effects of post-mating administration of the kisspeptin analog TAK-683 on luteal function and pregnancy-associated glycoprotein (PAG) levels during early pregnancy in Aleppo goats. A total of 45 lactating does synchronize during the non-breeding season were mated and randomly assigned on day 4 post-mating to receive either 1 mL saline (Control), 5 µg TAK-683 (TAK-5), or 25 µg TAK-683 (TAK-25) subcutaneously. Pregnancy diagnosis was performed on day 35, after which luteal ultrasonography and blood sampling were carried out only in the goats confirmed pregnant. Serum progesterone (P_4) and PAG concentrations were then determined from these samples using chemiluminescence immunoassay (CLIA) and enzyme-linked immunosorbent assay (ELISA), respectively. Both TAK-683 treatments significantly increased corpus luteum (CL) diameter compared with controls (Control: 7.68 ± 0.30 mm; TAK-5: 11.88 ± 0.67 mm; TAK-25: 11.56 ± 1.10 mm; P=0.023). The CL Doppler area tended to be higher in the TAK-25 group (45.55 ± 4.33 mm²) compared with the TAK-5 (33.61 ± 4.97 mm²) and Control (26.37 ± 4.90 mm²) groups (P=0.092). Endocrinologically, P4 concentrations were significantly elevated in TAK-5 and TAK-25 groups (Control: 4.63 ± 0.74 ng/mL; TAK-5: 7.73 ± 0.93 ng/mL; TAK-25: 10.08 ± 1.57 ng/mL; P = 0.022). Similarly, PAG levels were significantly higher following TAK-683 treatment (Control: 1.57 ± 0.07 O.D; TAK-5: 2.00 ± 0.07 O.D; TAK-25: 2.24 ± 0.13 O.D; P=0.015). A strong positive correlation was observed between P_4 and PAG values (r = 0.855; P<0.001). The findings demonstrate that TAK-683 exerts a dose-dependent luteotropic effect, improving early placental biochemical indicators through enhanced maternal progesterone secretion. These results suggest that TAK-683 may serve as a promising post-mating hormonal support strategy in goats, strengthening luteal-placental interaction during early gestation.

Keywords: Corpus luteum, goat, kisspeptin analog, pregnancy-associated glycoprotein, progesterone, TAK-683

INTRODUCTION

Progesterone (P_4) is a fundamental hormone that plays a critical role in maintaining pregnancy by regulating the production of various endometrial secretions required for embryonic growth (Spencer et al., 2007). Insufficient exposure of the uterus to P_4 during early gestation may lead to small and poorly developed embryos that fail to produce adequate interferon-tau (IFN-τ) during the period of maternal recognition, resulting in increased pregnancy losses (Antoniazzi et al., 2013). Therefore, decreased circulating P_4 associated with luteal insufficiency has been reported as one of the major causes of early embryonic mortality in ruminants (Diskin & Morris, 2008). One of the most common strategies to prevent reproductive losses due to luteal insufficiency is to increase endogenous P_4 levels through gonadotropin administration (Uyanık et al., 2024). In goats, treatments acting through luteinizing hormone (LH), such as gonadotropin-releasing hormone (GnRH) agonists and human chorionic gonadotropin (hCG), administered during or shortly after mating, have been reported to increase maternal P_4 concentrations, support corpus luteum (CL) function, improve pregnancy rates, and positively influence embryonic-fetal development (Çam et al., 2004; Lashari and Tasawar, 2010; Çetin et al., 2024).

In recent years, newly developed kisspeptin analogs have attracted attention as strong alternatives to gonadotropins (Beltramo and Decourt, 2018; Uyanık et al., 2024). The discovery that kisspeptins act through a central neuroendocrine mechanism regulating GnRH secretion has led to the development of new therapeutic approaches in reproduction (Roa and Tena-Sempere, 2007). Because kisspeptins strongly stimulate the release of LH and follicle-stimulating hormone (FSH) (Smith, 2009; Clarke, 2011), they have been reported to be potentially useful

in ovulation synchronization, puberty management, and anestrus treatment (Caraty and Franceschini, 2008; Okamura et al., 2013). Among these new long-acting kisspeptin analogs, TAK-683 is a potent KISS1 receptor (KISS1R) agonist with enhanced metabolic stability (Nishizawa et al., 2016; Uyanık et al., 2024). It has been demonstrated that bolus administration of TAK-683 stimulates GnRH and LH secretion in ovariectomized goats (Tanaka et al., 2013). In addition, TAK-683 induces ovulation and accelerates luteal formation when administered during the follicular phase in goats (Goto et al., 2014). Furthermore, subcutaneous administration of 5 µg TAK-683 has been shown to induce ovulation through a sustained 10-hour LH release, thereby accelerating CL formation in synchronized cyclic goats (Kanai et al., 2017). Parallel to these luteotropic effects observed in goats, post-mating administration of TAK-683 in ewes outside the breeding season has also been shown to strengthen luteal function, elevate maternal P_4 concentrations, and reduce pregnancy losses, similar to the action of GnRH agonists (Uyanık et al., 2024).

Although TAK-683 has been shown to strengthen luteal function and increase maternal P_4 levels, the biochemical reflection of this hormonal response in embryo-uterus interaction and placentation has not yet been fully clarified. Understanding these physiological processes requires not only hormonal evaluation but also the assessment of specific biomarkers that reflect embryonic development and trophoblastic activity. In this context, pregnancy-associated glycoproteins (PAGs) are highlighted as specific and early indicators of placentation in ruminants (Sousa et al., 2006). PAGs are glycosylated aspartic proteinases synthesized by binucleate trophoblast cells, which are unique to pregnancy (Wallace et al., 2015). They reflect biochemical communication between the embryo and the uterine environment, as well as the degree of trophoblastic invasion (Wooding, 2022). PAG concentrations increase in parallel with the progression of implantation, strengthening of placental maturation, and increased trophoblast proliferation (Szafranska et al., 2004; Wallace et al., 2015). Therefore, high PAG concentrations are associated with effective embryo-maternal signaling, an advanced placentation process, and healthy embryonic development (Sousa et al., 2006). Considering that maternal P_4 has an indirect regulatory role on uterine secretions and placental maturation, how luteotropic agents modulate the PAG response is an important clinical research question. Accordingly, although TAK-683 is known to increase P_4, its effect on PAG concentrations, which are biochemical indicators of embryonic-placental development, has not been investigated to date.

Based on the current literature, the present study hypothesizes that TAK-683 administration on day 4 after mating will dose-dependently (5 µg vs. 25 µg) strengthen luteal function, increase maternal P_4 secretion, support embryonic development and placentation, and consequently elevate PAG concentrations. Therefore, this study aimed to evaluate the effects of two different doses of TAK-683 administered on day four after mating in Aleppo goats synchronized during the non-breeding season with a short-term progesterone-based protocol on luteal function and serum PAG concentrations during early pregnancy.

MATERIALS AND METHODS

The experiment was conducted in the Reyhanlı district of Hatay, located in southeastern Türkiye (36°15′12.2″N, 36°32′02.6″E), during the non-breeding season (March-May). All procedures involving animals were performed in accordance with ethical standards and were approved by the Hatay Mustafa Kemal University Local Ethics Committee for Animal Experiments (Approval No: 2024/11-06).

Animal Material

A total of 45 clinically healthy, aged 3-5 years, weighing 40-50 kg, with a body condition score (BCS) ≥ 2.5, lactating and multiparous Aleppo goats were included in the study. Goats were housed in semi-open barns and grazed on natural pasture for approximately 12 hours per day. No additional concentrate or roughage was provided beyond grazing, and no flushing diet was applied. However, all goats had ad libitum access to fresh water.

Experimental Procedure

For estrus induction, intravaginal sponges containing 60 mg medroxyprogesterone acetate (MAP) (Esponjavet®, Hipra, Spain) were inserted into all goats (n = 45) for 7 days. At sponge removal, each doe received an intramuscular injection of 75 µg *d*-cloprostenol (Senkrodin®, Vetaş, Türkiye) and 500 IU equine chorionic gonadotropin (eCG) (Oviser®, Hipra Spain). Between 24 and 72 hours after sponge removal, fertile bucks were introduced to the herd twice daily for 2-hour mating sessions. Goats that accepted mating were marked and separated, and the day of mating was designated as Day 0.

Goats that mated within 24-72 hours after sponge removal were randomly assigned to one of three treatment groups on day 4 post-mating. The control group received a subcutaneous injection of 1 mL sterile physiological saline (0.9% NaCl, Polifleks®, Türkiye), while the experimental groups were administered either 5 µg (TAK-5) or 25 µg

(TAK-25) of TAK-683 acetate (TAK-683 acetate, MedChemExpress, USA, Cat. No: HY-P2161B) subcutaneously (Figure 1). TAK-683 was prepared following the manufacturer's instructions and previously reported methods (Uyanık et al., 2024), resulting in a final injectable solution containing 10 µg/mL (7.361 µM) of the compound.

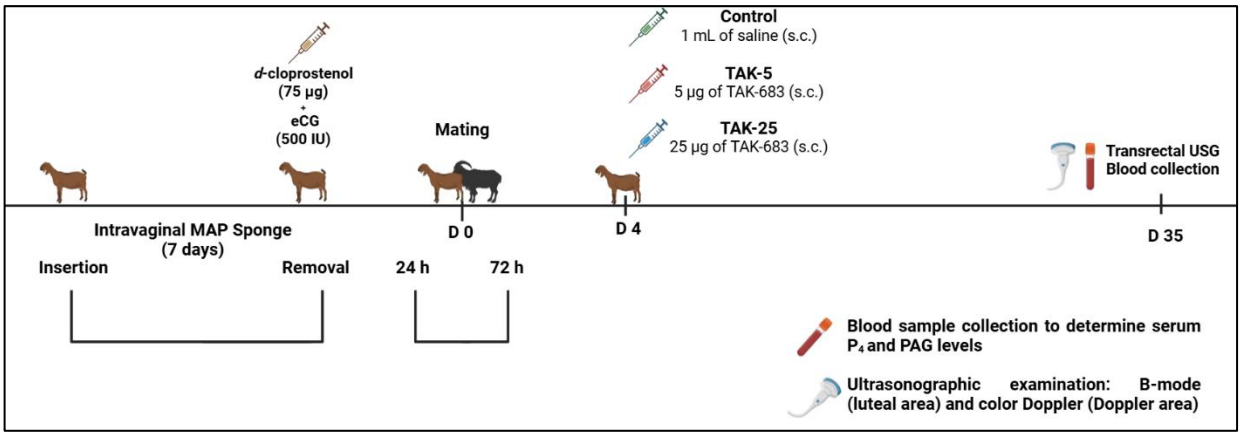

Figure 1. Experimental design and timeline of the study in goats.

Ultrasonographic Examination

Ultrasonographic examinations were performed transrectally on day 35 post-mating using a portable real-time B-mode ultrasound device equipped with a 5-10 MHz linear probe and color Doppler mode (SonoSite M-Turbo®, Fujifilm, USA). Both B-mode and color Doppler modes were used in all sequential examinations (Figure 1). Pregnancy diagnosis was based on the ultrasonographic visualization of the CL, embryonic vesicle, amniotic fluid, embryo, and embryonic heartbeat. Luteal assessments were conducted only in pregnant goats from the Control (n = 4), TAK-5 (n = 4), and TAK-25 (n = 4) groups. B-mode images were used to measure the luteal area (LA; mm²), defined as the sum of the maximum cross-sectional areas of all detected luteal structures. Color Doppler images corresponding to the same maximum cross-sectional plane were used to measure the Doppler area (DA; mm²), representing the total area of color Doppler signals within the defined LA. For each CL, a 30-second color Doppler video clip was recorded, and an image with the highest vascular signal was selected by frame-by-frame screening (Figure 2). All images were analyzed using ImageJ software (version 1.54d, National Institutes of Health, Bethesda, MD, USA). The mean DA value was calculated from the selected frames for each CL. The percentage of vascularization area was calculated by the following equation: percentage of vascularization area (%) = (DA/LA) × 100.

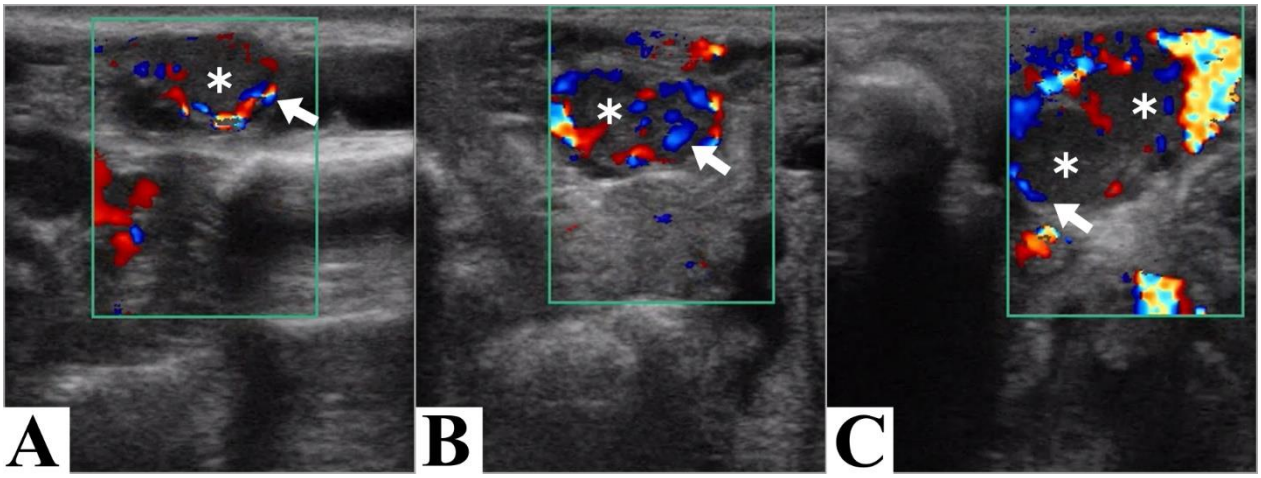

Figure 2. Color Doppler ultrasonographic images of the corpus luteum (CL) on day 35 of gestation in goats. Representative B-mode and color Doppler views of luteal tissue in (A) Control, (B) TAK-5 (5 µg TAK-683), and (C) TAK-25 (25 µg TAK-683) groups. *The asterisk (*) indicates the corpus luteum, and arrows (→) denote Doppler vascular areas within the luteal parenchyma.*

Determination of Serum P_4 (ng/mL) and PAG (O.D.) Levels

Approximately 8 mL of blood was collected from the jugular vein into dry serum tubes containing a clot activator gel (Vacusera®, Disera, Türkiye) for the determination of serum P_4 (ng/mL) and PAG (O.D.) concentrations (Figure 1). The collected samples were centrifuged at 3000 rpm for 10 minutes, and the obtained serum was stored at -20°C until analysis. Serum P_4 concentrations were measured using a chemiluminescence immunoassay (CLIA) analyzer (MAGLUMI-X8, Snibe Diagnostic, China). Serum PAG levels were assessed using a commercial Enzyme-Linked Immunosorbent Assay (ELISA) kit (Alertys Ruminant Pregnancy Test Kit, IDEXX Laboratories, Westbrook, ME, USA, Cat. No. 99-41169). Absorbance values were read at 450 nm using a microplate reader (Erba Mannheim, Lisascan EM, Czech Republic). The optical density (OD) value of each sample was calculated by subtracting the mean OD value of the negative control group from the sample OD value (S-N method). Since the intensity of the color reaction was directly proportional to the PAG concentration, OD values were used as indicators of serum PAG levels.

Statistically Analysis

Descriptive statistics for quantitative variables were expressed as mean ± standard error (Mean ± SEM), whereas categorical variables were presented as percentages. Due to the non-parametric distribution of the data, differences among treatment groups were analyzed using the Kruskal-Wallis test. When significant effects were detected, Dunn's post-hoc multiple comparison test was applied to determine pairwise differences. The relationship between serum P_4 and PAG concentrations was evaluated using Spearman's rank correlation coefficient. A significance level of $P<0.05$ was adopted for all analyses, and values between 0.05 and 0.10 were interpreted as a tendency. All statistical procedures were conducted using IBM SPSS Statistics software (Version 23.0, IBM Corp., Armonk, NY, USA).

RESULTS

On day 35 of gestation, CL diameter differed significantly among treatments, and both TAK-683 doses resulted in larger luteal diameters than the control group (Control: 7.68 ± 0.30 mm; TAK-5: 11.88 ± 0.67 mm; TAK-25: 11.56 ± 1.10 mm; P=0.023). In addition, color Doppler measurements tended to be higher in TAK-683-treated goats, indicating a numerical increase in luteal vascularization, with the greatest value observed in the TAK-25 group (Control: 26.37 ± 4.90 mm²; TAK-5: 33.61 ± 4.97 mm²; TAK-25: 45.55 ± 4.33 mm²; P=0.092). However, the number of CL, luteal area, and the DA/LA ratio did not differ among groups, despite numerically higher values in TAK-683-treated goats, particularly in the TAK-25 group (P>0.05) (Table 1).

Table 1. Luteal ultrasonographic parameters in pregnant goats treated with a single dose of TAK-683 (5 µg; TAK-5 or 25 µg; TAK-25) on Day 4 after mating or receiving no treatment (Control).

Endocrine evaluation revealed a significant increase in serum P_4 concentrations in both TAK-683 treatment groups compared with the control (Control: 4.63 ± 0.74 ng/mL; TAK-5: 7.73 ± 0.93 ng/mL; TAK-25: 10.08 ± 1.57 ng/mL; P=0.022). A similar pattern was observed for PAG, with higher levels detected in TAK-683-treated goats (Control: 1.57 ± 0.07 O.D; TAK-5: 2.00 ± 0.07 O.D; TAK-25: 2.24 ± 0.13 O.D; P=0.015) (Table 2). Additionally, correlation analysis revealed that serum P_4 and PAG concentrations were strongly and positively associated on day 35 of gestation (r=0.855; P<0.001).

Table 2. Serum progesterone (P_4, ng/mL) and pregnancy-associated glycoprotein (PAG, O.D.) concentrations on Day 35 of gestation in goats that were pregnant following treatment with TAK-683 at 5 µg (TAK-5) or 25 µg (TAK-25) on Day 4 post-mating or following no treatment (Control).

DISCUSSION

Our findings demonstrate that administration of the kisspeptin analogue TAK-683 on day 4 post-mating exerts a clear luteotropic effect in goats. Both doses significantly increased CL diameter and area compared with the Control group, which is consistent with previous studies reporting that TAK-683 stimulate LH release and strengthen luteal function (Goto et al., 2014; Kanai et al., 2017; Rahayu et al., 2017; Uyanık et al., 2024). The dose-dependent response suggests that luteotropic efficacy increases with higher TAK-683 doses, consistent with studies showing weaker effects at lower doses (Kanai et al., 2017). Although luteal blood flow ratios were numerically higher in TAK-683-treated goats, the difference was not statistically significant (Table 1), which may be related to the limited sample size. Biologically, however, this increase is relevant, since luteal perfusion is a major determinant of P_4 synthesis by enabling the transport of cholesterol substrates and LH to luteal cells (Kanazawa et al., 2025). In accordance, serum P_4 concentrations were significantly higher on day 35 of pregnancy in goats treated with TAK-683, confirming that this biological effect translated into an endocrine response (Table 2).

Pregnancy-associated glycoproteins are unique glycoproteins secreted by trophoblastic binucleate cells of the ruminant placenta and are important biomarkers of trophoblast activity and embryo-maternal interaction (Lear, 2020). In goats, PAGs become detectable in maternal circulation during approximately the third week of pregnancy, become more prominent on days 25-28, and increase sharply with progressive placental attachment (Singh et al., 2019). In dairy goats, PAG profiles gradually increase from day 26 to around day 50 (Singh et al., 2019), which corresponds to a period of accelerated placental growth and functional maturation. In the present study, PAG concentrations were significantly higher in TAK-683-treated goats, indicating stronger early placental development. This is likely associated with increased P_4 concentrations, since P_4 supports uterine secretions and conceptus development (Simintiras et al., 2019). Particularly during the early luteal phase, high P_4 accelerates embryo growth and elongation and has been linked to more advanced embryos in cattle (Simintiras et al., 2019). Similarly, Lashari and Tasawar (2010) reported that post-mating hCG administration in goats increased maternal P_4, improved placentation, enhanced placentome number, and consequently supported fetal development. Therefore, improved placentation potentially induced by TAK-683 through increased P_4 secretion may have accelerated trophoblastic development, leading to higher PAG production on day 35.

The strongest evidence supporting this interpretation is the highly positive correlation observed between serum P_4 and PAG levels ($r=0.855$; $P<0.001$). The fact that the highest P_4 levels coincided with the highest PAG levels indicates that strong luteal support positively influences placental growth. Previous studies also reported that goats carrying multiple fetuses exhibit higher P_4 concentrations and elevated PAG levels due to larger placental area (Singh et al., 2019). Adequate P_4 is crucial for preparing the uterus for placental attachment and maintaining functional placental development (Simintiras et al., 2019; Lonergan and Sánchez, 2020). Accordingly, the strong P_4-PAG association observed following TAK-683 administration provides important biochemical evidence that this treatment strengthens the luteal-placental unit as a whole.

CONCLUSION

In conclusion, our findings reveal that TAK-683 exerts a dose-dependent and pronounced luteotropic effect during early pregnancy in goats, indirectly supporting early placental development through increased P_4 secretion. Thus, TAK-683 may serve as a potential reproductive management tool by supporting the conceptus via both its direct effect on the CL and improvement of the uterine environment. The strong relationship between P_4 and PAG levels confirms enhanced luteal-placental interaction. Kisspeptin analogues appear promising for post-mating hormonal support strategies in ruminants; however, further field studies are required to evaluate the long-term impacts of TAK-683 on pregnancy maintenance, parturition, and offspring development.

Abstract

Cyclophosphazenes, an important class of inorganic ring compounds, possess a robust framework composed of phosphorus and nitrogen atoms, along with easily substitutable phosphorus–chlorine bonds. This structure provides an excellent core for the synthesis of organophosphazene derivatives, dendrimers, and polymers. Through the substitution of phosphorus–chlorine bonds with various nucleophiles, numerous derivatives with different physical and chemical properties can be obtained, many of which find applications in technology, medicine, and pharmacology. Schiff bases, which contain a carbon–nitrogen double bond (C=N, imine group), can be used in technology as catalysts, OLED (organic light-emitting diode) materials, and sensors (pH, metal-ion, and gas sensors). Furthermore, their strong activity against bacteria and fungi, their effectiveness against *Mycobacterium tuberculosis*, and their ability to scavenge free radicals and exhibit antioxidant properties make them noteworthy in medical applications.Owing to this broad functional profile, Acyclic and Cyclic Schiff base–modified cyclophosphazenes continue to attract increasing interest for the development of advanced materials, biologically active agents, and supramolecular architectures.

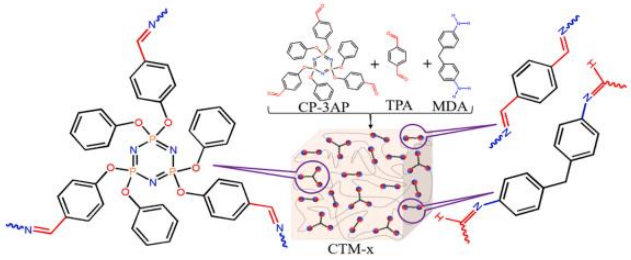
Keywords: Cyclophosphazene, Schiff base, Inorganic cyclic compounds

INTRODUCTION

Halocyclophosphazenes, among the most well-known members of inorganic heterocyclic rings, possess a backbone composed of repeating (-N=PX_2; X: Cl or F) units, in which each phosphorus atom is covalently bonded to two halogen atoms. Hexachlorocyclotriphosphazene ($N_3P_3Cl_6$, HCCP) and octachlorocyclotetraphosphazene ($N_4P_4Cl_8$, OCCP), possessing six and eight chemically reactive P–Cl bonds, respectively, act as key precursor molecules for the synthesis of cyclophosphazene derivatives (Chakraborty et al., 2021; Lee et al., 2024). Through nucleophilic substitution reactions with a variety of nucleophiles—such as amines, alcohols, aryloxides, and alkoxides—functionalized phosphazene derivatives can be readily obtained. Partially or fully substituted cyclophosphazene derivatives are obtained from the reactions of HCCP and OCCP with monofunctional nucleophiles, whereas their reactions with difunctional nucleophiles yield spiro-, ansa-, or bino-type derivatives (Tümer et al., 2008; Türe et al., 2020; Tümer 2022; Mutlu et al., 2022). Moreover, the reactions of HCCP and OCCP with tri- or tetrafunctional nucleophiles afford spiro-bino-spiro and spiro-ansa-spiro phosphazene derivatives (Kocak et al., 2013; Cemaloğlu et al., 2025). Therefore, the number of functional groups present in the nucleophile, as well as the stoichiometric ratio, plays a critical role in the synthesis of new compounds with structurally and functionally distinct properties. Moreover, the physical and chemical behaviors of these compounds vary depending on the nature of the nucleophiles attached to the cyclophosphazene framework. Such hybrid inorganic/organic heterocyclic cyclophosphazene derivatives exhibit a structural diversity that enables specialized applications in the fields of pharmacology, medicine, and technology (Usri et al., 2021; Casella et al., 2022; Dagdag and Kim, 2023).

Schiff bases are synthesized through the condensation reaction of aldehydes or ketones with primary amines, resulting in the formation of a characteristic azomethine (C=N) functional group (Raczuk et al., 2022). Their structural diversity and ease of modification make Schiff bases valuable intermediates in coordination chemistry

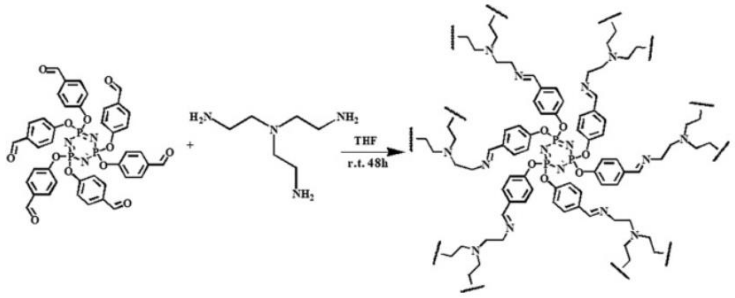
(Abd-El-Aziz et al., 2025; Rana et al., 2025), catalysis (Juyal et al., 2023), and the design of functional materials. They are also widely used in technology as OLED (organic light-emitting diode) materials (Kagatikar and Sunil, 2021; Nayak et al., 20221), and pH-, metal-ion-, and gas-responsive sensors (Goshisht et al., 2022; Alam et al., 2023; Azhar et al., 2025). Furthermore, their strong antibacterial and antifungal activities, as well as their ability to scavenge free radicals and exhibit antioxidant properties, make them noteworthy in medical applications (Abdel et al., 2023; Kumar et al., 2024; Marinova and Tamahkyarova, 2025).



The multi-armed architecture of HCCP and OCCP enables the attachment of numerous and diverse Schiff base ligands. The incorporation of Schiff base ligands into an inorganic phosphazene framework enhances their robustness and thermal stability, while reducing their sensitivity to solvent effects, pH variations, and light exposure. In conclusion, the synthesis of novel cyclophosphazene–Schiff base derivatives and the investigation of their potential applications are becoming increasingly important areas of research.

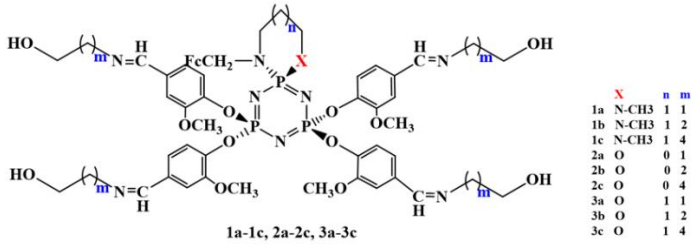
SCHIFF BASE–MODIFIED CYCLOPHOSPHAZENES

Acyclic Schiff base–modified cyclophosphazenes



Acyclic Schiff base–modified cyclophosphazene derivatives represent a notable class due to their versatile structural features and functional properties (Bertani et al., 1989; Khatri and Jain, 2012; El Brahmi et al., 2015; Katir et al., 2015; Jamain et al., 2020). They are typically obtained either by the reaction of halocyclophosphazene precursors with aldehyde-derived nucleophiles followed by condensation with primary amines to form the Schiff base (Tümer et al., 2010), or via the initial formation of the Schiff base through the reaction of primary amines with aldehydes or ketones, which is subsequently substituted onto the halocyclophosphazene framework (Odabaşoğlu and Turgut, 1999).

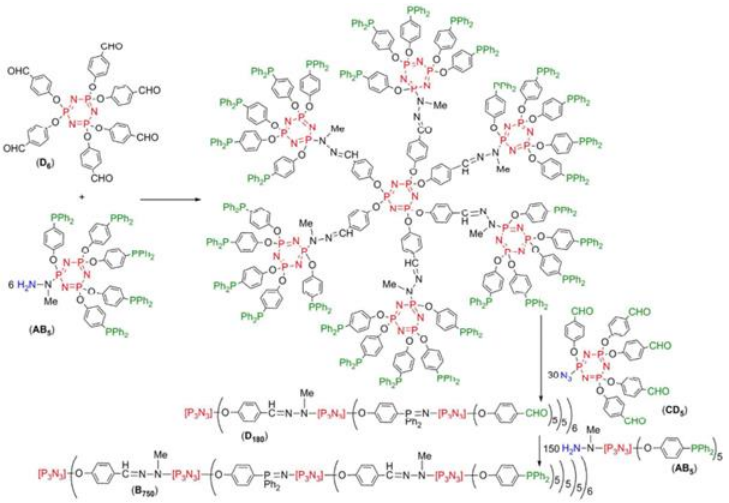
A novel Schiff base-derived polyimine vitrimer (CTM-x) was synthesized via the reaction of a cyclophosphazene bearing three aldehyde groups (CP-3AP) with terephthalaldehyde (TPA) and methylenediphenylamine (MDA) (Scheme 1). The resulting phosphazene-centered vitrimer exhibits outstanding flame retardancy and thermal stability due to the incorporation of cyclic phosphazene units, highlighting its potential for the development of high-performance vitrimers (Zhang et al., 2022).



Scheme 1. Preparation of CTM-x Vitrimers (Zhang et al., 2022)

A cyclophosphazene-centered hybrid porous polymer (PHPP) was successfully synthesized via a Schiff base reaction between hexakis(4-formylphenoxy)cyclophosphazene and 4-(2-aminoethyl)diethylenetriamine (Scheme 2). Despite its relatively low porosity, PHPP demonstrated high adsorption capacities for iodine vapor, Hg^{2+} ions, and Congo Red (CR), with values of 4.6 g g^{-1}, 435 mg g^{-1}, and 440 mg g^{-1}, respectively. The mesoporous structure and heteroatom-enriched framework of PHPP significantly enhanced host-guest interactions, thereby compensating for the limited surface area and pore volume and ensuring excellent recyclability. These findings highlight the potential of PHPP as an effective material for pollutant adsorption, environmental remediation, and the design of functional porous materials.

Scheme 2. Synthesis of a hybrid porous polymer via cross-linking of HAPCP with N,N-bis(2-aminoethyl)-1,2-ethanediamine (Wang et al., 2022).



As a result of the substitution of monospiroferrocenylphosphazene compounds with vanillin, three different compounds bearing four active aldehyde groups were synthesized. Subsequent reactions of these compounds with aliphatic amino-alcohol derivatives afforded nine Schiff base derivatives (Scheme 3). These newly synthesized Schiff base–modified compounds possess active hydroxyl groups at their terminal positions (Örgüler, 2025).

	X	n	m
1a	N-CH3	1	1

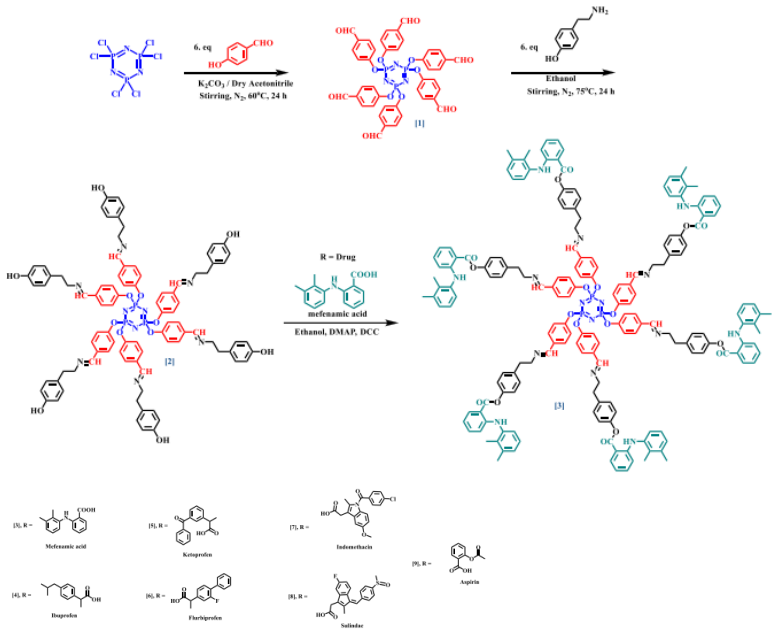
3a	O	1	1
3b	O	1	2
3c	O	1	4

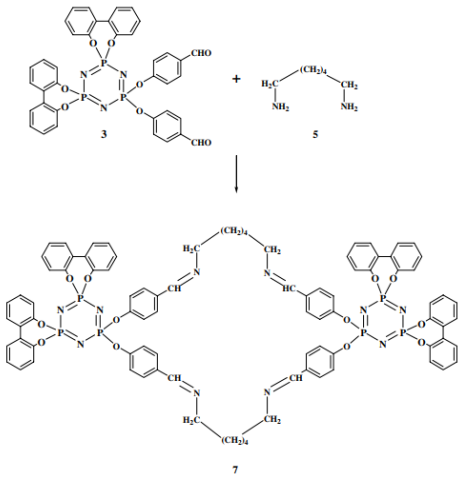


Scheme 3. Synthesis of Ferrocenylphosphazene-Schiff Base Compounds (Örgüler, 2025)

HCCP, due to its rich reactivity, continues to inspire researchers in the design and development of sophisticated dendrimer architectures. It enables the synthesis and functionalization of highly dense dendrimers bearing numerous terminal groups through only a few synthetic steps (Scheme 4). Acyclic Schiff base–modified cyclophosphazenes offer promising opportunities as next-generation smart dendrimers (Caminade et al., 2016).

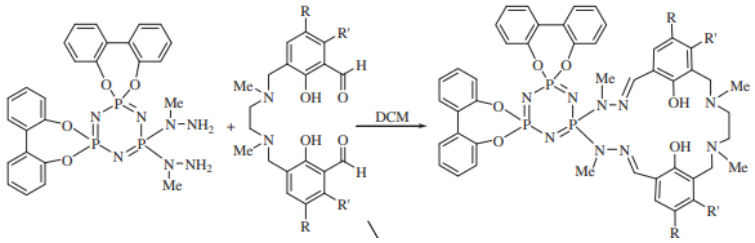
Scheme 4. Three-step synthesis of a third-generation dendrimer, a Schiff base derivative based on a cyclotriphosphazene core (Caminade et al., 2016).

As reported in a study by Meenink (2025), nine first-generation dendrimers were synthesized, seven of which were functionalized at their terminal ends with drugs to enhance anti-inflammatory activity (Scheme 5). Cytotoxicity assays using the RAW-264.7 macrophage cell line indicated that all dendrimers were non-toxic. ELISA analysis demonstrated that the dendrimer-drug conjugates significantly reduced TNF-α secretion compared to free NSAIDs, with the D4 dendrimer, bearing terminal ibuprofen groups, showing the highest anti-inflammatory efficacy. These results underscore the potential of dendrimer-based drug conjugates as a novel approach to improving the effectiveness of anti-inflammatory therapies (Meenink 2025).



Scheme 5. Synthesis of cyclophosphazene-centered dendrimers bearing Schiff bases (Meenink 2025).

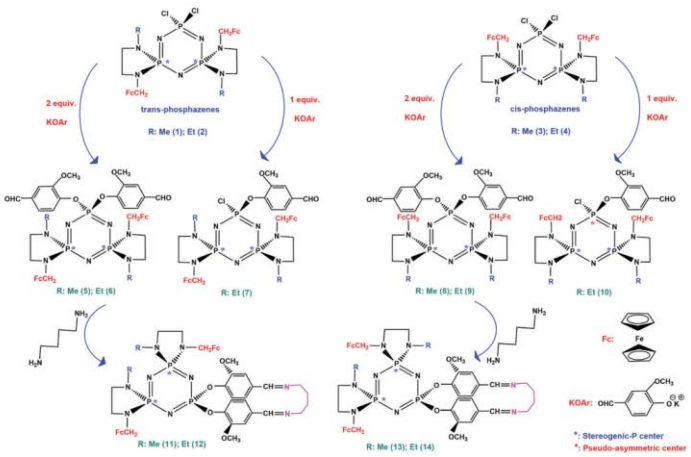
Cyclic Schiff base–modified cyclophosphazenes



Few studies have reported the synthesis of large macrocyclic Schiff bases attached on the cyclotriphosphazene framework. The imino nitrogen atoms within the macrocyclic cavity are capable of coordinating with metal ions, highlighting their potential for further applications.

$N_3P_3Cl_2(O_2C_{12}H_8)_2$ is an ideal precursor for advanced syntheses due to the presence of two reactive P–Cl bonds. Reaction with the sodium salt of 4-hydroxybenzaldehyde yielded $N_3P_3(O_2C_{12}H_8)_2[–O–C_6H_4–p\text{-}CHO]_2$ (3). Compound 3 is a notable scaffold, as it possesses two reactive CHO groups that allow for the facile formation of Schiff bases. Reaction of compound 3 with hexamethylenediamine led to the formation of a 42-membered macrocyclic structure (Scheme 6) (Chandrasekhar et al., 2006).

Scheme 6. Synthesis of macrocyclic Schiff bases centered on cyclophosphazene (Chandrasekhar et al., 2006)



The precursor $N_3P_3Cl_2(O_2C_{12}H_8)_2$ was reacted with $MeNH–NH_2$ to afford a fully substituted cyclic phosphazene derivative bearing two reactive amino groups. Subsequent reaction with dialdehyde compounds (3–6) led to the synthesis of 18-membered cyclotriphosphazene-containing macrocycles (7–10) containing two Schiff base units. These compounds are also structurally noteworthy, as they represent macrocycles with a high number of strong donors, such as phenolate oxygens and nitrogens, which can coordinate incoming metal atoms very effectively (Thilagar et al., 2012).

Scheme 7. Synthesis of macrocyclic Schiff bases (Thilagar et al., 2012)

In a study carried out by our research group in 2022, compounds (5, 6, 8, 9) were synthesized via the reaction of trans/cis-dispiroferrocenylphosphazene derivatives with vanillin. Subsequent reaction of these compounds with 1,4-diaminobutane gave rise to novel macrocyclic phosphazene Schiff bases (11–14) (Scheme 8) (Tümer et al., 2022).

The introduction of an imine functionality into ferrocenyldispirocyclotriphosphazenes is particularly noteworthy, as it has the potential to enhance both the biological activity and the complexation properties of these compounds. Moreover, the two imino nitrogen atoms within the macrocyclic cavity provide additional coordination sites, facilitating the development of novel coordination compounds with transition metal cations.

Scheme 8. Synthesis of bis-vanillinato bisferrocenyl dispiro-(N/N)cyclotriphosphazenes and their macrocyclic Schiff bases (Tümer et al., 2022)

CONCLUSIONS

Halocyclophosphazenes, particularly HCCP, play a central role in the synthesis of functionalized derivatives capable of forming both linear and macrocyclic architectures due to their versatile reactivity. Modification with Schiff bases enhances structural diversity and offers significant potential in areas such as coordination chemistry, catalysis, electronic materials, and sensor applications. Moreover, these compounds expand strategies for the design of phosphazene-based dendrimers and hybrid polymers, providing new opportunities for functional materials, drug design, and environmental applications. In the future, these systems are expected to be the focus of further studies in comprehensive biological and materials science applications.

Özet

Yıllardır mayaların, fermentasyon teknolojisinde ve biyoteknolojisinde; sirke, organik asit, etil alkol, enzim, protein, yağ ve vitamin, sucuk, kımız, kefir, yoğurt, peynir, ekmek, pasta vb. gıdaların ve gıda bileşimlerin üretiminde önemli rol oynamaları nedeniyle endüstriyel gıda üretiminde vazgeçilmez bir yerleri bulunmaktadır. Mayaların bu faydalarının yanında, hatalı üretim, uygun olmayan koşullarda depolama ve taşıma koşullarının yanında, tüketicilerin bu ürünleri tüketim aşamasına kadar geçen süreçte yanlış muhafaza etmelerinden dolayı gıdanın bozulmasına neden olmaktadır. Mayalar, fungusların *Ascomycetes* ve *Basidiomycetes* sınıfına ait ökaryotik, heterotrof, tek hücreli mikroorganizmalardır. Hücre büyüklüğü, hücre yapısı ve metabolik aktiviteleri yönünden diğer mikroorganizmalardan önemli farklılıklar göstermektedirler. Genellikle yuvarlak, silindirik, oval ya da limon şeklinde kendilerine özgü hücre yapısına sahiptirler. Mayalar çeşitli morfolojik ve biyokimyasal özellikleriyle birbirlerinden ayrılırlar. Mayaların bu özelliklerinden yararlanılarak tanımlamaları yapılmaktadır. Bu tanımlama işlemi için biyokimyasal (şeker asimilasyonu, üre hidrolizi, fermentasyonu vb), ve morfolojik (sıvı ve katı besiyerlerindeki görünüşleri, hücre bölünmesi, spor yapıları vb.) testlere dayanan geleneksel tanımlama yöntemleri geliştirilmiştir. Ancak bu yöntemler fazla işgücü ve zaman harcanmasının yanında bazı durumlarda yetersiz kalmaktadır. Bu nedenle API 20 C, API 20 C AUX ve API ID 32 C, Vitek gibi alternatif yöntemler geliştirilmiştir. Bu geleneksel yöntemlere paralel olarak, son yıllarda, moleküler biyolojinin gelişmesiyle birlikte mayaların tespit ve tanımlamasında Polimeraz Zincir Reaksiyonuna (PZR; Polymerase Chain Reaction-PCR) dayalı moleküler yöntemler oldukça önem kazanmıştır. PZR yöntemi; klasik belirleme ve tanımlama yöntemlerine alternatif olarak geliştirilen ve hızlı olduğu kadar yüksek seçicilik ve duyarlılığa sahip bir yöntem olarak, gıdalardaki kaliteyi bozan mayaların tanımlanmasında günümüzde kullanımı en çok tercih edilen yöntem olarak karşımıza çıkmaktadır. Hem faydalı hem de zararlı yönleri ile mayalar da gıda endüstrisinde önemli bir yer tutmaktadır. Bu nedenle tanımlamaları çok önemlidir. Bu derlemede mayaların tanımlanmasında kullanılan yöntemler açıklanacaktır.

Anahtar Kelimeler: PZR, Maya, API

Methods used in ıdentifying yeasts

Abstract

For years, yeasts have played an indispensable role in industrial food production due to their significant contribution to fermentation technology and biotechnology in the production of vinegar, organic acids, ethyl alcohol, enzymes, proteins, fats, vitamins, sausages, kumis, kefir, yogurt, cheese, bread, pastries, and other food products and food compounds. In addition to these benefits of yeast, food spoilage can occur due to faulty production, improper storage and transportation conditions, and incorrect preservation by consumers throughout the process leading up to consumption. Yeasts are eukaryotic, heterotrophic, single-celled microorganisms belonging to the *Ascomycetes* and *Basidiomycetes* classes of fungi. They differ significantly from other microorganisms in terms of cell size, cell structure, and metabolic activities. They generally have a unique cell structure that is round, cylindrical, oval, or lemon-shaped. Yeasts differ from one another in various morphological and biochemical characteristics. Yeasts are described using these characteristics. Traditional identification methods have been developed for this process, based on biochemical (sugar assimilation, urea hydrolysis, fermentation, etc.) and morphological (appearance in liquid and solid media, cell division, spore structures, etc.) tests. However, these methods require a lot of labor and time, and are insufficient in some cases. Therefore, alternative methods such as API 20 C, API 20 C AUX, API ID

32 C, and Vitek have been developed. In parallel with these traditional methods, molecular methods based on Polymerase Chain Reaction (PCR) have gained considerable importance in the detection and identification of yeasts in recent years, with the development of molecular biology. PCR, developed as an alternative to classical detection and identification methods, is a fast method with high selectivity and sensitivity, and is currently the most preferred method for identifying yeasts that spoil the quality of food. With both beneficial and harmful aspects, yeasts also hold an important place in the food industry. Therefore, their definitions are very important. This review will describe the methods used to identify yeasts.

Keywords: PCR, Yeast, API

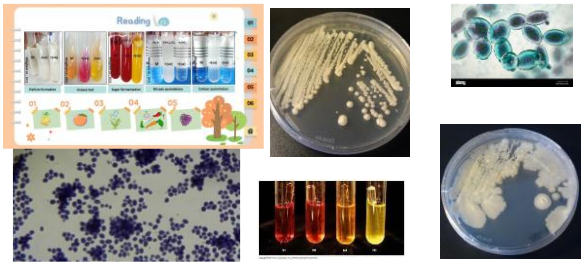
GİRİŞ

Mayalar organik asitleri kullanabilme, laktozu fermente edebilme proteolitik ve lipolitik aktiviteye sahip olmalarından dolayı, fermentasyon teknolojisinde ve biyoteknolojide; çeşitli gıdaların ve gıda bileşimlerin üretiminde önemli rol oynamaktadır (Biberoğlu, 2012).

Mayaların bu faydalarının yanında, hatalı üretim, uygun olmayan koşullarda depolama ve taşıma koşullarının yanında, tüketicilerin bu ürünleri tüketim aşamasına kadar geçen süreçte yanlış muhafaza etmelerinden dolayı gıdanın bozulmasına neden olmaktadır. Bu nedenlerle gıdalarda şişmeye, lezzet kaybına ve tekstür kalitesinde azalmaya neden olmaktadır. Ayrıca bazı mayalar, insan sağlığını olumsuz etkilemektedir (Anğ, 2014)

Bu nedenlerle, mayaların çeşitli kaynaklardan aranması ve tanımlanması çok önemlidir.

MAYALARIN TANIMLANMASINDA KULLANILAN YÖNTEMLER

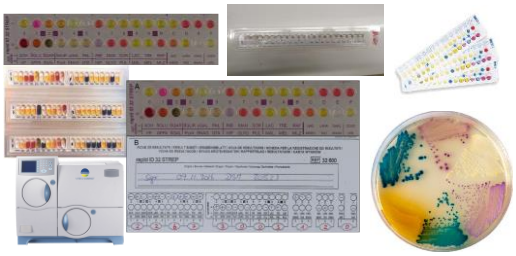


Tanımlama işlemi yapılmadan önce elde edilen izolatların maya olup olmadığı mikroskobik olarak belirlendikten sonra saflığının kontrolü yapılması gerekmektedir. Ayrıca analize alınan mikroorganizmaların genç kültür olması tavsiye edilmektedir. Mayaların tanımlanmasında en çok kullanılan yöntemler;

Ticari kitler

Moleküler Teknikler şeklinde sıralanmaktadır.

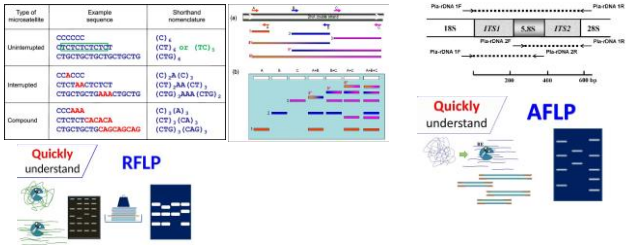
Mayaların Tanımlanmasında Kullanılan Konvansiyonel Yöntemler



Bu tanımlama yöntemleri mayaların morfolojik (makroskobik ve mikroskobik) ve biyokimyasal profillerinin incelenmesine dayanan Wickerham ve Auxanographic metotlarıdır. Konvansiyonel tanımlama yöntemleri şeker asimilasyonu-fermentasyon, azot asimilasyonu, Arbutini asimilasyonu, Diazonyum Blue B (DBB) testi, çeşitli ortamlarda gelişme (sıcaklık, çeşitli tuz ve şeker oranında gelişme) testi, üre hidrolizi, askospor oluşumu gibi analizleri içermektedir (Barnett ve ark., 1990); (Deak ve Beuchat, 1996); (Kreger–Van Rij,1987); (Kurtzman ve Fell, 2000). Bu testlerin örnekleri şekil 1’ de verilmiştir.

Şekil 1 Mayaların tanımlanmasında kullanılan konvansiyonel yöntemler (Hartline, 2025)

Mayaların Tanımlanmasında Kullanılan Ticari Kitler



Konvansiyonel tanımlama yöntemlerinin yanında, CHROMagar, API 20 C, API 20 C AUX ve API ID 32 C, Vitek gibi alternatif yöntemler geliştirilmiştir. Bu tanımlama yöntemlerinde spesifik besiyerleri ve çeşitli karbonhidrat kaynakları kullanılmaktadır. Ticari kitler konvansiyonel tanımlama yöntemlerinin minyatürize yapılmış şeklidir. Bu testlerin örnekleri şekil 2’ de verilmiştir (İnci ve ark., 2012); (Morovati ve ark., 2023); (Pincus ve ark., 2007).

Şekil 2 Mayaların tanımlanmasında kullanılan ticari kitler (Morovati ve ark., 2023)

Mayaların Tanımlanmasında Kullanılan Moleküler Teknikler

Mayaların belirli gen bölgelerinin ITS, IGS, (CGT) gibi çeşitli primerler kullanılarak çoğaltılması ve elektroforez ile gösterilmesine dayanan parmak izi (fingerprint) analizleri şeklinde sıralanmaktadır. Bu yöntemler PZR-RAPD, PZR-RFLP, PZR-AFLP ve Microsatellite analizleri şeklinde sıralana bilmektedir. Bu analiz yöntemleri şekil 3' te verilmiştir (Yalçın ve ark., 2010); (Pincus ve ark., 2007).

Şekil 3 PZR-RAPD, PZR-RFLP, PZR-AFLP ve Microsatellite analizleri (Anonymous, 2020a); (Anonymous, 2020b);

Mayaların tanımlanmasında kullanılan diğer moleküler teknikler;

Real-Time PZR; Herhangi bir çift sarmallı DNA ile araya giren spesifik olmayan flüoresan boyalar boyanması ve probun tamamlayıcı dizisi ile hibridizasyonununa dayanan bir yöntemdir. Bu analizde PZR aşamasında mikroorganizma moleküler olarak tanımlanmaktadır (Mackay, 2002).

MALDI-TOF MS; Bu yöntemde mikroorganizmalara ait biyomeküllerin (protein, peptid, şeker) ve büyük organik moleküllerin (polimer, dendrimer, makromolekül) iyonize edildikten sonra elektrik ve/veya manyetik alandan geçirilerek protein profilleri çıkarılmasıyla, bu profilin spektrumlarına ait grafiksel görüntüler, sistemin veri tabanındaki referans mikroorganizmaların uyumuna göre yapılmaktadır (Eren ve ark., 2021).

DNA SEKANS ANALİZİ; Genetik materyaldeki baz çiftlerinin (A, T, C, G) tam sırasını belirlenmesiyle genlerin yapısını, mutasyonları ve varyasyonları tespit etmeyi sağlayan bir yöntemdir. Bu yöntemde elde edile veriler çeşitli programlarla analize tabi tutulmaktadır (Behjati ve Tarpey, 2013).

Bu tanımlama yöntemlerin yanında Antijen ve antikor temelli, 1,3-beta-D-glukan, Galaktomannan, Koenzim Q10 gibi analizler de yapılmaktadır (Gülmez ve Alp, 2021); (Kurtzman ve Fell, 2000).

SONUÇ

Mayaların tanımlanmasında hızın yanında doğruluğun da çok fazla önemi vardır. Bu nedenle günümüzde konvansiyonel tanımlama yöntemlerini doğrulayıcı çeşitli (ticari ve genetik) yöntemler kullanılmaktadır.

Böylelikle hakim maya florasının belirlemesinin yanında, bu floranın teknolojik açıdan araştırılmasına imkan sağlamaktadır.

Teknolojinin ve genetik biliminin gelişmesiyle birlikte maya tanımlama yöntemlerinin gelişmesine ve optimizasyonuna imkan sağlamaktadır.

Özet

Gıdaların üretimden tüketiciye ulaşıncaya kadar yapılan işlemler sırasında çeşitli kaynaklardan bulaşan mikroorganizmalar, uygun koşullarda hızla çoğalarak fiziksel ve kimyasal kalitenin bozulmasına, bunun sonucunda çeşitli ekonomik kayıplara ve insan sağlığının bozulmasına neden olmaktadır. Mikroorganizmalar, bu zararlarının yanında, tıp, gıda, tarım gibi çeşitli alanlarda kullanılmaktadır. Bu organizmaların tespiti ve tanımlamaları çok önemlidir. Bu yöntemler arasında klasik (biyokimyasal ve morfolojik özelliklere dayanan) ve test kiti (enzim aktivitelerine dayanan) ile yapılan yöntemler gelmektedir. Günümüz de ise bu yöntemlerin yanında daha hızlı ve güvenilir DNA esaslı mikroorganizma tespit ve tanımlama yöntemleri geliştirilmiş ve yaygın bir şekilde kullanılmaya başlanmıştır. Bu yöntemin doğruluğunu artıran en önemli faktörlerden biri tespit edilecek veya tanımlanacak mikroorganizmanın DNA'sının olabildiğince saf olmasıdır. Bu nedenle çeşitli yöntemler geliştirilmiştir. Çeşitli araştırıcılarla ilk olarak tavsiye edilen tespit edilecek veya tanımlanacak mikroorganizmaların saf olarak elde edilmesidir. Bu yöntemler: mikroorganizma hücre duvarını mekanik (cam boncuk, mikro-akışkanlaştırıcı, sıcaklığın değiştirilmesi), fiziksel (yüksek basınçlı homojenizatör) ve kimyasal (Lizis) yöntemlerle parçalayıp, çeşitli kimyasallar (fenol, chloroform, proteinaz K) kullanılarak genetik materyalin saflaştırmasına dayanmaktadır. Hazır kitler, klasik saflaştırma yönteminin hızlı versiyonu olarak görülmektedir. Bu izolasyon ve saflaştırma yöntemlerinde çeşitli steril filtreler de kullanılmaktadır. Bu sektörün gelişmesiyle bazı firmalar DNA izolasyonunu otomatik olarak yapan aletler de geliştirilmiştir. Bu yöntemde analizi yapan kişi hücre parçalamasını yaptıktan sonra, saflaştırıcı solüsyonları içeren mikropleyt kutularını ve pipetleri alete yerleştirmesinden sorumludur. Bazı araştırıcılar mikroorganizmaları hücre parçalamayı ve analizi birlikte yaparak zamandan tasarruf etmeye çalışmaktadırlar.

Bu derlemede mikroorganizmaların DNA izolasyon ve saflaştırma yöntemlerinin çeşitlerine, işlem basamaklarına avantaj ve dezavantajlarına değinilecektir.

Anahtar Kelimeler: DNA, Saflaştırma, İzolasyon

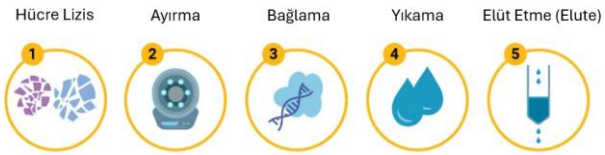
DNA Isolation And Purification Methods Of Microorganisms

Abstract

During the processing of food from production to consumption, microorganisms from various sources can multiply rapidly under suitable conditions, leading to a deterioration in physical and chemical quality, resulting in various economic losses and harming human health. Despite their harmful effects, microorganisms are used in various fields such as medicine, food, and agriculture. Identifying and describing these organisms is crucial. Today, alongside these methods, faster and more reliable DNA-based microorganism detection and identification methods have been developed and are widely used. These methods include classical methods (based on biochemical and morphological characteristics) and test kit methods (based on enzyme activities). One of the most important factors in increasing the accuracy of this method is ensuring that the DNA of the microorganism to be detected or identified is as pure as possible. Therefore, various methods have been developed. The initial recommendation from various researchers is to obtain the microorganisms to be detected or identified in pure form. These methods are based on breaking down the microorganism cell wall using mechanical (glass beads, microfluidizer, temperature modification), physical (high-pressure homogenizer), and chemical (lysis) methods, and purifying the genetic

material using various chemicals (phenol, chloroform, proteinase K). Ready-made kits are considered a faster version of the classic purification method. Various sterile filters are also used in these isolation and purification methods. With the development of this sector, some companies have also developed devices that automate DNA isolation. With the development of this sector, some companies have also developed devices that automate DNA isolation. In this method, after performing the cell lysis, the analyst is responsible for placing the microplate boxes containing the purifying solutions and the pipettes into the instrument. Some researchers are trying to save time by performing cell lysis and analysis of microorganisms simultaneously. This review will discuss the various methods for DNA isolation and purification from microorganisms, their procedural steps, advantages, and disadvantages.

Keywords: DNA, Purification, Isolation



GİRİŞ

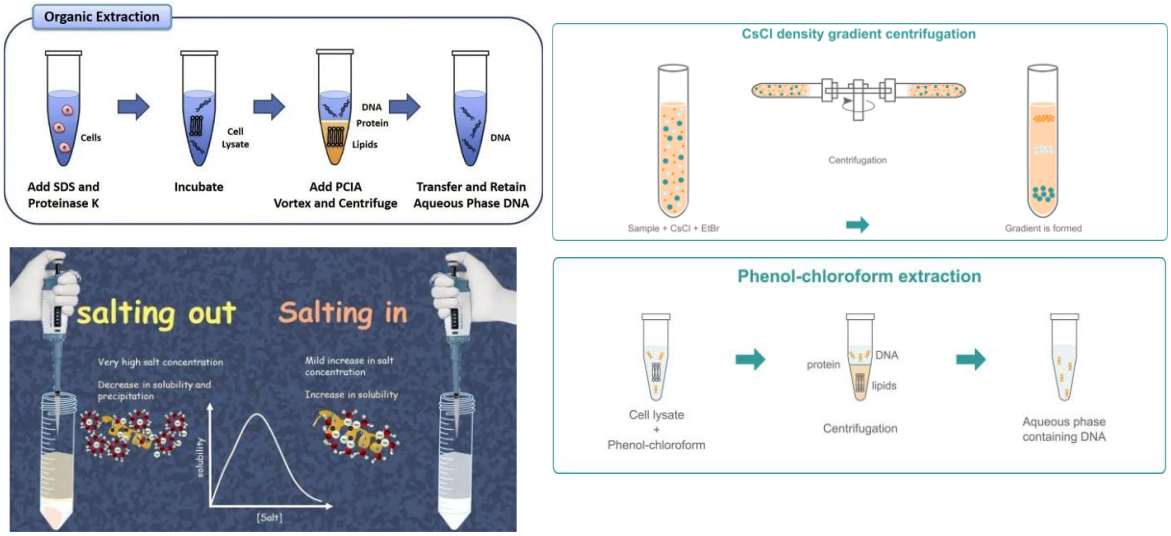
1983 yılından günümüzde, moleküler biyoloji ve genetik bilimlerinin gelişmesiyle birlikte gıdaları bozan ve patojen mikroorganizmaların tanımlanmasında ve aranmasında kolaylıklar sağlanmaktadır. Ayrıca, gıdalardan izole edilen mikroorganizmaların probiyotik ve starter kültür özelliklerinin araştırılmasına olanak sağlamaktadır. Moleküler çalışmaların, temeli DNA, RNA gibi genetik materyaller üzerinde yapılan analizlere dayanmaktadır (Anonymous, 2025; Sambrook ve ark., 1989).

Genotipik olarak tanımlamanın doğruluğu başta çalışan kişilerin profesyonelliği, optimum DNA izolasyon yöntemlerinin ve ideal malzemelerinin (kimyasal ve alet-ekipman) kullanılması gelmektedir. Özellikle DNA izolasyon yöntemleri mikroorganizmaların hücre yapılarına (hücre zarı, spor, endospor, hif vd.) göre değişiklik göstermektedir. Mikroorganizmaların DNA izolasyonu yapılmadan önce genç ve saf kültür olması önerilmektedir. Böylelikle daha sağlıklı sonuçlar çıktığı bildirilmektedir (Yıldırım vd., 2011).

MİKROORGANİZMALARIN DNA İZOLASYON VE SAFLAŞTIRMA YÖNTEMLERİ

DNA izolasyonunu genel prensibi hücre zarının parçalanması, DNA dışında kalan materyallerin uzaklaştırmasına (inaktivasyonu) ve DNA' nın elde edilip, saflaştırılmasına dayanmaktadır. Yöntem prensibi şekil 1' de verilmiştir. 1) Hücre yapısının bozulması, 2) Çözünür DNA'nın hücre kalıntılarından ve diğer çözünmeyen maddelerden ayrılması, 3) istenen DNA'yı saflaştırma matrisine bağlanması, 4) Protein ve diğer materyallerin saflaştırma matrisinden ayrılması, 5) İstenen DNA' nın eldesi (elüsyon oluşturma). Mikroorganizmaların DNA izolasyon ve saflaştırma yöntemleri aşağıda verildiği gibidir (Shetty ve Dairawan, 2020).

Şekil 1 DNA izolasyon ve saflaştırılma yöntemlerinin prensibi (Anonymous, 2025a).



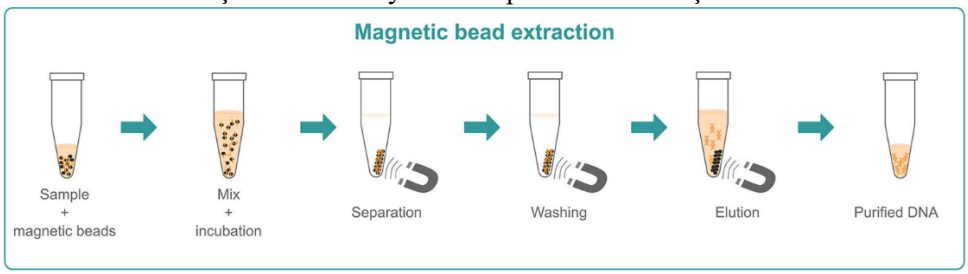
A- Kromatografi Temelli DNA İzolasyon Yöntemi:

Kolon, poliakrilamid, dekstran veya agarozdan oluşan gözenekli boncuklar içerir. Örnek üst kısma uygulanıp kolondan geçirildiğinde, mRNA ve proteinler gibi daha küçük moleküller boncukların küçük gözeneklerinden ve kanallarından içeri girmektedir. DNA molekülü geçememektedir. Sonuç olarak, DNA, daha küçük moleküllere kıyasla kolondan daha hızlı ayrılır.

Bu yöntemler arasında mikroorganizmaların DNA' sının izolasyonunda en çok kullanılan yöntemler Setiltrimetilamonyum Bromür (CTAB) ve Fenol-Kloroform yöntemleridir. Ayrıca bu iki yöntemlerde Proteinaz K kullanılabilmektedir. Bu yöntemler konvensiyonel DNA izolasyon metotları olarak geçmektedir.

Kromatografi temelli DNA izolasyon yöntemlerinde hazırlanan çözeltilerin pH, iyon dengesi, sıcaklık, analizi yapan kişinin profesyonelliği ve kullanılan alet-ekipmanlar çok önemlidir. Bu yöntemlerin prensipleri şekil 2' de görülmektedir (Ausubel, 1988); (Chacon-Cortes ve Griffiths, 2014); (Ghaheri ve ark., 2016); (Prins ve ark.,2024); (Ranjan ve Mahato, 2024); (Wydro, 2022); (Shetty ve Dairawan, 2020).

- EtBr-CsCl Gradyan Santrifüjleme Yöntemi:
- Alkali Ekstraksiyon Yöntemi:
- Silika Matrisler Yöntemi:
- Tuzlama (Salting-out) Yöntemi:
- Setiltrimetilamonyum Bromür (CTAB) Ekstraksiyon Yöntemi:
- Fenol-Kloroform Yöntemi:
- SDS-Proteinaz K Yöntemi:

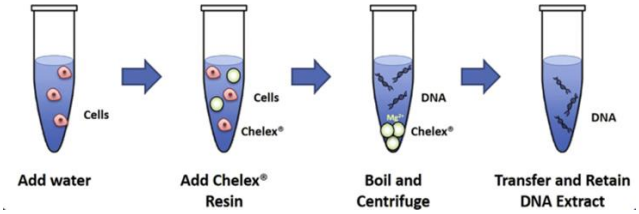


Şekil 2 Bazı Kromatografi temelli DNA izolasyon yöntemi (Elmesery, 2025); (Mészáros, 2024)

B- Silika Kolon Temelli DNA Ekstraksiyon Yöntemi:

Bu yöntemde, hücre içerisinde bulunan protein, inorganik ve organik materyaller silika kolonunun altında hapsederken, DNA içeren sulu fazın jel polimer tabakasının üzerinde kalmasını sağlanmaktadır. Bu yöntemle yüksek yoğunlukta DNA elde edilebilir (Chacon-Cortes ve Griffiths, 2014); (Prins ve ark.,2024); (Ranjan ve Mahato, 2024); (Shetty ve Dairawan, 2020); (Wydro, 2022); (Topçu ve ark., 2016).

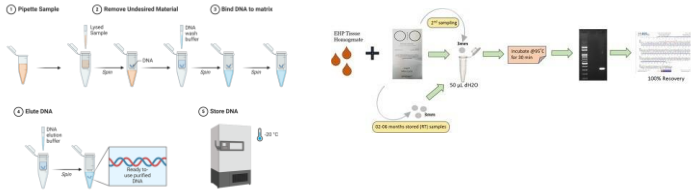
- Manyetik Boncuk Yöntemi: Şekil 3' de bu yöntemin prensibi verilmiştir.



Şekil 3 Manyetik boncuk yöntem prensibi (Mészáros, 2024)

C- Selüloz Temelli Kağıt Yöntemi:

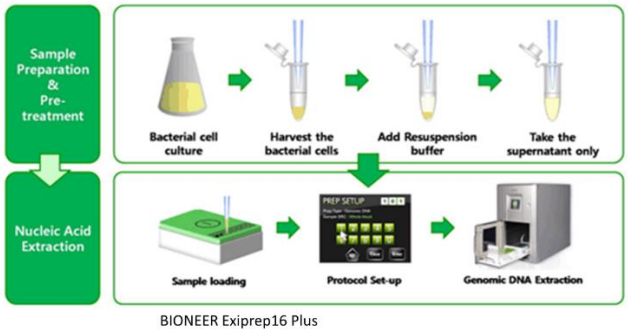
Selüloz, DNA'ya yüksek bağlanma eğilimine sahip, yoğun şekilde hidroksillenmiş bir polimerdir. Whatman FTA™ kaplamalı selüloz filtrelerin DNA' yı bağlama özelliği kullanılmaktadır (Chacon-Cortes ve Griffiths, 2014); (Prins ve ark.,2024); (Ranjan ve Mahato, 2024); (Wydro, 2022); (Shetty ve Dairawan, 2020).



-Chelex-100 Ekstraksiyon Yöntemi: Şekil 4' te bu yöntemin prensibi verilmiştir.

Şekil 4 Chelex-100 Ekstraksiyon yöntem prensibi

D- Filtre Kâğıt Temelli DNA Ekstraksiyon Yöntemi:

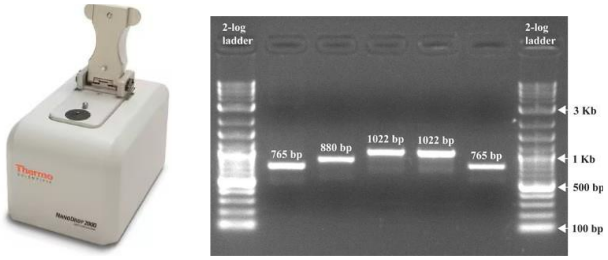


Çeşitli kaynaklardan DNA izole etmek için kullanılan, filtre kâğıdı kullanılan bir DNA ekstraksiyon yöntemidir. Ticari kit olarak kullanılır. Kullanılan kimyasal maddeler hazır halde gelmektedir. Şekil 5' de bu yöntemin prensibi verilmiştir (Chacon-Cortes ve Griffiths, 2014); (Çöl ve Karaali, 2016); (Dashti ve ark., 2009); (Prins ve ark.,2024); (Ranjan ve Mahato, 2024); (Wydro, 2022); (Shetty ve Dairawan, 2020).

Şekil 5 Filtre kâğıt temelli DNA ekstraksiyon yöntem prensibi (Mészáros, 2024)

E- Alet Temelli DNA Ekstraksiyon Yöntemi:

DNA izolasyon sektörünün gelişmesiyle bazı firmalar DNA izolasyonunu otomatik olarak yapan aletler de geliştirilmiştir. Bu yöntemde analizi yapan kişi hücre parçalamasını yaptıktan sonra, saflaştırıcı solüsyonları içeren mikropleyt kutularını ve pipetleri alete yerleştirmesinden sorumludur. Şekil 6' da bu yöntemin prensibi verilmiştir (Anonymous, 2025b); (Anonymous, 2025c).



Şekil 6 Alet temelli DNA ekstraksiyon yöntem prensibi (Anonymous, 2025b)

Ayrıca DNA izolasyon yöntemlerde hücre parçalama ve ekstraksiyon aşamalarında yüksek ısı ve düşük sıcaklıklar kullanılabilir. Bu yöntemlerin yanında, bazı araştırıcılar mikroorganizmaları hücre parçalamayı ve analizi birlikte yaparak zamandan tasarruf etmeye çalışmaktadırlar.

DNA İzolatlarının Saflık ve Büyüklük Kontrolü

İzole edilen ve saflaştırılan mikroorganizma DNA' larının saflık ve büyüklük kontrolü yapılması gerekmektedir. Bu amaçla, agaroz jel elektroforezi ve spektrofotometri (nanodrop) kullanılmaktadır. Nu yöntemler şekil 7' de verilmiştir (Lee ve ark., 2012).

Şekil 7 DNA izolatlarının saflık ve büyüklük kontrolü (Anonymous, 2025d); (Lee ve ark., 2012)

SONUÇ

DNA izolasyon ve saflaştırma yöntemleri moleküler analizlerin en önemli adımlarından biridir. Bu analizlerin doğruluğu için DNA izolasyonun ve saflaştırmasının doğru şekilde yapılması gerekmektedir. Bu nedenlerle birçok yöntem geliştirilmiştir.

DNA izolasyonun ve saflaştırmasında konvansiyonel yöntemler en çok kullanılan yöntemlerdir. Ancak bu yöntemlerin dezavantajı hazırlanan çözeltilerin pH, iyon dengesi, sıcaklık, analizi yapan kişinin profesyonelliği ve kullanılan alet-ekipmanlara dikkat edilmez ise DNA izolasyonu düzgün yapılamamaktadır. Avantajı ise maliyeti daha düşük ve çok fazla mikroorganizmanın DNA izolasyonu mümkündür. Diğer yöntemlerde (kit ve alet temelli DNA izolasyon yöntemlerinde) ise maliye yüksek ve mikroorganizmanın DNA izolasyon sayısı kısıtlıdır. Ancak kullanılan kimyasallar daha güvenilirdir.

Teknolojinin gelişmesi ve moleküler analiz tekniklerinin kullanımı arttıkça DNA izolasyon ve saflaştırma yöntemlerinin çeşitliği artmaktadır.

Abstract

Lamiaceae family has 300-400 endemic species that are widely distributed worldwide in particularly in the Mediterranean. One of the most used Lamiaceae members is *Thymus* L. The genus *Thymus* comprises 39 species in Türkiye. This species is named ‘‘kekik’’ in Turkish and used as tea and traditional medicine. In this study, the antioxidant and anticholinesterase activity of methanol extracts of *Thymus sipyleus* Boiss. (sipil kekiği) and *T. zygioides* Griseb. (bodur kekiği) were investigated. The species were collected in the region of Balıkesir. The antioxidant activities were analyzed based on DPPH free radical scavenging activity, *β*-carotene linoleic acid and cupric ion reducing antioxidant capacity (CUPRAC) assays.

Keywords: Lamiaceae, *Thymus,* antioxidant, anticholinesterase, DPPH

INTRODUCTION

The genus *Thymus* is a large genus belonging to the Lamiaceae (Labiatae) family (Touaibia, 2025). In Turkey, these species are described by 39 species with 64 taxa, of which 27 are endemic and are widely used as spices or drugs (Başer et al., 1995; Başer et al., 1997; Davis, 1988; Jalas, 1982). These species are well-known for their various biological activity, like antioxidant, antimicrobial, antifungal, antiviral, antitumor, anti-inflammatory, anticancer, and antihypertensive (Anwar et al., 2024; Nickavar and Esbati 2012).These species are native to the Marmara, Aegean, and Black Sea regions of Turkey and are used as traditional medicine because of their biological properties.

Thymus species are known as a source of phenolic compounds, which have strong antioxidant activity. Antioxidant compounds are polyphenolic structures and present in almost all plants, fruits, vegetables, microorganisms, fungi, and animal tissues. Antioxidants neutralize active oxygen formation or keep the active oxygen that can damage the body. Phenolic compounds act as antioxidants and inhibit various diseases such as cancer, cardiovascular, and neurodegenerative diseases (Safaei-Ghomi et al., 2009; Rice-Evans et al., 1996). Oxidative stress, as an instability in the manufacture and removal of free radicals and another reactive species, is well known to reason that the oxidation of major biomolecules leads to cellular damage and death (Kindl et al., 2015).

In the literature, research on the phenolic components in plant extracts and their bioactivities (antioxidant, antibacterial, and antifungal) has been conducted using various solvents (Asres et al., 2025; El-Bouzidi et al., 2025; Kaska et al., 2018; Polat et al., 2007; Rosenova et al., 2025). There are a few studies evaluating the phenolic profiles of methanol extracts of *T. sipyleus* and *T. zygioides* species and their contribution to their bioactivities (Llorent-Martínez et al., 2022; Gökbulut, 2015).

This study involved the definition of the antioxidant and anticholinesterase activities of *T. sipyleus* and *T. zygioides* through standard techniques: DPPH free radical scavenging activity, *β*-carotene linoleic acid assays and cupric ion reducing antioxidant capacity (CUPRAC). Additionally, the anticholinesterase activity of the samples was evaluated by AChE and BChE inhibitions. No prior research has been conducted to compare and analyze the antioxidant and anticholinesterase properties of *T. sipyleus* and *T. zygioides* collected from the Balıkesir region.

MATERIALS AND METHODS

Plant Material

The aerial parts of *T. sipyleus* collected from Balıkesir (Kazdağları, Edremit, rocky slopes), 913 m altitude in July 2016, and *T. zygioides* collected from Balikesir (Edremit, Kazdağları, Ortaoba village, rocky slopes), 355 m altitude in July 2016. The species were identified by Dr Selami Selvi of Balikesir University. The voucher sample is stored at the Altınoluk Vocational School, Balıkesir University, Balıkesir, Türkiye as SV 850 and SV 121, respectively. The plant samples were dried in the shade at room temperature for 15 days.

Preparation of Extracts

100 g of aerial parts of air-dried species were extracted with methanol (1 L) for 15 days. After filtration and evaporation, it was coded as TS (11.45 g) and TZ (13.23 g). All the extracts were kept at -20 °C until they were used for experimental studies.

Antioxidant activity

DPPH (1,1-diphenyl-2- picrylhydrazyl) free radical scavenging method

The free radical scavenging activity of *T. sipyleus* and *T. zygioides* essential oil and extracts was determined by the DPPH assay (Blois, 1958; Köksal et al., 2017; Miller, 1971; Ozer, 2018). Butylated hydroxyanisole (BHA) and butylated hydroxytoluene (BHT) were used as standard compounds. DPPH absorbs at 517 nm in its radical form, but upon reduction by an antioxidant or a radical species, its absorption decreases. A 0.1 mM solution of DPPH in methanol was prepared and 160 µL of this solution was added to 40 µL of the sample solutions in methanol at 10, 25, 50 and 100 µg/mL concentrations. The mixtures were kept in the dark for 30 min. The absorbance was measured at 517 nm.

β-carotene bleaching method

The antioxidant activity of *T. sipyleus* and *T. zygioides* was evaluated using *β*-carotene linoleic acid model system (Miller, 1971; Yılmaz et al., 2017). BHA and BHT were used as standard compounds. 0.5 mg *β* -carotene in 1 mL of chloroform was added to 25 µL of linoleic acid, and 200 mg of Tween 40 emulsifier mixture. After evaporation of chloroform under vacuum, 100 mL of distilled water saturated with oxygen, was through vigorous shaking. A mixture of four thousand microlitres was transferred into different test tubes containing different concentrations of the sample (10, 25, 50 and 100 µg/mL). As soon as the emulsion was added to each tube, the zero time absorbance was measured at 470 nm using a spectrophotometer. The emulsion system was incubated for 2 h at 50 °C. A blank, devoid of *β* -carotene, was prepared for background subtraction.

The CUPRAC method

The reducing capacity of *T. sipyleus* and *T. zygioides* was evaluated using the CUPRAC method (Apak et al., 2004; Bener et al., 2016; Ozer, 2018). EtOH was used as a negative control and curcumin as a positive control. Briefly, solution (1 mM DMF, 10 mM $CuCl_2$, 7.5 mM neocuproine, 1 M NH_4-CH_3COO pH 7.0), and distilled water were mixed in a 1:1:1:0.6 volume ratio. Afterward, 180 µl of the mixture was added into the wells, followed by 25 µL diluted compounds (1:20) in ethanol. The samples were held for 30 min at 25 °C. The absorbance was measured at 450 nm against a reagent blank.

Determination of the anticholinesterase activity

Determination of the anticholinesterase activity in vitro inhibition of AChE and BChE of the *T. sipyleus* and *T. zygioides* MeOH extracts were assessed by the spectrophotometric method developed by Ellman, Courtney, Andres and Featherston (Ellman et al., 1961; Reddy et al., 2015; Yılmaz et al., 2016). Galanthamine was used as a positive control. All tests were conducted in triplicate.

RESULTS and DISCUSSION

The antioxidant activities were mainly evaluated using three methods: DPPH free radical scavenging activity, *β*-carotene linoleic acid, and CUPRAC assays. In the DPPH and *β*-carotene linoleic acid assays, activities were measured at four concentrations: 10, 25, 50, and 100 µg/mL. BHA and BHT served as standards. The results are given in Table 1. In the CUPRAC, $TEAC_{CUPRAC}$ values of the extracts were calculated by using curcumin as a reference. $TEAC_{CUPRAC}$ of curcumin was found as 0.9 mmol TR g^{-1}.

To evaluate the free radical scavenging effectiveness of *T. sipyleus* and *T. zygioides* species, DPPH method was used. Methanol extracts of both sections have good antioxidant activity for all tested methods. As shown in Table 1, among the studied species, all of the extracts of *T. sipyleus* and *T. zygioides* exhibited a significant activity for *β*-carotene and DPPH methods when compared to those of BHA and BHT. In particular, *T. sipyleus* methanol extract exhibited a remarkable DPPH free radical scavenging activity with 100 µg/mL concentration. Inhibition value for the radical scavenging activity of the *T. sipyleus* methanol extract was found to be 78.79%. Also, the free radical scavenging activity of *T. sipyleus* extract was compared to that of BHA and BHT. On the other hand, inhibition values for BHA and BHT were found to be 72,74% and 81,05 %, respectively. These results indicated that the free radical scavenging effect of *T. sipyleus* methanol extract was higher than BHA. It could be concluded that the strong activity observed in that species is associated with a high amount of phenolic compounds. *T. sipyleus* methanol extract showed significant inhibition of lipid peroxidation in the *β*-carotene-linoleic acid system (72.92% inhibition at 100 µg/mL). Inhibition values of BHA and BHT were 71.99% and 81.63%, respectively.

Cu^{2+} reducing ability (CUPRAC method) is frequently used to determine the reducing powers of curcumin and methanol extracts of *T. sipyleus* and *T. zygioides* species (Figure 1). In CUPRAC method, *T. zygioides* methanol extract have better activity than the methanol extract of *T. sipyleus.*

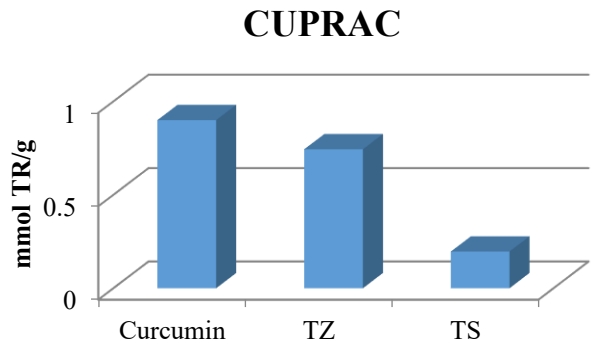

Figure 1. Cu^{2+} ion reducing power (CUPRAC) assay of the extracts and curcumin.

Acetylcholinesterase (AChE) is a crucial enzyme in the cholinergic system within both the central and peripheral nervous systems. Studies have shown that decreased levels of acetylcholine and butyrylcholine in the brain are among the most significant biochemical alterations observed in patients with Alzheimer's Disease. Consequently, one of the therapeutic strategies for Alzheimer's Disease involves the inhibition of AChE and BChE enzymes, which are responsible for the degradation of Acetylcholine and butyrylcholine (Özer et al., 2020).

Anticholinesterase activities of extracts from the species were assessed at a concentration of 200 mg/mL, with galanthamine serving as the standard compound. The results are presented in Table 2. The methanol extracts of *T. zygioides* and *T. sipyleus* showed moderate AChE (33,40 ± 3,59 and 32,19 ± 0,93%, respectively) and BChE (38,03 ± 1,94% and 47,89 ± 0,08 %, respectively) inhibitory activity.

Table 2. Anticholinesterase activity of the the extracts.

	AChE % Inhibition (200 mg/mL)	**BChE % Inhibition (200 mg/mL)**
TZ	33,4±3,59	38,03±1,94
TS	32,19±0,93	47,89±0,08
Galanthamine*	80,24 ± 0,28	80,78 ± 1,22
*Positive control		

CONCLUSION

In this study, *T. sipyleus* and *T. zygioides* methanol extracts were determined antioxidant activities and anticholinesterase properties. It was defined that the methanol extracts of these species had considerable effects in terms of the signified parameters. The fact that bioactivities such as free radical scavenging activity, *β*-carotene bleaching and anticholinesterase activities in the *T. sipyleus* extract were found to be higher than those in the *T. zygioides* extract. The data acquired in this work revealed that *T. sipyleus* and *T. zygioides* methanol extracts can be used in the food, cosmetic and pharmaceutical industries as natural antioxidants. In addition, the findings indicated that these two species were rich sources of natural AChE and BChE inhibitors. They can be used for the treatment of Alzheimer's Disease for their AChE and BChE inhibition effects.

Abstract

This study aimed to evaluate the gastroprotective and therapeutic effects of ethanolic and methanolic extracts from the pulp and seeds of two pumpkin species, *Cucurbita moschata* and *Cucurbita maxima*, against gastric ulcers induced in rats. Thirty-six rats were used to assess the impact of methanolic and ethanolic extracts administered orally at two doses (100 and 200 mg/kg) on gastric lesions provoked by ethanol and aspirin. The anti-ulcer efficacy was compared to the standard drug omeprazole. Parameters measured included the ulcer index, gastric fluid volume, pH, and total acidity. Pretreatment with all pumpkin extracts resulted in a significant and dose-dependent reduction in the ulcer index compared to the negative control group. The extracts also significantly modulated acid secretion parameters, notably reducing gastric fluid volume and total acidity while increasing pH. The ethanolic extracts from both species demonstrated superior efficacy, showing the most potent anti-ulcer activity. Qualitative phytochemical analysis revealed that these potent ethanolic extracts were rich in polyphenols and flavonoids, correlating with a high in vitro antioxidant power. The findings provide preliminary scientific evidence that *C. moschata* and *C. maxima* extracts possess significant anti-ulcer properties, attributed to their antioxidant phytoconstituents and ability to suppress gastric acid secretion. This supports the potential of pumpkin as a valuable dietary supplement or natural therapeutic agent for managing gastric ulcers.

POSTER PRESENTATION

From waste to nanofibers: Pullulan-assisted electrospinning of keratin

Havva Baskan-Bayrak[1,*] (Orcid: 0000-0002-8635-666X)

[1]Sabanci University Integrated Manufacturing Technologies Research and Application Center & Composite Technologies Center of Excellence, Manufacturing Technologies, Istanbul, 34906, Turkiye

Abstract

Electrospinning of biopolymer-based nanofibers provides opportunities for developing sustainable and functional materials. Keratin, from abundant agricultural waste such as poultry feathers, represents a renewable and eco-friendly resource that contributes to circular economy strategies and waste valorization. Its biocompatibility and biodegradability make it highly attractive for sustainable applications; however, the relatively low molecular weight, limited solubility, and viscosity-related challenges complicate its electrospinning. Pullulan, on the other hand, is a natural polysaccharide with excellent film-forming ability, and biodegradability, making it a suitable carrier matrix for fiber formation. Therefore, in this study, to overcome with the drawbacks of keratin and enable the formation of continuous nanofibers, keratin derived from poultry feathers was blended with aqueous pullulan solutions to produce pullulan/keratin nanofibers by electrospinning. Separate pullulan and keratin solutions were prepared and blended at various volume ratios (90/10, 80/20, 70/30, 60/40, and 50/50), and the resulting mixtures were electrospun at a tip-to-collector distance of 15 cm, an applied voltage of 20–25 kV, and a flow rate of 1 mL/h. Based on the morphological characterization, SEM analysis demonstrated the formation of uniform nanofibers, with fiber diameters progressively decreasing as the keratin content increased from 728 ± 96 nm for pure pullulan to 309 ± 48 nm for the 50/50 blend. The chemical structure of the nanofibers was also examined, and FTIR-ATR analysis confirmed the incorporation of keratin through the characteristic amide II peak at 1544 cm^{-1}. Furthermore, the nanofibers were subjected to heat treatment at different temperatures and subsequently tested for water solubility, revealing that all samples rapidly dissolved upon contact with water droplets, indicating limited resistance to aqueous environments. Overall, this study demonstrates the feasibility of producing pullulan/keratin nanofibers by electrospinning, highlights the processing limitations associated with keratin content, and suggests modification strategies to enhance water resistance and functionality of such biopolymer-based nanofibers.

Keywords: Electrospinning, keratin, pullulan, waste valorization, sustainable nanofibers.

Abstract

Antimicrobial resistance (AMR) represents a growing global health crisis, particularly with opportunistic pathogens such as *Pseudomonas aeruginosa*. This study aims to identify novel drug candidates against antimicrobial-resistant *P. aeruginosa* strains using a molecular profiling-based approach and to evaluate their efficacy in clinical isolates with distinct genotypes and phenotypes. The project was designed within a holistic framework encompassing: (i) determination of resistance profiles of clinical isolates to selected antibiotics, (ii) transcriptome-level analysis of genome reprogramming at sub-MIC and supra-MIC doses in strains resistant to piperacillin-tazobactam, imipenem, amikacin, and levofloxacin, (iii) identification of new therapeutic targets and drug candidates, (iv) evaluation of drug susceptibility in diverse genotypic and phenotypic backgrounds, and (v) assessment of candidate effects on biofilm formation and motility. From an extensive clinical strain library, 10 isolates were initially selected via disc diffusion method. DNA isolation, ERIC and RAPD-PCR, and agarose gel electrophoresis were employed to assess clonal relationships between the selected strains. Similarity analysis was accomplished by using the algorithm Paired group and similarity measure Dice coefficient. Analysis results were visualized with a dendrogram graph and identified eight distinct strains. Their biofilm formation and eradication abilities were characterized, and minimum inhibitory concentrations (MICs) for the selected antibiotics were determined. Subsequently, strains were cultivated under sub-MIC and supra-MIC conditions, RNA was extracted, and RNA-seq–based transcriptomic profiling was initiated. This study uniquely investigates transcriptomic responses of genetically diverse *P. aeruginosa* isolates to different antibiotic concentrations, enabling the identification of both concentration-dependent and concentration-independent regulatory patterns. Unlike conventional designs, our approach integrates antibiotic exposure and dose-dependent transcriptomic profiling, providing an unprecedented opportunity to reveal drug candidates that can inhibit or eradicate biofilm production. Ultimately, this work is expected to expand the therapeutic landscape against *P. aeruginosa* by guiding the repurposing or discovery of compounds effective in overcoming resistance.

Abstract

Carbon dots have attracted the attention of researchers in recent years due to their various properties, which make them usable in many application areas. In this study, we investigated the use of basic waste such as tangerine peels and the effect of various eutectic solvents on the synthesis of carbon dots. The role of different synthesis conditions in the synthesis of carbon dots has been studied. Eutectic solvents played a very effective role in the carbon dots synthesis, yielding successful results. In this study, hydrothermal synthesis approach, which is a common method for the preparation of carbon dots, was preferred. The synthesized carbon dots showed a strong luminescence ability because of their prominent fluorescence under UV light. In addition, the functional groups detected on the surfaces of the synthesized carbon dots were identical those in their overall structure.

Keywords: Carbon dots, eutectic solvents, hydrothermal synthesis.

Abstract

Acetic acid and its salts are a group used in many foods such as sweets, food supplements, yeast and yeast products, processed meat products, and sauces. Potassium acetate (PA) is a food preservative that is one of the salts of acetic acid. Genotoxicity tests help determine the genotoxic or antigenotoxic effects of various physical, chemical, and biological agents on genetic material. The single-cell gel electrophoresis assay, also known as the comet assay, can be applied to tissues that can be converted into a single-cell suspension, allowing for the detection of single and double-strand breaks in DNA, alkali-labile regions, apoptotic, and necrotic nuclei. In this study, human peripheral blood lymphocytes were treated with five doses of PA (12.5, 25, 50, 100, and 200 µg/mL) for 1 hour. Distilled water served as the negative control, and hydrogen peroxide as the positive control, in the study. Statistical analysis was performed using One-Way ANOVA. Upon examination of the results, a significant increase in comet tail length was observed with increasing concentration, except at the lowest concentration. A significant increase in comet tail intensity was observed at each concentration compared to the negative control group with increasing concentration. PA significantly increased the comet tail moment compared to the negative control at all concentrations except 12.5 and 100 µg/mL. It was concluded that PA causes genotoxic effects, especially at high doses. To draw conclusions regarding its use in foods, these findings need to be supported by other genotoxicity studies.

Keywords: Comet Assay, Food additives, Food Preservatives, Genotoxicity, Potassium acetate.

Abstract

The rapidly increasing global energy demand and excessive consumption of fossil fuels have resulted in severe CO_2 emissions and environmental pollution. This situation has intensified the need for sustainable and clean energy production technologies. Among these, the electrochemical splitting of water into hydrogen (HER) and oxygen (OER) evolution reactions has emerged as one of the most promising carbon-free energy conversion strategies. However, the high cost and scarcity of noble-metal-based catalysts such as platinum (Pt) and iridium oxide (IrO_2) limit their large-scale application. Therefore, developing low-cost, earth-abundant, and highly active electrocatalysts has become a major focus in energy conversion research. Carbon-based composite materials have attracted great attention due to their high electrical conductivity, large surface area, and chemical stability. These materials are widely employed in energy storage, electrocatalysis, and electrochemical sensing. In particular, graphene oxide (GO) and reduced graphene oxide (rGO) can form strong interactions with nanomaterials such as metal nanoparticles and carbon dots through their surface functional groups and flexible structures. Such interactions enhance electron transfer and reduce overpotential, improving overall electrocatalytic efficiency. Electrochemical modification is an effective approach to further enhance the performance of carbon-based materials. Electrodeposition offers advantages including controllable metal loading, short processing time, and simple operation. In this study, GO was transformed into flexible rGO films through chemical reduction, followed by electrochemical activation to increase their active surface area and improve charge transfer kinetics. Subsequently, rGO films were modified in a carbon dot–metal ion bath via electrochemical deposition. The resulting composite electrodes were systematically investigated to evaluate their electrocatalytic and energy storage properties.

Abstract

Osteoarthritis is the most prevalent form of arthritis in middle-aged and elderly populations and represents a serious degenerative joint condition. Methylsulfonylmethane MSM is a widely used dietary supplement, either alone or in combination with other nutrients, and has been reported to exhibit therapeutic benefits in the management of arthritis. Bioactive materials such as hydroxyapatite HAp and other calcium phosphates have gained significant attention as advanced pharmaceutical carriers due to their combined drug delivery potential and enhanced osteoconductivity. In this study, MSM doped HAp nanoparticles were successfully synthesized via the cost-effective and controllable wet precipitation method. Structural characterization utilizing XRD and FTIR confirmed the nanometer size of the material and the successful incorporation of MSM into the HAp matrix while maintaining the core crystal structure.

Keywods: methylsulfonylmethane, hydroxyapatite, drug delivery

Abstract

Sitka spruce (*Picea sitchensis*), a conifer species of both economic and ecological importance, is a vital candidate for genetic selection and breeding programs due to its broad genetic diversity. However, spruce species face increasing threats from environmental changes, particularly cold stress, which significantly impairs growth and productivity by inducing mechanical and physiological damage. Plants have developed adaptive responses such as cold acclimation to mitigate these effects, yet considerable variation in cold tolerance exists among individuals, driven by underlying genetic mechanisms. This study aimed to identify gene sequences associated with cold tolerance in Sitka spruce and to determine which candidate genes warrant further investigation. Cold-responsive genes from *Arabidopsis thaliana* were used in BLAST analyses against *Picea* genomic databases to identify homologous sequences. Phylogenetic relationships were assessed using BioEdit and MEGA, while conserved motif analyses were conducted via MEME and GOMo to infer functional significance and gene ontology. Results revealed that the GIGANTEA (GI) gene showed a high level of amino acid sequence homology. Phylogenetic analyses indicated close relationships between *Picea glauca* sequences and the *A. thaliana* genes CBF1, COR314-TM2, COR6.6, and COR15A. The genes GI, GRP7, and ERD10 were found to possess highly conserved motifs specific to each gene. Notably, all three genes were associated with chloroplast-related gene ontology terms, suggesting a shared functional role in cold stress response. These findings highlight ERD10, GI, and GRP7 homologs in *P. sitchensis* as promising candidates for further research.

Abstract

Exopolysaccharide (EPS) production is a key feature that enhances the probiotic potential and biotechnological value of lactic acid bacteria (LAB). EPS biosynthesis largely depends on the expression of genes such as *glycosyltransferase, epsA, epsC, epsD, flippase*, and *sugar transferase*. In this study, the expression levels of genes involved in EPS production were comparatively analyzed under standard medium (MRS, control) and optimized culture conditions that provided the highest EPS yield (for *L. salivarius* KC27L: 2% sucrose, 2% beef extract, incubation at 35°C for 18 h, pH 4.5; for *L. reuteri* KC21L: 2% sucrose, 2% peptone, incubation at 35°C for 18 h, pH 4.5). RT-PCR analyses (validated by melt curve) revealed that in *L. salivarius* KC27L, expression of *epsC* and *oligosaccharide* genes increased, whereas expression of *glycosyltransferase, epsA, epsD*, and *flippase* decreased. In *L. reuteri* KC21L, expression of *glycosyltransferase, epsA, epsC, epsD, flippase*, and *oligosaccharide flippase* genes showed an overall decrease. These findings indicate that EPS production capacity depends not only on culture conditions but also on the regulation of the corresponding biosynthetic genes. In particular, the increased expression of *epsC* and *oligosaccharide* genes suggests that they may serve as critical genetic determinants of EPS biosynthesis under optimized conditions. Overall, the results highlight that gene expression analysis is an important tool for understanding metabolic capacity and improving EPS production in LAB.

Özet

3-karboksi-4-hidroksibenzen sülfonik asit (5-sülfosalisilik asit, H_3ssal), sülfonik asit, karboksilik asit ve fenolik gruplarındaki altı potansiyel verici bölge sayesinde metal iyonlarına farklı biçimlerde koordine olabilen çok fonksiyonlu bir aromatik sülfonik asittir [1]. H_3ssal, üç farklı anyonik ligand tipi (H_2ssal^-, $Hssal^{2-}$, $ssal^{3-}$) oluşturabilir ve floresans ile proton iletkenliği gibi fiziksel özellikler sergiler [2-3]. Metal kompleksleri, serbest H_3ssal'a göre daha yüksek antimikrobiyal aktivite göstermektedir. Asimetrik yapısı nedeniyle ikinci dereceden doğrusal olmayan optik malzeme adayı olan H_3ssal, çok sayıdaki oksijen alıcısı sayesinde hidrojen bağları ve su molekülleri aracılığıyla kendi kendine düzenlenen kristal yapılar oluşturur [4]. İkincil N-verici bis(imidazol) ligandlar, $–CH_2–$ grupları sayesinde yarı rijit yapıda olup düşük boyutlu ağları daha karmaşık supramoleküler yapılara bağlamada etkilidir. Ayrıca, o-, m-, p- konumsal izomerizmleri koordinasyon polimerlerinin nihai yapısını ve özelliklerini belirgin biçimde etkiler [5].

(b)

*Sorumlu yazar e-mail: 2328125506@ogrenci.karabuk.edu.tr

Özet:

3,3-Ditiyodipropiyonik asit (DTDP) (Şekil 1), biyoteknolojik açıdan mikrobiyal olarak sentezlenen politiyoesterlerin (PTE'lerin) üretiminde öncü substrat olarak kullanılmasından dolayı önem taşımaktadır. DTDP, elektrokimyasal ve termodinamik araştırmalarda, ikincil pillerin geliştirilmesinde, amino asit analizlerinde kullanılmanın yanısıra kendiliğinden düzenlenen yapıların oluşturulmasında da tercih edilmektedir [1]. Bu ligant, hem şelatlayıcı hem de köprüleyici modlarda davranarak farklı anyonik türler oluşturabilir ve metal komplekslerinin kararlılığını arttırabilir. Öte yandan, 4,4′-bipiridin (bpy) sert N-verici merkezleri ile yarı rijit lineer yapısı, düşük boyutlu birimlerin zincir benzeri koordinasyon polimerlerine dönüşmesini kolaylaştırır [2-3].

Şekil 1. 3,3′-ditiyodipropiyonik asit ligantının yapısı

Bu çalışmada, Cd(II) metal iyonu ile 3,3′-ditiyodipropiyonik asit ve 4,4′-bipiridin ligandları kullanılarak {[Cd(DTPA)(bpy)]H_2O}$_n$ koordinasyon polimeri sentezlenmiştir. Elde edilen kompleksin kristal yapısı X-ışını tek kristal difraksiyon yöntemiyle aydınlatılmış ve Cd(II) iyonunun bozulmuş oktahedral geometriye sahip olduğu belirlenmiştir. DTPA ligantı karboksil oksijenleri üzerinden üç dişli köprü ligant olarak davranırken bpy ligantı aksiyel koordinasyondadır. Hidrat su molekülleriyle kurulan hidrojen bağları, supramoleküler yapıyı ek olarak stabilize etmektedir. Bu sonuçlar, Cd(II) iyonlarının karışık O- ve N-verici ligantların karışık ligantlı koordinasyon çeşitliliğine yeni bir örnek sunmaktadır.

Anahtar kelimeler: 3,3′-ditiyodipropiyonik asit**,** Cd(II) kompleksleri, bipiridin türevleri, koordinasyon polimerleri, tek kristal X-ışını analizi.

Teşekkür: Bu çalışma Karabük Üniversitesi Bilimsel Araştırma Projeleri Koordinatörlğü tarafından KBÜBAP-25-YL-126 numaralı Yüksek Lisans Projesi kapsamında desteklenmiştir.

Abstract

Excessive nitric oxide (NO) production upon macrophage activation plays a critical role in the pathophysiology of inflammatory processes. This study aimed to investigate the potential anti-inflammatory effects of Orlistat, a lipase inhibitor, on NO synthesis in LPS/IFN-ɣ-stimulated RAW 264.7 macrophages. An inflammation model was established by stimulating the cells for 20 hours with a combination of 100 ng/mL LPS and 2.5 ng/mL IFN-ɣ per well. The efficacy of Orlistat (0.625 µM and 1.25 µM) was evaluated at four different time points: two protective protocols (1-hour and 20-hour pre-incubation with Orlistat) and two therapeutic protocols (1-hour and 20-hour Orlistat application after LPS/IFN-ɣ stimulation). Nitrite levels in cell culture supernatants, an indicator of NO production, were measured spectrophotometrically using Griess reagent. Our findings confirmed that LPS/IFN-ɣ stimulation triggered a statistically significant ($p < 0.05$) increase in nitrite levels compared to the unstimulated control group. However, in all tested application protocols and at both Orlistat doses (0.625 µM and 1.25 µM), no statistically significant inhibition of this high NO production was observed. These results indicate that the low-dose Orlistat used was unable to exert sufficient suppressive effects on inducible nitric oxide synthase (iNOS) expression or activity. In conclusion, further *in vitro* studies using formulations with optimized solubility across a wider dose range (especially at higher concentrations) are needed to clearly assess the anti-inflammatory potential of Orlistat.

Abstract

Chronic myeloid leukemia (CML) is marked by the excessive growth of myeloid granulocytic cells in the bone marrow. The driving force behind this disease is the Bcr-Abl fusion protein, formed through a reciprocal translocation between the Abl gene on chromosome 9 and the Bcr gene on chromosome 22. This resulting Bcr-Abl1 oncoprotein exhibits continuously active tyrosine kinase activity, triggering cancer-promoting signaling pathways that enhance cell growth and suppress apoptosis. Tyrosine kinase inhibitors (TKIs) remain the cornerstone of CML treatment, providing improved survival and fewer side effects. However, resistance, often driven by mutations in the Bcr-Abl kinase domain, continues to pose a major clinical challenge. This underscores the urgent need for novel therapies that enhance treatment response, prevent resistance, and minimize toxicity. Consequently, there is growing interest in developing safer, natural-origin compounds as promising alternatives in anticancer therapy. *Nerium oleander*, a plant from the Apocynaceae family, is rich in various phytochemicals with broad therapeutic and pharmacological properties, including notable anticancer potential. In this study, *Nerium oleander* L. (MP-15) was collected from Burdur, Türkiye, and extracted with 70% ethanol. The extract's cytotoxic effects were assessed in vitro using the MTT assay on K562 and HL-60 leukemia cell lines, as well as on healthy peripheral blood mononuclear cells (PBMCs). According to the results, MP-15 demonstrated strong cytotoxic activity against K562 CML cells, with an IC_{50} value of 1.10 ± 0.42 µg/mL, outperforming imatinib ($IC_{50} = 3.84 \pm 1.04$ µg/mL), while showing less toxicity toward healthy PBMCs ($IC_{50} = 28.20 \pm 4.41$ µg/mL; Selectivity Index = 25.6). MP-15 also exhibited cytotoxic effects on HL-60 cells, with an IC_{50} of 8.53 ± 1.46 µg/mL. The apoptotic effects of MP-15 on K562 cells were further assessed using Annexin V/ethidium homodimer-III staining. After 24 hours of treatment, fluorescence microscopy of Annexin V-positive cells revealed that MP-15 induced strong apoptosis in K562 cells.

Özet

Schiff bazları, imin (C=N) fonksiyonel grubunu içeren ve geçiş metalleriyle kararlı kompleksler oluşturabilen önemli organik ligandlardır. Geniş biyolojik ve katalitik uygulama alanları nedeniyle yeni Schiff bazı türevlerinin sentezi ve karakterizasyonu literatürde önemli bir araştırma alanı oluşturmaktadır. Bu çalışma, benzaldehit türevlerinden 3 yeni Schiff bazı ligandının sentezlenmesini ve spektroskopik yöntemlerle karakterize edilmesini amaçlamaktadır. Sentezlerde; (1) 2-brombenzaldehit + 2-amino-4-nitrofenol, (2) 2-brom-5-metoksibenzaldehit + 2-amino-4-nitrofenol ve (3) 2-brom-5-metoksibenzaldehit + 2-aminofenol reaksiyonları kullanılmıştır. Bileşikler etanol çözeltisi içerisinde geri soğutucu altında 80 °C'de 6 saat kaynatılarak hazırlanmış, süzülüp kurutularak kristal formda izole edilmiştir. Sentezlenen Schiff bazlarının yapısal karakterizasyonu erime noktası tayini, FT-IR ve UV-Vis spektroskopisi ile gerçekleştirilmiştir. FT-IR analizlerinde karakteristik C=N gerilme bandı gözlenmiş; UV-Vis verileri bileşiklerin konjuge sistemlerine bağlı elektronik geçişleri doğrulamıştır. Çalışmanın ileri aşamasında, elde edilen bu yeni ligandların çeşitli geçiş metalleriyle kompleks reaksiyonları gerçekleştirilerek ilgili metal komplekslerinin sentezi ve karakterizasyonunun yapılması planlanmaktadır. Elde edilen sonuçların yeni ligand tasarımlarına ve potansiyel uygulama alanlarına katkı sağlaması beklenmektedir.

Anahtar kelimeler: Schiff bazı, Benzaldehit türevleri, Spektroskopik karakterizasyon

Abstract

Due to the rapid increase in global population, industrialization, and fast-paced consumption patterns, plastic use has become an integral component of modern life. Plastics are widely employed in various sectors, including packaging, cosmetics, medical devices, and electronics, due to their lightweight nature, durability, low cost, and ease of production. Microplastics (MP), defined as particles ≤5 mm, are categorized as primary and secondary. Primary MPs are intentionally manufactured in small sizes for use in cosmetics, cleaning products, and industrial applications. Secondary MPs emerge from the environmental degradation of larger plastic materials through sunlight, mechanical abrasion, and other external factors. These particles vary in size, shape, and chemical composition, enabling their widespread distribution across ecological systems. Humans and other organisms are exposed to MPs through inhalation, ingestion, dermal contact, and various environmental pathways. Once internalized, MPs may accumulate in tissues, inducing cellular, biochemical, and genetic alterations. This study aims to systematically evaluate research conducted between 2019 and 2025 that investigated the genotoxic potential of MP using chromosome aberration (CA), cytokinesis-block micronucleus (CBMN), and comet assays. The reviewed literature consistently demonstrates that MP exposure poses notable genotoxic hazards, either through direct interactions with DNA or indirectly by triggering oxidative stress. MPs can disrupt redox homeostasis by increasing the production of reactive oxygen and nitrogen species (ROS/RNS), leading to lipid peroxidation, protein oxidation, and DNA base modifications or strand breaks. Inadequate DNA repair further contributes to genomic instability, chromosome aberrations, micronucleus formation, and potentially carcinogenesis, as well as neurotoxic, immunotoxic, and hepatotoxic outcomes. Overall, the findings indicate that MPs may pose significant cytotoxic and genotoxic risks to environmental and human health, with toxicity influenced by particle size, shape, surface characteristics, and chemical composition. More comprehensive and mechanistic studies are required to elucidate better the genotoxic pathways and long-term biological consequences associated with MP exposure.

Keywords: Microplastic, cytotoxicity, genotoxicity, chromosome abnormality, micronucleus, DNA damage

POSTER PRESENTATION

Effect of PLGA–PEG–based *Hypericum perforatum* extract nanoparticles targeted with panitumumab in colorectal cancer cells

Sude Uveyik[1] (https://orcid.org/0009-0002-4726-0873), Fatma YURT [1,2*] (https://orcid.org/0000-0002-9394-6908)

Abstract

Colorectal cancer is among the most prevalent malignancies worldwide and is particularly notable for its limited therapeutic response in advanced stages. In this study, Hypericum perforatum (HP) extract, possessing potential for photodynamic therapy (PDT), together with the EGFR-targeting monoclonal antibody Panitumumab within the same nanosystem, was aimed to evaluate for the treatment of colorectal cancer. Accordingly, PLGA–PEG–based nanoparticles were prepared for HP loading using a double emulsion (W/O/W) technique, while Panitumumab was conjugated onto the nanoparticle surface through EDC/NHS-mediated covalent coupling. Dynamic light scattering measurements revealed that the PLGA–HP nanoparticles exhibited an average hydrodynamic diameter of 158 ± 5 nm, a main peak size of 187 ± 3 nm, and a PDI value of 0.218 ± 0.02, confirming a monodisperse distribution profile. The zeta potential of the Panitumumab-modified nanosystem was approximately –30 mV, indicating a surface charge consistent with electrostatic colloidal stability. FTIR analysis demonstrated characteristic changes in the 1650 cm^{-1} (Amide I) and 1540 cm^{-1} (Amide II) regions, along with a detectable shift in the ester C=O band at 1750 cm^{-1}, collectively confirming the successful covalent bound of the antibody onto the polymeric matrix. According to the BCA protein assay, the average conjugation efficiency was 27.29%, corresponding to 32.97 µg of Panitumumab per 1 mg of nanoparticles. HP release studies indicated higher cumulative release values under acidic conditions (pH 5.5) than at physiological pH (7.4), demonstrating a time-dependent and controlled release behavior. Overall, the findings show that HP and Panitumumab can be co-delivered effectively within a single polymeric nanosystem, and in vitro studies on the HT-29 colorectal cancer cell line are currently underway

Keywords: PLGA–PEG, Panitumumab, *Hypericum perforatum*, colorectal cancer, nanoparticles

Abstract

Ovarian cancer is considered one of the most common gynaecological cancers with a high mortality rate that is developed across the world after cervical cancer and uterine cancer. One of the main causes of failure in the ovarian cancer therapy is the development of chemoresistance. Cisplatin, a widely used chemotherapeutic agent for multiple human cancers, acts primarily by forming DNA cross-links that generate DNA adducts and ultimately block DNA repair in cancer cells. Although cisplatin is a first-line treatment, one of the biggest clinical issues is its resistance. This study investigated the involvement of two extracellular matrix (ECM) genes, *COL1A1* and *FN1*, in ovarian cancer that is resistant to cisplatin (A2780). A2780 cell lines were cultured in in RPMI-1640 medium. Moreover, RNA isolation, cDNA synthesis, qRT- PCR were performed respectively. Using quantitative real-time PCR (qRT-PCR), we investigated *FN1* and *COL1A1* genes expression levels in the human ovarian cancer cell line A2780 and its cisplatin-resistant variant A2780-R. The decreased *FN1* and *COL1A1* expression observed in cisplatin-resistant ovarian cells may reflect a cell-specific adaptive response, potentially influenced by differences in cisplatin dosing or exposure conditions that alter extracellular-matrix–related gene regulation. Cisplatin dose and the pattern of its administration can influence how cancer cells respond different dosing regimes may affect development of cisplatin resistance and therapeutic outcomes

Keywords: Ovarian Cancer, Cisplatin Resistance, *COL1A1*, *FN1*, Gene Expression, A2780 Cell Line.

Abstract

Nowadays, increasing energy demand and environmental challenges require the development of sustainable, clean, and high-performance energy storage systems. In this context, owing to their high power density, long cycle life, and rapid charge-discharge capabilities, supercapacitors stand out as promising energy storage devices and the development of new materials with increased power density, cycle life, and charge-discharge capabilities is crucial in this area. Graphene and graphene oxide have been extensively used for energy storage devices due to their improved mechanical properties, large surface area and electrical conductivity. However, charge storage mechanism of these nanomaterials may be affected by the lack of a redox site, exhibiting lower capacitance values in comparison with active carbon. In order to solve the mentioned issue, several techniques such as doping, modification and functionalization have been highly encouraged [1]. Within this motivation, in this study*, firstly, graphene oxide was synthesized by Hummer's method and then a chemical reduction method with hydrazine monohydrate was used to obtain reduced graphene oxide (rGO). In order to prepare functionalized rGO structures, two types of pre-synthesized isonitrosoacetophenone derivative (INAP and Me-INAP) were separately interacted with RGO by applying ultrasonication through a non-covalent functionalization strategy [2]. After the examination of the structural and morphological properties of the prepared materials, drop-casting technique was applied for the preparation of the modified carbon paste electrodes. Capacitive properties of INAP and Me-INAP functionalized rGO based electrodes were investigated by cyclic voltammetry in 2M H_2SO_4, 2M KOH and 2M Na_2SO_4 and specific capacitance values were calculated for acidic, alkaline and neutral medium. The obtained results revealed the efficiency of INAP and Me-INAP functionalized RGO as a promising alternative material in the field of energy storage for future applications.

Keywords: Reduced graphene oxide, non-covalent functionalization, energy storage, supercapacitor.

Abstract

Prostate cancer remains a leading cause of cancer-related mortality in men worldwide, exhibiting heterogeneous biological behavior from indolent to highly metastatic forms. Metastasis is the critical event determining prostate cancer prognosis and is responsible for the majority of prostate cancer–related deaths worldwide. While localized tumors are often manageable, metastatic spread renders the disease largely incurable. Understanding the molecular mechanisms driving this progression is essential for improving diagnostic and therapeutic strategies. This study investigated the expression profiles of the PCBB and IVD genes in prostate cancer cell lines representing distinct disease stages: PC3 and LNCaP. Following total RNA isolation, cDNA synthesis, and quantitative real-time PCR analysis, PCBB expression was significantly reduced in PC3 cells compared to LNCaP cells, suggesting a potential association between PCBB downregulation and metastatic phenotype. In contrast, IVD expression showed no statistically significant difference between the cell lines, indicating stable transcription across disease stages. These findings highlight the possible involvement of PCBB in molecular alterations linked to prostate cancer metastasis and underscore its potential value for future diagnostic or prognostic research.

Keywords: Prostate Cancer; PCBB; IVD; Metastasis; Gene Expression; RT-qPCR.

POSTER PRESENTATION

Efficacy of rosmarinic acid in reducing symptoms of acne vulgaris: Case study

Wioleta Faruga-Lewicka[1], Oliwia Kaczmarczyk[2], Wiktoria Kapica[2], Paulina Frątczak[2], Kamila Dutkiewicz[2], Julia Skwara[2], Jonatan Filarowicz[2], Julia Kościołek[2], Marek Kardas[1]

Zakład Technologii i Oceny Jakości Żywności w Zabrzu, Śląski Uniwersytet Medyczny
Śląska Wyższa Szkoła Medyczna w Katowicach, Koło Naukowe Skóra holistycznie

Abstract

Rosmarinic acid is becoming increasingly popular in cosmetology. It has been shown to inhibit elastase activity, thus preventing the degradation of elastin fibres. In addition, it has a purifying effect, reduces sebum secretion and inhibits excessive bacterial activity, so it appears to be an ingredient with beneficial effects in the treatment of acne vulgaris. The study involved evaluating the efficacy of rosmarinic acid 5% in reducing symptoms of acne vulgaris. Five women between the ages of 18 and 25 were enrolled in the study. Each had a diagnosis of acne vulgaris by a dermatologist and was not currently undergoing dermatological or any cosmetic treatment. The GEA (Global Acne Severity) and GAGS (Global Acne Grading System) scales were used to assess the severity of acne. The probands underwent 4 treatments at 2-week intervals. After a series of 4 treatments with 5% rosmarinic acid, improvements were observed in each proband. This was a reduction in inflammation, papules, pimples and blackheads. The clients' mean GAGS score before therapy was 23.8± 6.4, while after therapy it was 15.8± 7.03. On the GEA scale, the mean score before therapy was 2.8±0.75, while after therapy it was 2.0±0.63. These differences were statistically significant. Rosmarinic acid at a concentration of 5% showed high efficacy in reducing symptoms of acne vulgaris, as indicated by the results obtained in the GEA and GAGS scales. No irritant or other side effects were observed. More studies are needed to confirm its effectiveness.

Keywords: acne vulgaris; rosmarinic acid; GAGS; GEA;

Özet

Bu çalışmada N-(Fenil)maleimit, N-(4-Klorofenil)maleimit ve N-(4-Metilfenil)maleimit bileşikleri sentez edildi ve kinetik çalışma için asetonitrilde stok çözeltileri hazırlandı. Sentezlenen bileşiklerin asit katalizli hidrolizleri H_2SO_4, $HClO_4$ ve HCl çözeltilerinde 35.0±0.1°C' de incelendi. Elde edilen verilere Aşırı Asitlik metodu, aktivasyon entropisi ve sübstitüent etkisi uygulandığında farklı asit konsantrasyonlarında A-2 mekanizması ile uyumlu olduğu görüldü. Çalışılan bileşiklerin asit katalizli hidrolizlerinde kullanılan asitlerin katalitik etkileri farklı asit konsantrasyonlarında $HCl > H_2SO_4 > HClO_4$ sırasındadır. Bu sıralama A-2 mekanizması için karakteristiktir.

Abstract

Plants serve as valuable sources of raw materials and enzymes, and have been explored for these purposes for decades. However, challenges associated with plant cultivation, labor-intensive extraction processes, and contamination risks have driven a shift toward microbial production systems. Advances in biotechnology, especially gene cloning, that allowed the transfer and overexpression of target protein-coding regions in bacterial hosts have enabled the efficient microbial production of enzymes of plant origin. Plant-derived enzymes have been gaining industrial importance due to ethical, religious, and cultural preferences, their potentially lower allergenicity compared to animal-based proteins, and their wide range of applications. Bromelain, a cysteine protease with significant industrial and biomedical importance, is increasingly in demand. It possesses a broad range of therapeutic applications due to its fibrinolytic, anti-inflammatory, anticoagulant, analgesic, immunomodulatory, anticancer, and wound-healing properties and finds wide applications in food-processing, including meat tenderization and gluten-free flour production, textile, and cosmetic industries. Previous studies have shown that pineapple (*Ananas comosus*) fruit and stem tissues contain high bromelain activity. In contrast, crown leaves, typically considered agricultural waste, represent an underutilized biomass source, and their biotechnological valorization for enzyme production offers both economic and environmental advantages. This study aimed to clone the *Bromelain* gene, isolated from the *Ananas comosus* crown leaf into *E. coli* using recombinant DNA technology, and to confirm recombinant protein expression via SDS-PAGE analysis. The findings are expected to support optimization efforts in industrial bromelain production and to contribute to the expanding body of literature in plant-based enzyme biotechnology.

Keywords: Bromelain, *Ananas comosus*, gene cloning, enzyme production, biotechnology.

Abstract

Effective Thermal Energy Storage (TES) solutions are crucial for increasing energy efficiency and integrating renewable energy sources into thermal systems. Phase Change Materials (PCMs), with their high energy storage density, are promising candidates in this context. However, drawbacks such as leakage in the liquid phase and low thermal conductivity restrict their widespread commercial application. The objective of this study is to develop a porous hybrid supporting matrix utilizing the synergy of organic (PVA) and inorganic (Diatomite and Kaolin) components, capable of encapsulating PCMs without leakage. Mixtures prepared with varying ratios of Diatomite, Kaolin, and Polyvinyl Alcohol (PVA) were processed using the lyophilization (freeze-drying) technique. This method employs ice crystals as porogens, resulting in highly porous, open-celled scaffolds (matrices) with high surface area. A systematic optimization approach, featuring 12 different blend compositions, has been undertaken to study the effect of the Diatomite/Kaolin/PVA ratio. This systematic ratio analysis is critical for determining the optimal hybrid composition that maximizes the mechanical and morphological (SEM) properties and thermal stability (TGA) of the supporting scaffold. This work demonstrates the potential for developing high-performance composite FSPCMs, addressing the critical leakage problem in TES systems by utilizing the synergy of environmentally friendly and cost-effective clay-based materials.

Keywords: Thermal Energy Storage; Phase Change Material (PCM); Diatomite; Kaolin; Polyvinyl Alcohol; Lyophilization; Form-Stable Composites.

Abstract

Overweight and obesity are health disorders that can lead to serious non-communicable diseases. Non-invasive treatments that support fat reduction are increasingly used in cosmetology and aesthetic medicine. The study aimed to evaluate the effectiveness of a combination therapy involving ultrasonic lipocavitation and radiofrequency treatments in patients with excess abdominal fat. The treatments proved to be ineffective when not accompanied by lifestyle changes. Further studies are recommended in which participants will additionally follow a low-calorie diet and engage in regular physical activity.

Keywords: cavitation liposuction, radiofrequency, fat eduction, excess weight.

Abstract

L-asparaginases (L-ASNases) are hydrolase enzymes of critical clinical and industrial importance, widely utilized in pharmaceutical, food, and biotechnological sectors. They play a key role in acrylamide detoxification in the food industry and are effectively employed as antiproliferative biotherapeutics, particularly in the treatment of Acute Lymphoblastic Leukemia (ALL). Although the enzymes currently used in food applications are functional, there remains a need for variants that exhibit stability at higher temperatures and across broader salt ranges. Clinically used L-asparaginase preparations, primarily derived from *Escherichia coli* and *Erwinia chrysanthemi*, present major limitations such as immunogenicity, short serum half-life, and undesired glutaminase activity. Therefore, identifying alternative L-asparaginase sources with higher substrate specificity, lower toxicity, and improved stability has become increasingly important. In this context, the unicellular eukaryotic model organism *Tetrahymena thermophila* stands out as a promising source of novel enzymes and therapeutic proteins due to its broad physiological tolerance, glycosylation capacity, and suitability for recombinant protein production. Genomic data reveal two potential asparaginase variants with the annotations TTHERM_00042680 and TTHERM_00483700. Studies on the closely related species Tetrahymena pyriformis have highlighted a membrane-associated L-asparaginase that exhibits antiproliferative activity, lacks glutaminase function, and possesses a unique protein kinase-like feature. However, the actual biochemical activities of the asparaginase-like genes encoded in the *T. thermophila* genome have not yet been experimentally validated. In this study, we aimed to identify the most suitable *T. thermophila* enzyme for industrial and clinical applications by performing an in-depth bioinformatic analysis of the TTHERM_00042680 and TTHERM_00483700 genes. Accordingly, phylogenetic analyses, similarity matrices, and AlphaFold-based structural models were generated for the candidate sequences and compared with commercially known enzymes, leading to the identification of the optimal candidate.

Keywords: L-asparaginase, *Tetrahymena thermophila*, bioinformatics, phylogenetics, 3D modeling

Abstract

This study aimed to conduct the first comprehensive investigation into the anatomical, micromorphological, and ecological characters of the *Glaucium flavum*, *G. corniculatum*, and *G. leiocarpum* species belonging to the genus *Glaucium* Mill. (Papaveraceae), in order to contribute to their taxonomic distinction. Analyses of stem, sepal, and petal samples collected from the three species in the Aegean Region were conducted by sectioning using the paraffin embedding method, followed by staining with Safranin O and Fast Green FCF for anatomical examination. Scanning Electron Microscopy (SEM) was used to detect distinguishing structures on the epidermal surfaces of the petals and ovaries. Furthermore, soil samples were collected to determine the ecological variation of each species' habitat; their pH, salinity, organic matter, and various macro/micro element contents were analyzed. The findings allow for the determination of interspecific boundaries: Anatomically, calcium oxalate druse crystals were detected only in the leaf mesophyll of *G. corniculatum*. In terms of ovary epidermal micromorphology, dense, appressed trichomes were found in *G. corniculatum*, while distinct tubercles were observed in *G. leiocarpum*, and indistinct tubercles in *G. flavum*. Ecological analyses showed that the species are adapted to different soil chemistries. These new, measurable, and visually supported character sets make significant contributions to strengthening the systematic position of these taxa by being included in the identification keys for *Glaucium* species

Keywords: *Glaucium*, petal, ovary, micromorphology, anatomy, Aegean Region

Abstract

Supercapacitors are attractive energy storage devices due to their high-power density (10 kW kg^{-1}) and long cycling stability (>10,000 cycles). However, conventional carbon materials such as rGO typically deliver only 120–200 F g^{-1}, while MoS_2 suffers from limited conductivity, resulting in capacitance values of ≈150–350 F g^{-1} [1]. Even MoS_2/rGO hybrids rarely exceed 600 F g^{-1}, highlighting the need to design advanced composite electrodes that combine EDLC and pseudocapacitive properties to achieve higher specific capacitance [2]. In this study, a ternary hybrid electrode was prepared by integrating MoS_2, rGO, and NiMn-LDH via a hydrothermal method. The synthesis ratios were fixed as MoS_2:rGO = 9:1, Ni:Mn = 3:1, and MoS_2/rGO:LDH-NiMn = 1:1, with urea used in a 1:5 ratio relative to the total metal cations. The structural properties of the prepared materials were characterized by XRD (2°/min). XRD analysis showed rGO's broad (002) peak (25–26°), MoS_2 sharp peaks of the 2H hexagonal phase ($P6_3/mmc$), and in the hybrid, additional peaks at 11.58°, 23.5°, and 34.4° corresponding to NiMn-LDH (003)/(006)/(009), confirming successful LDH formation.

Abstract

Multiple myeloma (MM) is characterized by excessive immunoglobulin production, leading to constant proteostasis stress. When proteasomal capacity becomes limited, cells rely on lysosomal-autophagic pathways to maintain protein homeostasis. Rab7 is a key regulator of late endosome-lysosome trafficking, autophagosome-lysosome fusion, lysosomal positioning, and vesicular dynamics. However, the pharmacological inhibition of Rab7 has not previously been investigated in MM or other cancers. To evaluate the effects of CID-1067700 (known as Rab7 inhibitor) on lysosomal acidification in bortezomib-resistant (RPMI 8226 7B) and bortezomib-sensitive (RPMI-8226) myeloma cell lines. Parental RPMI-8226 (S) and long-term bortezomib-exposed resistant RPMI-8226-7B (R) cells were treated with CID-1067700. Cell viability was assessed by MTT assay (48-hour IC_{50}), while lysosomal acidification was evaluated through a single-run preliminary flow cytometry analysis using BioTracker NIR 633 across 6, 18, 24, and 48-hour time points. Rab7 inhibition reduced cell viability in a dose-dependent manner in both cell lines (48 h IC_{50}: Sen 50 µM; Res 55 µM). Lysosomal acidification increased over time in both lines; however, CID-1067700 produced minimal additional effect in sensitive cells. In contrast, resistant cells displayed a marked and exaggerated lysosomal acidification response at 48 hours following CID treatment, indicating a heightened stress-induced lysosomal activation capacity. These findings suggest that resistant cells are not characterized by elevated basal lysosomal activity, but rather by a stronger inducible lysosomal response under stress conditions. This study provides the first preliminary insight into Rab7 pharmacological inhibition in MM. Resistant cells exhibited a pronounced lysosomal acidification response to CID-1067700, whereas sensitive cells showed minimal changes. Further confirmation through additional experimental replicates is needed to substantiate these observations.

Abstract

Ketoprofen (KTP), a potent analgesic and anti-inflammatory non-steroidal anti-inflammatory drug (NSAID), exhibits limited bioavailability in topical applications due to its low aqueous solubility. The restricted solubility decreases the drug's dissolution rate, thereby negatively affecting dermal permeability[1]. Cyclodextrins are effective carrier systems capable of forming inclusion complexes with lipophilic drugs through their hydrophobic inner cavities, thereby enhancing solubility, dissolution rate, and stability. In this context, β-cyclodextrin (β-CD) can form effective and stable inclusion complexes with hydrophobic drugs such as KTP due to its structurally compatible internal cavity, and it is widely preferred in formulation studies owing to its well-established safety profile in the pharmaceutical field. This study aims to prepare β-CD inclusion complexes of KTP to enhance its solubility and dissolution rate and to evaluate the performance of these complexes in topical formulations[2-3]. KTP/β-CD inclusion complexes were prepared in a 1:1 molar ratio using the solvent evaporation method, and the KTP content in the complexes was quantified by UV–Vis spectrophotometry. A phase solubility study was conducted to investigate the solubility of KTP in the β-CD environment. The prepared complexes were comprehensively characterized using Fourier Transform Infrared Spectroscopy (FT-IR), X-ray Diffraction (XRD), Scanning Electron Microscopy (SEM), and Derivative Thermogravimetry/ Differential Scanning Calorimetry (DTG/DSC) analyses. Following characterization, two topical formulations were designed: a control formulation containing only KTP and a test formulation containing the KTP/β-CD complex. The *in vitro* release profiles of these formulations will be evaluated using Franz diffusion cells, and the collected samples will be quantitatively analyzed by a validated HPLC method. Comparative release data will reveal the effects of β-CD complexation on the release kinetics and potential topical bioavailability of KTP. This study aims to investigate the potential of β-CD complexation to improve the solubility and topical release behavior of KTP through comprehensive physicochemical and *in vitro* evaluations.

Abstract

Since the Industrial Revolution, the widespread expansion of urban life has necessitated the emergence of packaged foods, significantly increasing consumer demand. While packaged foods are favored today for their ease of use, accessibility, and cost-effectiveness, their ready availability often leads to unconscious consumer behavior. Consequently, consumers frequently purchase more than needed, resulting in spoilage and increased food waste. This constitutes a serious global problem regarding economic loss and food accessibility; therefore, studies focused on extending shelf life are crucial. Accordingly, this study investigates the usability of chitosan-based hydrogel films to increase the shelf life of packaged foods. Chitosan is a biopolymer obtained through the deacetylation of chitin, a natural polysaccharide derived from marine crustaceans like shrimp and crabs. Chitosan hydrogel was selected due to its antimicrobial, antifungal, and biodegradable properties, as extensive literature reviews suggest it effectively reduces microbial contamination. Unlike synthetic preservatives posing toxic risks or plastic packaging causing environmental damage, chitosan hydrogel offers an eco-friendly, biotechnological solution. In the experimental phase, chitosan powder will be dissolved in a 1% acetic acid solution at 25°C to obtain a homogeneous mixture, with glycerol added as a plasticizer. The mixture will be cast onto sterile surfaces and dried to produce a transparent hydrogel film. To test efficacy, perishable foods (e.g., sliced apples, tomatoes, or cheese) will be packaged using both chitosan hydrogel and standard synthetic plastic materials. Samples will be observed at specific intervals (Days 1, 3, 5, and 7) to record parameters including color change, odor, surface deformation, pH, mold growth, and weight. Additionally, vacuum packaging applications will be evaluated. It is expected that chitosan packaging will delay spoilage. Physical properties such as film thickness, permeability, and biodegradability will be analyzed to evaluate the material's durability and potential as an additive-free shelf-life extender.

Abstract

Rechargeable electronic devices, such as electric cars, mobile phones, and laptops, widely use mineral-rich lithium-ion batteries. These batteries have a limited lifespan and, when disposed of improperly, can cause significant environmental pollution. Recycling lithium from waste batteries offers a sustainable solution, reducing environmental impact while providing valuable raw materials for the pharmaceutical sector. This project focuses on obtaining lithium carbonate from waste lithium-ion batteries to be used as a raw material in lithium-based mental health medications. Lithium metal in waste batteries was precipitated using the ethanol sulfate technique, and the resulting lithium sulfate was converted into lithium carbonate by washing with sodium carbonate. The process achieved a 98% recovery rate for lithium. In parallel, cobalt from the batteries was separated as cobalt sulfate and cobalt hydroxide with high efficiency. The obtained lithium carbonate is suitable for use in psychiatric drugs addressing bipolar disorder and depression. By recycling lithium, this study simultaneously contributes to environmental sustainability and helps mitigate raw material shortages in the pharmaceutical sector, which have intensified after the Covid-19 pandemic. The project also demonstrates a practical roadmap for post-recycling utilization of lithium and highlights the potential of converting hazardous electronic waste into valuable resources. This approach may inspire future studies to explore the recycling and repurposing of other battery components or alternative battery technologies. Overall, the findings show that lithium from waste lithium-ion batteries can be efficiently recovered and transformed into pharmaceutical-grade lithium carbonate, bridging the gap between environmental management and pharmaceutical raw material supply.

Abstract

The Lamiaceae family is one of the richest families, containing over 7,000 species. Members of this family are distributed across various ecological environments in different regions of Turkey. The primary objective of this current study is to examine the morphological and phylogenetic aspects of Lamiaceae species identified in the Uşak University Campus and its surroundings. At the same time, the aim is to reveal the Lamiaceae biodiversity in the study area. First, the collected plant specimens were identified. After completing the identification of Lamiaceae species, morphological images of their flower structures were taken. Furthermore, phylogenetic trees were constructed using the sequences of the ITS gene region registered on the NCBI platform for each species, and their phylogenetic relationships were examined. Consequently, phylogenetic relationships were compared based on both morphological characteristics and the phylogenetic analyses obtained. The results of the study showed that the morphological and phylogenetic analyses supported each other, and the species generally clustered within their own genera. As seen in the tree and morphological images, Uşak University Campus is home to various genera, primarily the genus Salvia.

Abstract

Exosomes have emerged as promising biological tools in regenerative medicine due to their ability to transfer bioactive molecules and influence cell fate decisions. Human mesenchymal stem cells (hMSCs) and induced pluripotent stem cells (iPSCs) are widely used in tissue engineering owing to their multilineage differentiation capacity; however, directing their differentiation in a controlled and efficient manner remains a major challenge. In this study, exosomes derived from human osteoblast (hFOB) cells (Osteo-Exo) were investigated for their potential to induce osteogenic commitment in hMSCs and iPSCs. Exosomes were isolated using serial centrifugation and ultracentrifugation protocols, and their physicochemical properties were characterized by bicinchoninic acid (BCA) protein quantification and nanoparticle tracking analysis (NTA). Osteo-Exo were administered to hMSC and iPSC cultures at defined loading intervals. Morphological alterations associated with osteogenesis were monitored by inverted phase-contrast microscopy, while osteogenic differentiation was validated by immunofluorescence staining of RUNX2, osteopontin (OPN), and type I collagen (COL1A1). Furthermore, quantitative real-time PCR analyses were performed to assess the expression of osteogenic markers (Runx2, ALP, OPN) and pluripotency markers (OCT4, NANOG). Both hMSCs and iPSCs demonstrated early osteogenic commitment following the first exposure to Osteo-Exo, showing strong RUNX2, OPN, and COL1A1 signals, while untreated control cells remained negative for these markers. Gene expression analysis confirmed significant upregulation of osteogenic genes and downregulation of pluripotency markers, supporting the osteo-inductive effect of Osteo-Exo. These findings indicate that human osteoblast-derived exosomes promote osteogenic differentiation in both multipotent and pluripotent stem cells. Osteo-Exo represent a promising, cell-free biomimetic strategy that may contribute to future regenerative medicine and bone tissue engineering applications.

Polymer Science and Technology Program, Istanbul, Turkey

Corresponding author e-mail: hizs@itu.edu.tr

Abstract

Polyurethanes (PU) are polymers synthesized by the reaction of polyols with isocyanates, producing materials that range from soft and flexible to highly rigid depending on their chemical structure. Their physical properties, such as heat resistance, hardness, and flexibility, are strongly influenced by the type of monomers used, while the (-NH-CO-O-) bonds in their backbone provide chemical stability and mechanical strength. Liquid crystal (LC) compounds exhibit an intermediate state of matter, combining the fluidity of liquids with the long-range molecular order of crystalline solids. This unique dual nature allows LC materials to form highly ordered structures while maintaining mobility, making them attractive for advanced functional applications. When incorporated into polymer backbones, LC monomers can significantly enhance thermal, mechanical, and morphological properties. The incorporation of mesogenic groups into polymer structures is intended to improve molecular order and introduce liquid crystalline behavior, while long alkyl chains are often employed to lower the glass transition temperature (Tg), enhancing flexibility and processability. In this study, a side-chain liquid crystal polyurethane copolymer was synthesized. For this purpose, two different monomers, M1-diol (0.5 mmol, octadecyl-2,2-bis(hydroxymethyl)propionate) and M2-diol (0.5 mmol, 8-(4-cyanobiphenyl-4′-oxy) octyl-2,2-bis(hydroxymethyl)propionate) with HMDI (1 mmol, hexamethylene diisocyanate) in the presence of dibutyltin dilaurate as the catalyst. This study, conducted in our research group, was designed by taking as a reference our earlier study on PU synthesis with M2-diol. The objective was to improve the liquid crystalline properties of PU by incorporating long alkyl chains into its structure. Characterization results confirmed that long alkyl chains reduce crystallization and improve liquid crystalline behavior in the polyurethane copolymer. The chemical structure characterization was carried out using FTIR and HNMR spectroscopy, while the thermal properties were examined by differential scanning calorimetry (DSC), and the identification of liquid crystal mesophase structures and transition temperatures were performed using polarized optical microscopy (POM) and DSC, respectively.

Özet

Bu çalışmada, potansiyel bir hidrojen depolama bileşiği olan Sodyum bor hidrür'ün ($NaBH_4$) sulu faz hidroliz reaksiyonunda, bir biyo-atık olan pirinanın (zeytin posası) piroliz ve asitle fonksiyonelleştirilmesi yoluyla hazırlanan heterojen bir katalizörün performansı incelenmiştir. Araştırma, katalizörün hidrojen üretim hızı, reaksiyon kinetiği ve aktivasyon enerjisi üzerindeki etkilerini belirlemeye odaklanmıştır. Katalitik dehidrojenlenme reaksiyonu, karıştırmalı kesikli reaktör içerisinde gerçekleştirilmiştir. Üretilen hidrojen miktarı volumetrik olarak yüksek hassasiyetle belirlenmiştir. Deneysel koşullar 25 °C, 30 °C ve 35 °C olmak üzere farklı sıcaklıklarda standardize edilmiştir. Bulgular, reaksiyon sıcaklığındaki her 5°C'lik artışın (30 dakikalık zaman aralığında) Hidrojen verimini yaklaşık %15 oranında yükselttiğini göstermektedir. Esas olarak, pirina bazlı katalizörün kullanımı, self-hidroliz (katalizörsüz) reaksiyonlarına kıyasla aynı koşullar altında hidrojen verimini %27 oranında artırarak reaksiyon hızını önemli ölçüde katalize ettiğini kanıtlamıştır. Katalizörün yüzey morfolojisi ve kristal yapısı sırasıyla Taramalı Elektron Mikroskobu (SEM) ve X-Işını Kırınımı (XRD) analizleri ile karakterize edilmiştir. Sonuçlar, pirinanın ucuz ve çevresel açıdan sürdürülebilir bir kaynak olarak, $NaBH_4$ hidrolizi için yüksek performanslı katalizörlerin geliştirilmesinde önemli bir potansiyel taşıdığını doğrulamaktadır.

Abstract

Reliable electricity is a prerequisite for almost all contemporary biological and chemical workflows, from PCR-based diagnostics to vaccine cold-chain logistics. However, mobile laboratories and outreach clinics in rural or disaster-affected regions still depend largely on diesel generators, which are noisy, carbon-intensive and commercially unattractive due to fuel and maintenance costs. We present a trailer-mounted, renewably powered mobile energy station engineered to support three-phase biomedical and analytical instrumentation in off-grid contexts. The system integrates 22 photovoltaic modules with a LiFePO4 storage pack, three single-phase 48/8000 inverters configured for three-phase output, and an LPG backup generator. A layered automation scheme (Siemens S7-1200 PLC with distributed modules and Victron Cerbo GX telemetry) enables safe power management, alarm handling and remote supervision of critical loads such as −20 °C freezers, incubators and PCR thermocyclers. Proof-of-concept field tests used electric-vehicle charging as a proxy for peak laboratory demand: under overcast conditions, the station delivered 13.9 kWh over 75 minutes to an 11 kW load while maintaining system stability, revealing storage sizing and thermal management as key design levers. As a case application, we outline powering a 20–30 sample/day field PCR unit for zoonotic disease surveillance in remote agricultural communities, including continuous operation of biosafety cabinets, cold storage and data communication equipment. Target users are ministries of health, NGOs and commercial providers of mobile molecular diagnostics and vaccination campaigns who currently “buy power” piecemeal through diesel solutions. We identify a commercialization gap for standardized, field-tested power platforms tailored to biological and clinical equipment, bridging engineering suppliers and mobile health operators. By packaging renewable generation, storage, control and remote monitoring into a certified product that can be leased or sold as enabling infrastructure for mobile laboratories, the proposed architecture lowers operational costs, reduces emissions and de-risks deployment of off-grid biomedical services.

Keywords: autonomous instrumentation support, field PCR laboratory support, remote clinical outreach services, NGO-focused technology commercialization

Abstract
Water represents the main raw material in beer production, typically accounting for over 90% of the final product. Albania is characterized by abundant natural freshwater resources, originating from mountainous terrains with minimal anthropogenic impact. Despite this, limited scientific data exist regarding the suitability of different Albanian natural water sources in brewing technology. This study investigates the influence of water composition on the physicochemical characteristics of a Pale Ale beer style. Four natural spring waters sourced from distinct Albanian regions such as Selita, Lajthiza, Bogova, and Germenj were used in same brewing conditions. The purpose of this study is to assess how variations in mineral content and water profile may affect the final attributes of beer. Preliminary analytical results revealed minor variations across pH values, ethanol concentration, and total acidity among the samples. A more pronounced difference was observed in beer produced with Selita water, with the highest color intensity at 19.5 EBC. Although differences were limited at this stage, the findings suggest a measurable impact of water origin on brewing performance and final beer characteristics. These preliminary data support the suitability of Albanian natural water resources for application in the craft brewing industry.

Keywords: Water brewing, Albanian spring water, Pale ale beer, beer color, craft beer

INTRODUCTION

Albania is rich in water resources and hosts significant biodiversity, which represents an important natural asset for agro-industrial applications (Cullaj *et al.,* 2005). Despite this abundance, Albanian water resources remain largely under-investigated in relation to their technological suitability for food and beverage production, particularly in the brewing sector. Beer is one of the oldest alcoholic beverages and the most widely produced worldwide in terms of volume (Buiatti, 2009; Briggs *et al.,* 2004). Given that water constitutes more than 90% of beer, it should be considered a primary raw material whose characteristics can significantly influence the brewing process and the quality of the final product (Eumann, 2006; Comrie, 1967; Kunze, 2014). Discussions of brewing water composition commonly focus on total hardness, defined as the sum of alkaline-earth metal ions, primarily calcium and magnesium, with minor contributions from strontium and barium (Kadlec, 2002; Palmer & Kaminski, 2013). From this perspective, water chemistry plays a crucial role in determining beer style and ensuring the physicochemical stability of the final product (Punčochářová *et al.,* 2019; Briggs *et al.,* 2004). The mineral composition of brewing water is particularly critical because dissolved ions directly influence mash chemistry, enzymatic activity, yeast metabolism, and sensory attributes of beer (Kunze, 2014; De Clerck, 1957). Among these minerals, calcium (Ca^{2+}) is especially important, as it lowers mash pH through reactions with malt phosphates, enhances enzymatic efficiency during starch conversion, improves protein coagulation and beer clarity, and supports yeast flocculation and metabolic activity (Briggs *et al.,* 2004; Kunze, 2014). Magnesium (Mg^{2+}) contributes to water hardness and serves as a cofactor for yeast enzymes, thereby supporting fermentation performance (Walker, 1998; Stewart, 2017). Sulfate (SO_4^{2-}) accentuates hop bitterness and promotes a drier mouthfeel, whereas chloride (Cl^-) enhances perceived malt sweetness and fullness; the balance between these ions is a key determinant of beer flavor profile (Palmer & Kaminski, 2013; Bamforth, 2009). Because water chemistry affects mash pH, fermentability, and the extraction of bitter and aromatic compounds, brewers frequently adjust

mineral concentrations to optimize process conditions and achieve desired stylistic characteristics (Palmer, 2006; Kunze, 2014). Numerous scientific studies have demonstrated that variations in water mineral composition significantly influence both the technological aspects of brewing and the chemical composition of wort and beer (Punčochářová *et al.,* 2019; Barth, 2013; Montinari *et al.,* 2009; Briggs *et al.,* 2004). For these reasons, the present study aims to evaluate beers of the same style produced using different water sources from Albania, in order to assess the impact of water mineral composition on brewing performance and final beer quality.

MATERIAL AND METHODS

Yeast strains and growth condition

For this study 4 different spring water were used for the production of same style beer, respectively Germenj, Bogova, Selita and Lajthiza water. For the preliminary characterization and for the brewing trials, the commercial *S. cerevisiae* US-05 (SafeAle, Fermentis, Belgium) strain was used. For the beer fermentation, the yeasts were cultured aerobically at 28 °C in YEPD broth (Merck Millipore, Darmstadt, Germany) and after 48 hours the broth cultures were centrifuged at 8,000 rpm for 10 min at 4 °C. Finally, the cell pellet was washed twice with saline solution (0.9% w/v NaCl) and used as a starter. Cell density of inoculum was assessed using Thoma Counting Chamber (Thermo-Fisher Scientific) (Karaulli *et al.,* 2024).

Beer production

Saccharomyces cerevisiae US-05 commercial yeast strain was choose as starter for the production of a Pale Ale beer top fermentation style using a Brewzilla belonging to Pan's Microbrewery in Albania. Fermentation experiments were conducted at 20 °C ± 1 °C. In detail, 3 tests for each scheme were performed. For beer production, was used 90% Pale Ale malt and 10% Wienna malt (Château Pale ale, Castle Malting, Lambermont, Belgium) purchased by local distributors Albania. Hallertauer hop (Barth-Hass, Nürnberg, Germany) was added during the boiling and dry hopping phase. The main analytical characteristics of beer are shown on Table 1.

Table 1. Key parameters of the wort used for Pale Ale beer production.

	Unit	Germenj	Bogova	Selita	Lajthiza

Fermentation experiments were carried out at 20°C ± 1°C using thermoregulated stainless steel tanks (capacity 30 L), containing 20 L of wort. The starter cultures were inoculated at an initial concentration around 10^6 CFU/mL. At the end of the primary fermentation 5 g/L of sucrose was added as a primer for the secondary fermentation which took place in 330 mL dark brown glass bottles. After 40 days of maturation at 20 °C, the beers were subjected to chemical analysis.

Beer Chemical Analysis

A pH meter (Crison basic 20, Barcelona, Spain) was used to measure the pH. The density (g/cm3), alcohol content(%v/v) and color were determined according to the analytical procedures described by the European Brewery Convention (EBC). Titratable acidity (g/L) and volatile acidity (g/L) were determined according to Baiano *et al.,* (2023).

RESULTS

Beer is composed of approximately 90% water, making water an essential ingredient (Comrie, 1967). Water has a significant effect on the chemical and organoleptic characteristics of beer (Punčochářová *et al.,* 2019).

Fermentation Kinetics

In this study, four different natural freshwater sources (Bogova, Germenj, Selita, and Lajthiza) were used for the production of Pale Ale beer. The experiments were conducted to evaluate the suitability of these water sources for beer production. Figure 1 illustrates the density trends observed during alcoholic fermentation across the four experimental trials.

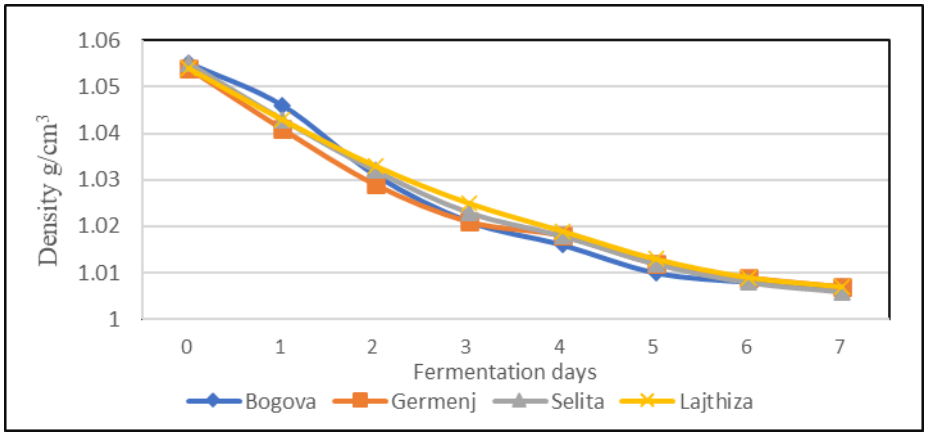

Figure 1. Density trends in Pale Ale beer produced from the four water sources studied.

As shown in Figure 1, the density decreased gradually in all four experiments, indicating active and stable fermentation. Fermentation lasted seven days for each experiment, and in all cases the final density reached 1.007 g/cm³, confirming the completion of the fermentation process and the utilization of fermentable sugars by the yeast. The progressive decrease in density is a typical indicator of fermentable sugar metabolism into ethanol and carbon dioxide, as widely described in the brewing literature (Briggs *et al.,* 2004; Kunze, 2014).

During the fermentation period, beer produced from the Bogova water source showed a slight slowdown in the first two days, reflected by a smaller decrease in density. This phenomenon may be related to the yeast adaptation phase (lag phase), during which the cells adjust to the new environment and activate metabolic mechanisms for fermentation. According to Palmer and Kaminski (2013), the physicochemical characteristics of water, particularly pH and mineral content (Ca^{2+}, Mg^{2+}), directly influence yeast metabolic activity and can cause variations in the initial fermentation kinetics. However, after this initial period, fermentation proceeded steadily and was completed within seven days, with the density decreasing from 1.055 g/cm³ to 1.007 g/cm³, indicating a complete and efficient fermentation.

Similarly, beer produced from the Germenj water source exhibited a slight slowdown in the middle of fermentation (days 3–4). This minor delay may be related to temporary changes in the rate of sugar consumption, as well as the influence of the water's ionic composition on yeast enzymatic and cellular stability. Several studies have reported that high or low concentrations of certain ions, such as bicarbonates or sulfates, can affect wort pH and fermentation efficiency (Bamforth, 2023; Kunze, 2014). Indeed, preliminary analyses of Germenj water (unpublished data) revealed high levels of Ca^{2+} and Mg^{2+} ions, which may explain the observed fermentation fluctuations. Despite this temporary slowdown, fermentation was completed within seven days, with the density decreasing from 1.054 g/cm³ to 1.007 g/cm³, indicating that the yeast successfully metabolized the available substrates.

Another important parameter indicating the progress of fermentation in the experiments conducted in this study is pH. Figure 2 shows the pH trends in beers produced from the water sources included in this study.

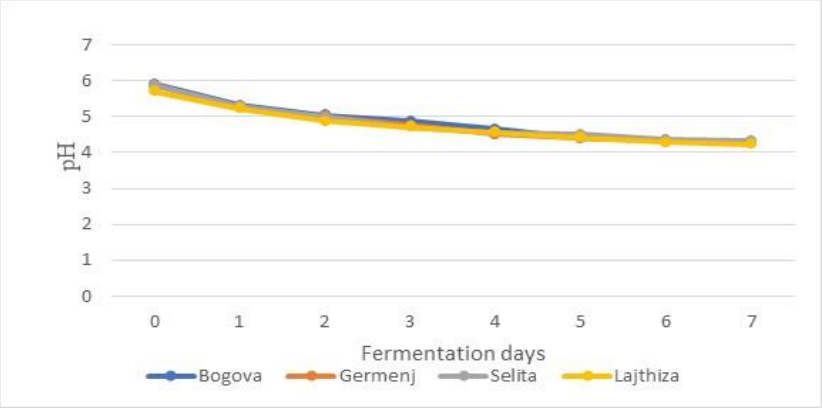

Figure 2. pH trends during fermentation in beers produced from the studied water sources.

As observed in the graph (Figure 2), the decrease in pH occurred gradually. The pH values during fermentation show expected changes corresponding to yeast metabolic activity. Beers produced from the water sources included in this study exhibited very similar initial pH values, while at the end of fermentation, the pH decreased to a range of 4.22–4.32 for all experiments. These values are consistent with the typical pH range of traditionally fermented beers and indicate complete and stable fermentation. According to the literature, the final pH of beer usually ranges from 4.0 to 4.5, depending on the beer style, yeast strain, and fermentation conditions (Kunze, 2014).
The slight differences in initial pH values among the experiments may be related to the physicochemical characteristics of the water used, particularly its bicarbonate content. Waters with higher HCO_3^- levels tend to produce a higher initial pH in the wort and, consequently, in the beer during the early stages of fermentation. Nevertheless, yeast metabolic activity during fermentation was strong, resulting in similar acidification across all experiments and achieving comparable final pH values.

Chemical parameters of beers.
The values of the main physicochemical parameters of the beers in this study are presented in Figure 3 and Table 2.

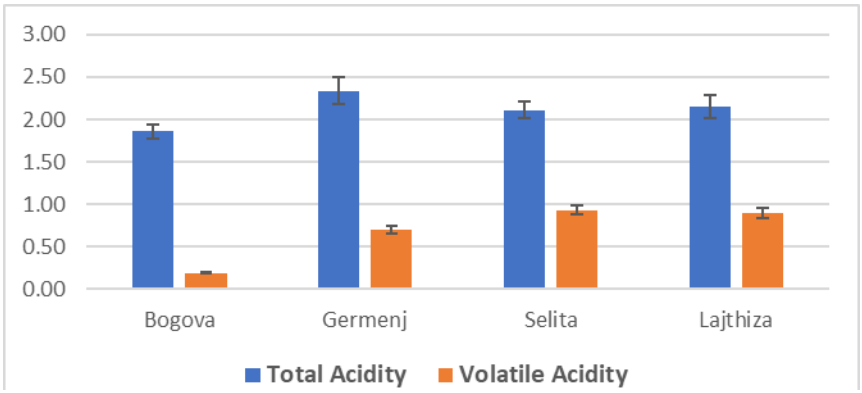

Figure 3. Total and volatile acidity values in the studied beers.

Figure 3 shows the total and volatile acidity values of the beers studied during fermentation. Total acidity values were higher in all four experiments, likely due to the production of organic acids resulting from yeast metabolic activity, including lactic, acetic, and succinic acids. (Briggs *et al.,* 2004; Bamforth, 2023).

Some studies suggest that certain yeast strains used in fermentation can produce high amounts of acetic acid in the presence of oxygen, particularly during wine fermentation (Comitini *et al.,* 2011). Volatile acidity, expressed as acetic acid, showed significant differences among the experiments. Beer produced from the Bogova water source exhibited the lowest value, approximately 0.19 g/L, while beer from the Selita water source showed the highest value, around 0.93 g/L.

Table 2. Alcohol content and color evaluation in the studied beers.

	Bogova	Germenj	Selita	Lajthiza
Alcohol (% v/v)	5.56 ± 0.04[a]	5.66 ± 0.03	5.63 ± 0.10	5.70 ± 0.09
Color (EBC)	17.67 ± 0.09	16.83 ± 0.29	19.50 ± 0.16	17.23 ± 0.42

a – Mean ± Stdev

Table 2, shows the alcohol content (% v/v) and color values (EBC) of the beers produced from the four studied water sources.

The alcohol content was relatively consistent across all beers, ranging from 5.56% (Bogova) to 5.70% (Lajthiza). This indicates that, despite minor differences in the mineral composition of the water, fermentation proceeded fully, and the yeast efficiently metabolized the available sugars. The alcohol values fall within the typical range for Pale Ale beers (4.5–6.0% v/v) (Briggs *et al.,* 2004; Kunze, 2014).

Regarding color, the measured EBC values ranged from 16.83 (Germenj) to 19.50 (Selita). This indicates that the beers produced fall within the typical Pale Ale color range (12–20 EBC), reflecting the controlled use of roasted malt. Minor differences in color between the water sources may be related to interactions between water minerals and malt components, as well as the formation of melanoidins during heating and mashing. However, the primary influence on color is attributed to the malt and thermal treatment (Bamforth, 2023; Palmer & Kaminski, 2017).

CONCLUSIONS

The water source influenced the initial fermentation kinetics, pH and volatile acidity of the beers, while the final alcohol content and color remained within the typical Pale Ale ranges. The beer from the Bogova spring water showed a higher initial pH (≈5.91) and slower early fermentation, with lower volatile acidity (0.19 g/L) and final alcohol of 5.56% v/v. Germenj beer reached 5.66% v/v alcohol at pH 4.22, Selita had the highest color (19.50 EBC) and volatile acidity (0.93 g/L), and Lajthiza beer fermented faster, reaching 5.70% v/v alcohol.

These results indicate that water composition affects fermentation and delicate chemical parameters, but controlled yeast activity ensures consistent final beer quality. Proper water selection is essential to optimize fermentation and maintain desired chemical and sensory characteristics.

ACKNOWLEDGEMENTS

The authors express their sincere gratitude to the staff of the Food Research Center at the Agricultural University of Tirana for their assistance with the chemical analyses performed for this study. We gratefully acknowledge the National Agency for Scientific Research and Innovation (AKKSHI) for funding this research project and for its continued institutional support in promoting applied scientific research and innovation in Albania.

Abstract

Age estimation constitutes a critical aspect of the autopsy process, particularly in the context of forensic identification. Due to their exceptional resistance to postmortem degradation, teeth are considered highly reliable indicators for age determination. Fourier Transform Infrared Spectroscopy (FT-IR) offers a non-destructive and efficient analytical technique for evaluating age-associated changes in the chemical composition of dental tissues. Diet, environmental exposures, and geological conditions are influential factors affecting the chemical composition of teeth and should be investigated within specific population contexts. The present study aimed to explore the association between chronological age and FT-IR spectral parameters in a Thai population, with the objective of contributing to the development of population-specific age estimation models. A total of 95 second molars (46 males and 49 females) were sectioned transversely and ground into fine powder prior to analysis using Attenuated Total Reflectance Fourier Transform Infrared Spectroscopy (ATR-FTIR). The carbonate-to-phosphate ratio was found to be correlated with age at death ($\rho = 0.184$), as was the amide-to-phosphate ratio ($\rho = 0.186$, $p < 0.05$). Additionally, a negative correlation with age was observed for ν_1PO_4/Amide I ($\rho = -0.178$, $p < 0.05$). Although further validation with larger and more diverse sample populations is required, these findings underscore the potential of ATR-FTIR spectral analysis for developing reliable and non-destructive age estimation models for forensic applications in Thailand.

Keywords: Age estimation, ATR-FTIR spectroscopy, Forensic Science

INTRODUCTION

Personal identification is a fundamental aspect of forensic investigations, with age estimation being essential information alongside sex, height, and ancestry. In living individuals, age can be determined through dental development examinations, official documents, and physical characteristics, whereas in deceased individuals, age estimation relies on cranial suture analysis, rib cartilage examination, and long bone measurements. However, post-mortem decomposition and thermal damage significantly reduce the accuracy of these methods, making precise age determination challenging in forensic cases.

Dental tissues are highly valuable forensic evidence due to their resistance to decomposition and unique individual characteristics. As the most mineralized structures in the human body, teeth remain intact long after other tissues have degraded, making them ideal specimens for victim identification in mass disasters, accidents, and criminal cases. The chemical composition of dental tissues comprises both organic and inorganic components. Enamel contains approximately 96% inorganic material (w/w), with proteins (mainly amelogenin at approximately 90%), collagen, lipids, and water constituting about 4% (w/w). Dentine has a composition similar to bone, consisting of approximately 70% inorganic material (w/w), 20% organic material, and 10% water.

Fourier Transform Infrared Spectroscopy with Attenuated Total Reflectance (FTIR-ATR) is a sensitive, non-destructive technique that requires minimal sample size and few chemicals. This method has gained increasing recognition in forensic investigations because it can identify the molecular-level chemical properties of various types of evidence. FTIR-ATR allows detailed analysis of both the organic and inorganic components of dentine,

enabling the correlation of spectral features with chronological age, and making it a potentially powerful tool in forensic dentistry.

However, dentine composition varies significantly between populations due to environmental factors, dietary habits, and genetic differences, making it inappropriate to directly apply international standards to Thai populations. Given the limited research on age estimation using dentine with FT-IR spectroscopy, the present study aimed to investigate the relationship between chronological age and FT-IR spectral characteristics in a Thai population, with the objective of developing population-specific forensic age estimation models.

MATERIALS AND METHODS

2.1 Dentine sample collection

Ninety-five non-carious permanent second molar samples (46 males and 49 females), with ages ranging from 20 to 85 years, were obtained from the Department of Forensic Medicine, Faculty of Medicine, Chiang Mai University, Thailand. This study was approved by the Ethics Committee of the Faculty of Medicine, Chiang Mai University (FOR-2565-09049). The teeth samples were cleaned with 0.9% normal saline solution followed by distilled water to remove any remaining blood, according to the method of Manuela et al. The dried samples were then stored in plastic bags at -20 °C until analysis.

2.2 Dentine preparation

Dentine samples were isolated by transverse sectioning (1 mm) using a low-speed cross-sectional saw, and the enamel surface was subsequently removed with a high-speed diamond bur. Both preparation steps were performed under continuous cooling with water to prevent heat-induced damage.

2.3 Fourier-Transform Infrared Spectroscopy - Attenuated Total Reflection (FTIR-ATR)

Dentine samples were pulverized using a freezing mill (SPEX CertiPrep 6750 Freezer/Mill) for 15 minutes. Ten milligrams of the dentine powder were analyzed using a Bruker INVENIO S FT-IR spectrometer equipped with a Specac Golden Gate™ single-reflection diamond ATR accessory (Specac Ltd., UK). Spectra were collected over the range of 4000–400 cm^{-1}, with a spectral resolution of 4 cm^{-1} and 32 scans per sample using OPUS software. An air background spectrum was recorded prior to each measurement, and the diamond crystal was cleaned between runs. Band intensities were quantified as absorbance peak heights after baseline correction and spectral normalization.

2.4 Spectra analysis

The spectra were acquired over the full mid-IR range (4000–400 cm^{-1}) using OPUS software. In order to evaluate the chemical composition of the samples several indices, summarized in Table 1 were calculated.

Table 1. Description of the indices used to evaluate the chemical composition of human dentine sample.

Index	Spectral relationship	Reference
Crystallinity index (CI)	$\frac{Abs(602\ cm^{-1})+Abs(562\ cm^{-1})}{Abs(590\ cm^{-1})}$	Weiner and Bar-Yosef, 1990

Type A Carbonate (API)	$\frac{Abs(1540\ cm^{-1})}{Abs(603\ cm^{-1})}$	Snoeck et al., 2014 Sponheimer and Lee-Thorp, 1999
Type B Carbonate (BPI)	$\frac{Abs(1415\ cm^{-1})}{Abs(603\ cm^{-1})}$	Snoeck et al., 2014 Sponheimer and Lee-Thorp, 1999
Carbonate (A+B) to Carbonate B (C/C)	$\frac{Abs(1450\ cm^{-1})}{Abs(1415\ cm^{-1})}$	Snoeck et al., 2014 and Thompson et al., 2009
Amide to Phosphate (Am/P)	$\frac{Abs(1650\ cm^{-1})}{Abs(1035\ cm^{-1})}$	Thompson et al., 2009
ν_1Phosphate to Amide I (ν_1PO_4/Amide I)	$\frac{Abs(960\ cm^{-1})}{Abs(1640\ cm^{-1})}$	France et al., 2014

2.5 Data analysis

Principal Component Analysis (PCA) is an unsupervised chemometric method used to reduce the dimensionality of multivariate data into a smaller number of variables called principal components (PCs). The PCs capture most of the information from the original dataset, with the information content decreasing in subsequent components; thus, the first PC contains the majority of information from the total dataset.

In this study, PCA was performed to analyze spectral data from human dentine samples. The dataset consisted of intensity values at various wavenumbers corresponding to different functional groups present in dentine. Samples were classified into two groups based on sex: male (group 1) and female (group 2). PCA was used to provide an overview of the multivariate data and to identify trends or patterns within the dataset. Score plots were generated to visualize the clustering of samples with similar characteristics and to highlight differences between sex groups.

Subsequent statistical analyses focused on chemometric indices to identify those showing the strongest associations with age at death or sex. Analyses were performed using IBM SPSS Statistics Base version 22. Pearson and Spearman correlation coefficients were used to assess associations. Indices exhibiting significant associations with age at death were subsequently modeled using linear regression to derive equations relating them to age at death. A significance level of 0.05 (95%) was adopted for all tests.

RESULTS and DISCUSSION

Figure 1 illustrates the ATR-FTIR spectral patterns of dentine from male and female samples. All spectra across different ages and sexes were visually inspected by examining the peaks present. No differences in the observed functional groups were detected between male and female samples.

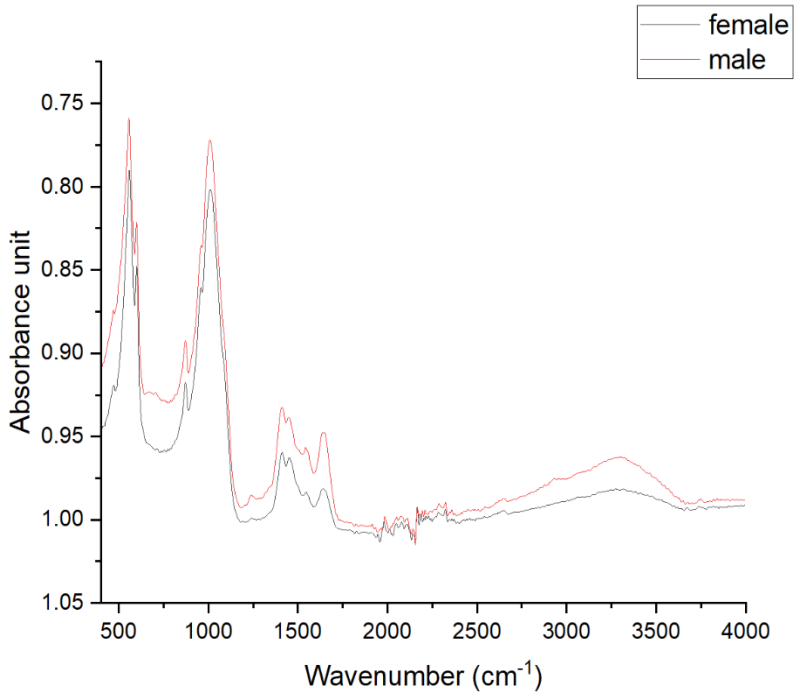

Fig.1 FT-IR spectrum of male and female dentine sample

Table 2. Absorption bands and/or range of chemical components present in human dentine.

Components	Absorption (cm^{-1})

male

As shown in Figure 1, ATR-FTIR analysis of human dentine revealed signals corresponding to the main functional groups within the tooth samples, as summarized in Table 2. Signals in the 460–470 cm^{-1} and 553–561 cm^{-1} ranges correspond to bending vibrations of phosphate groups, while those in the 958–961 cm^{-1} and 1000–1100 cm^{-1} ranges correspond to stretching vibrations of phosphate groups, reflecting the hydroxyapatite structure in dentine. Carbonate vibrations at 871 cm^{-1} indicate the substitution of phosphate positions in the mineral hydroxyapatite structure. Additionally, overlapping peaks associated with collagen were observed at 1409–1450 cm^{-1}, with amide III at 1240 cm^{-1}, amide II at 1541 cm^{-1}, and amide I at 1641 cm^{-1}.

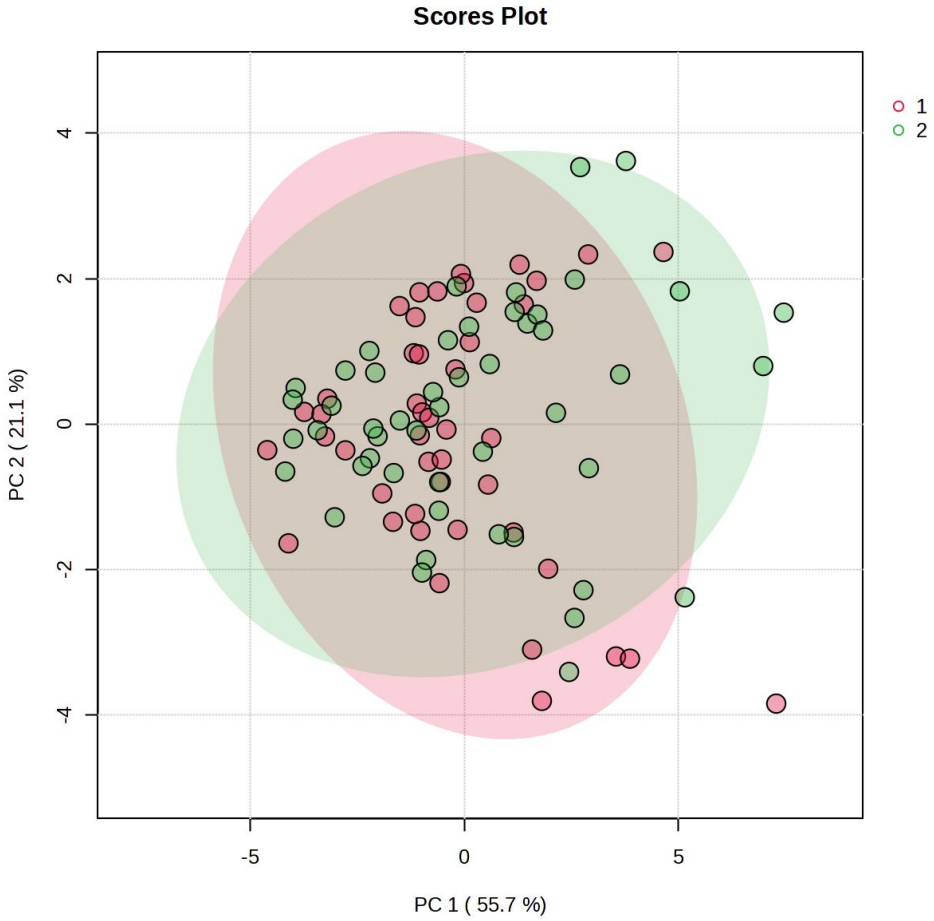

Fig.2 PCA score plot of functional groups found in human dentine

The PCA plot for sex classification showed that PC-1 (55.7%) and PC-2 (21.1%) accounted for the largest variation in the dataset. A total of 76.8% of the variation was captured by the first six PCs of the PCA model. However, as shown in Figure 2, PCA was unable to differentiate between male and female samples.

Statistical analysis revealed that the CI, API, BPI, and C/C indices showed no significant association with age at death (Table 3). In contrast, the carbonate-to-phosphate ratio was significantly correlated with age at death (Spearman's $\rho = 0.180$ and 0.184, $p < 0.05$), as was the amide-to-phosphate ratio (Spearman's $\rho = 0.186$, $p < 0.05$) and ν_1PO_4/Amide I (Spearman's $\rho = -0.178$, $p < 0.05$).

This study found that the carbonate-to-phosphate and amide-to-phosphate ratios in dentine spectra were significantly correlated with age at death, reflecting age-related changes in the chemical composition and structure of bioapatite and proteins in dental tissue. The use of FTIR-ATR for dentine analysis in this study aligns with previous research employing FTIR-ATR and chemometrics to estimate age at death from human bone, which

demonstrated statistical relationships between phosphate and carbonate indices and age, successfully developing accurate age prediction models (Pedrosa et al., 2020).

Furthermore, these findings highlight the potential application of FTIR-ATR spectroscopy for forensic age estimation from dental tissues. However, the observed statistically significant correlations in this study were of small to moderate magnitude. A larger sample size and a more balanced distribution of age groups are required to validate and strengthen the observed trends.

Table 3. Results of Spearman's correlation coefficients between CI, C/P, C/P(2), API, BPI, C/C, Am/P, and ν_1PO_4/Amide I chemometric indices and age-at-death.

ν_1PO_4/Amide I	95	-0.178*	0.043

*Significant for $\alpha = 0.05$

CONCLUSION

The application of the FTIR-ATR technique, combined with chemometric indices such as CI, C/P, API, BPI, C/C, Am/P, and ν_1PO_4/Amide I, was used to analyse human dentine. The study found that the carbonate-to-phosphate and amide-to-phosphate ratios increased with age, whereas the ν_1PO_4/Amide I ratio decreased, suggesting promising potential for estimating age at death. However, a larger sample size is needed to more accurately characterize changes in these indices, and this method should be applied in conjunction with other approaches to enhance reliability.

Özet

Funguslar, doğada en yaygın olarak bulunan mikroorganizmalardan biridir. Bu canlılar, organik maddelerin ayrıştırılmasında önemli rol oynar ve endüstri ile gıda sektörlerinde çeşitli biyoaktif bileşiklerin ve katma değerli ürünlerin üretiminde yaygın biçimde kullanılmaktadır. Ayrıca, funguslar bitki, hayvan ve insan sağlığı üzerinde doğrudan ya da dolaylı etkiler yaratarak önemli ekonomik ve sağlık sorunlarına neden olabilmektedir. Yaşam alanlarının çeşitliliği, fizyolojik, biyolojik ve biyoteknolojik özelliklerinin geniş spektrumu nedeniyle, fungusların biyolojik çeşitliliğinin belirlenmesine yönelik çalışmalar hem ekolojik hem de endüstriyel açıdan büyük önem taşımaktadır. Bu çalışmanın amacı, Van Gölü'nde bulunan fungusların biyolojik çeşitliliğini araştırmak ve bu ekstrem ekosistemdeki fungal topluluğun yapısını ortaya koymaktır. Bu kapsamda, Van Gölü'nden su örnekleri alınmış ve örnekler pH ve tuzluluk değerleri açısından analiz edilmiştir. Fungus türlerinin sudan izolasyonu için membran filtrasyon yöntemi uygulanmış ve Malt Extract Agar (MEA) besiyeri kullanılmıştır. Saflaştırma işlemleri sonucunda toplam 10 izolat elde edilmiştir. Elde edilen izolatlar, geleneksel morfolojik incelemeler ve moleküler tanımlama yöntemleri ile karakterize edilmiştir. Çalışma sonuçları, Van Gölü'nde alkalifilik ve alkalitolerant özellik gösteren mikrofungus türlerinin bulunduğunu ve bu türlerin ağırlıklı olarak *Aspergillus, Penicillium*, *Alternaria* ve *Fusarium* cinslerine ait olduğunu ortaya koymuştur. Bu bulgular, yüksek pH ve tuzluluk içeren ekstrem ortamların sahip olduğu özgün mikrobiyal çeşitliliğin anlaşılmasına katkı sağlamaktadır.

Anahtar kelimeler: Van Gölü, biyolojik çeşitlilik, alkalifilik funguslar, izolasyon

A preliminary study on alkaliphilic fungi from Lake Van

Abstract

Fungi represent one of the most ubiquitous groups of microorganisms in the environment. They play a vital role in the decomposition of organic matter and are extensively utilized in the industrial and food sectors for the production of various bioactive compounds and value-added products. Furthermore, fungi exert considerable economic and health impacts through their diverse interactions with plants, animals, and humans. Given the diversity of their habitats and the breadth of their physiological, biological, and biotechnological characteristics, studies aimed at elucidating fungal biodiversity are of significant scientific importance. The present study aimed to investigate the biological diversity of fungi inhabiting Lake Van. For this purpose, water samples were collected and analyzed for pH and salinity parameters. Fungal species were isolated using the membrane filtration technique in conjunction with Malt Extract Agar (MEA) medium. Following purification procedures, a total of ten isolates were obtained. These isolates were subsequently identified through a combination of conventional morphological characterization and molecular analyses. The findings revealed that alkaliphilic and alkalitolerant fungal species are present in Lake Van, predominantly belonging to the genera Aspergillus, Penicillium, Alternaria, and Fusarium. These results contribute to the understanding of extremophilic fungal diversity in hypersaline and alkaline aquatic ecosystems.

Keywords: Lake Van, biodiversity, alkaliphilic fungi, isolation

GİRİŞ

Ekstremofiller, yüksek ve düşük sıcaklıklar, aşırı pH veya tuzluluk, radyasyon varlığı, aşırı basınç veya çok yüksek hidrokarbon konsantrasyonu gibi aşırı fiziksel veya jeokimyasal koşullarda gelişebilen mikroorganizmalardır. Fungusların genel olarak nötr veya hafif asidik pH'ta büyümeyi tercih etmelerine rağmen, bazılarının yüksek pH'ta da gelişebildiği belirlenmiştir. Bu ortamlarda gelişebilen organizmalar, yüksek pH'a dayanıklı olan amilaz, lipaz ve proteaz gibi alkali enzimler üretir ve bu enzimler biyoteknolojik olarak tekstil, gıda, ilaç endüstrisi vb. alanlarda kullanılabilir (Fernández-López ve ark.,2023).

Sodalı (veya alkali) topraklar ve göller, Dünya'daki en alkali doğal yaşam alanlarıdır. pH değerleri genellikle 9 ila 11 arasında değişen bu ortamlar, aynı zamanda genellikle yüksek Na+ konsantrasyonlarına sahip çok tuzlu ortamlardır. Sodalı göller ve toprakların önemli bir rezervuarı Batı Sibirya, Altay, Trans-Baykal bölgeleri (Rusya), Moğolistan ve Afrika'da bulunur. Bu bölgelerdeki Magadi ve Natron Gölleri'nin pH değerleri 12'ye yaklaşır (Grum-Grzhimaylo ve ark.,2018). Ayrıca çimento üretimi, çivit boyası üretimi, madencilik faaliyetleri, kağıt ve kağıt hamuru üretimi ve gıda işleme atık suları gibi çeşitli endüstriyel faaliyetler sonucu da alkali ortamlar meydana gelebilir (Fernández-López ve ark.,2023).

Yüksek pH değerlerinde (pH: 8-11) gelişebilen fungusların türleri ve çeşitliliği geniş çapta ve yeterince incelenmemiştir (Grum-Grzhimaylo ve ark.,2016). Funguslar ile çalışılırken alkalifilik ve alkaliye toleranslı suşları izole etmek zordur çünkü alkalin ortamların fungus çeşitliliğini incelemek için nötr veya asidik izolasyon ortamları kullanılmaktadır ve bu da alkalifilik suşların tanımlanma ve izole edilme olasılığını azaltmaktadır (Fernández-López ve ark.,2023).

Ülkemizde de Doğu Anadolu Bölgesi'nde yer alan ve tuzlu bir soda gölü özelliği taşıyan Van Gölü bulunmaktadır. Van Gölü sadece ülkemizde değil, Dünyada da en büyük soda göllerinden biridir ve Dünya'nın en büyük 3. kapalı havza gölüdür (Poyraz ve Mutlu,2017). Son yıllarda, soda göllerinin alkalifilik mikroorganizmaları üzerine yapılan çalışmalar artış göstermiştir. Mikrobiyal çeşitliliği araştırmak için kültüre bağımlı yöntemleri, kültür bağımsız yöntemleri ve modern yöntemler kullanmışlardır (Paquette ve ark.,2024; Kaale ve ark.,2025; Jeilu ve ark.,2025). Bunlara ek olarak, çeşitli mikrobiyal toplulukların yapısını ve çeşitliliğini incelemek için amplikon dizilemeler ve yüksek verimli dizilemelerden yararlanılmıştır (Jeilu ve ark.,2022). Ancak Van Gölü üzerine yapılan çalışmalar sınırlıdır (Poyraz ve Mutlu,2017; Ersoy Omeroglu ve ark.,2021) ve funguslar üzerine çalışmalar üzerine yeterince odaklanılmamıştır. Bu sebeple çalışmada Van Gölü'nden alınan su örneklerinden fungal cinslerin ve türlerin izolasyonu üzerine ön deneme yapılması amaçlanmıştır.

MATERYAL METOD

Örnekleme ve İzolasyon

Su örnekleri üç farklı lokasyondan alınmıştır. Örnekleme lokasyonu olarak kullanılan bu kıyıların isimleri Merkez (yaklaşık 38,6ºK, 43,3ºD), Tatvan (yaklaşık 38,5ºK, 42,3ºD) ve Ahlat'tır (yaklaşık 38,8ºK, 42,6ºD). Su örnekleri kıyıdan yaklaşık 1-2 m uzaklıktan ve 1 m derinlikten alınmıştır. Örnekler steril şişelere konularak hemen taşınmış ve oda sıcaklığında saklanmıştır. Örneklerin tuzluluğu (Eclipse El Refraktometresi), ve pH'ı (Mettler Toledo) belirlenmiştir.

Alkalitolerant/alkalifilik suşların ilk izolasyonu için Malt Extract Agar kullanılmıştır. Ortaya çıkan fungal izolatlar saflaştırılmış ve morfolojik karakterizasyonu yapılmıştır. İzolasyon için 100'er ml su örneği steril 0,45 µm 'lik membran filtrelerden filtrasyon yöntemi ile filtre edilmiştir ve filtreler besiyerine alınarak 25°C'de 7-10 gün boyunca inkübe edilmiştir.

Morfolojik ve Genetik Karakterizasyon

Filtrasyon petrileri 25°C'de 7-10 gün boyunca inkübe edildikten oluşan küf kolonileri incelenmiş ve farklı morfolojide olduğu düşünülen küf kolonileri Malt Ekstrakt Agar'a 3 nokta yöntemiyle inoküle edilmiş ve 25°C'de 7 gün inkübe edilmiştir. İnkübasyon sonucu gelişen fungal izolatların morfolojik tanımlaması, kültürel özelliklerine göre yapılmıştır. Koloni çapları, renkleri ve dokuları, misel ve spor yapıları stereomikroskop ve ışık mikroskobu ile incelenmiştir. İzolatlar morfolojik ve mikroskobik özelliklerine göre cins düzeyinde ayırt edilmiştir.

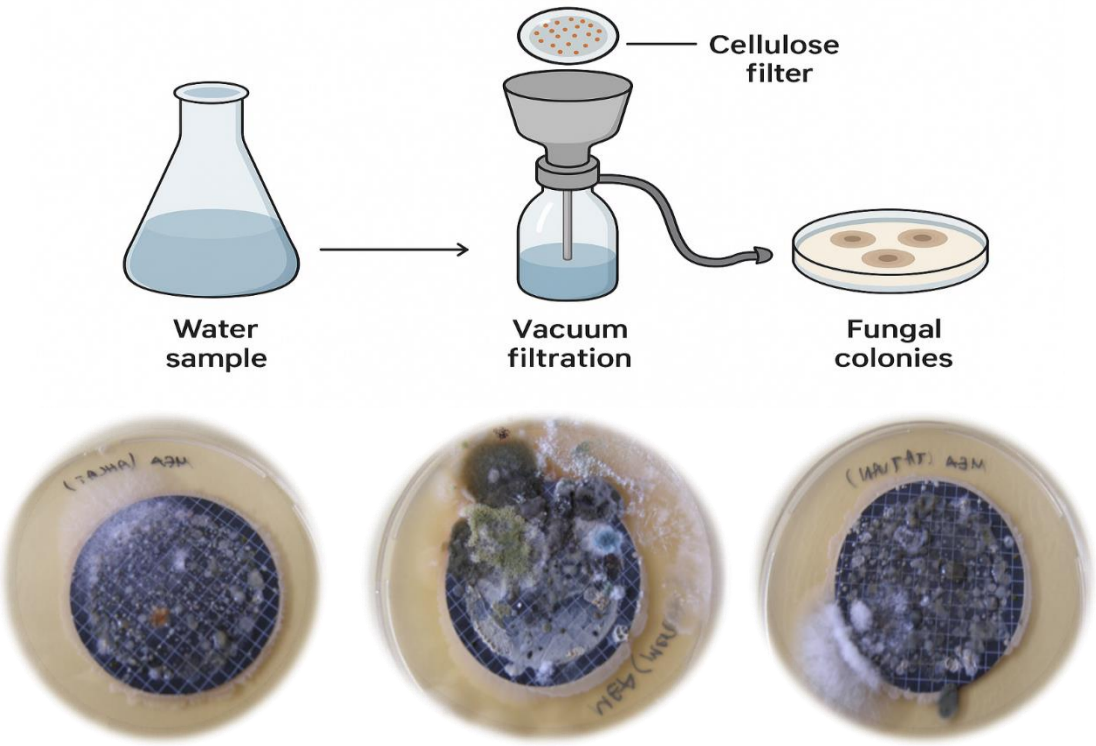
Tüm izolatlar, DNA ekstraksiyonu için 25 °C'de 7 gün geliştirilmiştir. Mantar genomik DNA'sı, üreticinin talimatlarına göre "Zymo Fungal/Bacterial DNA İzolasyon Kiti" kullanılarak ekstrakte edilmiştir. Elde edilen DNA, ITS (Internal Transcribed Spacer) bölgelerinin PCR amplifikasyonu için kullanılmıştır. Bu primerler ribozomal DNA (rDNA) dizisinin 18S – 5.8S – 28S bölgeleri arasındaki ITS1 ve ITS2 bölgelerini çoğaltır. Tür tanımlamada en yaygın kullanılan genetik markerdir. Elde edilen DNA'nın kalitesi ve miktarı NanoDrop ile ölçülmüştür (Esen ve Turgay,2022; Seri,2022)

DNA Dizi Analizi

PCR örnekleri agaroz jelde yürütülerek yaklaşık 500-600 bç ürün verip vermediğine bakılmıştır. Ardından ITS PCR örnekleri sekansa gönderilerek dizi analizi yaptırılmıştır. Analiz ve verilerden elde edilen diziler BLAST ile NCBI veri tabanında bulunan dizilerle karşılaştırma yapılarak küf cinsleri tanımlanmıştır.

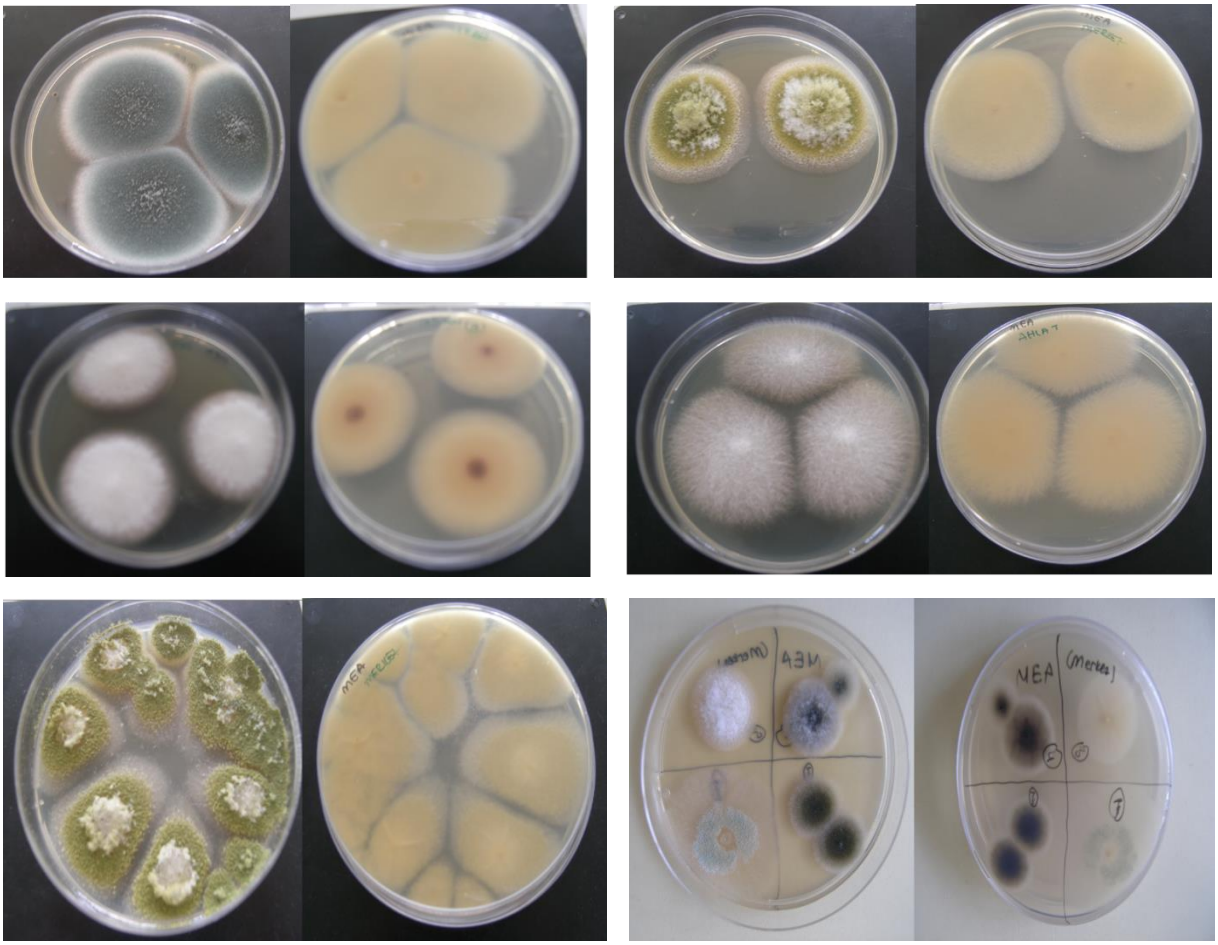
BULGULAR

Örnekleme ve İzolasyon



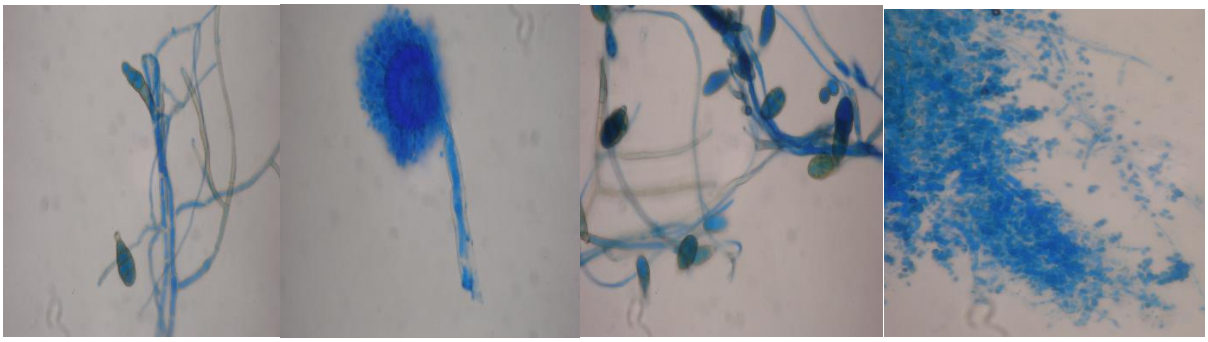
Su örneklerinin tuzluluk ve pH sonuçları çizelgede verilmiştir.

Tablo 1: Örneklerin tuzluluk ve pH değerleri



ÖRNEK	TUZLULUK (%)	pH
Merkez	%1.7	9.5
Tatvan	%1.8	9.8
Ahlat	%1.8	9.6

Küf izolatlarının makroskobik ve mikroskobik analizleri



Su örnekleri membran filtreden geçirildikten sonra farklı olduğu düşünülen toplamda 9-10 küf kolonisi saflaştırılmıştır.

Şekil 1: Memran filtrasyon ve inkübasyon sonrası filtrelerde gelişen koloniler

Şekil 2: MEA besiyerlerindeki koloni morfolojileri (25°C'de 5 gün)

Şekil 3: Kolonilerin mikroskopik görüntüleri

Yapılan morfolojik incelemelerde koyu yeşil/siyah renkte, tozlu-kadifemsi yüzeyi bulunan kolonilerin *Aspergillus* cinsine ait olabileceği (*Aspergillus niger*), mavi-yeşil, kadifemsi koloni morfolojisine sahip kolonilerin *Penicillum* cinsi, gri-yeşil merkez ve pamuksu beyaz kenarı olan kolonilerin *Cladosporium,* sarı-yeşil spor tabakası oluşturabilen, ortası beyaz, kenarları yeşilimsi-sarı renk tipik özellik gösteren kolonilerin *Aspergillus flavus* olabileceği belirlenmiştir. Kolonileri kadifemsi, yoğun ve dairesel ortada koyu mavi-yeşil, kenarlara doğru daha açık yeşil, arka yüz renksizden sarımsı-beje kadar olan koloniler *Penicillium'un* tipik özelliğidir ve muhtemelen *P. chrysogenum* olabileceği sonucuna varılmıştır. *Alternaria spp.* Kültürde genellikle orta koyu, kenar açık dairesel koloniler oluşturur. Mikroskop altında tipik olarak zincir halinde, bölmeli görülür. Koloniler yoğun, pamuksu (cotton-like), beyaz-krem renkte ve merkezde hafif sarımsı/bej tonlamalar görülüyorsa ve kolonilerin arkadan görünümü pembe-kahverengi ise bu görünüm *Fusarium*'un tipik özelliğidir ve koloni morfolojisi ile örtüşmektedir.

Diğer petrilerde de koloniler gençken beyaz/krem, olgunlaştığında siyah renkli ve yoğun, tozlu ve siyah renkte koloniler olduğundan *Aspergillus niger* olarak tanımlanmıştşr.

Moleküler Karakterizasyon

Yapılan DNA Ekstraksiyonu sonrası 9 adet ekstraksiyon başarı ile yapılmıştır. PCR işlemi ve DNA dizi analizi sonrası ise 4 adet dizi verisi analiz edilmiştir.

Tablo 2: Dizilenen İzolatlar ve Benzerlik Gösterdiği Türler

ÖRNEK	Benzerlik Gösterdiği Tür	Numarası	Baz Eşleşme Oranı
V1	*Aspergillus flavus* isolate AF-36	PQ422926.1	527/529(99%)
V2	*Penicillium* sp. G418	KJ443251.1	506/511(99%)
V3	*Alternaria* sp. CBS 127959	KY940806.1	559/560(99%)
V4	*Penicillium chrysogenum* isolate 5a-6	PV612027.1	557/560(99%)

TARTIŞMA ve SONUÇ

Çalışmada analizler sonucu *Aspergillus*, *Penicillium* ve *Alternaria* cinslerine ait fungus cinsleri belirlenmiştir. Alkalifilik funguslar üzerine yapılan çalışmalar incelendiğinde Steiman ve ark. (2004) Mono Gölü'nden (ABD) elde edilen, pH'ı 8 ila 9,2 arasında değişen toprak ve tortu örneklerinden çok çeşitli funguslar izole etmiştir. İzolasyon için çalışmamıza benzer şekilde pH = 8 olan Malt Extract Agar kullanmışlardır. Elde edilen izolatların çoğu alkaliye toleranslıdır.

Farklı çalışmalarda *Acremonium* ve *Sodiomyces* türleri farklı alkali ortamlardan izole edilmiştir. Bu türlerden bazıları 10 ve 11 pH aralığında gelişebilir. Diğer izole edilmiş türler arasında elde edilen *Fusarium* ve *Penicillium* cinslerine ait türler bulunmaktadır. Bu iki cinsin bazı suşları hafif ile orta alkali toleranslı bir profil sergilemiştir (Fernández-López ve ark.,2023).

Asya ve Afrika'daki soda göllerinin etrafındaki topraklardan alınan 100 alkalitolerant ve alkalifilik izolat tanımlandığında ise Emericellopsis(Hypocreales, Hypocreomycetidae), Plectosphaerellaceae (Hypocreomycetidae), Pleosporaceae (Dothideomycetes), Chaetomiaceae (Sordariomycetidae) belirlenmiştir. Özellikle Sodiomyces türleri *Acrostalagmus luteoalbus Emericellopsis alkalina*, ve Alternaria yüksek ortam pH'ında en iyi şekilde gelişmiştir. Orta alkalitolerantlar arasında Scopulariopsis üyeleri, Fusarium, Cladosporium türleri belirlenmiştir. Zayıf alkalitolerantlar, nötr veya asidik pH'ta büyüme optimumuyla *Penicillium* sp, *Purpureocillium lilacinum* ve *Alternaria alternata* türleri olarak belirlenmiştir (Grum-Grzhimaylo ve ark.,2016).

Abstract

The genetic composition of a population is crucial for understanding its evolutionary history, genetic diversity and for applications in forensic science and medicine. Short Tandem Repeats (STRs) are powerful molecular markers used in genetic studies due to their high variability and widespread distribution in the genome.The number of repeats varies from one individual to another, making these sequences suitable for identification purposes due to their high discriminatory power. DNA analysis for this purpose in Albania began in 2009, using a technique that studies 17 STR markers. For the purposes of this study, allelic data from STR markers were processed in three sample sets of different sizes—specifically 200, 1000, and 2000 unrelated individuals from the Albanian population.Differences were observed in some of the allelic frequency values when comparing data from the three samples. Forensic population parameters for the Albanian population were analysed using the STRAF program version 2.1.5. The results showed that the first sample, consisting of 200 individuals, was insufficient for assessing Hardy-Weinberg equilibrium. For the other two samples, the processing results confirmed equilibrium conditions.These experiments with different size of the sample emphasize the fact that in statistical study of STR markers, the sampling of data to be analysed is of great importance.

Keywords:STR, sampling, STRAF, Hardy-Weinberg.

INTRODUCTION

Genetic studies have emerged as a cornerstone in the fields of biology and medicine, offering essential insights into human evolution, health, and population diversity. Over the last decades, advances in molecular biology have enabled researchers to analyze genetic variation with unprecedented precision, allowing for more accurate reconstructions of population history, improved understanding of hereditary diseases, and the development of powerful forensic identification tools (Jobling and Gill, 2004). One of the most significant areas of focus within modern genetic research is the study of Short Tandem Repeats (STRs)**.** STRs consist of short DNA sequences, typically between two and six base pairs that are repeated consecutively at specific loci throughout the genome. First introduced into forensic applications in the early 1990s, STRs quickly became central markers due to their abundance, stability, and ease of amplification through polymerase chain reaction (PCR) techniques (Jeffreys et al., 1985; Butler, 2012). These markers are exceptionally valuable because of their high degree of polymorphism**.** The number of repeated units at an STR locus varies widely among individuals, which results in a high level of allelic diversity within populations (Butler, 2015). This variation makes STRs particularly powerful for distinguishing between individuals, supporting their widespread use in human identification, kinship testing, and population genetic studies (Gill et al., 2006). Beyond forensic applications, STRs also contribute to broader biological research. Population geneticists use them to investigate gene flow, migration patterns, and demographic events such as bottlenecks or expansions (Holsinger and Weir, 2009). In medical genetics, STR instability has been linked to certain hereditary disorders, highlighting their relevance not only as neutral markers but also as elements with potential functional significance (Pearson et al., 2005). In Albania the analysis of STRs for identification purposes started in 2009, in the beginning with few biological samples which grow up year after year. In this paper we will discuss about the sample size and its implications in allele frequencies and other parameters studied. The size of the sample plays a critical role in the accuracy and reliability of studies involving Short Tandem Repeat

(STR) markers. Adequate sampling ensures that observed allele frequencies reliably reflect the true genetic diversity of the target population, reducing the risk of sampling error and frequency distortion (Weir, 2005). When sample sizes are too small, rare alleles may be missed, allele frequency estimates become unstable, and key statistical parameters such as heterozygosity or F-statistics can be significantly biased (Balding & Nichols, 1997). Such limitations may lead to incorrect interpretations of population structure, genetic differentiation, or the forensic informativeness of specific loci. Conversely, sufficiently large samples improve statistical power, increase the precision of allele frequency estimation, and enhance the reliability of population comparisons, kinship calculations, and forensic match probabilities (Butler, 2015). Therefore, careful selection of an adequate sample size is essential for producing robust and interpretable results in STR-based genetic research.

MATERIALS AND METHODS

Biological sample used for this study was saliva in buccal swabs, from unrelated anonymized albanian individuals. The ratio between number of samples representing 12 administrative divisions in which is organized Albania is saved in three sample sets of different sizes - specifically 200, 1000 and 2000 individuals.

DNA extraction, STR typing and fragment analysis

Extraction was performed using QIAamp DNA Investigator Kit with a final volume of DNA extract of 50µl. The commercial STR kit for amplification is NGM SelectTM kit (Thermo Fisher) a five dyes kit which simultaneously amplifies 16 separate STRs: D3S1358, VWA, D16S539, D2S1338, D8S1179, D21S11, D18S51, D19S433, THO1, FGA, D10S1248, D22S1045, D2S441, D1S1656, D12S391 and SE33 and the sex determining marker Amelogenin. Volumes for PCR reactions were halved resulting in the final volume of 12.5 µl. Fragment separation was performed using ABI PRISM® 3500 Genetic Analyzer (Applied Biosystems) using POP-4 polymer and the collection software Data Collection, version 2.0. Data was sized using GeneMapperTMID-X Software version 1.5. All laboratory procedures were conducted in accordance with rigorous internal control standards, including the use of controls supplied within the kits, to ensure quality control.

Data analysis

Forensic parameters such as Hardy-Weinberg equilibrium, match probability, power of discrimination, and other statistical analyses of STR data were conducted using STRAF version 2.1.5. Allele frequencies were studied in three samples

RESULTS AND DISCUSSION

The comparison between samples resulted in the expected changes in allele frequency values, reflecting the natural variability that arises from differences in sample size, composition and population representation. Such fluctuations are common when analyzing STR markers, as allele frequencies are sensitive to factors such as sample size, population substructure, and the presence of rare alleles. In some cases, even slight variations in the demographic or geographic characteristics of the sampled individuals can lead to measurable shifts in the distribution of alleles across loci. These differences do not necessarily indicate methodological inconsistencies; rather, they highlight the dynamic nature of genetic diversity and the importance of carefully selecting representative samples to ensure accurate population-level inferences. In the third sample there are 39 more alleles present than in the first sample. Results of these findings are presented in the table 1.

Table 1. The diferences in the number of alleles

Locus	Number of alleles in sample 1 (200 individuals)	Number of Alleles in sample 3 (2000 individuals)	Difference between sample 1 and sample 3
D1S1656	15	17	2
D16S539	7	8	1
vWA	7	10	3
D2S441	9	10	1
D12S391	17	19	2
D18S51	13	15	2
D19S433	14	15	1
D21S11	13	15	2
FGA	14	19	5
SE33	33	48	15

The differences between the second and the third sample in terms of number of alleles resulted in smaller changes such as in locus SE33 there were detected 45 alleles in second sample (1000 individuals analysed) versus 48 alleles in the third sample (2000 samples analysed) but comparing with the first sample (200 individuals analysed) there were detectes 13 alleles more. There were identified respecively these number of alleles in sample 1 – 194 alleles; in sample 2 – 228 alleles; in sample 3 – 252 alleles.
Distribution of alleles for 16 STRs studied in the third sample is presented in figure 1.

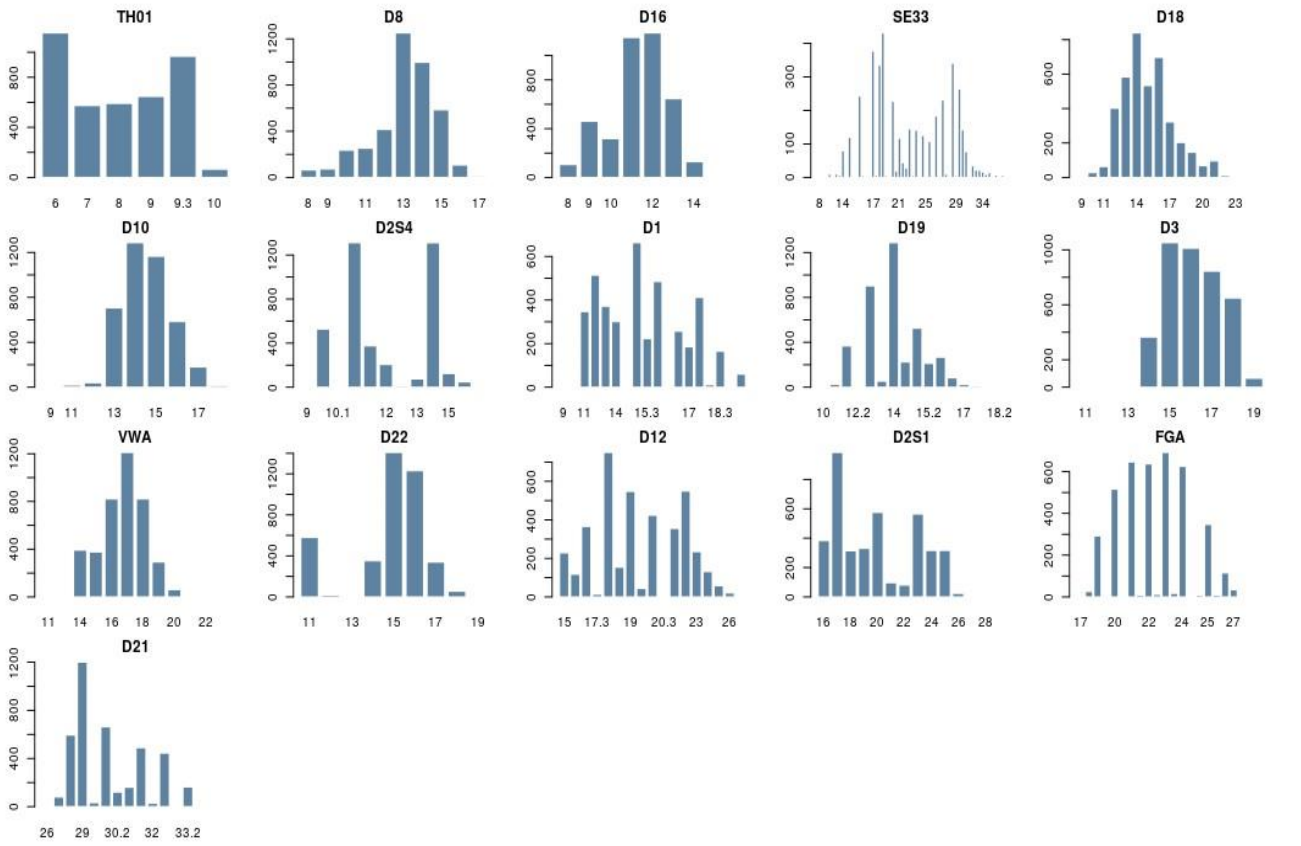

Figure 1. Distribution of alleles for 16 STR

There were no significant changes in forensic parameters analyzed by STRAF, statistical tests for sample 1 resulted in insufficient data for Hardy- Weinberg equilibrium meanwhile for the second and third sample showed no significant deviance from Hardy- Weinberg equilibrium (P-value > 0.05).

SE33 locus resulted in the highest levels of both expected and observed heterozygosity(Hexp and Hobs), reflecting significant genetic diversity at this locus within the population (Zaimi et al., 2025).
Across comparative studies, locus SE33 consistently emerges as one of the most polymorphic and forensically informative autosomal STR markers. In the Albanian population, SE33 exhibits very high variability, with 48 detected alleles, observed heterozygosity around 0.93, and a powerof discrimination (PD) of 0.9928**.**These values closely align with findings from other European populations. For example, studies from Slovenia report similarly high heterozygosity (≈0.93–0.97) and extremely high PD values, confirming SE33's exceptional discriminatory capacity across the region(Zupanič et al., 2014).Similarly, a study in a Western Sicilian population (n = 120) found that SE33 had a PIC of 0.9705 and an astounding PD of 0.99999, together with a high power of exclusion (PE = 0.9001) (Ventura Spagnolo et al., 2017).

CONCLUSION

In the statistical study of STR markers, the size of the sample represents one of the most critical determinants of analytical reliability. A sufficiently large sample is essential for capturing the true distribution of alleles within a population, minimizing the effects of random genetic drift and sampling error (Kalinowski, 2012). Small or inadequate sample sizes can lead to underrepresentation of rare alleles, unstable allele frequency estimates, and inflated measures of genetic diversity, which compromise the accuracy of key forensic parameters (such as heterozygosity, power of discrimination, or match probability) (Josse et al.,, 2001). Moreover, small samples limit the statistical power of tests for Hardy–Weinberg equilibrium and population differentiation, increasing the likelihood of false positives or negatives in genetic inference (BMC Genomics, 2016).

Recent work re-evaluating guidance on population sampling for highly polymorphic STR loci has shown that as sample size increases, the probability of capturing rare or previously unobserved alleles improves markedly, and the benefit of further sampling eventually plateaus. (Hares, 2025). These findings reinforce that robust sample sizes ensure greater precision, narrower confidence intervals, and more dependable interpretations of population structure. In forensic applications, where allele frequency data directly inform match probabilities and likelihood ratios, such reliability is indispensable. Careful attention to sample size is fundamental for producing valid, reproducible, and forensically meaningful results in STR-based genetic research.

Özet

Bruselloz, dünyanın çeşitli bölgelerinde çok sayıda insan ve hayvan türünü etkileyen, hayvancılık, halk sağlığı ve ekonomi üzerinde etkisi olan önemli zoonotik bir hastalıktır. Brusellozun kontrolü, üreticiler arasındaki farklı düzeyde çiftçilik uygulamaları ve hastalık hakkında algı farklılıkları, sürü sağlığı politikasının eksikliği, bruselloz prevalansının belirli zaman aralıklarıyla yapılmaması, aşılama eksikliği, hayvan hareketliliğinin takibindeki aksaklıklar, mesleki riskler nedeniyle veterinerlik uygulamalarında hala büyük bir sorun olmaya devam etmektedir. Birçok ülke, bruselloz kontrolünde farklı kontrol yöntemleri seçse de çoğu, var olan prevalansa bağlı olarak ilk seçeneği aşılama yönünde kullanarak sürü bağışıklığını artırmayı hedeflemektedir. Sonrasında sürveyans çalışmaları ve screening testler ile oluşan bağışıklık ve prevalans/insidans oranına göre mevcut stratejiler değerlendirilerek faz-kontrol programları yürütülmektedir. Dünyada hastalığı eradike edebilen çok az ülke mevcut ise de WOAH, FAO ve WHO gibi uluslararası organizasyonlar ile ortak yürütülen projeler sayesinde 30'dan fazla ülkede hastalık kontrol altına alınabilmiştir. Bruselloz, ruminantlar başta olmak üzere çok sayıda hayvan ve insan türünü etkilese de bu sunuda, brusellozun kontrol ve eradikasyonu amacıyla temel olarak sığırlarda ve insanlarda uygulanan yaklaşımlar anlatılmaktadır.

Anahtar Kelimeler: Bruselloz, Eradikasyon, Kontrol Stratejileri

Brucellosis control and control strategies in cattle and humans

Abstract

Brucellosis is a significant zoonotic disease affecting numerous human and animal species worldwide, impacting livestock production, public health, and the economy. Control of brucellosis remains a significant challenge in veterinary practice due to inconsistent farming practices and perceptions about the disease among producers, inadequacy of herd health policy, lack of regular brucellosis monitoring, inadequate vaccination and monitoring of animal movements, and occupational risks. While many countries employ different methods for brucellosis control, most aim to increase herd immunity by using vaccination as the first step depending on the existing prevalence. Subsequently, existing strategies are evaluated based on the immunity generated by surveillance and screening tests, and the prevalence/incidence ratio, and phase-control programs are implemented. While only a few countries have eradicated the disease globally, the disease has been brought under control in more than 30 countries thanks to joint projects with international organizations such as WOAH, FAO and WHO. Although brucellosis affects numerous animal and human species, particularly ruminants, this presentation primarily describes approaches used in cattle and humans to control and eradicate brucellosis.

Keywords: Brucellosis, Control Strategies, Eradication

GİRİŞ

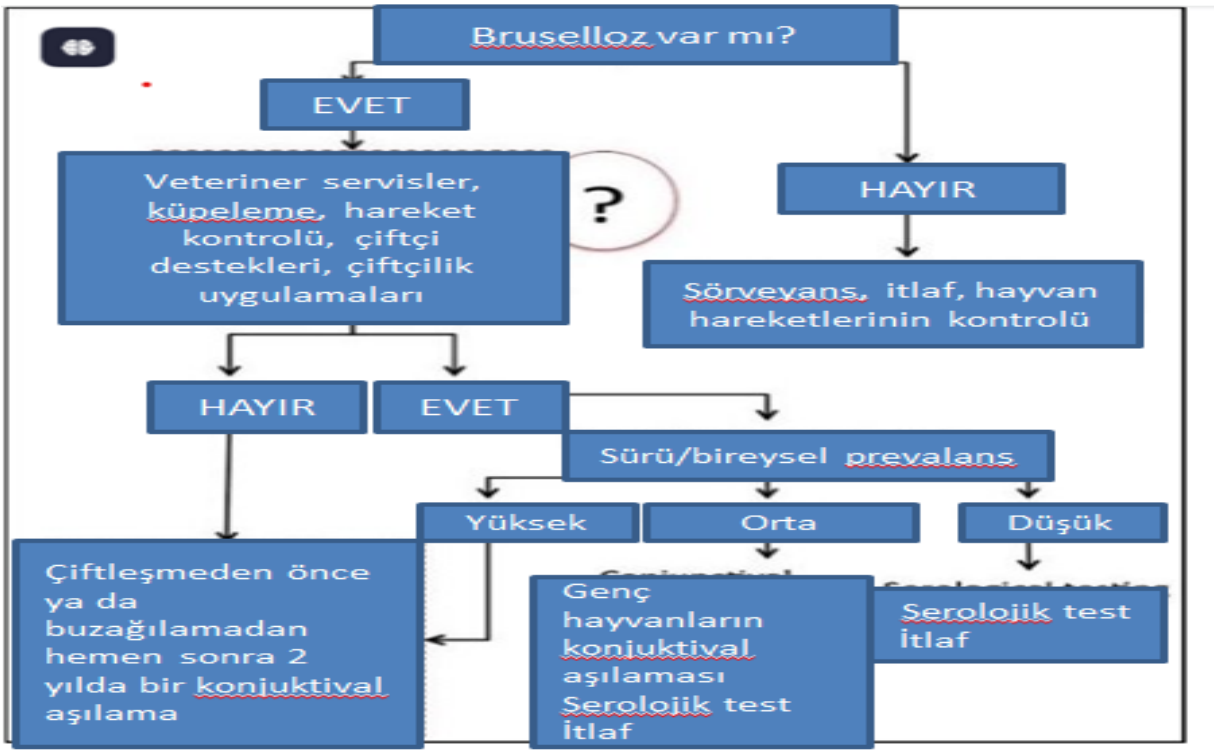
Bruselloz kontrol programlarının amacı hastalığın insan sağlığı üzerine ve ekonomik sonuçlara etkilerini azaltmaktır. Hastalığın popülasyondan eliminasyonu kontrol programının tek amacı değildir. Enfeksiyonun popülasyondaki kontrol edilebilir bir seviyede kalması kabul edilebilir. Kontrol programının süresi belirsizdir ve hastalık yeniden çıkmasın diye kabul edilebilir seviyeye indirildikten sonra bile gözden geçirilmelidir. Çoğu ülkede bruselloz kontrol yöntemleri hükümet mevzuat düzenlemeleri ile desteklenir. Desteklerin olmadığı diğer ülkelerde otorite yoktur. Bu sebeple enfekte sürülere uygulanan yöntemler değişkenlik gösterebilir. Bu işlemler test ve izolasyon/kesim, hijyen, hayvan hareketlerinin kontrolü ve aşılama genel kategorileri altında sınıflandırılır (Corbel MJ, 2006).

Brusellozun önlenmesi ve kontrolü, sürveyans ve risk faktörlerinin önlenmesinden geçer. En etkili önleme stratejisi enfekte hayvanların eliminasyonu ile mümkündür. Yüksek prevalansa sahip bölgelerde hayvanların aşılanması öncelikli kılınmıştır. Düşük prevalanslı bölgelerde ise masraf-fayda analizi hesabına göre strateji düşünülmelidir. Aşılama ve uzaklaştırmanın uygulanmadığı ülkelerde korunma, hayvanların itlafı ile birlikte insanlardaki enfeksiyona farkındalık oluşturmak, gıda güvenlik önlemleri, mesleki hijyen ve laboratuvar güvenliği gibi biyogüvenlik uygulamalarına bağlıdır. Diğer koruma stratejileri pastörize süt ürünleri kullanımı ve bu konuda eğitim kampanyaları, tarım ve et işleme, koruyucu bariyerler ve doğumdan sonra enfekte materyallerin uygun şekilde imhasıdır (Wasif M ve ark., 2024).

Uluslararası çeşitli kamu kuruluşları brusellozun önlenmesi ve kontrolü amacıyla birlikte çalışmalar yürütmektedir. Bu kuruluşlardan WHO, bruselloz uygulamalarında standartları sağlamada teknik tavsiye ve destek sağlar. İnsan ve hayvan sağlığı sektörleri arasında bilgi paylaşımını ve koordinasyonu sağlar. FAO, OIE, MZCP (Akdeniz Zoonoz Kontrol Programı), majör hayvan hastalıkları için global bir erken uyarı sistemi (Global Early Warning System for Major Animal Disease-GLEWS) ile ülkeleri hastalıkların önlenmesi ve yönetimi konusunda destekler. Bruselloz kontrol programlarının hazırlanmasından evvel; genel tanımlamalar ve ölçüm sistematiği için veri sağlanması gerekliğidir. İzleme (monitoring), Gözetim ve Tarama (screening) (MOSS) ile aşağıda belirtilen maddeler kontrol programı öncesi belirlenir (Corbel MJ, 2006 - Zhanga N ve ark., 2018).

Hayvanlarda bruselloz sürveyansı ile aşağıda belirtilen çeşitli etiyolojik, epidemiyolojik, klinik durum, koruma ve kontrol stratejilerine ait veri setleri oluşturulur. Bunlar; Hayvanlarda bruselloza neden olan majör türlerin tespiti, Primer rezervuarlarda temel seviyede enfeksiyon seviyesinin tespiti, Evcil hayvan yetiştirme türü, pazarlama ve kesim sistemleri, Mevcut hayvan sayıları ile köy/sürü deki tanımlamalar (kayıtlar), Sürveyans için veri kayıt sistemleri ile mevcut veri kaynakları, Sürveyans belirleyicileri, Sürveyans verisinin epidemiyolojik analizi, Sürveyansdaki politik ve yasal durumlar, Sürveyansda finansal ve yönetim faktörleri, Sürveyansda kültür, motivasyon ve eğitim faktörleri, Laboratuvar desteği ve test stratejileri, Bruselloz kontrol stratejileri ve uygunluğu (Fizibilite, etkinliği, kabul edilebilirliği)

Yukarıda belirtilen veriler doğrultusunda bulaş yollarının belirlenmesi veya mevcut durumun ortaya konulması amacıyla; prevalans, insidans, letalite gibi tanımlanmış hedeflerin ortaya konulması, laboratuvar teşhisleri için bakteriyolojik, serolojik (+,-, şüpheli), klinik (belirsizlik süresi) gibi tanımlamaların yapılması, özel vaka tanımları geliştirilmesi, akış şeması oluşturulması, yeni veri toplama sistemleri oluşturulması, öngörülmeyen problemler için pilot test belirlenmesi, laboratuvarların rolünün yeniden gözden geçirilmesi, hatalar olduğunda sistemin kontrolü amacıyla izleme ve müdahale seçeneklerinin oluşturulması, sürveyans analizi sonrası, sürveyans yaygınlaştırma yöntemleri geliştirilmesi, biyogüvenlik başlığı altında ifade edilen kategoriler (a. Hayvan hareketlerinin kontrolü, b. Suni tohumlama, c. Ziyaretçi girişi, d. Hijyenik uygulamalar, e. Karkas, fetüs, plasentanın imhası, f. Ortak meralar, g. Halk sağlığı eğitimi) ile pastörizasyon kontrol stratejileri birlikte değerlendirilerek aşağıda belirtilen kontrol stratejileri ve uygunluğu (Fizibilite, etkinliği, kabul edilebilirliği) belirlenir. Stratejilerinin ekonomik, etkinlik ve sürdürülebilirlik analizleri yapılarak en uygun olanı belirlenir (Corbel MJ, 2006 - Zhanga N ve ark., 2018- Roy S ve ark., 2011).



Stratejilerin oluşturulması ile ilgili bilgiler coğrafik dağılım ve uygulanan yöntemler, mevcut altyapı, mevcut kanun ve yönetmelikler, ekonomi, başarı oranları, sürdürülebilirlik gibi çok çeşitli faktörlerin değerlendirilmesi ile elde edilir. Tablo-1 (Zhanga N ve ark., 2018) de bu faktörlerin bazılarının değerlendirilmesi gösterilmiştir. Bu stratejiler Şekil 2 (Corbel MJ, 2006). de belirtildiği gibi kontrol fazının dönemine bağlı olarak genellikle aşağıda belirtildiği üzere birden fazla stratejik yaklaşımın kombinasyonu ile elde edilmektedir.

Aşılama stratejisi
Test ve itlaf/tazminat stratejisi
Test ve ayırım stratejisi
Test ve kesim stratejileri

Şekil 1. Bruselloz varlığına dayalı kontrol yaklaşımları (Corbel JM 2006).

Şekil 2. İnsanlarda ve hayvanlarda bruselloz kontrol ve eradikasyon programları (Corbel JM 2006)

İnsanlarda Brusellozun Kontrolü

Bruselloz, insanlarda kronik seyirli rekurrent zoonotik bir hastalıktır. Hayvanlardan insanlara bulaş başlıca üç şekilde önlenebilmektedir: 1) süt ürünlerinin pastörizasyonu ve et ürünlerinin uygun şekilde hazırlanması; 2) bruselloz gözetimi ve kontrol programları; ve 3) hayvancılık ürünlerini işleyenlere bulaşın önlenmesi, iyileştirilmiş sanitasyon ve hayvancılık ürünlerinin güvenli bir şekilde işlenmesi konusunda eğitim. Bu kontrol yöntemleri temel olarak, hayvan sürülerinin bazılarından (veya muhtemelen hepsinden) insan popülasyonuna bulaş oranlarını azaltmayı sağlar (Roy S ve ark., 2011). Aşı eksikliği ve insanda hastalık yönetimiyle ilişkili zorluklara rağmen, gerçek zorluk hayvan brusellozunu ortadan kaldırmaktan geçer (Ko J ve ark., 2003). Brusellozun kontrolünde başarılı olan programların çoğu gelişmiş ülkelerde gerçekleşmiş ancak gelişmekte olan ülkeler bu hastalığın yükünü taşımaya devam etmektedir. Özellikle, endemik olmayan gelişmiş ülkelerdeki insan bruselloz vakalarının çoğu, endemik bölgelerden ithal edilen süt ürünlerinden (Al Dahouk S ve ark., 2003) veya hastalığı ithal eden hastalardan (Luzzi GA ve ark., 1993) kaynaklanmaktadır. Sığırlar (S19), koyun ve keçiler (Rev 1) etkili aşılarına rağmen, ekonomik olarak zayıf endemik bölgelerdeki kontrol çabaları, yetersiz altyapı ve fon eksikliği nedeniyle başarısız olmuştur. Önemli bir sorun, kontrol önlemlerinin uzun bir süre devam etmesi gerekliliği ve vaka sayısı azalmaya başladığında sürdürülmesi zor olabilecek bir izleme sistemiyle tamamlanması gerektiğidir (Şekil 1 ve 2). Buna örnek, eski Sovyet Cumhuriyetinin mevcut durumu verilebilir; burada SSCB'nin; idari, ekonomik ve kamu sağlığı altyapısının çöküşü, brusellozun yeniden ortaya çıkmasına yol açmıştır (Lundervold M ve ark., 2004). Gelişmekte olan dünyada, özellikle Afrika'da, hayvancılıkla ilişkili brusellozun yıllık ekonomik etkisine ilişkin verilerin değerlendirilmesi genellikle zor olmuştur (McDermott JJ ve ark., 2002). Hem iç hem de uluslararası pazarlar için hayvancılık ürünleri satışının önemli olduğu Arjantin ve Meksika gibi ülkelerde, yıllık korunma maliyetlerin sırasıyla 60 milyon ABD doları ve 200 milyon ABD doları olduğu tahmin edilmektedir. Kullanılan önlemlere bakılmaksızın, endemik bölgelerde insan brusellozunun ekonomik yükü yüksektir ve yaygın ve sürdürülebilir kontrol çabalarını haklı çıkarır (Kahl-McDonagh MM ve ark., 20007). Göçebe ve göçmen popülasyonlarında hastalık kontrolünün zor olduğu kanıtlanmıştır. İnsanlar için kullanılan bir bruselloz aşısı yoktur ve brusellozun ortaya çıkması doğrudan bir bölgedeki hayvan brusellozunun varlığıyla bağlantılıdır. Bu bağlamda, Dünya Sağlık Örgütü, hayvanlarda kontrol ve eradikasyon programlarının uygulanmasının yanı sıra insan aşısının geliştirilmesini yüksek bir öncelik olarak tanımlamıştır. Aşı uygulaması, yalnızca eski Sovyetler Birliği ülkelerinde kullanılan bir korunma yöntemidir. Sovyet bilim insanları aşı uygulama yöntemlerini deri altı, deri içi, kas içi ve damar içi (Franco MP ve ark., 2007) olarak farklı şekillerde denemişlerdir. Gürcistan'da aşının intravenöz kullanımı yapılmıştır. Aşı uygulamasında humoral bağışıklığın aktivasyonu ile sağlanan antikorların aglütinasyon yeteneğinin korunmada etkili olduğu bildirilmiştir.

Şu anda, aşı etkinliği ile ilgili belirsizlikler, hastada oluşturduğu olumsuz etkiler ve antibiyotiklerin daha etkili bir tedavi seçeneği olması nedeniyle kullanılmamaktadır. Son olarak, aşı tedavisinin gözden geçirilmesi, Brusella aşısının geliştirilmesi için yararlı bilgiler sağlar. İnsan Brusella aşı adaylarının, aşının serolojik ölçümlerde artışa neden olması ancak etkisiz olduğu gözlemlenmesi nedeniyle hücre aracılı bağışıklık tepkisine dayanan koruma korelasyonlarını kullanmaları gerektiği öne sürülmüştür (Akhvlediani T ve ark., 2010). Güvenli ve etkili bir insan bruselloz aşısının geliştirilmesi, halk sağlığı üzerinde geniş bir etkiye sahip olacaktır. Endemik bölgelerdeki insan aşıları, kontamine gıda ürünlerinin tüketiminden kaynaklanan hastalık bulaşını ve potansiyel biyoterörizm veya biyolojik savaş ajanlarını önleyebilir ve aerosol tehdidine karşı koruma sağlayabilir (Bossi P ve ark., 2004 - , Bossi P ve ark., 2004). S19'un canlı zayıflatılmış aşı modeli olarak tanınması, SSCB'de 3 milyondan fazla insanın aşılanması da dahil olmak üzere insan kullanımına yönelik girişimde bulunulmasına yol açmıştır (Vershilova PA ve ark., 1961).

İnsanlarda brusellozun önlenmesi hala hayvan konaklarında hastalığın ortadan kaldırılmasına veya kontrol altına alınmasına, mesleki faaliyetler yoluyla enfeksiyona maruziyeti sınırlamak için hijyenik önlemlerin alınmasına ve süt ürünlerinin ve diğer potansiyel olarak enfekte olmuş gıdaların etkili bir şekilde ısıtılmasına bağlıdır. Aşılamanın insan hastalıklarının önlenmesinde artık sadece küçük bir rolü vardır, ancak geçmişte canlı zayıflatılmış *B. abortus* suşları 19-BA ve 104M (esas olarak eski Sovyetler Birliği ve Çin'de kullanılmıştır), fenol-çözünmeyen peptidoglikan aşısı (önceden Fransa'da mevcuttu) ve polisakkarit protein aşısı (Rusya'da kullanılmıştır) dahil olmak üzere çeşitli preparatlar kullanılmıştır. Hepsinin etkinliği sınırlı bulunmuş ve canlı aşılar söz konusu olduğunda potansiyel olarak ciddi reaktojenite ile ilişkilendirilmiştir. Şu anda, böyle bir gelişmenin aşılama ve bağışıklama konusunda DSÖ küresel programı kapsamında bir öncelik olması gerektiği yönündeki önerilere rağmen, görünürde

insan aşısı olmamasına rağmen, insan brusellozunun kontrolü hayvan hastalıklarının kontrolüne ve uygun gıda güvenliği düzenlemelerinin yürürlükte olmasına bağlı olmaya devam etmektedir. Sütün pastörizasyonunun veya kaynatılmasının insanlarda brusellozun en temel kontrolü olduğu öne sürülmüştür (Makita K ve ark., 2010).

Brusellozun bir sürü problemi olması ve uzun süre antibiyotik kullanımı gerektirmesi sebebi ile hayvanlarda antibiyotik kullanımı yapılmamaktadır. Ancak etkenin zoonotik yapısı ve insanlarda kullanılan bir aşısının olmaması sebebi ile antibiyotiklerle tedavi edilmektedir (Solera J, 2010). Tedavide kullanılan antibiyotik tercihleri açısından bir direnç gelişimi yoktur. Ancak koyun suşu *B. melitensis* için intermedier bir durumun varlığı belirlenmiştir (Wareth G ve ark., 2021).

Eradikasyon

Eradikasyon, patojenik ajanı bir ülkeden ya da bir bölgeden yok etmek demektir. Bir alandan veya bir popülasyondan eradikasyon için oldukça organize çabalar gerekir. Eradikasyon kavramsal olarak kontrolden çok farklıdır. Kontrol ne kadar iyi uygulanırsa uygulansın ne geçici ne de otomatik bir sonucudur. Kontrol programı için uygulamadan tamamen farklı bir organizasyon ve saniter önlemlere bağlıdır. Eradikasyon programının başarısı için hayati faktörler yeterli laboratuar desteği alınan bir sürveyans sistemi ile çiftçiler, karar vericiler ve tüm paydaşlar tarafından eradikasyonun anlaşılması ve amaçlarının paylaşılması gerekir. Popülasyonu enfeksiyondan etkilenmeden tutabilmek için önleyici tedbirler alınmalıdır (Corbel MJ, 2006 - Zhanga N ve ark., 2018).

Lokal insan ve hayvan popülasyonu ve bölge ile ilgili yeterli bilgi gereklidir. Yukarıda önleme ve kontrol için tanımlanan stratejiler eradikasyon içinde kullanılabilir. Ancak birbirini kapsayacak şekilde olmalıdır. Yapılacak işlemler uygun stratejinin belirlenmesi sonrası Şekil 1 ve 2 de gösterildiği gibidir.

Uzun süreçte, eradikasyon programları kontrol programları ile kıyaslansa da ekonomik olarak daha avantajlıdır. Ancak bu avantaj daima pratiğe aktarılmaz. Aslında eradikasyon programı var olmayan kaynakların mobilizasyonunu ya da karar vericilerin destekleyebileceğinden daha uzun zaman gerektiren yatırımları gerekli kılar. Kontrol stratejilerinde kararları desteklemek için cost-benefit ve cost-etkinlik analizleri kullanılır. Ancak epidemiyolojik analiz yokluğunda derinliğine bir analiz bulunmamaktadır (Corbel MJ, 2006 - Zhanga N ve ark., 2018- Roy S ve ark., 2011).

SONUÇ

Sonuçlar, brusellozun eradikasyonunun sistematik ve karmaşık bir program olduğunu ve kısa sürede tamamlanamayacağını göstermiştir. Başarı veya iyimser beklentiler elde edilse bile, projeler her zaman sürdürülmelidir. Avustralya ve Yeni Zelanda, ari duruma ulaşmak için 20 yıldan fazla zaman harcanmış ve programlar ariliğin sürdürülmesi için devam etmektedir. Amerika Birleşik Devletleri ise 1934 ile 2000 yılları arasında ari sürü bildirimine ulaşmak için 64 yıl harcamıştır. Hastalığın kontrol programlarına dahil edilen diğer ülkeler ve bölgeler de onlarca yıldır bruselloz kontrol programları uygulanmasına rağmen çok sınırlı sayıda ülke hastalığın bulaşını kontrol altına alabilmiştir (Corbel MJ, 2006 - Wasif M ve ark., 2024 - Zhanga N ve ark., 2018).. Bu nedenle daha fazla zamana ve çabaya ihtiyaç duyulmaktadır. Başarısız uygulama ve kampanyaların sonuçları, İrlanda ve Yunanistan'ın deneyimleri ile ortaya konulmuştur (Minas A ve ark., 2004- Sheahan M ve ark., 2006).

Aşılama, test-kesim ve itlaf uygulamaları tek başına sığırlarda eradikasyon için yeterli olmamaktadır. Hayvan hareketlerinin kontrolü, sürveyans sistemlerinin kullanımı ve yeterli laboratuvar desteği programın başarısına katkı sunan yardımcı önlemlerdir. İnsan ve hayvan bruselloz sürveyansında rol oynayan birçok faktör tüm ülkelere veya bölgelere uymayacağından, yukarıda tartışılan tüm faktörler tasarım veya değerlendirme aşamasında dikkatlice düşünülmelidir. Ayrıca, kontrol veya eradikasyon başarılı bir şekilde ilerledikçe, bir sürveyans programı, azalan insidans oranlarını hesaba katmak ve tanımlanması daha zor olabilecek yeni veya yeniden enfeksiyonları değerlendirmek için gerekecektir. Eradikasyon sağlandıktan sonra gözetimi sürdürmek problemin sürüden-bölgeden ariliğinin sürdürülmesi için zorunludur. Arilik döneminin konfirmasyonu için eradikasyon sonrası hastalık ajanının populasyondaki varlığı en az 5 yıl takip edilmelidir. Eradikasyon başarıldığında prevalans 5 yıl boyunca <%0.2 ve son 3 yılda abort bildirimi olmamalıdır.

Abstract

The examination period represents one of the most demanding phases in university life, characterized by increased academic pressure, elevated stress levels, and substantial changes in students' daily routines. Academic stress is widely recognized as a significant predictor of students' psychological well-being and academic performance. At the same time, nutritional habits tend to deteriorate during exams, often leading to insufficient energy intake, irregular meals, or increased consumption of fast food and stimulants. This study explores the interaction between academic stress and exam-period dietary patterns, and their combined influence on students' physical, mental, and academic functioning.
A cross-sectional descriptive study was conducted with university students from various public and private institutions in Tirana, Albania. Data were collected through a structured questionnaire evaluating stress levels, dietary habits, sleep patterns, concentration difficulties, and perceived academic performance. Findings indicate that 62.8% of students rely on fast food and energy drinks during examinations, while 74% report changes in appetite and eating patterns. High stress levels were associated with insomnia (79%), concentration difficulties (82%), increased fatigue (68%), and self-reported reductions in academic performance.The results highlight the importance of addressing academic stress as a core factor influencing student functioning, while also recognizing nutrition as a mediating component that may exacerbate or alleviate stress-related outcomes. Strengthening awareness and promoting healthier lifestyle strategies during examination periods may contribute to improved well-being and better academic results among university students. Insights from this study align with the doctoral research focus on academic stress and performance, offering practical implications for student support services in higher education.

Keywords: exam stress, nutrition, university students, dietary habits, mental health

INTRODUCTION

The examination period often represents a phase of increased psychological pressure, strict deadlines, and high cognitive demand for university students. During this time, maintaining balanced nutrition plays a crucial role not only in academic performance but also in overall physical, emotional, and psychosocial well-being. The relationship between stress and nutrition is bidirectional: academic stress influences eating behaviors, while inadequate nutrition can further exacerbate stress, anxiety, and cognitive impairment.

Unhealthy dietary choices during exam periods, such as skipping meals or consuming energy-dense, nutrient-poor foods, may result in fatigue, impaired concentration, emotional instability, and weakened immune function. Previous studies have shown that students experiencing high academic stress tend to consume fewer fruits and vegetables, skip breakfast more frequently, and increase their intake of fast food, sugary snacks, and energy drinks. These behaviors are consistently associated with poorer mental health outcomes and reduced academic performance.

Despite growing international evidence on the relationship between diet, stress, and student well-being, data from Albania remain limited. Therefore, this study aims to assess dietary habits during exam periods and their impact

on the physical, mental, and emotional health of students at Aldent University, contributing valuable evidence to the national literature.

MATERIALS AND METHODS

Study Design and Setting

A descriptive cross-sectional study was conducted at Aldent University following the February 2025 examination period. Data collection took place in March 2025 to capture students' recent experiences related to diet, stress, and well-being during exams.

Participants

The study population consisted of Bachelor and Master students enrolled at Aldent University. A total of 448 students voluntarily participated by completing an anonymous online questionnaire. Doctoral students were excluded due to differences in academic workload and stress patterns.

Data Collection Instrument

Data were collected using a structured online questionnaire designed to assess: - Socio-demographic characteristics (gender, age, residence, level of study) - Dietary habits during the examination period - Physical activity frequency - Sleep quality and concentration difficulties - Perceived impact of nutrition on physical, mental, and emotional health

Statistical Analysis

Data were analyzed using Google Forms and Microsoft Excel. Descriptive statistics were applied, and results were presented as frequencies and percentages. Data visualization included bar charts, histograms, and pie charts.

Ethical Considerations

Participation was voluntary, and informed consent was obtained prior to questionnaire completion. The survey was anonymous, and all data were treated confidentially and used exclusively for research purposes.

RESULTS

Table 1. Socio-demographic Characteristics of Participants (n = 448)

Variable	Category	Percentage (%)
Gender	Female	92.0
	Male	8.0
Residence	Urban	86.6
	Rural	13.4
Age group	18–21 years	78.6
	22–24 years	20.3
	>25 years	1.1
Level of study	Bachelor Year I	45.5
	Bachelor Year II	27.5
	Bachelor Year III	4.9
	Master Year I (Scientific)	8.0
	Master Year II (Scientific)	10.7
	Professional Master	3.3

Table 3. Meal Frequency During Examination Period

Meals per day	Percentage (%)
1 meal	13.2
2 meals	40.8
3 meals	28.8
4 meals	13.4
>4 meals	3.8

Table 4. Food Categories Consumed During Examinations

Food category	Percentage (%)
Fast food	65.2
Energy drinks	56.0
Sweets	49.3
Coffee/Tea	39.3
Fruits	27.0
Vegetables	20.5
Dairy products	15.2
Nuts	11.2
Grains	10.9
Alcohol	2.7

Table 5. Lifestyle and Well-being Indicators During Examinations

Variable	Category	Percentage (%)
Dietary imbalance	Yes	71.0
	No	29.0
Weight changes	Yes	76.0
	No	24.0
Weight change type	Weight loss	66.0
	Weight gain	34.0
Physical activity	None	69.6
	1–2 times/week	20.8
	3–5 times/week	6.7
	Daily	2.9
Sleep disturbances	Yes	80.0
	No	20.0
Concentration difficulties	Yes	90.0
	No	10.0

DISCUSSION

The findings of this study confirm that the examination period is a critical phase for university students, during which dietary habits, physical activity, and sleep patterns are significantly disrupted. In line with the study hypothesis, changes in diet quality and meal frequency were associated with negative physical, mental, and emotional outcomes.

The high prevalence of fast food, energy drink, and sugary food consumption reflects coping behaviors linked to academic stress and time constraints. Similar patterns have been reported in previous studies, which demonstrated that poor diet quality is associated with reduced academic performance and poorer mental health outcomes. The predominance of female and first-year Bachelor students may reflect greater health awareness and increased vulnerability to academic stress during early university years.

The majority of students reported sleep disturbances, concentration difficulties, and lack of physical activity, all of which are known to exacerbate stress and impair cognitive functioning. Weight fluctuations observed during the examination period further indicate metabolic and behavioral disruptions associated with stress and unhealthy eating habits.

Overall, the results highlight the need for targeted interventions aimed at promoting healthy eating, regular physical activity, and stress management strategies during examination periods. Universities should consider implementing nutrition education programs, accessible healthy food options, and initiatives encouraging physical activity to support student well-being and academic success.

CONCLUSIONS

This study demonstrates that examination periods significantly affect dietary habits, physical activity, and overall well-being of university students. Unhealthy eating patterns, combined with high stress levels and physical inactivity, negatively impact physical, mental, and emotional health. Implementing structured nutritional education programs, promoting regular meal planning, and encouraging physical activity during exam periods may help improve student well-being and academic performance.

Abstract

In this study, a novel chalcone-modified sulfonamide-based polymeric sorbent was successfully synthesized, starting from a cross-linked polystyrene high internal phase emulsion (PS-HIPE). The synthesis involved sequential chlorosulfonation of PS-HIPE, followed by sulfonamidation with aminoacetophenone, and subsequent reaction with salicylaldehyde via a Claisen–Schmidt reaction to incorporate the chalcone functional group. The resulting polymeric sorbent was comprehensively characterized using various analytical techniques, including scanning electron microscopy with energy-dispersive X-ray spectroscopy (SEM-EDX), Fourier-transform infrared spectroscopy (FTIR), X-ray photoelectron spectroscopy (XPS), Brunauer–Emmett–Teller (BET) analysis, and classical analytical methods. Also, the molecular structure of the resulting aluminum complex was also predicted using density functional theory. Batch adsorption studies were performed to evaluate the sorbent's efficiency for aluminum Al^{3+} removal from aqueous solutions, investigating the effects of adsorbent dosage, pH, initial Al^{3+} concentration (5–500 ppm), and contact time. The optimal adsorbent dosage was determined to be 25 mg. The maximum aluminum sorption capacity of the adsorbent was found to be 56.84 mg g^{-1}. Analysis of the equilibrium data using Langmuir and Freundlich isotherm models demonstrated that the experimental results fitted the Langmuir isotherm model best, suggesting a monolayer adsorption mechanism. The kinetic study indicated that the adsorption process followed the pseudo-second-order kinetic model. These findings suggest that the chalcone-modified polyHIPE is a highly effective sorbent for aluminum removal from water.

Keywords: Aluminum Removal, PolyHIPE, Chalcone, Sulfonamide, Adsorption.

INTRODUCTION

There is growing concern regarding contamination of drinking water sources with metals due to their potential acute and chronic adverse effects on humans. Aluminum (Al) is the most prevalent metallic element in Earth's outer crust, accounting for 8% of its mass. It is released from both natural and anthropogenic sources. Due to anthropogenic impacts that encourage aluminum release into aquatic environments, many natural water bodies are affected by acidification (Lydersen et al., 2002). Over recent decades, significant research has focused on removing toxic metals from natural water bodies and wastewater. Electrodialysis, adsorption, chemical precipitation, membrane filtration, and cation exchange are methods suggested for Al removal from aqueous solutions (Al-Muhtaseb et al., 2008; Aly et al., 2014; WANG et al., 2007). Among available water treatment technologies, adsorption is considered reliable for metal removal due to its low cost, efficiency, and diverse adsorbent selection. Polymeric adsorbents have been extensively used for effective heavy metal removal through physical mechanisms. This method has advantages including simplicity, scalability, recyclability, and ease of functionalization. These materials can be prepared with high porosity and substantial surface areas, making them effective adsorbents for heavy metal removal from wastewater.

High internal phase emulsion (HIPE) methods are templates with an internal phase volume ratio of 0.74 or greater. In water-in-oil emulsions, curing the external phase forms highly porous polymers called polyHIPEs (Barbetta & Cameron, 2004; Cameron, 2005; Silverstein, 2014; Yavuz et al., 2019). PolyHIPEs have hierarchical porosity, with properties including ease of preparation and tunable porosity. Removing the water phase creates voids, while surfactant ratio calibration enables void interconnections through polymer wall thinning.

The interconnected macroporous structure of open-cell PolyHIPE reduces diffusional paths and improves mass transport. This makes it widely used in applications like adsorption, separation, tissue engineering, and loading materials (Aldemir Dikici et al., 2022; Lima et al., 2023; Zhao et al., 2021).

This porous material suits adsorption applications due to its surface area, functional groups, and mass transfer properties. MS Silverstein [24] showed improved adsorption of polar VOCs and CO2 through polyHIPE hypercrosslinking (Castaldo et al., 2023).
PolyHIPE with epoxy groups was prepared by emulsion polymerization, followed by hyper-crosslinking and functionalization to create adsorbents with porous structures and dithiocarbamate groups for Pb^{2+} extraction (Yin et al., 2025).
Chalcone consists of aromatic rings connected by an α, β-unsaturated carbonyl system (Menezes et al., 2025). Chalcone products occur in plants, spices, fruits, and vegetables (Orlikova et al., 2011). Their structure allows metal ion coordination, as studied in 2'-hydroxychalcone-aluminium systems (Debattista & Pappano, 1997).
We report a chalcone-modified polystyrene PolyHIPE for aluminum ion removal from aqueous solutions. Chalcone was introduced via chlorosulfonation/sulfonamidation/Claisen-Schmidt reaction. The sorbent was characterized and its Al3+ adsorption studied through batch experiments examining parameters like dosage, concentration, pH, and kinetics. Maximum capacity was determined and mechanisms evaluated using isotherm and kinetic models.

MATERIALS AND METHODS

Chemicals and Materials

Styrene (Sigma Aldrich), Divinyl benzene (Sigma Aldrich), sorbitan monooleate (Sigma Aldrich), $K_2S_2O_8$ ((Sigma Aldrich) , $CaCl_2$ (Sigma Aldrich), isopropyl alcohol (Sigma Aldrich), chlorosulfonic acid (Fluka), acetone (Sigma Aldrich) p-aminoacetophenone (Sigma Aldrich), salicyl aldehyde (Sigma Aldrich), 1-methyl-2-pyrrolidone (Sigma Aldrich), trimethylamine (Fluka), ether (Sigma Aldrich), ethanol, sodium hydroxide, $NaNO_3$, HCl , phenol-phthalein and other chemicals were supplied commercially.

Preparation of PolyHIPE

The organic phase, which contained styrene (8 mL, 69.7 mmol), divinylbenzene (DVB) (2 mL, 7.1 mmol), and sorbitan monooleate (Span 80) (2.05 g, 4.7 mmol), was added to a 250 mL round-bottom reaction flask equipped with a mechanical stirrer. Nitrogen gas was passed through the mixture for 15 min to remove ambient oxygen. The aqueous phase was prepared separately by dissolving potassium persulfate (0.2 g, 0.74 mmol) and calcium chloride (1 g, 6.80 mmol) in distilled water (90 mL) and passed through nitrogen gas for 15 min. Under nitrogen gas flow, the organic phase in the reaction flask was stirred at a constant stirring speed of 300 rpm while the water phase was added dropwise through a dropping funnel for 30 minutes. After the addition of the entire water phase, stirring was continued at 300 rpm for 1 hour to obtain a homogeneous emulsion. The mixture was stirred at room temperature at 50 rpm for 20 minutes to remove any air bubbles that might remain in the emulsion. The resulting emulsion was placed in a 50 ml centrifuge tube for polymerization and left in an oven at 60°C for 48 hours. The resulting PolyHIPE was washed first with water and then with isopropyl alcohol by Soxhlet extraction for 24h to remove purities and then left to dry in a vacuum oven at 40°C for 24 hours.

Chlorosulfonation of the PolyHIPE (CS-polyHIPE)

The polyHIPE obtained was subsequently reacted with an excess of chlorosulfonic acid, utilized as a solvent, for a duration of 24 hours at ambient temperature. This reaction resulted in the formation of chlorosulfonated polyHIPE (Bicak & Senkal, 1997). The obtained CS-polyHIPE was washed successively with acetone, ice water, and acetone in order to remove soluble impurities. Subsequently, CS-polyHIPE was dried in a vacuum oven for 24 hours at room temperature.

Sulfonamidation of the CS-polyHIPE with 4-aminoacetophenone

A quantity of 4 g of p-aminoacetophenone (0.030 mol) was dissolved in 20 mL of 1-methyl-2-pyrrolidone (NMP). Then, 4 mL of (0.030 mol) trimethylamine was added as an acid scavenger. CS-polyHIPE (5 g) was added to this solution in portions at 0 °C. The reaction mixture was stirred with a magnetic stirrer at ambient temperature for 24 hours and at 60°C for 2 hours. Following the completion of the reaction, the sulfonamidated polyhipe was washed with excess water, ethanol, and ether, respectively, to remove soluble impurities. The sulfonamidated polyhipe obtained was then dried under vacuum at room temperature for 24 hours.

Preparation of the Chalcone modified PolyHIPE

The synthesis of chalcone-modified polyHIPE was performed through a Claisen-Schmidt reaction. For this purpose, 25 mL ethanol was added to 2.40 grams of sulfonamide modified polyHIPE. A base solution was prepared by dissolving 0.5 grams of sodium hydroxide in 5 milliliters of water. This base solution was then slowly added to the reaction medium. Subsequently, 1.10 milliliters of salicylaldehyde (0.010 moles) were added dropwise, and the reaction was carried out at 25°C for 24 hours. The resultant product was then subjected to a thorough wash with water and filtration. The product was purified by Soxhlet extraction with acetone for 2 days and then dried in a vacuum oven for 1 day.

Characterization of the Chalcone modified polyHIPE

The synthesized materials were characterized using Fourier-Transform Infrared Spectroscopy (FTIR-ATR) (Perkin Elmer Spectrum 100), SEM FEI-Philips XL30 environmental scanning electron microscope with a field emission gun equipped with an energy-dispersive X-ray analysis unit operating at 10.0 kV was used to analyze the surface morphology. Thermo Scientific K-Alpha X-ray Photoelectron Spectrometer was used to identify the elemental composition of the polymer surfaces operated in the range between 100 and 4000 eV.

Adsorption Experiment

Batch adsorption experiments were conducted by mixing a known amount of the adsorbent with Al(III) solutions of various concentrations. The effects of pH (2.0–5.0), initial concentration (5–500 mg/L), and contact time (5–120 min) were studied. The residual Al(III) concentration in the solution was determined using an UV-spektrophotometry). The amount of Al(III) adsorbed and the removal efficiency were calculated.

RESULTS

In this study, chlorosulfonated poly (styrene-DVB)-based PolyHIPE was interacted with 4-aminoacetophenone to obtained sulfonamidated PolyHIPE. After that, this product was reacted with salicyl aldehyde in the presence base catalyst using Claissen-Schmidt reaction for 24 h at room temperature (Scheme 1).

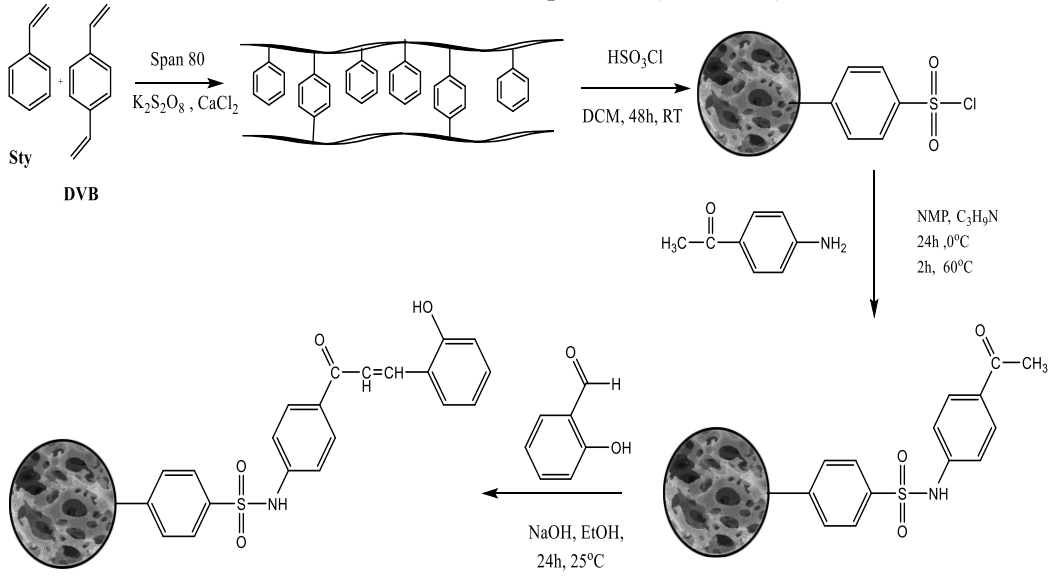

Figure 1. Chalcone modified PolyHIPE

The molecular structure of aluminum complex was predicted using M06-2X density functional in 6-31+G(d,p) basis, in Gaussian suite(Frisch et al., 2009) . The chalcone group chelated with aluminum ion and the remaining positions were saturated with water, Figure 1. The average Al-O bond distances were predicted to be 1.9 Å.

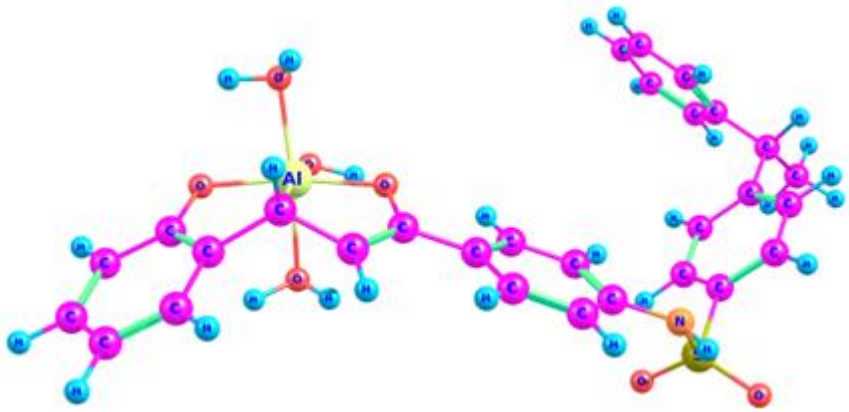

Figure 2. The structure of the aluminum complex of chalcone-modified polyHIPE.

The adsorbents were characterized using FTIR spectra. According to the Figure 3, S=O stretching vibration occurs at 1124-1161 cm^{-1} in the sulfonamide modified polyHIPE. The stretching vibration bands in the chalcone modified polyHIPE were observed at 1640 cm^{-1} is attributed to the C= O group. Also, the stretching vibration band at about 1598 cm^{-1} belongs to olefinic C=C conjugated to the chalcone group. Subsequent to the adsorption process, a decline in the peak intensity of the carbonyl group (1640 cm^{-1}) and the C=C (1598 cm^{-1}) double bond is observed. This is attributable to the formation of a complex Al^{3+} with the chalcone group.

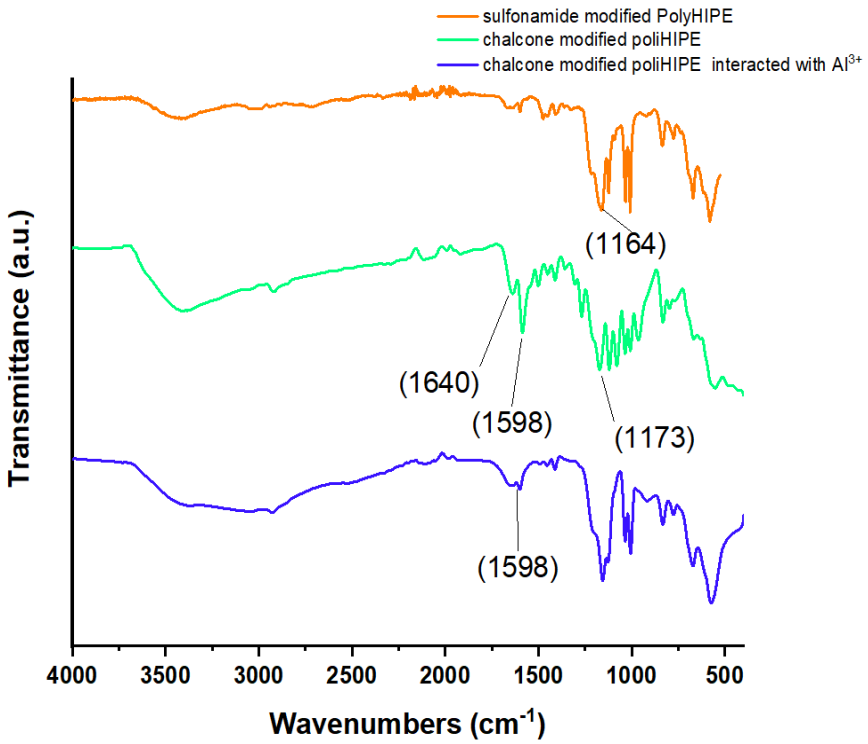

Figure 3. The FTIR spectra of sulfonamide modified polyHIPE, chalcone modified polyHIPE and chalcone modified polyHIPE interacted with Al^{3+}

In order to ascertain the effect of aluminum concentration on adsorption capacity, 0.025 g of polyHIPE was utilized in an interaction with 10 mL of an Al^{3+} solution, with initial concentrations ranging from 5 to 500 ppm. Following the filtration of the samples, the resin's sorption capacities were examined colorimetrically, as previously described, and calculations were performed in accordance with equation 1. According to the Figure 9, the data indicate a positive correlation between the initial Al^{3+} concentration and the Al^{3+} sorption capacity. The maximum capacity for Al^{3+} was determined to be 56.84 mg/g adsorbent in a solution with a concentration of 500 ppm.

Table 1: Aluminum Adsorption Capacity

Concentration (mg/L)	Capacity
5	0.15
10	1.52
25	4.05
50	15.25
65	18.25
125	40.04
250	51.02
350	56.56
500	56.84

CONCLUSION

In this study, a chalcone-modified polystyrene-based PolyHIPE was successfully synthesized and fully characterized using morphological (SEM), spectrophotometric (FTIR, XPS), and analytical methods. The characterization results indicated that the chalcone functional group was successfully incorporated and that an ionic interaction occurred between the chalcone group and the Al^{3+} ion upon adsorption. The molecular structure of the resulting aluminum complex was also predicted using density functional theory and the complexation via chalcone group was also verified.

Following the determination of the optimal adsorbent dosage, comprehensive batch sorption experiments were conducted, varying key parameters such as initial aluminum concentration and pH. The maximum aluminum sorption capacity of the synthesized sorbent was determined to be 56.84 mg g^{-1}. The adsorption equilibrium data were found to be best described by the Langmuir isotherm model (R^2=0.993), which suggests a favorable, monolayer adsorption process on a uniform surface. Furthermore, kinetic studies demonstrated that the adsorption process closely followed the pseudo-second-order kinetic model (R^2=0.999), indicating that chemisorption, likely involving the formation of a covalent bond between the adsorbent and aluminum, is the primary rate-limiting step.In conclusion, the findings of this research highlight the potential efficacy and superior performance of the chalcone-modified polyHIPE adsorbent for the efficient removal of aluminum ions from contaminated wastewater.

Abstract

tert-Butylhydroquinone (TBHQ) is one of the synthetic phenolic antioxidants widely used in edible oils due to its strong antioxidant properties, low cost, chemical stability, and availability (Yue et al., 2016). TBHQ has become attractive in the field of food technology due to its superior shelf-life extension, particularly in snack foods with high surface area and oil absorption(Asap & Augustin, 1986). Considered one of the most effective synthetic antioxidants, TBHQ is widely used in the food industry to delay oxidative spoilage and maintain quality of food products. TBHQ is a critical food additive with the ability to stabilize free radicals by interrupting oxidation chain reactions; it remains on the product, maintaining its protective properties even after high heat treatments during production, making it essential for post-packaging stability (Warner & Gupta, 2005). zeolitic imidazolate frameworks (ZIF-8) is a porous structure belonging to the MOF class, formed by the coordination of zinc ions with imidazole-derived ligands. Its unique structure makes it widely used in gas storage, catalysis, drug delivery, and, especially, electrochemical sensing. In recent years, hybrid structures obtained by modifying ZIF-8 have shown higher electrochemical performance (Lu et al., 2020). The most important properties of ZIF-8 are chemical stability, high surface area, biocompatibility, and the presence of various chemical groups. Thanks to these properties, ZIF-8 is an excellent adsorbent for biomaterials. This composite material combines the unique properties of its components, improving the properties of each in various applications, especially in electrochemical sensing, drug delivery, catalysis, and biotechnology (Jiang et al., 2019; Khezerlou et al., 2022; Paul et al., 2022). Although traditional instrumental methods such as high-performance liquid chromatography (HPLC)(Amlashi et al., 2014), gas chromatography-mass spectrometry (GC-MS) (Guo et al., 2006), and UV-visible spectrophotometry (Capitán-Vallvey et al., 2001) have been used for the detection of antioxidants, these have always been quite laborious and time-consuming techniques. Electrochemical sensors offer a timely alternative for the detection of TBHQ due to their simplicity, amenability to miniaturization, rapid and sensitive quantitative analysis (Tormin et al., 2012), (Ziyatdinova et al., 2014). In the first part of the study, the synthesis and characterization of novel ZIF-8 were performed. In the second part, ZIF-8 was used alone and in combination with AuNPs to modify the GCE surface and investigate its electrochemical properties.

Keywords: Electrochemical Sensor, ZIF-8, Biocompatibility, AuNPs, TBHQ

INTRODUCTION

Substances used for purposes such as preservation, preservation, flavor deterioration, and inhibition of microorganism growth during the production, processing, packaging, and storage stages of foods are called "food additives" (Ayper & Binokay, 2010). Approved by the European Union and classified with the "E" code, these substances can cause various health problems, ranging from allergic reactions to cancer, when consumed above the acceptable daily limits set by international commissions (Karatepe & Ekerbiçer, 2017). Antioxidants, which hold a significant place among these additives, are widely used to extend the shelf life of foods by preventing oxidative spoilage. In addition to natural antioxidants, synthetic antioxidants are more frequently preferred in the industry

due to their low cost, high stability, and easy availability (Thomas et al., 2015). However, it has been reported that excessive use of synthetic antioxidants can cause nutrient losses and toxic effects (Liu et al., 2020; Prabakar & Narayanan, 2006).

TBHQ, a synthetic phenolic antioxidant, is frequently added to food products to prevent oxidative deterioration of fats and oils (Fan et al., 2018). While not causing changes in the color, taste, or odor of foods is a significant advantage of TBHQ, excessive use is known to carry serious health risks such as liver damage and carcinogenic effects (Lu et al., 2020). Therefore, the use of TBHQ is strictly regulated in many countries, and the Acceptable Daily Intake (ADI) has been determined as 0−0.7 mg kg^{-1} by the JECFA (JECFA, 2011). These potential effects of TBHQ on food quality and public health necessitate the determination of its amount in foods using sensitive, rapid, and cost-effective methods. Although chromatographic methods such as spectrophotometry, HPLC, and GC-MS have been reported in the literature for the determination of TBHQ, the expensive equipment and time-consuming nature of these techniques have increased the need for more practical alternatives. In this context, electrochemical sensors, with their simple instrumentation, high sensitivity, and fast response time, offer a significant advantage over traditional methods (Paul et al., 2022).

In recent years, metal-organic frameworks (MOFs) have attracted considerable attention in the development of electrochemical sensors due to their large surface areas and tunable pore structures (Yuan et al., 2020). ZIF-8, a subclass of ZIFs, are particularly notable for its excellent thermal and chemical stability (Assfour et al., 2010). However, like most MOF structures, ZIF-8's insulating properties and low electrical conductivity limit its performance in electrochemical applications(Song et al., 2012). To overcome this limitation, integrating highly conductive metal nanoparticles into MOF structures has emerged as an effective strategy. The high catalytic activity and electron transfer rate enhancement of gold nanoparticles (AuNPs) significantly improve the sensor performance of MOF-based composites (Wang et al., 2018).

In this study, AuNPs@ZIF-8 nanocomposites functionalized with Au nanoparticles were synthesized and modified onto a glassy carbon electrode (GCE) for the electrochemical determination of TBHQ. This developed sensor platform aims to offer high sensitivity, low limit of detection (LOD), and superior selectivity for TBHQ analysis, thanks to the synergistic effect created by the high conductivity of Au nanoparticles and the large surface area of ZIF-8.

MATERIALS AND METHODS

Materials and reagents

2-methylimidazole (2-MeIm), KOH, $Zn(NO_3)_2.6H_2O$, disodium monohydrogen phosphate, sodium dihydrogen phosphate, TBHQ, sodium sulfate, chitosan, potassium ferricyanide ($K_3[Fe(CN)_6]$), potassium chloride KCl, and potassium ferrocyanide ($K_4[Fe(CN)_6]$) were purchased from Sigma-Aldrich and used as received. Butylated hydroxyanisole and phosphate-buffered saline buffer solution were prepared fresh before each measurement. Double distilled water (DDW) was used throughout the experiments. All chemicals were of analytical grade and were used without any purification process, and distilled water and methanol were used in the preparation of the solutions.

Preparation of ZIF-8

ZIF-8 was synthesized using the following procedure (Yang et al., 2018). First, 10 mmol of $Zn(NO_3)_2.6H_2O$ was dissolved in 100 mL of methyl alcohol and stirred for 10 min. Then, 100 mL of methyl alcohol containing 40 mmol of 2-MeIm was slowly added and stirring continued for 24 h at room temperature. The resultant ZIF-8 was isolated by centrifugation, washed thoroughly with methanol, and dried at 70°C, yielding 77 % as a brown solid compound.

Preparation of ZIF-8 sensor and the electrodeposition of ZIF-8/Au-NPs

During the cleaning process of the electrode surfaces, a 0.05 µM alumina solution was dropped onto the cleaning pad, and the surface was cleaned with circular movements. Then, the electrode surface was cleaned with ultrapure water and ethyl alcohol in an ultrasonic bath for 2 minutes for each solution to remove any impurities that might remain on the surface. The working electrode (GCE) surface was prepared using a simple and rapid technique called "drop-casting" to obtain ZIF-8 using 6 µL with micropipette, and the electrode was dried at room

temperature. After obtaining ZIF-8/GCE, the electrode deposed with AuNPs using CV electrodeposition method, for electrodeposition of Au NPs, by cyclic voltammetry, a potential window of 0.5 to 1 V and a scan rate of 100 mV s^{-1} for 20 cycles was applied into the 5 mM solution of chloroauric acid. And the modified electrode was obtained with AuNPs@ZIF-8/GCE.(Saeb & Asadpour-Zeynali, 2022)

Electrochemical characterization

Computer controlled IVIUM electrochemical analyzer and BASi brand cell stand (C3) were used for electrochemical measurements. In the experiments, glassy carbon electrode (GCE) was used as the working electrode, Ag/AgCl electrode as the reference electrode, and platinum wire electrode as the counter electrode. Electrochemical characterization of sensors made using Cyclic Voltammetry (CV) and Electrochemical Impedance Spectroscopy (EIS) methods using a 5.0 mM $Fe(CN)_6^{3-/4}$ solution containing 100 mM KCl. The Nyquist plots of EIS were used to follow the impedance changes of the electrode surface after the modification.

RESULTS AND DISCUSSION

FT-IR Spectroscopy

Fourier transform infrared spectroscopy (FT-IR) (λ = 400–4000 cm^{-1}) was performed to identify the functional groups of 2-MeIm and the synthesized ZIF-8 shown in Fig. 1A. In both spectra, the stretching vibrations of the ring v(C–H) appear around ~2925 cm^{-1}, indicating the presence of the imidazole heterocycle. The characteristic ring vibrations v(C=N) in 2-MeIm and ZIF-8 at showed at 1043 cm^{-1}, 1060 cm^{-1} respectively, while the v(C=C) group are observed in the region 1450–1600 cm^{-1} in both 2-MeIm and ZIF-8, indicating that the heterocycle remains intact. Bands in the 1300–1100 cm^{-1} region are assigned to v(C–N) stretching within the imidazole ring, demonstrating that the organic linker structure is conserved upon framework formation. Additionally, a band in the low-frequency region at 421 cm^{-1} is attributed to the v(Zn–N) stretching bond, providing direct evidence for coordination between Zn^{2+} ions and the nitrogen atoms of deprotonated 2-MeIm, thus confirming the successful construction of the ZIF-8 framework (Attwa et al., 2024; Rahim & Majid, 2023).

SEM-EDS

The Scanning Electron Microscope (SEM) analysis of the synthesized ZIF-8 Fig. 1C illustrates an aggregated microstructure composed of closely packed, irregularly shaped particles with rough surfaces, characteristic of polycrystalline framework materials. The wide particle size distribution and pronounced surface corrugation are expected to increase the accessible surface area and create a large number of potential active sites, which can facilitate mass transport and enhance interfacial interactions in adsorption or sensing processes. The formation of these dense agglomerates with nanoscale texturing (around 150-205nm) suggests a reproducible synthesis route.

The elemental composition of the synthesized ZIF-8 was evaluated by Energy Dispersive X-ray Spectroscopy (EDS), as shown in the elemental mapping and corresponding spectrum. The EDS map as shown in Fig. 1C reveals a homogeneous spatial distribution of zinc (Zn), carbon (C), and nitrogen (N) over the examined area, indicating that the inorganic nodes and organic imidazolate linkers are uniformly dispersed within the framework. The EDS spectrum Fig. 1C, exhibits intense peaks in the low-energy region (0–3 keV) associated with light elements such as nitrogen, which is characteristic of the 2-MeIm linker that contain the light elements such as carbon (C), nitrogen (N) and oxygen (O), with pronounced Zn peaks at higher energies, confirming the presence of Zn^{2+} centers in the structure. The table of elemental composition also provides the ration of the element in the framework of ZIF-8.

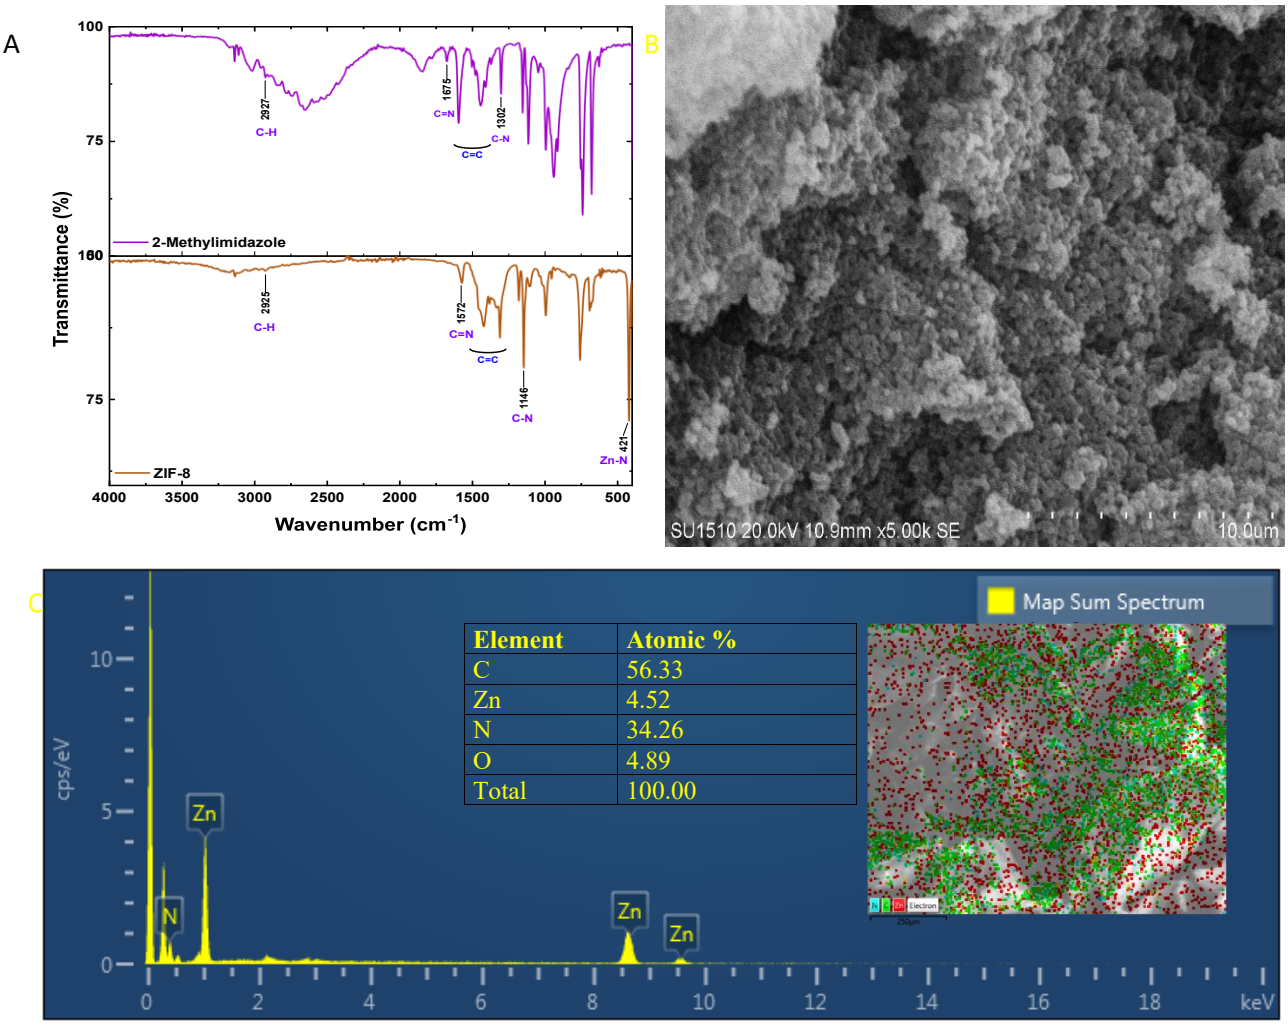

Figure 1. (A) FTIR spectroscopy of 2-MeIm and the synthesized ZIF-8. **(B)** SEM images of ZIF-8**. (C)** EDS spectrum and elemental composition of ZIF-8 powder.

Voltammetric Study

In order to examine electrochemical characterization of the modified electrodes with ZIF-8/GCE and Fe-AuNPs@ZIF-8/GCE, Cyclic voltammetry was tested in a redox probe containing 0.1 M KCl. High peak current was observed in the GC electrode modified with ZIF-8/GCE but voltammograms showed the highest peak current of GC electrode modified with AuNPs@ZIF-8/GCE. Additionally, the potential difference between the oxidation peak and reduction peak of the AuNPs@ZIF-8/GCE electrode in $[Fe(CN)_6]^{3-/4-}$ redox probe decreased because of the good electron transfer capability.

In this study, EIS, a common electrochemical characterization method was also used to further investigate the electron transfer kinetics of the different electrodes, According to the results of Impedance Spectroscopy, it can be said that ZIF-8 and Au nanoparticles increase the electrode surface conductivity and improve the electrochemical properties. These results are in consistent with those obtained using CV and show that the best conductivity is observed in ZIF-8/Au-NPs modified electrode.

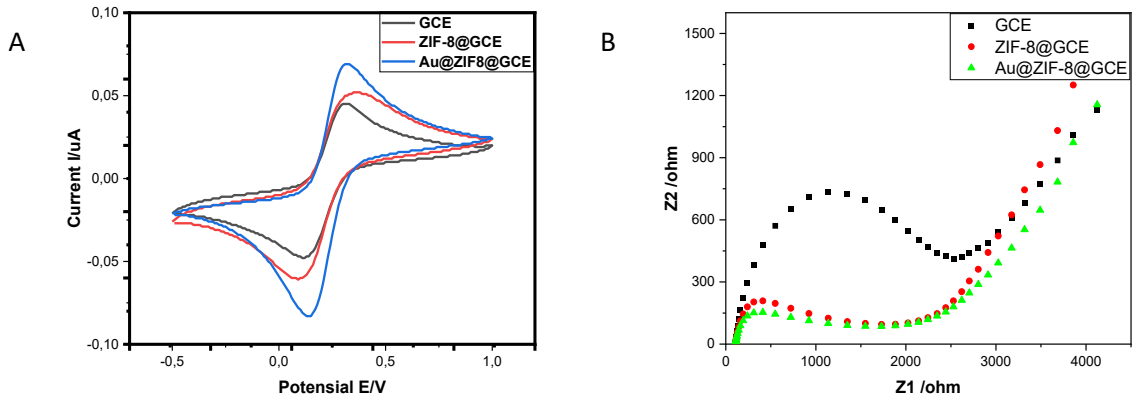

Figure 2. **(A)** CV voltammograms of Bare GC electrode (black), ZIF-8/GCE (red) and AuNPs@ZIF-8/GCE (blue). **(B)** EIS voltammograms of Bare GC electrode (black), ZIF-8/GCE (red) and 2-MeIm AuNPs@ZIF-8/GCE (green).

Optimization of Experimental Conditions

In this study, the amount of ZIF-8 and pH value were investigated to determine the optimal experimental conditions for AuNPs@ZIF-8/GCE that result in the highest detection sensitivity of TBHQ. the results shown in Fig. 3.

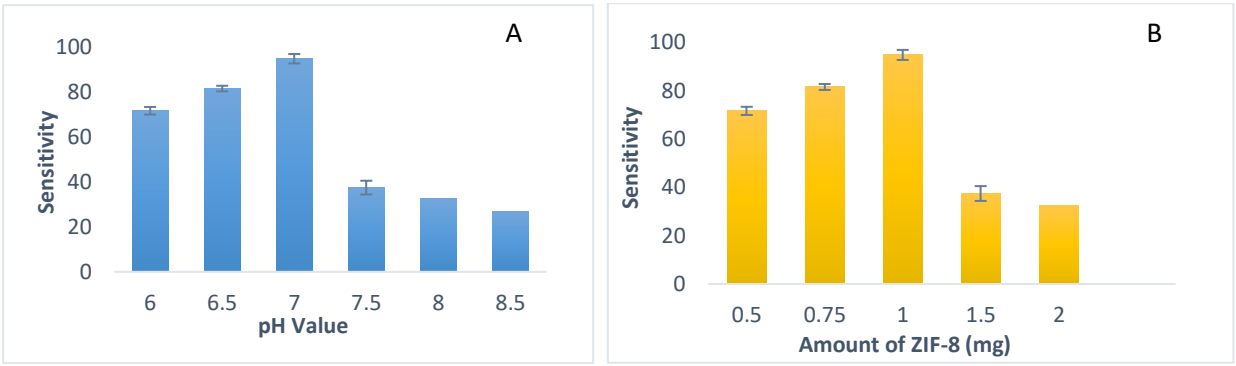

Figure 3. The optimum conditions of AuNPs@ZIF-8/GCE for TBHQ in PBS solution.

Calibration Curve plotting

DPV measurements were taken in 5 mL of 0.1 M PBS (pH 7) at constant temperature (vs. Ag/AgCl) under optimum experimental conditions. The typical current-potential response of ZIF-8/GCE for TBHQ measurements and the DPV curve depending on the TBHQ concentration. The current response increased linearly as the TBHQ concentration increased from 1.96×10^{-5} M to 1.67×10^{-4} M, the correlation value was 0.999 and the sensitivity was found to be 5.943±0.063 $\mu A.\mu M^{-1}$, shown in Figure 4 A, B. The typical current-potential response of AuNPs@ZIF-8/GCE and the DPV curve depending on the TBHQ concentration. The current response increased linearly as the TBHQ concentration increased from 1.96×10^{-5} M to 1.67×10^{-4} M, the correlation value was 0.998 and the sensitivity was 13.844±0.1 $\mu A.\mu M^{-1}$. shown in Figure 4 C, D.

The limit of detection (LOD) of the AuNPs@ZIF-8/GCE sensor was estimated to be as 5.52×10^{-6} M, and the limit of quantification (LOQ) was estimated to be as $1.84x10^{-5}$ M.

The repeatability and reproducibility of AuNPs@ZIF-8/GCE for TBHQ has been studied the response current of 5.0×10^{-5} M DA in PBS buffer by using five paralleled modified electrodes prepared under the same conditions. The relative standard deviation (RSD) of measurements is calculated to be 4.7%, and 2.8% for repeatability and reproducibility, respectively.

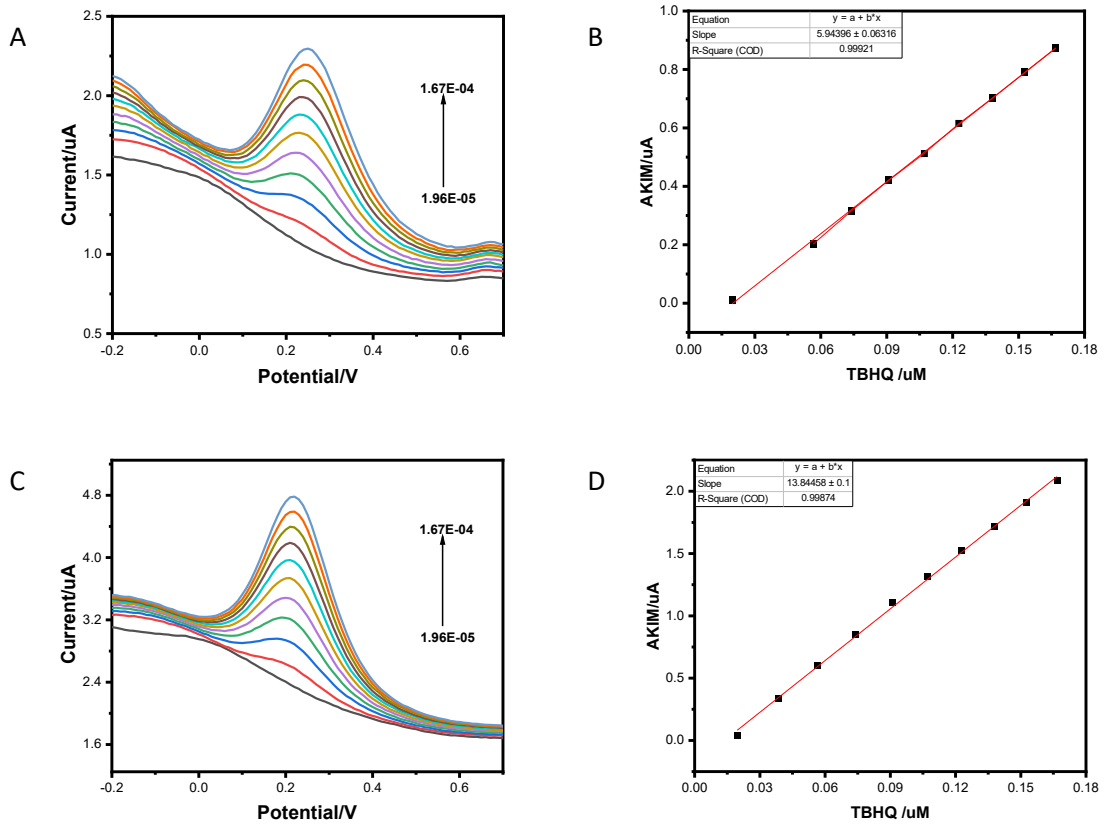

Figure 4. (A) Calibration curves **(B)** Plots of peak currents vs. the concentration by successive additions of TBHQ for ZIF-8/GCE in optimum conditions. **(C)** Calibration curves **(D)** Plots of peak currents vs. the concentration by successive additions of TBHQ for AuNPs@ZIF-8/GCE in optimum conditions.

CONCLUSION

In this study, ZIF-8 was synthesized via hydrothermal technique using $Zn(NO)_3.6H_2O$ and 2-methylimidazole for chemical sensing and TBHQ detection. The ZIF-8/Au-NP combination exhibits high conductivity when tested in electrochemical voltammetry and can be tested on a variety of biological analytes. These ZIF-8/Au-NPs exhibit activity and very high sensitivity, serving as a superior sensor for TBHQ detection at pH 7. Our work develops a promising, low-cost, and stable electrochemical sensor for TBHQ detection.

Abstract

Liquid crystals (LCs) occupy an intermediate state between crystalline solids and isotropic liquids, exhibiting partial molecular order and temperature-dependent anisotropy. These properties allow the modulation of optical and mechanical behavior, which underpins their use in displays, sensors and other photonic devices. The integration of heterocyclic rings into LC structures is crucial for tailoring molecular polarity, geometry, mesophase stability and luminescence. In particular, five-membered heterocycles can generate significant dipole moments, enabling thermotropic liquid crystals with desirable alignment characteristics for applications such as spatial light modulation, optical data storage, thin-film transistors, ferroelectric switching and fluorescent bioanalytical probes.

Nitrogen-rich heterocycles have gained increasing interest due to their technological and biological versatility. Compounds like 1,2,3-triazoles show notable biological activity and are used in dyes, corrosion inhibitors and photostabilisers, with several derivatives also exhibiting fluorescence. Tetrazoles constitute another important class, widely employed in pharmaceuticals, energetic materials, coordination cheff **Computational approach to evaluating** mistry and sensor technologies. Their role as bioisosteres of carboxylic acids, owing to comparable pKa values, further enhances their relevance in drug design. Efficient syntheses based on azide addition to activated nitriles allow high-yield formation of aryl tetrazoles under mild conditions.

In this study, poly (vinyl tetrazole) (PVT) was prepared starting from poly(acrylonitrile) (PAN). Obtained PVT was modified with cholesteryl chloroformate for preparation of the liquid crystalline polymer.

Keywords: Liquid crystals, Tetrazoles, Thermotropic mesophases, Nitrogen-rich heterocycles, Polyacrylonitrile.

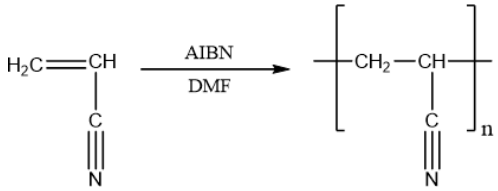
INTRODUCTION

Liquid crystals (LCs) represent a unique class of materials that cannot be fully categorized as solids or liquids, as they exhibit intermediate ordering and anisotropic behavior within specific temperature ranges. While solids possess a well-defined lattice structure with ordered molecular arrangement, liquids display disordered molecular motion; LCs lie between these two states, maintaining partial molecular orientation despite(Collings & Hird, 2017; Dierking, 2003). This molecular tunability enables significant changes in optical and mechanical properties, forming the basis of LC-based technologies such as displays, thermometers, and various optoelectronic devices.

The incorporation of heterocyclic rings into LC structures has become strategically important for designing advanced functional materials due to their influence on phase behavior, polarity, molecular geometry, and luminescence (Seed, 2007). Five-membered heterocycles, in particular, introduce longitudinal and lateral dipoles that support applications including spatial light modulators (Sandman, 2000), optical data storage (H. Zhang et al., n.d.), thin-film transistors (Dimitrakopoulos et al., 2006; O'Neill & Kelly, 2003), ferroelectric materials (Geelhaar & Merck, 1988), and fluorescent probes (Barbarella et al., 2001). Luminescent LCs are especially valuable because their self-organizing ability enhances optical performance, including polarized light emission (Tariq et al., 2013).

Nitrogen-rich heterocycles, such as 1,2,3-triazoles, are widely studied for their biological activity (Calderone, 2002) and utility in dyes, inhibitors, photostabilizers, and imaging applications (Padwa & Pearson, 2003; Sivakumar et al., 2004). Similarly, tetrazole derivatives have gained major importance across pharmaceuticals, coordination chemistry, energetic materials, and sensor technologies due to their stability and versatile functionality (Benson, 2002; Cui et al., 2012; Fischer et al., 2016; Frija et al., 2010; Göbel et al., 2010; Kumar et al., 2016; Liu et al., 2014; Roh et al., 2012; Sarvary & Maleki, 2015; Wang et al., 2007; Wittenberger, 1994; Z. Bin Zhang et al., 2016). Tetrazoles also act as bioisosteres of carboxylic acids owing to their comparable pKa values (Herr, 2002). Their synthesis commonly proceeds via azide addition to activated nitriles, followed by cyclization into the tetrazole ring, producing yields of 63–97% (Sarngadharan et al., 2022).

Recent developments highlight tetrazoles as efficient ligands in coordination chemistry and as essential components in applications ranging from explosives to agrichemicals. Their chemical stability and metabolic resistance further support their use as carboxylate substitutes in drug design, reinforcing their significance in modern material and pharmaceutical research (Du et al., 2012; Gallardo et al., 2000; Meyer et al., 1998).

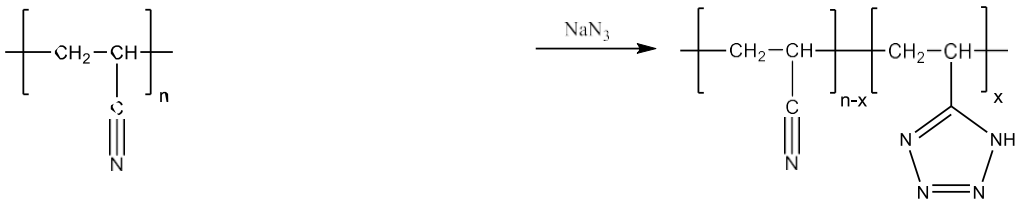


Cholesteryl functional tetrazole based polymer was synthesized and characterized spectrophotometrically. After that, phase transition temperatures were determined by differential scanning calorimetry (DSC) measurement. The phase exhibiting the nematic (N) phase was determined by polarizing optical microscope (POM) and DSC.

MATERIALS AND METHODS

Acrylonitrile (Sigma Aldrich), cholesteryl chloroformate (Sigma Aldrich), AIBN (Fluka) and other chemicals are commercially available and were used as received.

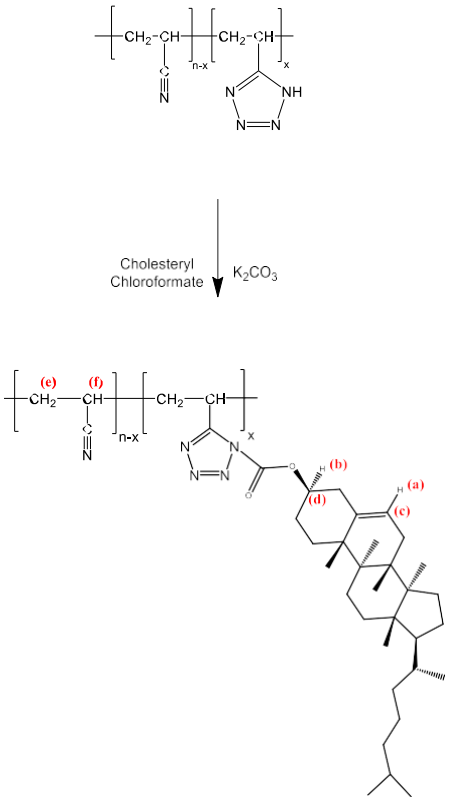
Polymerization of ACN



10 mL of ACN was placed into a 250 mL two-necked flask. Subsequently, 0.334 g AIBN and 35 mL DMF were added and dissolved. The polymerization reaction was carried out in an oil bath at 65 °C under nitrogen for 4 hours. Upon achieving room temperature, the viscous reaction mixture was added to into 250 mL of water for precipitation of the polyacrylonitrile (PAN). Following filtration, the obtained PAN was washed with excess of ethanol. After that, PAN was dried under vacuum (Scheme 1).

Scheme 1. Polymeryzation of acrylonitrile

Modification of PAN with sodium azide and click reaction



The tetrazole-cyclization reaction of PAN with sodium azide and ammonium chloride was carried out in a conical bottle equipped with a stirrer and a reflux condenser. Approximately 2.65 g of PAN powder and 100 mL of DMF were added to a 250 mL conical bottle, with stirring conducted at ambient temperature. Subsequently, 3.25 g of NaN_3 and 2.675 g of NH_4Cl were added into the PAN solution with constant stirring at room temperature. The bottle was promptly transferred into a water or oil bath and heated to 120 °C, with constant stirring for a duration of 18 hours. The intermediate product underwent spontaneous and gradual precipitation from the reaction mixture over the course of the reaction. The final reaction mixture was added to distilled water, resulting in the formation of a complete precipitate and the elimination of DMF. The products obtained were treated in 150 mL of 0.5 M HCl for the formation of the PVT and repeatedly washed with distilled water for a complete removal of Cl^-, Na^+, and H^+. The desired polymer was then left to dry in air for several days to constant weight. The following is a description of the nominal tetrazole-cyclization reaction (Scheme 2):

Scheme 2. Preparation of PVT

Cholesteryl functional tetrazole based polymer

A quantity of 0.60 g of PVT was dissolved in 28 mL of dimethylformamide (DMF) in the presence of 3.65 mL of triethylamine (TEA). 2.80 g of cholesteryl chloroformate was dissolved in 15 mL of THF. The solution was added dropwise to the reaction mixture and was stirred at room temperature for a period of 24 h. The reaction mixture was subjected to a process of precipitation on ice, followed by the addition of a small quantity of distilled water to ensure thorough precipitation. The mixture was stirred at room temperature using magnetic stirring and the filtrate was decanted. The residue was filtered through filter paper and washed with distilled water. The drying process was conducted within a vacuum oven. Scheme 3 also shows the synthesis of cholesteryl functional tetrazole based polymer.

Scheme 4. Preparation of cholesteryl functional tetrazole based polymer

RESULTS and DISCUSSION

PVT was prepared starting from PAN. For this purpose, PAN was obtained radical polymerization of acrylonitrile monomer using AIBN at 65 °C under nitrogen for 4 hours. The tetrazole-cyclization reaction of PAN with sodium azide and ammonium chloride were performed to obtain PVT.

Amine content of the PVT was found using titrimetric method and amine content of the polymer was calculated as 12.5 mmol amine per gram polymer.

According to the FT-IR spectra (Figure 1), the bands between 3200 and 3700 cm^{-1} were observed due to NH stretching vibration. Strong absorption peaks at 2242 cm^{-1} and 1632 cm^{-1} belong PAN C≡N and C=C stretching vibrations respectively. Also, the peak at 1357 cm^{-1} belongs to C-H and N-H bending.

In the spectra of PVT, a strong absorption was observed at 2930 cm^{-1} due to asymmetric CH_2 stretching vibration. The bands between at 2868–2612 cm^{-1} suggests the presence of tetrazole groups. A much stronger peak at 2240 cm^{-1} is belong PAN C≡N stretching vibration. After tetrazole formation, this band becomes weaker and disappears. Also, four PVTs all exhibit medium bands at 1551, 1416 and 1384, 1046 cm^{-1}, which are due to the C≡N stretching and bending vibrations of the characteristic tetrazole ring, respectively.

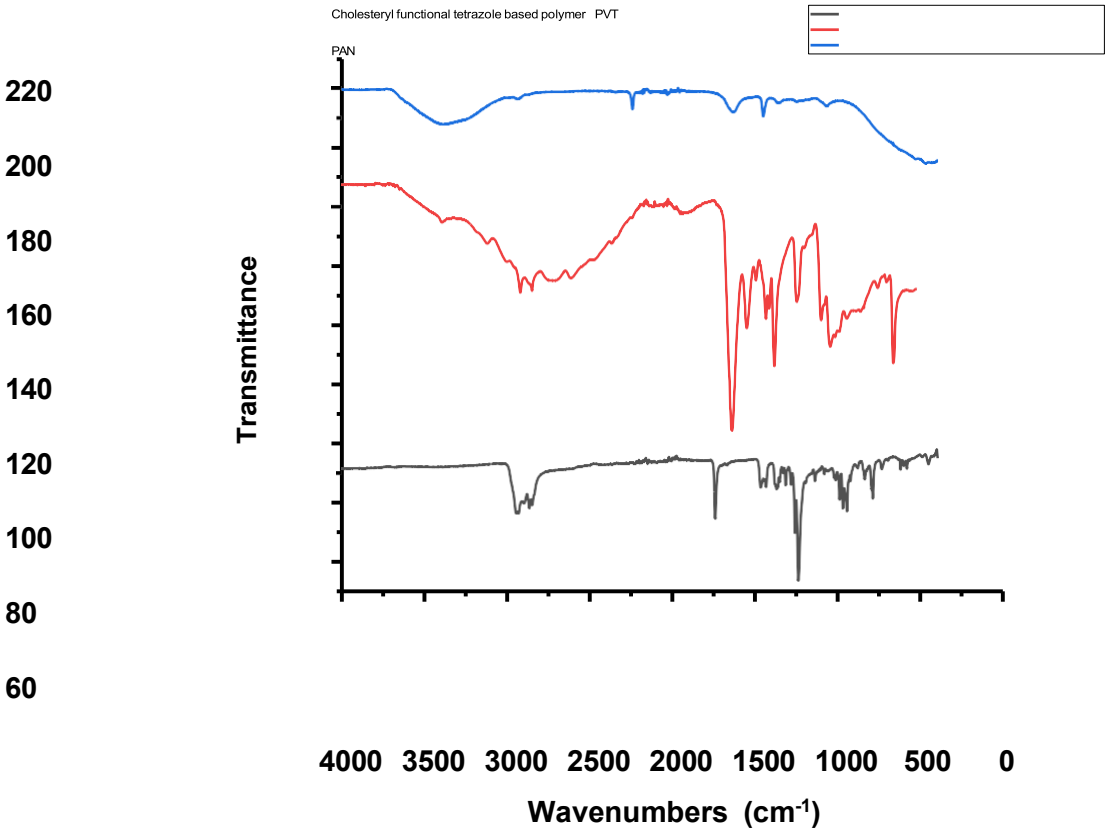


Figure 1. FT-IR spectra of PAN, PVT and cholesteryl functional tetrazole based polymer

Cholesteryl functional tetrazole based polymer was characterized by using FT-IR (Figure 1), ^{1}H-NMR ($CDCl_3$) (Figure 2) and ^{13}C-NMR ($CDCl_3$) (Figure 3).
According to Figure 1, aliphatic C–H stretching peaks of cholesterol were observed at between 2845-2863 cm^{-1} and 2928 cm^{-1}. The peak at 1742 cm^{-1} belongs to C=O stretching vibration.

^{1}H -NMR (Figure 2) ($CDCl_3$, d): 0.70–2.04 (m, 41H, cholesteryl protons), 2.50–2.51 (d, 2H, CH_2), 4.80–4.87 (m, 1H, oxycyclohexyl) (b), 5.45 (1H, s, alkenyl) (a), 2.0-2.10 (e) (CH_2), 3.0-3.5 (f) (CH).

A different method of characterization, ^{13}C-NMR (Figure 3), is said to produce prominent peaks at 123 and 80 ppm, thus confirming the existence of =C-H bond (c) and -CHO functional group (d), respectively.

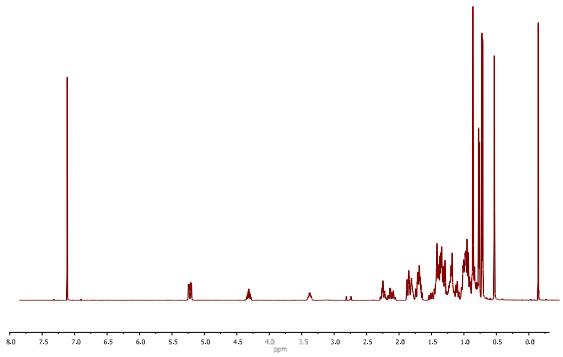

Figure 2. ^{1}H-NMR spectrum of modification of cholesteryl functional tetrazole based polymer

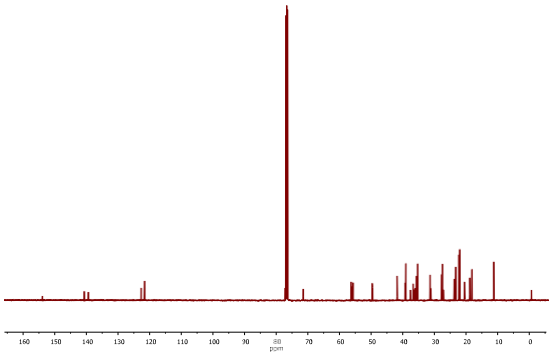

Figure 3. ^{13}C-NMR spectrum of cholesteryl functional tetrazole based polymer

The mesophase properties of the cholesteryl functional tetrazole based polymer were determined using DSC and POM.

In the DSC thermogram (Figure 4), an endothermic melting peak was recorded at 128.2 °C during the heating cycle, corresponding to the formation of the mesophase. In the cooling cycle, an exothermic crystallization peak was observed at around 105 °C.

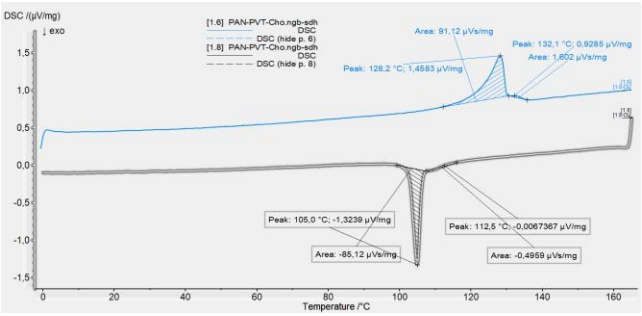

Figure 4. DSC thermogram of the cholesteryl functional tetrazole based polymer

During the POM analysis (Figure 5), a monotropic nematic liquid-crystalline phase was observed at 134 °C in the cooling cycle. At this temperature, a narrow temperature interval of nematic texture appeared, indicating a transition from the isotropic phase to the nematic phase. As cooling continued, a transition from the nematic phase to the crystalline phase was detected at approximately 130 °C. These observations are in good agreement with the thermal data obtained from the DSC measurements.

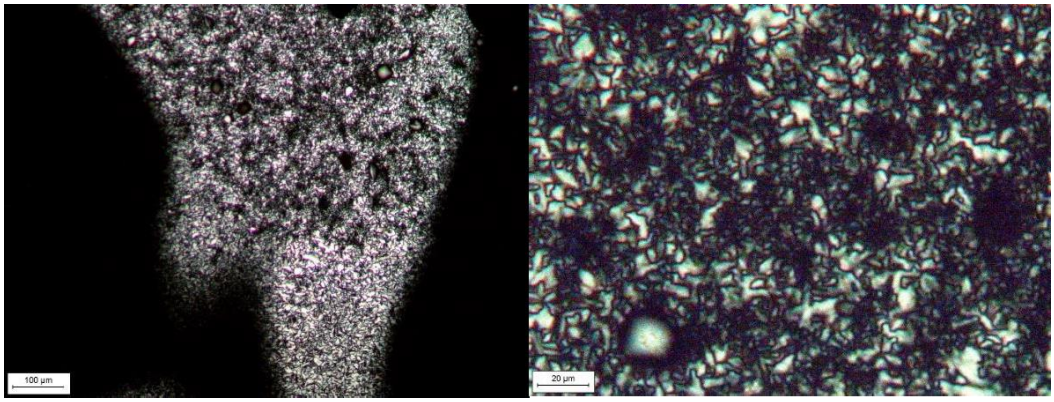

Figure 1. Snapshot pictures of mesophases of the cholesteryl functional tetrazole based polymer observed by POM

When evaluated together, the POM and DSC results clearly confirm the presence of a monotropic nematic phase in the compound.

CONCLUSION

Liquid crystals occupy a unique state of matter, combining fluidity with partial molecular order, and their properties can be finely tuned through structural modifications. Incorporating heterocyclic units-especially nitrogen-rich five-membered rings-significantly enhances the functional capabilities of LC materials by influencing polarity, geometry, phase behavior, and optical performance. Among these, triazole and tetrazole derivatives stand out for their structural versatility, stability, and wide applicability across optoelectronics, sensing, coordination chemistry, and pharmaceutical design. Their ability to act as bio isosteres and form robust intermolecular interactions further strengthens their role in developing next- generation functional materials. Overall, heterocycle-modified liquid crystals represent a powerful platform for advancing modern technological and biomedical applications.
